WELLCOME HISTORICAL MEDICAL LIBRARY

TO THE

Honoured, and Truly Learned,

Edmond Dickenſon, M. D.

Phyſician to the KING'S Perſon and Family.

THE Art of Chymiſtry, (*Honoured Sir*) although in its Speculations moſt Noble and Delectable to a Philoſophick Mind, and in its Practice highly Inſervient, and Beneficial to Mankind; yet hath it not eſcaped the Obloquies, and falſe Imputations of Detractors, and Calumniators, who either through Ignorance, Idleneſs, or Envy (or all of them conjoin'd) have made a falſe Repreſentation of this moſt Noble Art to the World, and endeavoured to ſet Mankind at the greateſt diſtance from that which is its higheſt intereſt to court. For which cauſe, ſuch Writings as Promulge, and offer at the advancing of the *Chymical Art*, ſtand in need of ſuch a Patron as is able to defend them againſt all the Cavils of Pride, Envy, and Ignorance.

And if the Exquiſite Parts, and Profound Learning in the more Abſtruſe Philoſophy, together with a Long, and Indefatigable Scrutiny and Labour in the Chymical Art, accompanied with a happy Practice in the Honourable Faculty of Phyſick, be fit Accompliſhments to Entitle one a **Mecænas** of this Art; then are thoſe Excellencies all met and Concentred in your ſelf, as is evident to the whole World by your Curious and Learned Epiſtle to **Mundanus**, and his Anſwer to it, which anſwer will be a Laſting Teſtimony of your great Worth and Merit.

For certainly, Sir, it is no ſmall evidence of your Worth and Abilities in the *Pyrotechnick Art*, that a Philoſopher who had been more than forty years an *Adept*, in all that time ſhould not find three Perſons, beſides your ſelf, whom he thought worthy to make certain of the truth of what they ſought, and aſpired after; and yet gave you an Ocular Satisfaction and Certitude of that which Thouſands have deſired to ſee, but could not: And further ſeriouſly profeſſing, that if he had had the ſame liberty from his Maſter, that ſome *Adepts* enjoy, that he would have revealed to you the whole Secret.

Theſe things have induced me humbly to offer this Book to your Patronage, not doubting but under your Name and Protection, it will be able to overcome many Difficulties, and obtain a free paſſage in this our *Engliſh* World, to the benefit and advantage of many well-diſpoſed perſons, who ſeek after Honeſt, Profitable, and Commendable Arts, which I am fully perſwaded was the chief end of the Author in Writing; and I am ſure is mine in Tranſlating his Works. You are throughly acquainted with *Glauber's Writings*, you know his Menſtruums, and his Medicines, and are able to atteſt the truth of what others may account falſe and impoſſible. As for ſuch of them as concern the higher Claſſes of Chymiſtry, I ſhall ſay nothing (being yet but *ad Corinthum vergens*) but commit them to your Mature Judgment, and Protection, humbly craving your pardon for this my preſumption, and for what Errors or Overſights I may have committed in this Work; and deſiring your Favourable Acceptance of theſe my poor Endeavours. I take leave to conclude with a paſſage of the abovementioned Excellent **Mundanus**. *I am fully perſwaded, that by the Bleſſing of God upon your Sagacious Labours, you will at length obtain that which will abundantly Compenſate your Pains and Coſt.* To which I adjoin my own hearty Wiſhes; and that after you have been as happy in this World, as true Philoſophy can make a Man, you may be Eternally Happy in that which is to come. I am

SIR,

An Honourer of

Your Name and Learning,

CHRISTOPHER PACKE.

THE

THE PREFACE TO THE READER.

THat the *Art of* Chymistry *is very useful and highly serviceable in Physick, Chyrurgery, Husbandry, and Mechanick Arts, is long since evinced by the Excellent Mr.* Boyl (*the Honour both of our Age and Country*) *in his Experimental Philosophy, or Philosophick Essays; who in* Essay I. and II. *shews that the Examination of the Juices of Human Bodies, by the Art of* Chymistry, *may illustrate their Use and Nature. And that by it may be Explicated the Nature of our several Digestions, and their Aberrations. And afterwards* Cap. VIII. pag 194. *speaking of the advantages that* Chymistry *affords to the* Therapeutick *or* Curative *part of Physick, (which is the chief and principal), and to which all the other parts are subservient) is pleased to express himself thus:* I cannot but think that if *Chymistry* did no more than assist us, by the resolution of Bodies, to extricate their more active parts, and partly by such Resolutions, and partly by associating Bodies together, to alter the former Texture of Natures productions, or present us with new Concretes of new Textures; by this very means, if Men want not Curiosity and Industry, to vary and prosecute Experiments, there must necessarily arise such a store of new and active Medicines, that in all probability, many of them will be found endow'd with such vertue as have not been (at least in that degree) met with, in the usual Medicines, whether Simple or Compound, to be bought in Apothecarys Shops; and consequently, even without any notable discovery, or improvement of Principles, Chymists (even as Matters now stand with them) may considerably add to the Pharmaceutical part of Physick. But if the Operations of *Chymistry* were seriously enquired into, and throughly understood, I make little doubt, but by a skilful Application of them, and especially by a series of them, in a Rational and Orderly way succeeding one another, there may be found out a great many preparations of Remedies, both very different from the common Ones, and far more Noble than they. *And presently after he adds.* That if we had but a few Potent Menstruums to dissolve and unlock Bodies with, I scarce know what might not be done in *Chymistry. Then further in that* Essay *where he treats of the usefulness of* Chymistry *to the Empire of Man over the Inferiour Works of Nature; he proceeds to shew that* Chymistry *is very serviceable to Husbandry in all its parts, and to other professions that serve to provide Men with Food or Raiment, or do otherwise minister to the Necessities or Accomodations of Life, as* Bakers, Brewers, Dyers, *&c.*

Thus far this Learned Philosopher: *To which I shall only add this, That if when he wrote those Essays,* Chymists *were able to contribute so much to the Necessities and Conveniences of Mankind, when* Chymistry *was but young in* England, *and but few Chymists who were accurate in their Operations, and perhaps, fewer who had any competency of Learning, or so much as lightly Tincted with the* Hermetick Philosophy; *if, I say, that it discovered so great a light when it had but newly ascended our Horizon, and was, as I may say, but in its Infancy, what assistance may now be had from it, when (notwithstanding all the Obstacles, and unkind usage it hath met with al) it is grown to a more virile Age and Vigour: But although* Chymistry *be much enlarged, and advanced in* England, *in respect of the Numbers, and Qualifications of the Lovers, and professors of it; yet are not Chymists free from pressing Disadvantages, not having the freedom of administring their own Medicines, how powerful and salutiferous soever, and otherwise adapted to the Necessities of the Sick, than the common* Apparatus *of Physick. So, that as the Case now stands, the help and Succour which the Sick and Diseased receive from Chymical Physick, is but very small to what they might have, if knowing Chymists had the freedom of exercising that Art in all its parts, which with much Industry, Labour, and Costs, they have been sollicitous to attain. But when this discouragement of ingenuity and Obstacle of the publick good, shall become more apparent to those in whose power it is to redress it, I do not doubt but it will meet with a Remedy.*

But now, to give some account of my present undertaking. I have at length (by God's help, and the assistance of my Subscribers) finished my Translation of Glauber's Works, *and here present it to the Reader, in the* English *Tongue. How well I have performed it, I must submit to the judgments of others: I could have been very glad to*

have

have seen it done by some abler hand; but when I have heretofore proposed the doing but of some parts of it to those whom I knew might easily have accommodated English *Artists therein; telling them that I wondered so Excellent an Author, should be so long extant, and that none should unveil him of his* Latin *and* German *Coverings, and put him into an* English *Dress. I have had for answer, That this Age was not worthy of it; so that it seems to me, that the Providence of God had reserved it for fitter times, although to be done by one of the meanest of the Sons of* Pyrotechny. *But this I can say, that I have acquitted my self in this matter, as well as the slenderness of my Parts, weakness of Body, and the necessary Affairs of my Laboratory would permit me; but*

——Ubi desint Vires, acceptanda est Voluntas.

I desire the Lovers of Chymistry *to accept my Labours, with the same good will that I have undergone them, having no other end but to serve my Country. And I hereby return thanks to all those generous spirited Gentlemen and others, who have Subscribed to, and promoted this Work, without whose assistance (the Charge being very great, as well as the labour (to me) almost insupportable) it must yet have remained hid and unserviceable to the* English *Reader. But I am in an especial manner obliged to that publick spirited Gentleman (whom I ought to name, were it lawful to do it without his leave) who freely offered me and put into my hands a not inconsiderable part of the Materials for this Work, which part also had been more considerable than it was, had not the Spirit of some, (who unjustly hinder'd it) been as Mean and Sordid, as his was Generous. But that Loss was, in part, made up to me, by a well-minded Artist, to whom I also return Thanks.*

I have Printed this Book upon far better and larger Paper than I proposed to do it in; for at the time of setting forth my first Proposals, I had not the German *Pieces, but when they came to my hands, upon a more accurate computation of the matter, I found that if I should go on to do the Work upon the Paper I had proposed, the Book would swell to too great a thickness for its breadth and length, and not be only ill shaped, but inconvenient to be read. By this means my Subscribers have a much better Book than I promised them, although the Charge hath also been Considerably greater to me, than I at first expected.*

The Reader hath all here in one Volumn which Glauber *ever Printed, as far as I can find upon diligent Enquiry at* Amsterdam, *where all his Writings were Printed, and where I purchased the Original Copper Plates belonging to them. But whereas, as 'tis said in the* Explication of Miraculum Mundi, *page* 177. *That the Cut there described was not Printed in the Latin Copies, nor to be found among the Original Plates; yet notwithstanding, I was unwilling that the Work should go without the Figure of so useful a Furnace as that is, for the Torrefying, or Calcining of Ores, and separating, and depurating their Metals, for which reason I have caused it to be Delineated and Printed with others before the* Continuation of Miraculum Mundi, *after page* 188. *I have also procured from the hand of another Friend, who is a Lover of Art, the Draught of the Refrigeratory, Furnace, or Instrument, which serves for the making the* Mercury of Wine, *purifying, and fixing of* Argent-vive, Antimony, Sulphur, *&c. and many other uses which an Ingenious Artist will find out. This Furnace the Author always endeavoured to conceal, but describes it in some part in the beginning of the sixth part of the* Spagyrical Dispensatory, *to which Description I have added the Figure. The Figures of the several Vessels and Instruments belonging to the Fifth Part of the Furnaces, are referr'd to at the beginning of the Fourth Part, but since, for the better orders sake I have placed them before the said Fifth Part.*

These Twelve following Treatises were never Printed in Latin, *but in the* German *Tongue only,* viz. *The* Third, Fourth, *and* Fifth Centuries; *the* Second *and* Third Appendixes *to the Seventh Part of the* Spagyrical Dispensatory. *The* Book of Fires. Proserpine. Elias the Artist. The three Fire-stones. The Purgatory of Philosophers. De Lapide Animali. The Secret Fire of Philosophers. *All which I have caused to be Translated (my self being ignorant of the* German *Tongue) by a person well skill'd both in the* High-Dutch, *and also in* Chymistry, *whereby I hope this Book will not be altogether unserviceable nor unacceptable even to the Learned; besides, all the Works of this Author that are in Latin are very difficultly (if at all) to be met with at any Book-sellers Shop in* London, *and those that are, at a dear rate: For when I had entered upon this Translation, I was forced to send to* Amsterdam *to have all the* Latin *pieces compleat.*

The Author in many places refers to his Opus Saturni, Opus Vegetabile, *and the* Concentration of Heaven and Earth, *which Treatises, I am assured, were never printed (at least under those Titles) which also seems to be manifest from his Epistle to the* First Century, *or General Appendix, wherein he inculcates, that for want of time, he had inserted the sum of them all in that Treatise. He also mentions a Seventh part of* the Prosperity of Germany, *in the Preface to the Second Part of* Pharmacopœia Spagyrica, *which was never Printed under that Title, but I am induced to believe it is the* Novum Lumen Chymicum, *as partly appears by compariug it with the foresaid Preface. And it is evident that in some parts of his Writings he hath mentioned a Treatise by one Name, and afterwards Printed it by another, as,* The Testimonium Veritatis, *which was afterwards Printed by the Name of* Explicatio Miraculi Mundi. *As for the* Opus Saturni, *I have heard that there are some Manuscript Copies of it, and had hopes of obtaining it from two several hands, but both failed me. I have been also informed, that there are* Five Centuries *in Manuscript more than I have Printed, but could never understand in what hands they were, except one of them,* viz. *the sixth, the proprietor of which would not be so kind as to let me have it to print.*

I have (by the advice of an Honourable Person) left out the Author's Religious and Moral Digressions, where I could do it without prejudice to the matter; as also his Apologetical Writings, except his Apology against Farnner, *which I have printed, forasmuch as it is intermixt with many profitable Secrets, which perhaps, he would not have published, at least not at that time if they had not been, as it were, extorted from him by the ill Treatment of that Ungrateful Man.*

I could not place the several Treatises in that order which the Author published them, without breaking the order of the several parts, as of the Miraculum Mundi, Spagyrical Pharmacopœa, *and* Prosperity of Germany; *for being many years in publishing, they were done promiscuously, but how they succeeded one another so far as the* Nature of Salts, *the Reader may satisfie himself in the Preface to that Treatise. And as his Writings were published by piecemeal, so are the principal Secrets he teacheth, scattered up and down in divers parts of them, in one place he treat-*

eth

eth of a thing obſcurely, or but in part; in another place of the ſame thing openly in that part which he had veiled in the other. Sometimes he declares a Proceſs very openly, omitting only ſome ſmall Circumſtances, or Manual Operation, which would ſeem to many either impertinent, or not neceſſary to be done, when notwithſtanding, the buſineſs will not ſucceed without it. An inſtance of this may be given in his Sal Mirabilis, *whoſe preparation he teacheth obſcurely in the* Nature of Salts, *but more openly in the Second Part of* Miraculum Mundi. *In the* Nature of Salts, *and in the Sixth Part of the* Pharmacopœia Spagyrica, *he teacheth how to Diſſolve Gold therewith, and thence to make a kind of* Aurum Potabile, *but wholly omits the adding of a certain Vegetable Sulphur, without which, the work will not anſwer the Deſcription; this Defect he ſupplys in the* Second Century, *after a twofold manner, the one not obvious to every Man's Apprehenſion, I mean the intent of the Author,* viz. *in thoſe Proceſſes where he ſhews the making of a Vegetable Sulphur; but the other ſheweth the neceſſary Manual Operation in plain and open words. And this he hath done with all his Secrets on ſet purpoſe, that they ſhould be found out by none but the Induſtrious.*

And this hath given occaſion to many, who have not taken pains to read him with diligence, or not being experienced in Operating, to reproach him for an obſcure, yea, even for a falſe Writer, becauſe they have made two or three Superficial, or Unskilful Trials of his Proceſſes, which have not ſucceeded according to their Expectations; when indeed, the fault was in themſelves, either in not perceiving the Author's intention, or their own want of skill in rightly managing the Operation: And I know ſome Perſons that ſometime ſince ſaid Glauber *had been too dark in his Writings, who now think he hath wrote too plain.*

But having mentioned this, I will here (for the ſake of thoſe Country Gentlemen, who have ſubſcribed to this Work) a little Elucidate the Author's Proceſs about the inverſion of Common Salt, with Lime, for the enriching of Poor and Barren Land. He indeed ſpeaks of ſeveral Saline Preparations, which greatly promote the fertility of the Earth, but this with Common Salt, and Lime, is the cheapeſt of all, and alſo is moſt eaſie to be done, for any Plowman, or Labourer, having but once ſeen it done, may be preſently able to manage it. The ſum of it is, that Common Salt be turn'd from its ſharpneſs, into an Alcalizate Nature (which is hot and fat) which then by its Magnetick force will attract from the Air a Vivyfying, Fructifying, Salt-nitrous power, and long retain it in the Earth, which is the cauſe of all Growth and Vegetation, as the Author ſheweth in the Continuation of Miraculum Mundi, *and many other places; but gives the Proceſs of the preparation in plain and open words in the Appendix to the Fifth Part of the* Proſperity of Germany, *page* 416.

Neither is the practice of preparing either the Land, or the Seed, in order to the better Crop, altogether Novel, as may partly be ſeen in Virgil, Georgic Lib. 1. *where he ſaith,*

Semina vidi equidem multos medicare ſerentes,
Et Nitro prius, & nigra perfundere amurca;
Grandior ut fœtus ſiliquis fallacibus eſſet, &c.

Which in *Engliſh* may ſound thus:

Some have I ſeen their Seeds to ſow prepare,
With Nitre and Oyl-Lees, for they by care
Will grow far greater, and be ſooner ripe, &c.

The Lime muſt be ſpread upon the ground, where no Rain can come to it, till it ſlake it ſelf by the Air, and fall into a Powder; of this Powder you are to take four hundred weight to one hundred weight of any common foul Salt, which is too impure for the uſe of the Kitchen, where ſuch may be had, otherwiſe clean Salt, (for that will be cheaper than Dung) the Salt and Lime are to be well mixed, and then moiſtened with ſuch a quantity of Water, (or rather Urine where it may be had) as will bring the Lime and Salt mixed, to the Conſiſtency of a ſtiff Mortar. Of this Maſs Balls are to be made about the bigneſs of ones Fiſt, and laid under a Shead, or Hovel to dry; being dried, they are to be burnt in a Kiln as Lime is, ſo that the Balls may be red hot for an hour at leaſt; or where no Lime-Kiln is near, they may be burnt by building a Pile in the Field, firſt with a Lay of Wood, then a Lay of Balls, then Wood again, and ſo till all the Balls are placed fit for burning. When the Balls are burnt, they are to be again placed upon a Floor under a Shead, or Hovel, where they may be expoſed to the Air, but kept free from the Rain, and if you break them with a Clod-beater preſently, the Air will the ſooner act upon them, and cauſe them again to fall into a Powder; which Powder may then be carried out and ſpread, or rather ſowed out of a Seedlet, thicker or thinner as the Land ſhall require. Provided this be done in the beginning of Summer about the time of Fallow, for that being many Months before the Seed is to be ſowed, the fieryneſs of this rich Compoſt will be Contemperated by the Air and the Earth, and changed into a Nitrous fatneſs, which joining it ſelf with the Earth, is again Magnetically attracted by the Seed when it is ſown, whoſe growth is thereby ſwiftly promoted, and its Multiplication much augmented. But if any ſhould caſt this Matter upon his Land ſoon after it is burnt, and preſently after that ſhould ſow his Seed, inſtead of having a greater Crop than he uſed to have, he would have a leſs, or perhaps none, that Year, but the next Year, and ſo on for many Years, the ſame Land would bring forth plentifully. Therefore it is neceſſary, that this Matter ſhould lie ſix or ſeven Months ſpread upon a Floor, and now and then turn'd with a Shovel, as you turn Malt, that it may be Contempered, and Animated by the Air; or be caſt upon the Land ſo long before the Seed be ſown. The reaſon is the very ſame as with Dung, for none takes freſh Dung and ſpreads it upon his Land when he is about to ſow his Seed, for if he ſhould, his Seed would be burnt up; but the Husbandman lets his Dung lie ſome time to rot, as he calls it, after which he lays it on his Land, and lets it lie ſpread ſome time before he Plows it in, and all this is but to Contemper the heat of the Animal Salt contain'd in the Dung, and turn it into a Nitrous Nature. Thus much I thought good to ſay about this Matter in the plaineſt words, leaſt any, not throughly underſtanding the Author's Intention, ſhould erre in the firſt Experiment, and ſo unjuſtly blame the Author, and forbear themſeldes and deterr others

from profecuting that eaſie Practice, which I am confident, if rightly managed, will bring much profit to many perſons in this Nation. This muſt alſo of neceſſity be a profitable Work to thoſe who will undertake it upon the account of making of Salt-petre; *eſpecially to ſuch as underſtand the Nature and Generation of that Excellent ſalt, which is of ſuch incomparable uſe in the Preparation of Medicines, ſeparating of Metals, and in many Mechanick Arts.*

Now forasmuch as in this Work Sal Mirabilis, Spirit of Nitre, *and* Spirit of Salt, *are recommended to very many uſes, and every one that hath a mind to make Experiments with them, may not have the knowledge, or the conveniency of preparing them, I hereby ſignifie, that I intend (God willing) to prepare and keep by me the Author's* Sal Mirabilis *of both ſorts, that peculiar* Spirit of Salt, *which he commends againſt the Scurvy and other Diſeaſes, and alſo to keep Beer from ſowring in the Summer, in the* Conſolation of Navigators. *His* Panacea of Antimony, *and* Golden Panacea, *ſpoken of in the Second Part of the* Pharmacopœia Spagyr. *the* Explication of Miraculum Mundi, *and divers other places. His* Aurum Diaphoreticum, *alſo the* Tincture of Gold, *or* Aurum Potabile, *are deſcribed to be made of the* Irreducible Blood of the Lyon) *in the Sixth part of the* Spagyrical Pharmacopœia, *Chap.* 22. *Theſe I purpoſe conſtantly to keep by me for the accommodating of Phyſicians, and others, who ſhall have occaſion to buy them. Thoſe are Excellent Medicines, and ſuch as a Phyſician may have ſome confidence in; and indeed, this Book contains a great variety of ſuch Medicines as will get a Phyſician Honour, which (I hope) will be tryed by all thoſe who delight to do good, and be brought into uſe for the general Help and Comfort of the ſick. For I freely confeſs, that if I have any thing in Medicine, beyond what is commonly known, I have had the Foundations of it from this Author; and if God ſhall pleaſe to grant me life to a fit time, I doubt not but I ſhall from thoſe Foundations be able to raiſe ſuch a Superſtructure as ſhall teſtifie the truth of his Writings, and powerfully evince the Worth and Excellency of Chymical Medicines, and that demonſtratively in matter of Fact,* viz. *by the Curing of both Acute and Chronick Diſeaſes.*

And now by way of Concluſion, I have only one thing more to add; and that is a Requeſt to all the Ingenious Lovers of Chymiſtry, that they would not occaſion this Work which I have undergone with ſo much labour, and loſs of time from my private Concerns, meerly for the good of others, to redound to my own hurt; my meaning is, That I might not be put to the charge and trouble of Letters about Curious Enquiries, wherein I am to have not the leaſt profit: This I mention, becauſe I have had divers ſuch Letters come to my hands ſince I have been about it, and that ſometimes two or three very long ones with many Queries, in one Week. Now ſhould this continue, and I endeavour to ſatisfie all the Doubts, and gratifie all the Curioſities of all ſuch non-conſidering perſons, truly I ſhould have no time beſides what this would take up, to provide for my ſelf and Family. But notwithſtanding what I have ſaid, if any Ingenious Perſon ſhall ſtand in need of my Aſſiſtance, in preparing of any thing for him, or otherwiſe, wherein I may have a reaſonable recompence for my Time and Trouble, I will be ready to give him the beſt aſſiſtance I can. For I am now but juſt ready to receive a Writ of Eaſe from three Years daily labour and care about this Work, and I would be willing to enjoy it ſome time, that I might again with diligence apply my ſelf to my Laboratory, the effects of which, if God ſhall ſee good, may at one time, or other, ſhew themſelves to the World. In the mean time, I wiſh all Honeſt and Ingenious Lovers of the Spagyrick Art, good Succeſs in their Studies and Labours, that thence the Penuries and Miſeries of Mankind, eſpecially of the ſick, may be effectually remedied; that they may Cooperate as Inſtruments with the great ends and providences of the Almighty, to bring about that time, in which God ſhall be Glorified all the World over, and Men live in a more ſerene and tranquil condition than yet they have done, which ſhall always be the Deſire and Prayers of him that is a Lover of Pyrotechny, *and Honourer of all true Artiſts.*

From my Houſe next Door to the Sign of the *Gun* in *Little Moor-Fields*, the 1688.

Chr. Packe.

THE FIRST PART OF Philosophical Furnaces.

Containing a new Art of making *Spirits*, *Oyls*, *Flowers*, and other Medicaments, by the help of the first of those Furnaces, after a very easie and peculiar manner out of Vegetables, Animals and Minerals: With their Chymical and Medicinal use.

A *Preface* to the Courteous Reader.

I *Have hitherto reserved to my self as Secrets, some peculiar Furnaces and compendious Ways of Distilling, which with diligent study and speculation I found out some few years since, by which many excellent Works, impossible to be done by the vulgar Art, may be performed; but now at last I have, considering with my self how advantageous it may be to the World, determined to conceal this Art no longer, but for the good of my Neighbour to publish it, by giving to* Chymists *a perfect and fundamental information of this new-invented Art, that they may no longer for the future spend their Time and Money in long tedious Operations, but may after a more easie way, by the help of my Furnaces, be able to effect many excellent things. Now this Book shall be divided into Five Parts, the first whereof shall teach how to build a Furnace, in which incombustible things are distilled and sublimed, and indeed such things which cannot be done by Retort or any other Vessels, and how the Spirits, Flowers, and Oyls of Minerals, and Metals may by the help thereof be prepared, as also what their Use and Vertues are.*

In the Second Part shall be shewed another Furnace, in which combustible things, as Vegetables, Animals, and Minerals are distilled and most perfectly subtilized: by help whereof many most excellent Medicaments for the cure of most grievous and otherwise incurable diseases may be prepared.

In the Third shall be taught a certain new invention hitherto unknown, of distilling Burning Spirits, as of Wine, Corn, Fruits, Flowers, Herbs and Roots; as also the Waters of Vegetables and Animals, and that in a great quantity, in a short time, and without much costs; as also of boyling Beer, Mead, Wine, and other things, which otherwise are made in Copper or Iron Vessels; and all this by the help of Wooden Vessels, and benefit of a certain small Copper, or Iron instrument of two or three pound weight, and that after a certain easie manner without Furnaces. This newly-invented Art doth also teach divers Chymical Operations, as Putrefactions, Digestions, Circulations, Extractions, Abstractions, Cohobations, Fixations, &c. And this invention is very necessary and profitable for young beginners in this Art, for they need not in the making of burning Spirits, Waters of Vegetables, Extracts, and other Medicaments so many Furnaces, and so many Copper, Iron, Tin, Earthen and Glass Vessels, for it is here taught how all the aforesaid Operations may be done onely by the help of a certain small Copper or Iron Instrument in Wooden Vessels as well as by Alembicks and other great Copper Vessels, by which means a great deal of Costs is saved.

In the Fourth Part shall be taught another certain, and hitherto unknown Furnace, in which all Chymical Operations may most easily be done: being most profitable for the trying of the Natures of Minerals and Metals; as also for the proving, examining, melting, cupelling, and separating of Metals, that nothing may be lost of them, and that after a compendious and easie way, and also to great advantage.

In the Fifth shall be taught how to make and prepare Iron, Earthen, Glass, and other kind of Instruments necessary for the aforesaid four Furnaces, as also other necessary, and most profitable Manuals.

And in the First Part, the Fabrick of the first Furnace being delineated, I shall also shew how by the help thereof may be made Spirits, Oyls, Flowers, and other most profitable Medicaments, also their Vertues

A *Preface* to the Reader.

Vertues and Uſe, and that as faithfully as I may, and without fraud. And truly I do not doubt but thoſe of underſtanding will approve of this Work, but ignorant Zoilus's *will contemn it: For it is ſaid according to the Proverb,* He that builds by the highway, will hear many things from them that find fault, *and eſpecially from the vulgar,* &c. *But it would be well if thoſe* Thraſoes *would put forth ſomething more excellent, before they find fault with and carp at other Mens pains and labours.*

Wherefore let no one raſhly judge of this Work, untill he be throughly informed concerning the ſame, and then I do not doubt but the Authour ſhall be by him commended.

And if haply all things ſhall not preſently ſucceed well, to his mind, with him that ſhall build this Furnace, and operate therewith, let him think with himſelf that perhaps he hath erred in ſome part, (for it is a new and unknown work, in which any one may eaſily err) and not preſently therefore murmur againſt the Authour, blaming him, becauſe he hath not wrote clear enough, but let him aſcribe it to his own ignorance, and let him ſtudy to underſtand the Authour's meaning, and ſtill be practiſing upon it, and then I do not doubt, but he will have better ſucceſs, which I pray every one may have. Amen.

The EXPLICATION of the Figures of the firſt Furnace in all its parts.

The Second Furnace.

THE FIRST PART OF Philosophical Furnaces.

Of the Structure of the First Furnace.

AS for the first Furnace, it may be built greater or lesser as you please, a regard being had of the quantity of the Matter to be distilled, and also either round or square; either of Bricks, or by a Potter with Potters Clay. Now when the Diameter is of one span, *viz.* withinside, the height must be of four, *viz.* one from the bottom to the grate, another from the grate to the hole made for putting in of Coals, and two from thence to the top of the Pipe, which must at least go forth out of the Furnace one span, lest the receivers should by the neerness of the Furnace be heated. The Pipe also must have on the fore part a Diameter, answering the third part of the intrinsecal Diameter of the Furnace; also a little larger on the hinder part than the forepart. Let the grate be such an one, as may be taken out at your pleasure and made clean, being stopt by the Matter that is cast in and distilled: for it is easily stopt in distilling of Salts melted with the coals, whereby the aire is kept from coming to the fire, and the distillation by consequence hindred: Or let there be put into the Furnace cross-wise two strong iron bars, upon which lay four or five lesser, distant the one from the other the breadth of a finger, going a little out of the Furnace, by which when they are stopt, you may take them out with a pair of Tongs, and cleanse them from the burnt Matter, and then again put them into their own places: wherefore also the Furnace must on the fore part be open under the grate, that you may the better order the grate.

Also the grate must have above, a covering of Iron or Stone, with a hole in the middle thereof with a certain distinction, which is to be filled with sand, that the cover may the better and more fitly shut the hole, and prevent the exhaling of the spirits which by this means will, being forced, go forth thorow the Pipe into the receivers, after you have cast in the matter which is to be distilled.

Of the Receivers.

Let the Receivers be made of glass, or of strong earth, which may retain the spirits, and such is the Waldburgick, Hassiack, Frechheimensian, Siburgic earth, *&c.* They are better that are made of glass, if they are to be had, and those especially which are made of strong and firm glass, which may be smoothed about the joints with a Smiris stone, and so fitted that they may the better be joyned together, and then they need not luteing (but how they shall be smoothed with the Smiris stone, and be fitted, shall be taught in the Fifth part, which treats of Manuals) because by this means they are joyned so close, that no spirits can go through the joynts: otherwise you must close the joynts with the best Lute, such as will not let the spirits exhale, which shall be taught in the Book treating of Manuals. The form of the recipient you may see in the delineation thereof. As for the quantity thereof, know that by how much the greater they are, so much the better they are, for then you need the fewer, but the more, by how much the lesser they are. Let the superiour orifice be larger than the inferiour, so that alwaies another receiver may with its inferiour orifice be joyned to it, and let the inferiour orifice have a Diameter of three fingers breadth, or thereabouts; I mean in case the Diameter of the Furnace be of one span. For a greater Furnace requires greater holes, as also orifices of the receivers, by which means a sufficient and due proportion of air may be given to the fire: or if the Diameter of the Furnace be more than a span, it must also have two or three pipes (which being considered together, should have a wideness answering the wideness of the third part of the Furnace, for so great a wideness, and so much air is required, if the fire burn freely and do its office) to which vessels of the aforesaid proportion must be applyed, that the fire be not choaked.

Now, the Figure that is annexed will teach the

conjunction of the Receivers, as alſo their application to the Furnace. And, in the firſt place, the Receiver ſtands in a three-foot ſtool bored thorow in the middle, that the neck of the firſt Receiver may paſs thorow, to which is applyed a diſh with a pipe receiving the dropping ſpirits: To the firſt there is joyned a ſecond, and to that a third, and ſo conſequently (*viz.* near unto a wall or ladder) ſo many as you pleaſe. Let the upper Receiver, and indeed all the reſt, be left open: To the lower as hath been ſaid, is joyned a diſh with a pipe, by which the diſtilled Spirits run down into another certain glaſs veſſel added thereunto, which being filled, is taken away, and another is ſet in the place of it, becauſe that is ſet under it without luting, and therefore may eaſily be changed. And if you pleaſe to diſtil any thing elſe, you may take away that diſh with a pipe, and make it clean, and then joyn it cloſe again (that no ſpirit may breath forth) to the neck of the lower receiver. And if that diſh cannot be ſo cloſely joyned, that nothing exhale, pour in a ſpoonful of Water, for that doth aſtringe, neither doth it hurt the ſpirits, becauſe in the rectifying it is ſeparated.

Of the ſubliming Veſſels.

Theſe you need not make of glaſs, or of ſuch earth as may retain the ſpirits, as hath been above mentioned; it is ſufficient, if ſo be they be made of good common Potters earth, and be well glazed within, *viz.* of ſuch a form and figure, as appears by the annexed delineation.

Yet you muſt chuſe good earth that will endure the fire, for the lower pots are ſo heated by the fire, that they would be broken if they ſhould not be made of good earth.

Now I will ſhew you in general the manner it ſelf of diſtilling; as alſo, the manual neceſſaries in every diſtillation.

The manner of Diſtilling.

In the firſt place, let there be ſome burning Coals put in, which afterwards muſt be covered with more until the Furnace be full almoſt to the pipe, which being done, let not the uppermoſt cover be laid over its hole (that the heat and ſmoak may paſs that way, and not thorow the pipe, and receivers, which will thereby be red hot; and this will be a hindrance to the diſtillation) until the fire be ſufficiently kindled, and the Furnace be throughly hot; then caſt in, with an Iron ladle, of the matter prepared for diſtillation as much as will cover the Coals, which being done, ſtop the Furnace very cloſe, by preſſing down ſtrongly the upper cover upon its hole or ſand, which is put in the lower part of the hole, being a place made for that purpoſe. Now let him that caſts in any thing thorow the middle hole, preſently ſtop it with a ſtopple of ſtone, and that very cloſe, for by this means all thoſe things which were caſt in, will be forced, after the manner of a thick Cloud, to break forth through the pipe into the receivers, and there to condenſe themſelves into an acid ſpirit or oyl, and thence to diſtil into the diſh ſet under, through the pipe whereof they do yet diſtil down further into another glaſs receiver. The Coals being burnt out, and all the ſpirits being come forth, you muſt caſt in more Coals, and more materials, until you have got a ſufficient quantity of Spirits. In this way of diſtilling, you may at your pleaſure ceaſe, and begin again without any danger.

When you will make clean the Furnace, you need do nothing elſe, then draw out the Iron bars that lye on the croſs bar, that the *Caput Mortuum* may fall down, which afterwards may be taken away with a Fire-ſhovel, which being done, you muſt put in the bars again, and lay them on the croſs-bars as before, upon which you muſt caſt burning Coals, and upon them others, until there be enough, then on them all, being well kindled, caſt your materials.

When you go to make clean the receivers, and to begin to diſtil another thing, you need not remove them, but only pour pure Water into them, *viz.* by their upper receiver, by the deſcending whereof the other are purified.

And by this way, not only out of Vegetables, and volatile Minerals (incombuſtible) but alſo out of fixed Metals and Stones, ſpirits, oyls, and flowers, are drawn forth wonderfully, eaſily, and in good quantity, which otherwiſe could never have been done by the vulgar art of diſtilling.

Now, in this Furnace are diſtilled only ſuch materials, which being diſtilled, yield an incombuſtible humidity, as common Salt, Vitriol, Allom, and other Minerals and Metals, each of which doth yet require their peculiar manuals, if operated upon.

Now, becauſe this Furnace doth not ſerve for every matter, becauſe the materials to be diſtilled are caſt upon burning Coals, which are things combuſtible, I have determined in the ſecond part to give another, *viz.* a leſſer, unlike to this, yet convenient to diſtil all combuſtible things that are endued with volatile ſpirits, as Tartar, Harts-horn, Amber, Sal Armoniack, Urine, *&c.* There are, by the help hereof, made moſt ſubtile, volatile, ſulphureous ſpirits of Salts, and Minerals, as of common Salt, Vitriol, Allom, Nitre, Antimony, and of all other Minerals and Metals, which otherwiſe, without this Furnace, could not have been made, with which ſpirits, wonderful things are performed in Medicine and Alchymy, as in the Second Part ſhall be demonſtrated more largely.

Now I will ſhew you a way to make other Receivers belonging to the firſt Furnace, and indeed, ſuch as are more fit for ſome Operations, as the former were more fit for others: wherefore let him that will operate, chuſe theſe, or the other, as he pleaſeth.

As therefore the former being erected upwards by a wall, or ladder, by which means the ſpirit might aſcend from one into another ſo long, until being refrigerated and condenſed might again drop downward into the diſh that is annexed thereto: ſo theſe are a contrary way ſet and placed collateral in a veſſel filled with cold Water to condenſe the ſpirits, by which means you need not ſo many receivers; alſo they muſt not be faſhioned like the former, as to be open above, and below, but only above like pots that ſerve for boyling: but this you muſt obſerve, that by how much the deeper and larger they are, by ſo much the better they are.

Alſo you muſt joyn them together by the help of earthen pipes, being ſo diſtinct, that the ſpirits may be kept back, being yet hot (and not refrigerated) from paſſing out of one into the other, but being forced through the middle of the ſeparation of the pipes, may go to the bottom of every receiver, and thence ariſe by another pipe into another receiver that hath a double cover like the former, where again deſcend-

deſcending to the cold bottom, remain refrigerated and condenſed. Now three or four of theſe are enough (whereas of other, thirteen or fifteen are required) a regard being had of their Greatneſs.

You may ſee the figure of theſe receivers, as alſo their joyning together by the annexed delineation. Now, for the moſt part, one is ſufficient for him that diſtils a few things, eſpecially if the matter be not pretious, and then let one crooked earthen pipe at leaſt be joyned, one arm with the pipe that goeth forth of the Furnace, the other with the Receiver, but ſo that it go into the receiver downwards, even to the middle thereof, and then you need not ſhut the orifice of the receivers, for it is no great matter if ſomewhat evaporate, *viz.* if the matter to be diſtilled be not pretious. And by this way may new ſpirits and new flowers be made every hour, with the help of one Furnace, and one recipient, but with this caution, that for every new diſtillation, the recipient be waſhed with Water before it be put to the pipe; which being put to, you may then caſt your ſpecies into the Furnace; and this do till you have a ſufficient quantity of ſpirits.

And this way of diſtillation ſerves eſpecially for the trying of the natures and properties of many and divers Minerals, ſuch as yield in the fire ſpirits and flowers. For it would be too tedious in every new diſtillation to apply a new and diſtinct receiver: as alſo many ſtudious of the Chymical art would quit their ſtudy, being able to make by retort but one tryal in a day. And no wonder if expences, and loſs of time ſhould deter many.

Now here there is no need of many Retorts, nor of luting them, nor of receivers, and ſuch like ſuperfluous things; neither is there here required the conſtant preſence of the operator, the obſervation of the regiment of fire, the neglect whereof would otherwiſe endanger the loſs of the retorts and receivers, and by conſequence the loſs of labour. Theſe and ſuch like tedious things are not here to be cared for, becauſe it is ſufficient only to caſt the Matter upon the coals, and cover the Furnace, and then preſently go forth the ſpirits, and flowers of the ſame kind with their mineral: of which when thou haſt got a ſufficient quantity, thou muſt draw out the Iron bars, upon which the coals lye, that they may fall down, and be taken away; and whilſt the Furnace is yet hot, to put in the Iron bars again, and upon them to lay freſh coals, which then will of their own accord be kindled with the heat of the Furnace. In the mean time you muſt take away the receiver, and make it clean and ſet it to again, or if you had rather put another clean one, *viz.* for the new diſtillation of another Matter.

And by this way, divers things may be in the ſpace of one hour diſtilled, and ſublimed, *viz.* in a ſmall quantity. But he that will diſtil, or ſublime in a greater quantity, let him take three or four pots that the ſpirits may paſs from one into another, that nothing thereof be loſt. Here needs not (as I ſaid before) the continual preſence of the operator, for he may be gone, ceaſe, or repeat as he pleaſe, becauſe the work is without danger of breaking the retorts, and receivers.

He that knows the uſe of this Furnace, may do many things in a ſhort time with little coſt. For any one may do more by the help thereof in one hour, than in the common way in twenty four, by which way alſo there is a great ſaving of coals, becauſe ten pound of coals will do more this way than a hundred the other. As for example, he that will try, ſhall make a pound of ſpirit of Salt in one hour with three, four, or five pounds of coals; whereas after the other way are required fifty or ſixty pounds, and at leaſt twenty or thirty hours time, *viz.* in the common way by the help of retorts: which is indeed very tedious.

Alſo by this way may be made the flowers of minerals, and metals, in a great quantity, very eaſily, and in a ſhort time without great coſt, ſo as that in one hours ſpace, with three or four pound of coals may a pound of the flowers of Antimony be made. And this is no ſmall help to the Phyſitian, and Chymiſt.

Moreover this furnace being once built, endures for many years, and being broken is eaſily repaired.

And by this way you ſhall need only materials to be diſtilled, no retorts and receivers are in danger, by which means much coſt is ſaved.

Beſides the aforeſaid ways, I have yet another, and that more compendious, *viz.* of diſtilling, and ſubliming, and more eaſy, by which means in a very little time, an incredible quantity of ſpirits of Salts, and flowers of Minerals, and metals may be made; which I ſhall refer till another time, becauſe for the preſent I have ſaid enough.

Now I do not doubt, but diligent Chymiſts will follow my ſteps, and find out thoſe things which are unknown to me. *For it is eaſier to add to things found out, than to find out things unknown.*

The conſtruction therefore of the furnace being in my opinion clearly ſhewed, there now follows the manner of diſtilling, and ſubliming with it.

Although haply, and contrary to my hope any obſcurity ſhould be met withal, yet one proceſs will explain another: and the diligent operator, and ſearcher of Nature ſhall without doubt, by his practiſe attain the effect after the ſame manner as I have preſcribed: which together with the bleſſing of GOD, I heartily wiſh all pious Chymiſts, *Amen.*

How the Spirit of Salt is to be diſtilled.

THE reaſon why I enter upon the ſpirit of ſalt, before I ſay any thing of the ſpirits of vegetables, is this, *viz.* becauſe it is even the chiefeſt, which can be made in this furnace: for few exceed this in ſtrength and vertues; wherefore I alſo have given it the preeminency. Neither is there any of the acid ſpirits, about which the Chymiſts hitherto have been more buſied, than this, wherefore alſo it is of all, of greateſt price, *&c.* for ſome have mixed ſalt with potters clay, and have made this mixture into little balls, which they have to get the ſpirit, forced by retort in a very ſtrong fire: ſome have mixed ſalt with bole, ſome with the powder of tyles, others with burnt Allume, *&c.* Schroder

Others uſing a more compendions way have made ſalt to flow in a retort, which hath a pipe both in the upper, and hinder part; by the uper pipe of which they have dropped in cold water, to elevate the ponderous ſpirits of the ſalt, but by the hinder they have blown with Bellows, to force the ſpirits into the retort: and this way is not altogether to be ſlighted, yet it hath this inconveniency, that in proceſs of time the retorts are broken

that they can no longer retain the ſalt, and ſo the diſtillation is intercepted. Some have attempted it with Iron retorts, but by this means the ſpirits have been deaded, becauſe they eaſily ſet upon the Iron, whence inſtead of ſpirit they have had flegme. And ſuch, and other tedious wayes of diſtilling they have invented; and by the beſt of them indeed they could ſcarce diſtill one pound in 25. or 30. hours ſpace with 50. 60. or 100 pound of coals; this being the reaſon, becauſe the ſalt is very little wrought upon, and therefore it is that few ever had the ſpirit right and good, whence alſo the vertues thereof have been unknown.

And this therefore I was willing to make known, that it might appear, what price this ſpirit hath hitherto been of, and how eaſie, and abundantly, and with what little coſt, it may after my new invented way be made.

It is ſaid above, that the materials may in this way of diſtilling be immediately caſt into the fire; yet this muſt be wiſely underſtood. For although ſome of the ſpecies may without any preparation be immediately caſt into the fire, yet it doth not follow that all and every one of them muſt: for in ſome of them we muſt uſe our diſcretion, as in the diſtilling of ſalt. For if the ſalt be immediately caſt into the fire, it will not only yield no ſpirits, but will leap ſo long upon the coals, until it find a deſcent to the loweſt part of the furnace: Now this may be prevented divers wayes; and firſt indeed after this manner: Diſſolve ſalt in common water, then quench burning coals with this water, that they may be impregnated with the ſalt, which afterwards ſet on fire in the furnace: but you muſt firſt caſt in other burning coals, upon which you muſt caſt thoſe that are impregnated with ſalt untill the furnace be full, as is above ſaid: and while the coals burn, the ſalt is reſolved by the force of the fire into ſpirit.

Now you muſt obſerve that he that diſtils ſpirit of ſalt after this manner, muſt make choice of glaſs receivers, becauſe the ſpirit whileſt it is hot, penetrates by reaſon of its wonderful ſubtilty, thoſe that are earthen. And this ſpirit is of a moſt grateful taſte. But in defect of glaſs receivers, I ſhall ſhew you another way wherein you may uſe thoſe that be of earth.

Mix ſalt, and vitriol or allome together, grinding them very well in a Morter (for by how much the better they are ground, the more Spirit they yield.) Then caſt this mixture into the fire with an Iron Ladle, *viz.* ſo much of it as will be ſufficient to cover the coals, and then with a great fire the ſpirits come forth into the receivers, where being coagulated, they diſtill down into the diſh, and thence into another receiver. And if thou knoweſt how to work aright, the ſpirits will like water continually run out thorow the pipe, the thickneſs of a ſtraw; and thou mayeſt eaſily every hour make a pound of the ſpirit. Now the reaſon why thou ſhalt by this way have more ſpirits than by the other, is this, *viz.* becauſe the vitriol and allome, which is mixed with the ſalt, makes it flow quickly, by which means it is prevented from falling down through the coals to the lower part of the furnace, but ſticking to the coals is almoſt all of it turned into ſpirits. The *Caput Mortuum*, which is reddiſh, eaſily falls with the aſhes through the grate, and can no more be diſtilled, but yields by excoction a white fixed ſalt, which ſerves for the flowing of metals; and being diſſolved in warm water ſerves alſo for a glyſter againſt the Worms, which it kills, and purgeth alſo the Bowels.

Thou wilt object, that the ſpirit made after this manner, is not the true ſpirit of ſalt by reaſon of the mixture of vitriol and allome, but mixed, and compounded. I anſwer; There can by this way diſtil no ſpirit of vitriol, or allome, being that which I often tryed, caſting vitriol or allome into the furnace, where I received no ſpirit at all; the reaſon of this is, becauſe theſe ſpirits are far more heavy than the ſpirit of ſalt, neither can they aſcend ſo great a heighth, *viz.* of three ſpans, but are burnt, whence unleſs the flegme, nothing diſtils. Wherefore the ſpirit of ſalt that is made after this manner is not mixed, but pure and meer ſpirit of ſalt, of the ſame taſt and vertue as that is of, that is made by it ſelf; becauſe in this furnace the ſpirit of allome and vitriol, cannot be made unleſs a pipe go out of the furnace neer the grate, as you may ſee by the delineation of the furnace, for otherwiſe it cannot be made; beſides, theſe ſpirit are better, and more truly taught in the ſecond part. And if it be granted that ſomewhat together with the ſpirit of ſalt comes forth (which is yet impoſſible) what hurt I pray you comes from thence either in the ſolution of metals, or medicine? wherefore the ſpirit made after this way is not to be ſuſpected. Yet I will ſatisfie the incredulous, and will ſhew him another way without the addition of allome or vitriol, for the diſtilling of that ſpirit, but that will be in the ſecond part of this Book, where I will teach you the furnace, by which is made ſpirit of Nitre, Aquafortis, and amongſt combuſtibles, the Oyles of vegetables, and Fats of animals and other things which cannot be made by this: and by this way I will ſatisfie thoſe, who are not pleaſed with the former.

Now for want of glaſs receivers, we are forced to uſe earthen, but theſe cannot retain the ſpirit of ſalt made after the aforeſaid wayes; in which caſe I could indeed diſcover a certain little manual, by vertue of which the aforeſaid ſpirit may be received even in a great quantity in earthen recipients: but for certain cauſes I ſhall here be ſilent, and ſhall refer it till the edition of the ſecond part. Let it ſuffice therefore that I mentioned ſuch a thing, wherefore omitting that, I ſhall proceed to ſhew you the vertues, and uſe of this ſpirit, as well in Alchymy, as in Medicine, and other Mechanical Arts.

Of the Uſe of the Spirit of Salt.

IT is worth while, to ſpeak of the power, and vertues of this excellent ſpirit; what other Authors have clearly deſcribed, I ſhall here paſs over, and refer the Reader to the writings of thoſe Authors; touching only on ſome few of which they ſaid nothing.

The Spirit of ſalt is by moſt accounted a moſt excellent medicine, and ſafely to be uſed, as well inwardly as outwardly: It extinguiſheth a preternatural thirſt in hot diſeaſes, abſtergeth and conſumeth flegmatick humours in the Stomack, exciteth the Appetite, is good for them that are hydropical, have the Stone, and Gout, *&c.* It is a menſtruum diſſolving metals, excelling all other therein: For it diſſolveth all metals and minerals (excepting ſilver) and

almoſt

almoſt all ſtones (being rightly prepared) and reduceth them into excellent medicaments. It doth alſo many excellent things in mechanical arts.

Neither is it to be ſlighted in the kitchen, for with the help thereof are prepared divers pleaſant meats for the ſick as well as for thoſe that are in health, yea and better than with Vinegar, and other acid things: and it doth more in a ſmall quantity, than Vinegar in a great. But eſpecially it ſerves for thoſe Countries that have no Vinegar. It is uſed alſo inſtead of Verjuice, and the juice of Lymons. For being prepared after this way, it is bought at a cheaper rate than Vinegar or juice of Lymons. Neither is it corruptible as expreſſed juices are, but is bettered by age. Being mixed with Sugar it is an excellent ſauce for roaſt meat. It preſerves alſo divers kinds of Fruits for many years. It makes alſo Raiſins, and dryed Grapes to ſwell, ſo as to acquire their former magnitude again, which are good to refreſh a weak Stomach in many diſeaſes, and ſerves for the preparing of divers kinds of meats of Fleſh and Fiſh; but you muſt mix ſome water with the ſpirit, or elſe the Raiſins will contract too much acidity. This ſpirit doth eſpecially ſerve for making meats delightfully acid; for whatſoever things are prepared with it, as Chickens, Pigeons, Veale, *&c.* are of a more pleaſant taſte than thoſe which are prepared with Vinegar. Beef being macerated with it, becomes in a few dayes ſo tender, as if it had been a long time macerated with Vinegar. Such, and many more things can the Spirit of Salt do.

A diſtillation of Vegetable Oyles, whereby a greater quantity is acquired, than by that common way, by a Veſica.

As many Diſtillers as hitherto have been, have been ignorant of a better way to diſtill Oyles of Spices, Woods, and Seeds, than by a veſica or alembick, with a great quantity of water. And altho' they may alſo be made by retort, yet there is a great deal of care required, or elſe they contract an *Empyreuma*; wherefore that way, by a ſtill, is alwayes accounted the better, which way indeed is not to be ſlighted, if you diſtill Vegetables of a low price, and ſuch as be oleaginous; but not ſo in the diſtillation of Spices, and of other things that are of a greater value, as are Cinnamon, Mace, Saffron, *&c.* which cannot be diſtilled in a gourd ſtill without loſs, becauſe then there is required a great quantity of water, and by conſequence great, and large veſſels, to which ſomething adheres, wherefore we loſe almoſt half, which is not to be ſo much valued in vegetables that are oleaginous, as in Anniſeed, Fennel, and Caryoway-ſeed, *&c.* But the loſs made in the diſtilling of dryer and dearer vegetables, as of Cinnamon, *Lignum Rhodii*, *Caſſia*, is evident enough, and by conſequence not to be ſlighted. Neither can it be, that all things can be diſtilled that way, for a good quantity by coction acquireth a gummy tenaciouſneſs, which cannot aſcend with the water. But that this way for the future may be prevented, I will ſhew another way to diſtill the Oyles of Spices, and other precious things, which is done with ſpirit of ſalt, whereby all the Oyle is drawn forth without any loſs, the proceſs whereof is this, *viz.* Fill a gourd with Cinnamon or any other Wood, or Seed, upon which pour ſo much of the ſpirit of ſalt, as will be ſufficient to cover the wood, then place it with its Alembick in Sand, and give it fire by degrees that the ſpirit of ſalt may boyl, and all the Oyle will diſtill off with a little flegme; for the ſpirit of ſalt doth with its acrimony penetrate the wood, and freeth the Oyle that it may diſtill off the better and eaſier. And by this way the Oyle is not loſt by the addition of that great quantity of water in thoſe great and large veſſels, but is drawn in leſſer glaſs veſſels with the addition of a little moyſture. Diſtillation being finiſhed the ſpirit is poured off by inclination from the wood, being again uſeful for the ſame work. And if it hath contracted any impurity from the wood, it may be rectified: but the reſidue of the ſpirit which remains in the wood ye may recover, if that wood be caſt into the aforeſaid furnace upon burning coals, by which means it may come forth again pure, and clear: and by this means we loſe none of the ſpirit of Salt. And after this way by help of the ſpirit of Salt, are drawn forth Oyls of dearer Vegetables together with their Fruit, which cannot be done by a ſtill.

There are made alſo by means thereof Oyles of Gumms and Roſins, clear, and perſpicuous.

The clear Oyle of Maſtick, and Frankincenſe.

Take of Frankincenſe or Maſtick powdered ſmall, as much as will ſerve to fill the third part of a Retort (which muſt be coated) upon which pour a ſufficient quantity of ſpirit of Salt, taking heed that the Retort be not filled too full, or elſe the ſpirit when it boyles, flows over it, then place it in ſand, and give fire by degrees, and there will firſt come out ſome phlegme, after which a clear tranſparent oyle together with the ſpirit of ſalt, which muſt be kept by it ſelf, after this a certain yellow Oyle which muſt be received by it ſelf, and laſt of all there follows a red Oyle, which altho' it is not to be caſt away, yet it is very unlike to the firſt, ſerving for outward uſes, and to be mixed with Oyntments and Emplaſters, for it doth wonderfully conſolidate, and therefore good in new and old Wounds. The firſt being well rectified, is in its ſubtilty, and penetrating faculty not unlike to ſpirit of wine, and may profitably be uſed inwardly and outwardly, *viz.* in cold affects, but eſpecially in the ſtiffneſs of the Nerves, cauſed by cold humors, upon which follows a contraction; but then you muſt firſt rub the member contracted with a linnen cloath, that it may be well warmed, into which then the Oyle muſt be chafed with a warm hand. For it doth do wonders in ſuch like affects of the Nerves. *Thuſer French*

After the ſame manner may Oyles be made out of all gumms. The red, tenacious and ſtinking Oyles of Tartar, Harts-horn, Amber, *&c.* diſtilled after the common way by retort are alſo rectified with ſpirit of ſalt ſo as to become tranſparent and to loſe the *Empyreuma* contracted by diſtillation.

Now the cauſe of the blackneſs, and fetidneſs of theſe kind of Oyles, is a certain volatile ſalt which is to be found as well in Vegetables, as certain Animals, which is eaſily mixed with the Oyle, and makes it of a brown colour. For every volatile ſalt whether it be of Urine, Tartar, Amber, Harts-horn, and of other Vegetables and Animals, is of this condition and nature, as to exalt, and alter the colours of ſulphureous things, and that either

for the worſe or for the better: but for the moſt part it makes Oyles thick, black and ſtinking, as you may ſee in Amber, Harts-horn, and Tartar. The cauſe therefore of the blackneſs, and fetidneſs of theſe Oyles being known we may the more eaſily take heed thereof in diſtilling, and being contracted, correct them again by the help of ſpirit of Salt. For all volatile ſalt hath contrariety to any acid ſpirit, and on the other ſide, every acid ſpirit hath a contrariety with all volatile ſalts, that have the nature of ſalt of Tartar. For metals that are diſſolved with acid ſpirits are as well precipitated with ſpirit of Urine, or any volatile ſalt as with the liquor of ſalt of Tartar; which ſhall be more at large declared in the ſecond part.

The volatile ſalt therefore is by the mortifying acid ſpirits, as of Salt, Vitriol, Allom, Vinegar, *&c.* deprived of its volatility, and is fixed, by which means being debilitated it forſakes its aſſociate which was infected with blackneſs by it: it is neceſſary that we ſhould proceed after the ſame manner with theſe fetid Oyles, *viz.* as follows.

Take any fetid Oyle of Tartar, Amber, *&c.* with which fill the fourth part only of a glaſs Retort, and upon it pour by drops the ſpirit of ſalt; and it will begin to be hot, as it is uſed to be, when Aqua fortis is poured on ſalt of Tartar; wherefore the ſpirit is to be poured on it by little and little, and by drops for fear of breaking the glaſs: Now the ſigne of the mortification of the volatile ſalt is, when it ceaſeth to make a noiſe, and then no more is to be poured on, but ſet your Retort in ſand, & give fire to it by degrees, as is uſed to be done in the rectifying things of eaſie elevation: and firſt of all will go forth a certain ſtinking water, after which comes a tranſparent clear, and odoriferous Oyle, and after that a certain yellow, clear, and alſo well ſmelling Oyle, but not ſo as the firſt, wherefore each muſt be taken a part by changing the receivers. Now theſe Oyles become more grateful than thoſe fetid ones of the ſhops. For theſe Oyles retain their clearneſs, and fairneſs, the cauſe of their fetidneſs, and redneſs being taken away by the ſpirit of ſalt. In the bottom of the Retort remains the black volatile ſalt with the ſpirit of ſalt, from whence it may be ſublimed into an odoriferous ſalt reſembling ſalt armoniack in taſt. The ſpirit of ſalt is alſo deprived of its acidity, and coagulated by the volatile ſalt, and is like *tartarum vitriolatum*, appointed alſo for its uſes, as ſhall be ſpoken in the ſecond part, of the ſpirit of Urine.

After the ſame manner alſo are rectified other Oyles, which by length of time have contracted a clammineſs, as are Oyle of Cinnamon, Mace, Cloves, *&c.* with the ſpirit of Salt, if they be rectified by Retort, for then they acquire again both the ſame clearneſs, and goodneſs, as they had when they were newly diſtilled.

Here I muſt make mention of a certain error of Phyſitians, not only of ignorant Galeniſts but Spagyricks, committed in the preparations of ſome Chymical medicaments. For many have perſwaded themſelves that Oyle of Tartar, Harts-horn, *&c.* having loſt its ſtink, is a Medicine radically taking away all obſtructions; but this muſt be taken with a grain of ſalt. For ſome have rectified theſe kinds of Oyles by calcined Vitriol, and by that means have ſomewhat made them loſe their *Empyreuma*, but with all their Vertues; which others obſerving have conceived that the fetidneſs thereof is not to be taken away, becauſe the Vertue of them is thereby loſt, as if the Vertue conſiſted in the fetidneſs thereof; but that is a very great error, becauſe fetidneſs is an enemy to the heart and brain, and in it is no good. But this is granted, that they that take away the fetidneſs of thoſe Oyles mortifie the vertues of them. But thou ſayſt, How then muſt we proceed in taking away their fetidneſs without the loſs of the vertues? Muſt they be rectified by the ſpirit of ſalt? as even now thou taughteſt. R. No, for although I ſaid that Oyles might be clarified with ſpirit of ſalt, yet it doth not follow that my meaning was, that that clarification was the mending of them: This is only a way of clarification, whereby they become more grateful; and it is not to be ſlighted, a better being unknown. But how they are to be rectified from their fetidneſs and blackneſs, without the loſs of their Vertues, and to be made more noble, doth not belong to this place, becauſe it cannot be done by this Furnace: I ſhall refer the reader therefore to the †ſecond part, where it ſhall be ſhewed, how ſuch ſpirits are to be rectified without the loſs of their vertues, which being ſo prepared may well be accounted for the fourth Pillar of Phyſick. And theſe things I was willing at leaſt for information ſake to ſhew you, not to offend you, and that becauſe I was moved with pity, and compaſſion towards my neighbour.

† *pag 16*

The Quinteſſence of all Vegetables.

POur upon Spices, Seeds, Woods, Roots, Fruits, Flowers, *&c.* the Spirit of Wine well rectified, place them in digeſtion to be extracted, untill all the eſſence be extracted, with the Spirit of Wine; then upon this Spirit of Wine, being impregnated, pour the beſt Spirit of Salt; and being thus mixed together, place them in Balneo to digeſt, untill the Oyle be ſeparated, and ſwim above from the Spirit of Wine, then ſeparate it with a ſeparating glaſs, or diſtill off the Spirit of Wine in Balneo, and a clear Oyle will aſcend; for if the Spirit of Wine be not abſtracted, then that Oyle will be as red as blood; and it is the true quinteſſence of that vegetable, from whence by the Spirit of Wine it was extracted.

The Quinteſſence of all Metals and Minerals.

DIſſolve any metal (excepting Silver, which muſt be diſſolved in Aqua fortis) in the ſtrongeſt ſpirit of Salt, and draw off the flegme in Balneo; to that which remains pour the beſt rectified ſpirit of Wine, put it to digeſting, untill the Oyle be elevated to the top as red as blood, which is the tincture, and quinteſſence of that metal, being a moſt Precious treaſure in medicine.

Lond. pag 89.

A ſweet and red Oyle, of Metals and Minerals.

DIſſolve a Metal or Mineral in ſpirit of Salt, diſſolve alſo an equal weight of ſalt of Wine eſſentificated; mix theſe diſſolutions, and diſtill them by retort in a gradual heat, and there will come out an oyle ſweet, and as red as blood, together with the ſpirit of Salt; and ſometimes the neck of the retort and receiver will be coloured like a Peacocks tail with divers colours, and ſometimes with a golden colour.

And becauſe I would without any difference comprehend all Metals and Minerals under one certain general

general proceſs; let him that would make the eſſence of ſilver take the ſpirit of nitre, and proceed in all things as was ſpoken of the other metals. Concerning the uſe of theſe eſſences, I need not ſpeak much thereof; for to him that knows the preparation ſhall be diſcovered the uſe thereof. Concerning the corroſive oyles of metals and minerals, ſeeing they cannot be deſcribed by any one proceſs, it will be worth while to ſet down what is peculiar to each of them, as followeth. *Therefor Frenchpag 90*

The Oyle, or Liquor of Gold.

DIſſolve the calx of gold in the ſpirit of ſalt, (which muſt be very ſtrong, or elſe it cannot diſſolve it) but in defect of the ſtrongeſt ſpirit thereof, mix a little of the pureſt ſalt-peter; but that oyle is the beſt which is made with the ſpirit of ſalt alone. From the gold diſſolved abſtract half the ſolution, and there will remain a corroſive oyle, upon which pour the expreſſed juice of lemons, and the diſſolution will become green, and a few feces fall to the bottom, which may be reduced in melting. This being done, put this green liquor in Balneo, and draw off the flegme: that which remains take out, and put upon a marble in a cold moiſt place, and it will be reſolved into a red oyle, which may ſafely, and without danger be taken inwardly, curing thoſe that are hurt with Mercury. But eſpecially it is commended in old ulcers of the mouth, tongue, and throat, ariſing from the French pox, leproſy, ſcorbute, *&c.* where the oyl of other things cannot be ſo ſafely uſed. There is not a better medicine in the exulceration, and ſwelling of the glandules, in the ulcers of tongue and jaws, which doth ſooner mundify, and conſolidate. Neither yet muſt we neglect neceſſary purgings, and ſudorificks, for fear of a relapſe, the cauſe not being taken away.

Neither will there any danger follow, whether it be given inwardly, or uſed outwardly, as in the accuſtomed uſe of other medicaments, and gargariſms; for it may daily, and truly without all danger be uſed at leaſt three times with a wonderful admiration of a quick operation.

Oyle of Mars.

DIſſolve thin plates of Iron in rectified ſpirit of ſalt, take the ſolution, which is green, of a ſweet taſt, and ſmelling like fetid ſulphur; and filter it from that filthy and feculent reſidence: then in a glaſs gourd in ſand, abſtract all the humidity (*viz.* with a gentle fire) which will be as inſipid as rain-water, becauſe the iron by reaſon of its dryneſs, hath attracted all the acidity to it ſelf: but in the bottom will remain a maſs as red as blood, burning the tongue like fire: it takes away all proud fleſh of wounds, and that without all danger. It is to be kept in a glaſs cloſe ſtopt from the air, leſt it be reſolved into an oyle, which will be of a yellow colour. But he that deſires to have the oyle, may ſet it on a marble in a moiſt Cellar, and within a day it will be reſolved into an oyle, which will be in colour betwixt yellow and red: It is a moſt excellent ſecret in all corroding ulcers, fiſtulas, cancer, *&c.* being an incomparable conſolidator, and mundifyer. And it is not without profit mixed alſo with common water to waſh the moiſt, fetid ulcers of the leggs; which cauſe tumours, by being applyed warm like a bath, for it dryes, and heals ſuddenly, if withal Purges be adminiſtred. It cures alſo any ſcab. That red maſs (being yet unreſolved) being put on the oyle of ſand, or flints (of which in the ſecond part) makes a tree to grow in the ſpace of one or two hours, having root, trunk, and boughs: which being taken out, and dryed, in the teſt yields good gold, which that tree extracts from the earth, *i. e.* from the flints, or ſand. Thou mayſt if thou pleaſeſt, more accurately examine this matter.

Oyle of Venus.

SPirit of Salt doth not eaſily work upon Copper, unleſs it be firſt reduced into a calx, and that after this manner. Take plates of Copper made red hot in an open crucible, quench them in cold water, and they will cleave into red ſcales: then the remainders of the plates make red hot, and quench as before: do this ſo often, till thou haſt got a ſufficient quantity of the calx; which being dryed, and powdered, extract with the rectified ſpirit of ſalt, in ſand, until the ſpirit of ſalt be ſufficiently coloured with a green tincture, which you muſt decant, and filter; and then abſtract from it the ſuperfluous moiſture, that there may remain a green thick oyle, which is an excellent remedy for ulcers, eſpecially ſuch as are Venereal, being applyed outwardly.

Oyle of Jupiter *and* Saturn.

NEither are theſe two metals eaſily diſſolved in the ſpirit of ſalt, yet being filed, are diſſolved in the beſt rectified ſpirit of ſalt. But the operation is performed better with the flowers of theſe metals (the preparation whereof ſhall be hereafter taught.) Take therefore the flowers, upon which in a gourd glaſs pour the ſpirit of ſalt, and preſently the ſpirit will work upon them, eſpecially being ſet in a warm place; filter the yellow ſolution, and abſtract the humidity, until there remain a yellow heavy oyle, which is proper againſt putrid ulcers.

Oyle of Mercury.

NEither is this eaſily diſſolved with the ſpirit of ſalt: but being ſublimed with vitriol, and ſalt is eaſily diſſolved. Being diſſolved, it yields an oyle very corroſive, which muſt be uſed with diſcretion, wherefore it is not to be adminiſtred, unleſs it be where none of the other are to be had. For I ſaw a woman ſuddenly killed with this oyle, being applyed by a certain Chyrurgeon. But this oyle is not to be ſlighted in eating ulcers, tetter, *&c.* which are mortified by it. *See French p. 92*

Oyle of Antimony.

CRude Antimony that hath never undergone the fire, is hardly diſſolved in ſpirit of ſalt: alſo the *Regulus* thereof; but the *Regulus* being ſubtilly poudered, is more eaſily wrought upon, in caſe the ſpirit be ſufficiently rectified. *pag 35. 6.*

The *Vitrum* is more eaſily, but moſt eaſily of all the flowers are diſſolved, being ſuch as are made after our preſcription a little after ſet down. Neither is *Butyrum Antimonii* (being made out of ſublimed Mercury, and Antimony) any thing elſe but the *Regulus* of Antimony diſſolved with ſpirit of *French p. 88*

ſalt; for ſublimed Mercury being mixed with Antimony, feeling the heat of the fire, is forſaken by the corroſive ſpirits aſſociating themſelves with the Antimony, whence comes the thick Oyle; whileſt which is done the ſulphur of Antimony is joyned to the Quick-ſilver, and yields a Cinnabar, ſticking to the neck of the Retort; but the reſidue of the Mercury remains in the bottom with the *Caput Mortuum*, becauſe a little part thereof doth diſtill off: And if thou haſt skill thou mayſt recover the whole weight of the Mercury again.

And theſe things I was willing the rather to ſhew thee, becauſe many think this is the Oyle of Mercury, and therefore that white powder made thence by the pouring on of abundance of water they call *Mercurius vitæ*, with which there is no mixture at all of Mercury, for it is meer Regulus of Antimony diſſolved with ſpirit of Salt, which is again ſeparated, when the water is poured on the Antimonial butter; as is ſeen by experience; For that white pouder being dryed, and melted in a crucible yields partly a yellow Glaſs, and partly alſo a Regulus, but no Mercury at all.

Whence it doth neceſſarily follow that that thick oyle is nothing elſe but Antimony diſſolved in ſpirit of Salt. For the flowers of Antimony being mixed with ſpirit of Salt, make an oyle in all reſpects like to that butter which is made of Antimony, and ſublimated Mercury, which alſo is after the ſame manner by the affuſion of a good quantity of water precipitated into a white pouder, which is commonly called *Mercurius vitæ*: It is alſo by the ſame way turned into *Bezoardicum mineral*, viz. by abſtracting the ſpirit of Nitre, and it is nothing elſe but Diaphoretick Antimony.

For it is all one whether that Diaphoretick be made with ſpirit of Nitre, or with Nitre it ſelf, *viz.* corporeal, for theſe have the ſame vertues, although ſome are of opinion that that is to be preferred before the other; but the truth is, there is no difference. But let every one be free in his own judgment, for thoſe things which I have wrote, I have not Writ out of ambition, but to find out the truth.

Now again to our purpoſe, which is to ſhew an oyle of Antimony made with the ſpirit of ſalt.

Take a pound of the flowers of Antimony (of which a little after) upon which pour two pound of the beſt rectified ſpirit, mix them well together in a glaſs, and ſet them in ſand a day and night to diſſolve, then pour out that ſolution together with the flowers into a retort that is coated, which ſet in ſand, and firſt give a gentle fire, untill the flegme be come off, then follows a weak ſpirit with a little ſtronger fire, for the ſtronger ſpirits remain in the bottom with the Antimony: then give a ſtronger fire, and there will come forth an oyle like to the butter of Antimony made with ſublimed Mercury, and is appropriated to the ſame uſes, as follows.

The flowers of Antimony, White and Vomitive.

TAke of this butter as much as you pleaſe, upon which in a glaſs gourd, or any other large glaſs pour a great quantity of water until the white flowers will precipitate no more; then decant off the water from the flowers, which edulcorate with warm water, and dry with a gentle heat, and thou ſhalt have a white pouder.

The Doſe is, that 1. 2. 3. 8. 10. grains be macerated for the ſpace of a night in wine, which is to be drank in the morning, and it worketh upward and downward. But it is not to be given to children, thoſe that be old, and weak, but to thoſe that be ſtrong, and accuſtomed to vomiting. When at any time this infuſion is taken and doth not work, as ſometimes it falls out, but makes the Patient very ſick, he muſt provoke vomiting with his finger, or elſe it will not work, but make thoſe that have taken it to be ſick, and debilitated even to death. We muſt alſo in the over much working of theſe flowers drink a draught of warm Beer, or rather of warm Water, decocted with Chervil, or Parſly, and they will work more mildly. But let not him that is able to bear the operation thereof any way hinder it, for there is the greater hope of recovering his health thereby, for they do excellently purge choler, and evacuate flegme in the Stomack, being humors that will not yield to other Catharticks; they open obſtructions, reſiſt the putrefaction of the blood, the cauſes of many diſeaſes, ſuch as are Feavers, Head-aches, *&c.* they are good for them that are Leprous, Scorbutical, Melancholical, Hypochondriacal, infected with the French-Pox, and in the beginning of the Plague. In brief, they do work gallantly, and do many things.

After the taking of them, the Patient muſt ſtay in his bed or at leaſt not go forth of his houſe, for to avoid the aire, or otherwiſe they may be miſtruſted.

And becauſe of their violence they are feared, and hated, I ſhall in the fourth part of this Book for the ſake of the ſick ſet down ſuch as are milder, and ſafer, ſuch as ſhall work rather downward than upward, cauſing eaſie vomits, which alſo thou mayeſt give to children, and thoſe that are old without danger, yet ſome reſpect being had of the diſeaſe, and age.

The flowers of Antimony diaphoretical.

THE foreſaid flowers if they be caſt into melted Nitre, and be left a while in melting, are made fixt, ſo as to become Diaphoretical, and loſe their Cathartical Vertue. The acid water being ſeparated from the flowers, if it be evaporated, leaves behind the beſt ſpirit of ſalt, ſerving for the ſame or ſuch like uſes again.

Of the External uſe of the Corroſive Oyle of Antimony.

THis oyle hath been long uſed by Chirurgions, for they have with a feather applyed it to wounds almoſt uncurable, to ſeparate impurities, for the acceleration of the cure, that afterwards other medicaments being applyed may the better operate. But it is better if it be mixed, with ſpirit of Salt, for they are eaſily mixed and it is made more mild thereby, and the too great corroſive faculty thereof is mitigated. Neither is there any other beſides the ſpirit of Salt, with which this oyle can be mixed, unleſs it be the ſtrongeſt ſpirit of Nitre, for the weak ſpirit of Nitre precipitates the butter of Antimony, as you may ſee in the preparation of *Bezoardicum Minerale*. But the ſtrongeſt ſpirit of nitre diſſolving this butter, makes a red ſolution of wonderfull Vertue in Chymiſtry, of which we are not to treat in this place; and if this

this be drawn off again by diſtillation, it leaves behind the firſt time a fixed Antimony, and Diaphoretical, which otherwiſe muſt be drawn off twice, or thrice, *viz.* if it be weak, and not able to diſſolve the butter without precipitation.

Now this *Bezoardicum* is the beſt, and ſafeſt Diaphoretick in all diſeaſes that require ſweat, as in the plague, French pox, feavers, ſcorbute, leproſy, *&c.* if it be given from 6. 8. 10. to twenty grains in proper vehicles; it penetrates the whole body, and evacuates all evil humours by ſweat and urine.

The Oyl of Arſenic *and* Auripigmentum.

AS the ſpirit of ſalt doth not eaſily work upon Antimony by reaſon of the abundance of crude ſulphur, unleſs it be reduced into flowers, in the preparation whereof, ſome part of its ſulphur is burnt; ſo alſo *Arſenic* and *Auripigmentum* are hardly diſſolved with ſpirit of ſalt, unleſs they be reduced into flowers, and the ſpirit of ſalt be very ſtrong, which may be able to work upon it. Theſe may be diſtilled by retort like Antimony into a thick heavy oyl; which being uſed in cancrous eating ulcers, exceeds that of Antimony in mortifying, mundifying, and purging thoſe evils. After the ſame manner may corroſive oyls be made out of all the realgars being ordained for outward uſes.

French p. 88. Oyl of Lapis Calaminaris.

TAke of the beſt yellow or red *Lapis Calaminaris* very ſubtilly powdered, as much as you pleaſe, and pour upon it five or ſix times as much of rectified ſpirit of ſalt, mix and ſtir them well together, and do not leave them long unſtirred, but ever and anon ſhake the glaſs with the materials; and this do oftentimes, or elſe the *Lapis Calaminaris* will grow together into a very hard ſtone, which can be diſſolved no more, and is prevented by the aforeſaid often ſhaking: and when the ſpirit of ſalt will diſſolve no more thereof in *frigido*, ſet the glaſs in warm ſand ſo long, until the ſpirit be tinged with a moſt yellow colour, which then decant, and pour on freſh, and again ſet it in digeſtion to extract, and do not forget to ſhake the glaſs often. The ſolution being finiſhed filter it, and caſt away the reſidue of the *terra mortua*. Afterwards ſet the ſolution in ſand, and give fire, and almoſt three parts of the ſpirit of ſalt will go over inſipid, which is nothing but the flegme, although the ſpirit was never ſo well rectified; the reaſon whereof is the moſt dry nature of *lapis calaminaris*, to which the ſpirit of ſalt is very friendly, and therefore very hard to be ſeparated from it. For I never knew any mineral or metal (beſide *Zinck*) which exceeds *lapis calaminaris* in dryneſs. At laſt when no more flegm will go over, let all things cool; which being done, take out the glaſs, and thou ſhalt find a red thick oyl, as fat as oyl olive, and not very corroſive; for that ſpirit of ſalt being almoſt mortified with the *lapis calaminaris* is deprived of its acidity. This oyl is to be kept from the air; or elſe within a few dayes it attracts much air which it converts into water, and thereby becomes weakened.

This Oyl is of wonderful Vertue, being uſed as well inwardly as outwardly. And I wonder that in ſo long a time there hath been no body, who hath operated in *lapis calaminaris* and deſcribed the nature thereof, ſeeing it hath in it a golden ſulphur (of which thing in the fourth Part) for if the terreſtreity thereof were ſeparated from it artificially, pure gold would be manifeſted therein; now the greateſt part thereof is volatile, and immature, and cannot eaſily be reduced into a body in melting, wherefore hitherto that ſtone hath not been eſteemed of by Chymiſts, but to the wiſe was alwayes pretious, *&c.*

The uſe of the Oyl of Lapis Calaminaris.

IF it be given from 1. 2. 3. drops to ten, and fifteen with ſutable vehicles, it purgeth the dropſy, leproſy, gout, and other noxious fixed humors not yielding to vegetable Catharticks, of which more at large in the ſecond Part of the ſpirit of urine and ſalt of tartar. It ſerves outwardly for an excellent vulnerary balſome, the like to which can ſcarce be ſhewed, not only in reducing old corrupt wounds, but alſo in thoſe that are green, for it doth powerfully dry, mundify, and conſolidate.

It is alſo uſed in houſhold affairs, for birdlime being diſſolved in it, yields a certain tenacious matter ſerving to catch birds, mice, *&c.* about the houſe or in the field. For it is as permanent in the heat of the Sun, as in the cold of Winter, wherefore it may be uſed at any time of the year; all ſmall animals ſtick to it if they do but touch the matter.

A ligature or ſtring ſmeered therewith, and bound about any tree prevents the ſpiders from climbing up thereon, and other kinds of inſects that are noxious to the fruit; a thing worth taking notice of.

This oyl is not by the pouring on of water corrupted, neither is it precipitated, as that of Antimony: wherefore it is uſeful for many things. Common yellow ſulphur boyled in it, *viz.* in a ſtrong fire, ſo as to be diſſolved in it, ſwims upon it like fat, is thereby purified and made as tranſparent as yellow pellucid glaſs, and a better medicine than thoſe common flowers of ſulphur: it ſerves alſo for other uſes, all which to relate here it would be too tedious.

This oyl being mixed with clean ſand, and diſtilled by retort in a fire that is very ſtrong (otherwiſe the ſpirit of ſalt will not leave the *lapis calaminaris*) yields a moſt fiery ſpirit, the *lapis calaminaris* remaining in the bottom of the retort.

This ſpirit is ſo ſtrong, that it can ſcarce be kept; it diſſolves all metals, and all minerals (excepting ſilver and ſulphur) wherefore by the help thereof many excellent medicaments are made, which cannot be made with the common ſpirit though never ſo well rectified, which although it be often rectified, yet it is not without flegm, which cannot be ſeparated from it by the power of rectification, ſo well as with *lapis calaminaris*.

This ſpirit doth perform many things in medicine, & alchymy, as alſo in other arts, as you may eaſily conjecture; but here is not opportunity to ſpeak more of theſe things, yet for the ſake of the ſick I ſhall add one thing, to which few things are to be compared; the plain & ſhort proceſs whereof I would not have thee be offended at. And it is this, *viz.* mix this ſpirit with the beſt rectifyed ſpirit of wine, digeſt this mixture ſome while, and the ſpirit of ſalt will ſeparate the ſpirit of wine, and will make the oyl of wine ſwim on the top, the volatile ſalt being mortified: and this oyl is a moſt incomparable cordial, eſpecially if with the ſaid ſpirit of wine, ſpices have firſt been extracted, and with the ſaid ſpirit of ſalt, gold hath been diſſolved. For then in the digeſtion of this mixture, the oyl of wine being ſeparated, attracts the eſſence of the cordial ſpecies, and of other ve-

getables, being extracted before with the ſpirit of wine, as alſo the tincture of gold, and ſo by conſequence a moſt efficacious incomparable and univerſal medicine for all diſeaſes, fortifying the *Humidum radicale*, that it may be able to overcome its enemies; for which let praiſe and glory be given to the immortal God for ever who hath revealed to us ſo great ſecrets.

Of the Extrinſecal uſe of the ſpirit of Salt in the Kitchen.

I Said before that inſtead of Vinegar, and verjuice it may be uſed, as alſo inſtead of the juice of Limons, now it remains that I ſhew you how it is to be uſed, and that indeed as well for the ſake of the healthy as the ſick.

Let him therefore that will dreſs a pullet, pigeons, veal, *&c.* in the firſt place put a ſufficient quantity of ſpices, of water, and butter, and then as he pleaſeth a greater, or leſſer quantity of ſpirit of ſalt: and by this means fleſhes are ſooner made ready being boyled, then that common way; an old hen though the fleſh thereof be old is made as tender as a chicken by the addition of this ſpirit: but he that will uſe it inſtead of the juice of Limons with roſt meat, muſt put into it the pill of Limons for preſervation ſake, becauſe it preſerves it. It is uſed inſtead of verjuice by it ſelf alone, or mixed with a little ſugar, if it be too acid.

He that will ſtew beef, and make it as tender as kid, muſt firſt diſſolve in it tartar and a little ſalt before he wets the fleſh therewith, and the fleſh will not only be preſerved but made tender thereby: but to keep fleſh a long time you muſt mix ſome water therewith, and with weights preſs down the fleſh, that it may be covered with the pickle: for by this means fleſh may be preſerved a great while.

After the ſame manner may all kinds of garden fruits be preſerved, as cucumbers, purſlain, fennel, broom, German capers, *&c.* and indeed better than in vinegar. Alſo flowers, and hearbs may a long while be preſerved by the help thereof, ſo that you may have a roſe all the winter.

It preſerves alſo wine, if a little be mixed therewith. A little thereof being mixed with milk precipitates the cheeſe, which if it be rightly made is never corrupted, being like to ſuch cheeſe as they call *Parmeſan*. The whey of that milk diſſolves Iron, and cures any ſcab being waſhed therewith.

With the help of ſpirit of ſalt is made with honey, and ſugar a moſt pleaſant drink, not unlike to wine. There is made alſo of certain fruits with the ſpirit of ſalt a very good vinegar like to the Rheniſh vinegar. Such and many more things, which I will not now divulge, may be done with ſpirit of ſalt.

And thus have I in ſome meaſure taught the uſe of the ſpirit of ſalt, which I would not have you take as if I had revealed all things; for, brevities ſake, as alſo for ſome other reaſons I have ſilently paſſed over many things. Neither do I know all things my ſelf: but thoſe things, which I do know, I have ſo far declared that others may from thence have hints of ſeeking further. He that would deſcribe all, and every power and vertue thereof, had need to write a whole volum, the which is not my purpoſe at this time to do, but may perhaps be done another time. There ſhall alſo be ſhewed in the ſecond part of this book, ſome ſecrets which may be prepared by the help of this ſpirit: as how it may be dulcified to extract the tincture of gold, and of other metals, leaving a white body, which tincture is a medicine not to be ſlighted. Wherefore now ſeeing it is manifeſt how great things this ſpirit can do, every one will deſire a good quantity for his houſhold uſes, eſpecially ſeeing moſt excellent ſpirits may be made after an eaſie and ſhort way.

How an acid ſpirit, or vinegar may be diſtilled out of all vegetables, as hearbs, woods, roots, ſeeds, &c.

FIrſt put a few living coals into the furnace, then put upon them the wood that is to be diſtilled, that it may be burnt: out of which whilſt it is burning goes forth the acid ſpirit thereof into the receiver, where being condenſed it falls down into another receiver, reſembling almoſt common vinegar in its ſmell, wherefore alſo it is called the *vinegar of woods*.

And after this manner you may draw forth an acid ſpirit out of any wood, or vegetable, and that in a great quantity without coſts, becauſe the wood to be diſtilled is put but upon a very few living coals, and upon that another, for one kindles the other; and this ſpirit requires no more charges than of the wood to be diſtilled; which is a great difference betwixt this, and the common way of diſtilling, where beſides retorts, is required another fire; and out of a great retort ſcarce a pound of ſpirit is drawn in the ſpace of five or ſix hours; whereas in ours in the ſpace of one day, and that without any coſt or labor may be extracted twenty or thirty pound, becauſe the wood is immediately to be caſt into the fire to be diſtilled, and that not in pieces, but whole. Now this ſpirit (being rectified) may commodiouſly be uſed in divers Chymical operations, for it doth eaſily diſſolve animal ſtones, as the eyes of Crabs, the ſtones of Perches, and Carps, Corals alſo and Pearl, *&c.* as doth vinegar of wine. By means thereof alſo are diſſolved the glaſſes of metals, as of tin, lead, Antimony, and are extracted, and reduced into ſweet oyles.

This vinegar being taken inwardly of it ſelf doth cauſe ſweat wonderfully, wherefore it is good in many diſeaſes, eſpecially that which is made of Oak, Box; Guaiacum, Juniper, and other heavy woods; for by how much the heavier the woods are, by ſo much the more acid ſpirit do they yield.

Being uſed outwardly it mundifies ulcers, wounds, conſolidates, extinguiſheth, and mitigates inflammations cauſed by fire, cures the ſcab, but eſpecially the decoction being made of its own wood in the ſame. Being mixed with warm water for a bath for the lower part of the body, it cures occult diſeaſes of women; as alſo malignant ulcers of the leggs,

This ſpirit therefore deſerves ſome place in the ſhops, *i. e.* it is unjuſtly rejected in the ſhops, ſeeing it is eaſie to be made. In diſtilling of wormwood and other vegetables, there remaines in the bottom of the furnace aſhes, which being extracted with warm water yields a ſalt by decoction, which being again diſſolved in its own ſpirit or vinegar, and filtred, doth by the evaporation of the flegm, being placed in a cold place paſs into a Cryſtalline ſalt, which is of a pleaſant taſt, not like unto a *lixivium*, nor unto other ſalts that are diſſolved in the air. This ſalt is alſo more efficacious (being reduced into Cryſtals by its proper Spirit) than that which is made by the help of ſulphur, or Aqua fortis, and oyl of Vitriol, and otherways which Chymiſts, and Apothecaries uſe.

The

The ſpirit of paper and linnen cloath.

Pieces of linnen cloth gathered, and got from Sempſters being caſt into the furnace upon living coals, yield a moſt acid ſpirit, which tingeth the nailes, skin, & hair with a yellow colour, reſtores members deſtroyed with cold, is good in a gangrene, and eryſipelas if linen clothes wet in the ſame be applyed thereto, *&c.* The ſame doth ſpirit made of paper, *viz.* of the pieces thereof.

The ſpirit of ſilk.

After the ſame manner is there a ſpirit made of pieces of ſilk, which is not ſo ſharp as that which is made of linnen and paper, neither doth it tinge the Skin, but is moſt excellent in wounds as well old as green, and it makes the Skin beautiful.

The ſpirit of mans hair, and of other animals, as alſo of horns.

Out of horns alſo, and hair is made a ſpirit, but moſt fetid, wherefore it is not ſo uſeful, although otherwiſe it may ſerve for divers arts: being rectified it comes clear and to be of the odour of the ſpirit of urine. It diſſolves common ſulphur, and yields a water, that cures the ſcab in a very ſhort time.

Now for this buſineſs, ſhreds of woollen cloth undyed may ſerve, being caſt in a good quantity into the furnace. Pieces of cloath dipt in this ſpirit and hanged in vineyards, and fields, keep out Deer and Swine from coming in, becauſe they are afraid of the ſmell of that ſpirit, as of an huntſman that waits to catch them.

The ſpirit of vinegar, honey, and ſugar.

He that will diſtil liquid things, muſt caſt red hot coals into them, as for example into vinegar in the furnace, or if it be honey, or ſugar, let them firſt be diſſolved in water, by which means they will be drank up by the coals, which being therewith impregnated, muſt afterwards at ſeveral times be caſt into the furnace, and be burnt; and whilſt the coals are burning, that which is incombuſtible comes forth. And by this means you may diſtil liquid things in a great quantity.

Vinegar which is diſtilled this way, is of the ſame nature, as that which is diſtilled in cloſe veſſels.

But honey and ſugar that are diſtilled after this manner, are a little altered, and acquire other vertues: but how they ſhall be diſtilled without the loſs of their volatile ſpirit ſhall be taught in the ſecond Part. Alſo after this manner may all liquid things being drunk up by living coals be diſtilled.

Of the uſe of diſtilled vinegar many things might be ſaid, but becauſe the Books of all the Chymiſts treat abundantly thereof, I account it needleſs to repeat what they have writ. Yet this is worth taking notice of, that the ſharpeſt vinegar hath a great affinity with ſome metals, which may be extracted by the help thereof; alſo diſſolved, and reduced into medicaments; yea, many things may be made with the help thereof, as the books of all the Chymiſts teſtify.

But there is yet another vinegar, of which there is often mention made in the books of Philoſophers, by the help whereof, many wonderful things are performed in the ſolution of metals, the name whereof the ancients have been ſilent in; of which I do not here treat, becauſe it cannot be made by this furnace; but I ſhall treat of it in another part; yet ſo that I incur not the Curſe of the Philoſophers.

How ſpirits may be made out of the ſalt of tartar, vitriolated tartar, the ſpirit of ſalt tartarizated, and of other ſuch like fixed ſalts.

As many Chymiſts as there hath been, almoſt all have been of the opinion that a ſpirit cannot be drawn out of ſalt of tartar, and other fixed ſalts. For experience hath taught that by retort little or no ſpirit can be drawn from thence, as I had often experience of before the invention of this furnace: the reaſon of which thing was the admixtion of ſand, earth, bole, pouder of tiles, *&c.* for to prevent the flowing of the ſalt of tartar, being by this means diſperſed. But this is done through the ignorance of Authors, who have been ignorant of the properties of ſalt of tartar. For a ſtony matter, as ſand, flint, bole, *&c.* being mixed with ſalt of tartar, feeling the heat of the fire, and being made red with the ſame, is joyned to it moſt cloſely, ſo as no ſpirit can be drawn from thence, but become a moſt hard ſtone. For ſand, and ſuch things that are like to it, have ſo great an affinity with the ſalt of tartar, that being once united can ſcarce ever be ſeparated. Yet it may be made by Art by the addition of pure ſand, or flint, becauſe the whole ſubſtance of the ſalt of tartar may be turned into a ſpirit in the ſpace of one or two hours, as ſhall be taught in the ſecond part, and it excells all other medicaments in vertue, in curing the ſtone, and gout. And if by the regiment of art there be left any *Caput Mortuum* in the diſtillation, it hath, being diſſolved in the air, a power to putrify metals being prepared, and mixed with it, in the ſpace of few hours, ſo as to make them become black, and to grow up like trees with their roots, trunks, and boughs, which by how much the longer they are ſo left, become the better. Of calx of lead being ſubtilized, and of ſalt of tartar may be made a *ſpiritus gradatorius* of wonderful vertues as well in Medicine as Alchymy. There is made of the *Caput Mortuum, per deliquium* a green liquor which doth wonderful things; whence it is proved, *That Saturn is not the loweſt of the Planets*; enough to the wiſe.

And ſo is the Lac Virginis, and the Philoſophical Sanguis Draconis made.

Sometimes there is found a certain earth, or bole, which hath no affinity with tartar, which being mixed with ſalt of tartar yields a ſpirit, but very little. But in this furnace may all fixed things be elevated, becauſe the ſpecies not being included in it, but diſperſed, being caſt upon the fire, are from the fire elevated through the aire, and are being refrigerated in the recipients again condenſed, which cannot be ſo well done by a cloſe retort.

He therefore that will make the ſpirit of the ſalt of tartar, need do nothing elſe than to caſt the calcined tartar into the fire, and it will wholly come over in a ſpirit: but then there are required glaſs recipients, becauſe thoſe that are earthen cannot retain it.

And this is the way whereby moſt fixed ſalts are diſtilled into a ſpirit by the firſt furnace. In the ſecond furnace (*viz.* in the furnace of the ſecond Part) it may be done better, and eaſier, where together with the preparation ſhall be taught the uſe thereof.

The ſpirits, flowers, and ſalts of Minerals and ſtones.

BY this way ſpirits may be raiſed from any mineral or ſtone, and that without the addition of any other thing: yet ſo as that the minerals, and ſtones, as flints, Cryſtal, talk, *lapis calaminaris*, Marcaſite, Antimony, being ground be with an Iron ladle caſt upon the coals, and there will ariſe together with a certain acid ſpirit, ſome ſalt and flowers, which are to be waſhed off from the recipients, and filtred, and the flowers will remain in *Charta bibula*, or filter for the water together with the ſpirit, and the ſalt paſſeth through the filter, all which may be ſeparated, rectified and be kept by themſelves for their proper uſes. Now this you muſt know, that you muſt chooſe ſuch minerals which have not been touched by the fire, if you deſire to have their ſpirit.

How minerals, and metals may be reduced into flowers, and of their vertues.

Hitherto to the flowers of metals, and minerals have not been in uſe, excepting the flowers of Antimony, and ſulphur, which are eaſily ſublimed: for Chymiſts have not dared to attempt the ſublimation of other metals, and fixed minerals, being content with the ſolution of them with Aqua fortis, and corroſive waters, precipitating them with the liquor of ſalt of tartar, and afterward edulcorating, and drying them; and being ſo prepared they have called them their Flowers: but by Flowers I underſtand the ſame matter which is by the help of fire without the addition of any other thing ſublimed, and turned into a moſt ſubtile pouder, not to be perceived by the teeth or eyes, which indeed is (in my judgment) to be accounted for the true flowers; when as the flowers which others make are more corporeal, and cannot be ſo well edulcorated, but retain ſome ſaltneſs in them, as may be perceived by the increaſe of their weight, and therefore hurtful to the eyes, and other parts.

But our flowers being by the force of the fire ſublimed by themſelves, are not only without ſaltneſs, but are alſo ſo ſubtile that being taken inwardly preſently operate, and put forth their powers, *viz.* according to the pleaſure of the Phyſitian. Neither is their preparation ſo coſtly as the others.

Metals alſo, and minerals are maturated, and amended in their ſublimation, that they may be the more ſafely taken; but in other preparations they are rather deſtroyed, and corrupted, as experience witneſſeth: Now how theſe kind of flowers are to be made I ſhall now teach, and indeed of each metal by it ſelf, whereby the artiſt in the preparation cannot erre, and firſt thus.

Of Gold and Silver.

GOld and ſilver can hardly be brought into flowers, becauſe many are of opinion, that nothing comes from them in the fire, eſpecially from Gold, although it ſhould be left there for ever: which although it be true, *viz.* that nothing comes from gold in the fire, although it ſhould remain there a long time, and from ſilver but a little except it have copper or any other metal mixed, which yet vapours away but by little and little.

Which I ſay although it be ſo, yet they being broken and ſubtilized and ſcattered upon coals, and ſo diſperſed, may by the force of the fire and help of the air be ſublimed, and reduced into flowers.

Now ſeeing the aforeſaid metals are dear, and of a great price, and the furnace with its recipients large, I would not that any one ſhould caſt them in, eſpecially gold, becauſe he cannot recover them all; but I ſhall to thoſe that deſire to make theſe flowers ſhew another way in the ſecond part, whereby they may make them without the loſs of the metal; to which I refer the reader. For this furnace ſerves for the ſubliming of metals, and minerals, which are not ſo pretious, the looſing of part whereof is not ſo much regarded. And thus much is ſaid to ſhew that gold, and ſilver, although fixed, may be ſublimed. Now other metals may more eaſily be ſublimed, yet one more eaſily than another, neither need they any other preparation but beating ſmall, before they be caſt into the fire.

Flowers of Iron and Copper.

TAke of the filings of Iron or Copper, as much as you pleaſe, caſt them with an Iron laddle upon burning coals, *viz.* ſcatteringly, and there will ariſe from Iron a red vapour, but from Copper a green, and will be ſublimed into the ſublimatory veſſels. As the fire abates it muſt be renewed with freſh coales, and the caſting in of theſe filings be continued, until you have got a ſufficient quantity of flowers, and then you may let all cool. This being done take off the ſublimatory veſſels, take out the flowers, and keep them, for they are very good if they be mixed with unguents, and emplaſters: and being uſed inwardly cauſe vomiting; therefore they are better in Chirurgery, where ſcarce any thing is to be compared to them. Copper being diſſolved in ſpirit of ſalt, and precipitated with oyl of vitriol, edulcorated, dryed, and ſublimed, yields flowers, which being in the air reſolved into a green balſom, is moſt uſeful in wounds and old putrid ulcers, and is a moſt pretious treaſure.

Flowers of Lead and Tin.

YOu need not reduce theſe metals into ſmall crums, it is ſufficient if they be caſt in piece by piece, but then you muſt under the grate put an earthen platter glazed, and filled with water, to gather that which flows down melted, which is to be taken out, and caſt again into the fire, and this ſo often until all the metal be turned into flowers, which afterwards are again, the veſſels being cold, to be taken out, as hath been ſaid of the flowers of *Mars* and *Venus*. And theſe flowers are moſt excellent being mixed with plaiſters and oyntments in old and green wounds, for they have a greater power to dry, than metals calcined, as experience can teſtifie.

Of Mercury.

THis is eaſily reduced into flowers, becauſe it is very volatile, but not for the aforeſaid reaſon, becauſe it leapes in the fire, and ſeeks to deſcend.

And

And if you deſire to have the flowers thereof, mix it firſt with ſulphur that you may pulverize it, and caſt it in mortified. And if you caſt into a red hot crucible ſet in the furnace, a little quick Mercury, *viz.* by times with a ladle, preſently it will fly out, and ſome part thereof will be reſolved into an acid water, which is to be preferred before the flowers in my judgment; but the reſt of the Mercury drops into the receiver. But here are required glaſs veſſels, becauſe the aforeſaid water is loſt in earthen. And this water without doubt doth ſomething in Alchymy: It is alſo good being applyed outwardly, in the ſcab, and venereal ulcers.

The flowers of Zinck.

IT is a wonderful metal, and is found in the ſpagyrical anatomy to be meer ſulphur, golden, and immature. Being put upon burning coals doth ſuddenly fly away wholly; it is inflamed alſo, and partly burns like common ſulphur, with a flame of another colour, *viz.* golden purple: and yields moſt gallant white, and light flowers.

The uſe.

BEing given from 4, 5, 6, grains to 12, they provoke ſweat wonderfully, and ſometimes vomit, and ſtools, according to the offending matter. The vertues thereof being externally uſed are alſo wonderful, for there are not found better flowers, for they do not only ſpeedily conſolidate freſh wounds, but alſo old, ſuch as always drop water, in which caſes they excell all other medicaments. For they are of ſuch dryneſs, which hath joyned with it a conſolidating vertue, as that they do even things incredible. They may be uſed divers ways, as to be ſtrewed by themſelves, putting over them a ſtiptick plaiſter, or being brought into an unguent with honey to be put into wounds; which unguents in deep wounds may be boyled to a hardneſs for the making of ſmall ſuppoſitories, which are to be put into the wounds, which muſt afterwards be covered with ſome plaiſter, and preſerved from the air. Being applyed after this manner they cure fundamentally, being mixed with plaiſters alſo they do wonderful things.

If they be mixed with roſe, or rain water, ſo as to be united together, and afterwards ſome of this mixture be ſometimes every day dropt into red eyes that water, yielding not to other ophthalmicks, do reſtore, and heal them.

Theſe flowers being taken up in lint and ſtrewed upon thoſe places of Children that are galled with their urin (thoſe places being firſt waſhed with water) heal them quickly. They heal alſo quickly any excoriation which is contracted by lying long in any ſickneſs, and is very painful, if they be ſtrewed thereon.

Theſe flowers alſo are more eaſily diſſolved in coroſive waters, than other metals, and minerals, neither doth the ſpirit leave them in the fire, but an inſipid phlegm only diſtills off, leaving a fat and thick oyl, as is above ſaid concerning the *lapis calaminaris*, being ordained for the ſame uſes, but more efficacious then that. Which ſpirit if it be by the violence of fire driven forth, is of ſo great ſtrength, that it can ſcarce be kept. And not only ſpirit of ſalt, but alſo Aqua fortis, and Regia may after this manner be exalted, ſo as to be able to do wonderful things in the ſeparation of metals; but here is not place for theſe things, they ſhall be ſpoken of in the fourth part.

But you need not make flowers for this work, becauſe crude Zinck doth the ſame, although the flowers do it ſomething better: whence it appears that a metal contracts a higher degree of dryneſs in ſublimation.

Flowers of Antimony.

THere is no difficulty to make the flowers of Antimony, for Chymiſts have a long time made uſe of them, and becauſe their preparation was tedious, they were not ſold at a low rate.

Wherefore there was no body willing to attempt any thing elſe in them, becauſe they were uſed only for vomiting; the doſe whereof was from 1. 2. 3. 4. grains to 8. and 10. in affects of the ſtomack and of the head, as alſo in feavers, plague, morbus gallicus, *&c.* Neither is it a wonder if Chymiſts tryed no farther in them, for we ſee that there are found men in theſe days who perſwade themſelves that there is nothing which was not found out by the learned ancients, can be found out in theſe days, and if there were any thing to be yet found out it was found out already by them. But this opinion truly is very fooliſh, as if God gave all things to the ancients, and reſerved nothing for them that ſhould come after. Neither indeed do they underſtand nature in their operations, which works inceſſantly, and is not wearied in her labours, *&c.* But however it is manifeſt that God hath revealed things in theſe times which were hid from them of old, and he will not ceaſe to do the ſame even to the end of the world.

But to return to our purpoſe again, which is to ſhew an eaſier way of making the flowers of Antimony, whereby a greater quantity may be had, as alſo that they may ſerve for other uſes.

Take of crude Antimony poudered as much as you pleaſe, and firſt make your furnace red hot, then caſt in at once a pound of Antimony, or thereabouts, *viz.* ſcatteringly upon the coals; and preſently it will flow, & being mixed with the coals by the force of the fire will be ſublimed through the air into the receivers like a cloud, which will there be coagulated into white flowers. Note, that when the firſt coals are burnt up, more muſt be put in to continue the ſublimation, and thoſe muſt be firſt kindled before they are put in, leſt the flowers be by the duſt of the coals ariſing together with them diſcoloured, and contract thence a gray colour: but it matters not if you will not uſe them by themſelves to provoke vomiting, becauſe there is no danger thereby, for that colour comes only from the ſmoake of the coals, wherefore you need not be afraid of them. But let him that diſlikes this colour, firſt kindle the coals before he put them into the furnace, and then he ſhall have white flowers. Alſo you muſt not ſhut the middle hole through which the coals, and Antimony are caſt in, that thereby the fire may burn the more freely: for elſe the flowers of the ſuperior pots will be yellow and red, by reaſon of the ſulphur of the Antimony, which is ſublimed higher than the regulus. Now you may by this way make a pound of the flowers with 3. 4. or 5. pound of coals. It is a little that goes away from the Antimony, *viz.* the combuſtible ſulphur, which is burnt, all the reſt going into flowers. You muſt have a care to provide a ſufficient quantity of ſubliming pots by reaſon that a large ſpace is required for the ſublimation of the flowers.

The flowers that are prepared after this way, are ſold at a lower rate, ſo that one pound thereof is cheaper, than half an ounce of thoſe that are made after the other manner. Alſo they are ſafer, as being made with an open free flame of the fire, for they do not provoke vomit ſo vehemently; moreover the flowers of the lower pots are not vomiting, but diaphoretical, as if they had been prepared with nitre, for thus they are corrected by the fire: And by this way at one and the ſame operation divers flowers of divers operations may be made, for the flowers of the lower pots are diaphoretical, of the middle a little vomitive, but of the uppermoſt vehemently vomitive. For by how much the more they have endured the fire, by ſo much the better are they corrected; from whence the diverſity of their power proceeds. Wherefore each of them are to be kept by themſelves, and the uppermoſt for plaiſters or butter, or oyl, and thoſe to be made ſweet or corroſive thereby; The middle for purging, and vomiting, but the lowermoſt for ſweat, being more excellent than *Bezoardicum Minerale*, or *Antimonium Diaphoreticum* made with nitre. Truly I do not believe that there is an eaſier way of making vomiting, and diaphoretical flowers, than ours. Now for the uſe of them, you muſt know that thoſe that are vomitive are to be adminiſtred to thoſe that are ſtrong, and accuſtomed to vomit: but to Children, and old Men with diſcretion, as hath been ſaid above of the butter of Antimony: but thoſe that are diaphoretical may be given without danger to Old and Young, to thoſe that are in health, and to the ſick; in any affliction that requires ſweat; as in the Plague, Morbus Gallicus, Scorbute, Leproſy, Feavers, *&c.* The Doſe of them is from 3, 6, 9, 12, grains to 24. with proper vehicles to ſweat in the bed; for they do expel as well by ſweat, as by urine, all evil humours. And becauſe they that are vomitive are in a greater quantity than thoſe that are diaphoretical, and not ſo neceſſary as theſe, and there may be many more doſes out of them; it is neceſſary to ſhew you how thoſe that are vomitive may be turned into diaphoretical; and that may be done three wayes; the two former whereof I have before ſhewed concerning the butter of Antimony made of flowers with ſpirit of ſalt, the third is this, *viz.* put the flowers in a crucible covered, (without luting) leſt any thing fall into it, ſo ſet them by themſelves in a gentle fire, that they melt not, but be made only darkly glow for the ſpace of ſome hours; then let them cool, for they are become fixed aud diaphoretical. Although they had before contracted ſome yellowneſs or aſh-colour, yet by this means they are made white, fixed, and diaphoretical. Alſo theſe flowers are uſed in ſtiptick plaiſters by reaſon of their dry nature, with which they are endued.

Alſo they are melted into a yellow tranſparent glaſs, neither is there taught an eaſier way of reducing Antimony by it ſelf into a yellow tranſparent glaſs, where crude Antimony is firſt ſublimed, and being ſublimed is melted into glaſs.

This ſublimation ſerves inſtead of calcination, by the help whereof 20 pound are more eaſily ſublimed, than by the help of the other one pound is brought into calx.

Neither is there here any danger of the aſcending fumes, becauſe when the Antimony is caſt into the fire you may be gone, which is a ſafe, and eaſy calcination, whereas the common way requires the continual preſence of the artiſt ſtirring the matter, who alſo takes out the matter when it is once grown together, and grinds it again; by which means he hath much to do, before the matter come to a whiteneſs; but by our way, the matter is at the firſt time made ſufficiently white, and more than by that common way of calcination and agitation. I ſuppoſe therefore that I have ſhewed to him that will make glaſs of Antimony, the beſt, and hitherto unknown way; which being taught, I hope there is no man will hereafter like a fool go that tedious way of the Antients, but rather follow my ſteps. For by this way may any Phyſitian, moſt eaſily be able to prepare for himſelf vomitive and diaphoretical flowers, and alſo glaſs of Antimony *per ſe*.

Of thoſe Flowers may be made oyls both ſweet and corroſive, and other medicaments, as hath been above ſaid of the ſpirit of ſalt, and ſhall afterwards be ſpoken in the Second Part.

Let him that will make Flowers of the Regulus, fairer than thoſe which are made of crude Antimony, caſt it being poudered into the fire, and in all things proceed as hath been ſaid, and he ſhall have them, *&c.* for they are eaſily ſublimed. Now, how the regulus is to be made after a compendious manner, you ſhall find in the Fourth Part. The ſcoriæ alſo are ſublimed, ſo as nothing is loſt. But he that will make Flowers that ſhall be diſſolved in the aire into a liquor muſt add ſome calcined tartar, or ſome other fixt vegetable ſalt, and he ſhall have Flowers that will be diſſolved in any liquor: but he that will make red Flowers as well thoſe that are diaphoretical, as thoſe that are purging, muſt mix iron, and he ſhall have Flowers like to Cinnabar: Let him that deſires green, mix copper, if purple, *lapis calaminaris*.

And thus out of any mineral may be made Flowers whether it be fixed, or volatile; for it is forced to fly on high being caſt into the fire. And theſe may be uſed diverſly in Chyrurgery, in plaiſters and unguents; for they dry, and aſtring potently, eſpecially thoſe that are made of *lapis calaminaris*. Neither are they to be ſlighted that are made of the golden, and ſilver marcaſite. Thoſe that are made of arſenic & auripigmentum, are poyſonous, but are uſeful for Painters. Arſenic & auripigmentum being calcined with nitre, and then ſublimed, yield Flowers that are ſafely to be taken inwardly, expelling all poyſons by ſweat and ſtool: For they are corrected two wayes, *viz.* firſt by the nitre, ſecondly by the fire in the ſubliming: they are not therefore to be feared, becauſe that Arſnick was poyſonous before the preparation thereof. For by how much the greater poyſon it was before preparation, ſo much the greater medicine afterwards.

The Flowers of ſulphur are taught in the Second Part, although they may alſo be made by this furnace, *viz.* the natures and properties thereof being known by an expert Artiſt, or otherwiſe it is burnt.

So alſo ſtones being prepared are brought into Flowers, and many other things, of which we need not ſay any thing, only let him that pleaſeth make tryal thereof. *Lemnich p. 231.*

And now I ſuppoſe I have made plain, and ſhewed you clearly how diſtillation is to be made in this our firſt furnace; wherefore I will now end.

He

He therefore that underſtands and knows the fabrick of the furnace (which he may underſtand by the delineation thereof) and the uſe thereof, will not deny but that I have done a good work, and will not diſapprove of my labour.

And this is the beſt way of diſtilling, and ſubliming incombuſtible things. In the Second Part you ſhall find another furnace in which are diſtilled combuſtible things, as alſo moſt ſubtil ſpirits, *&c.* The firſt furnace ſerves alſo for other uſes, as the ſeparation of metals; of the pure from the impure; for the making of the central ſalt, and of the *humidum radicale* of them all. But becauſe it cannot be done after the aforeſaid way, by which things are caſt into the fire to get their flowers, and ſpirits, but after a certain ſecret Philoſophical manner, by the power of a certain ſecret fire, hitherto concealed by the Philoſophers (neither ſhall I proſtrate that ſecret before all); It is ſufficient that I have given a hint of it for further enquiry, and have ſhewed the way to other things.

FINIS.

THE

SECOND PART

OF

Philoſophical Furnaces:

Wherein is Deſcribed the Nature of the Second Furnace; by the help whereof, all volatile, ſubtle, and combuſtible things may be diſtilled; whether they be Vegetables, Animals, or Minerals, and that after an unknown and very compendious Way; whereby nothing is loſt, but even the moſt ſubtle ſpirits may be caught and preſerved, which elſe without the means of this Furnace is impoſſible to be done by Retorts or other Diſtilling Inſtruments.

Of the Structure of the Second Furnace.

THE Diſtilling Veſſel muſt be made of Iron, or good earth, ſuch as can abide in the fire (whereof in the fifth Part of this Book it ſhall be taught) and you may make it as big or as little as you pleaſe, according as your occaſion ſhall require. That of iron is moſt fit to be uſed for ſuch ſpirits, as are not very ſharp or corroding, elſe they would corrode the veſſel: but that of earth may be uſed for ſuch things, as ſhew their activity upon the Iron, and do make it to melt, as ſulphur, Antimony and the like; and therefore you ought to have two ſuch veſſels, *viz.* one of iron, and one of earth, to the end that for both ſorts of materials (corroſive or not corroſive) you may have proper veſſels, and fit furnaces for their diſtilling, and that they may not he ſpoiled by things contrary and hurtful to them. The ſhape of the veſſel is ſhewed by the foregoing figure, *viz.* the lower part of it ſomewhat wider than the upper part, and twice as high as wide; at the top having a hollow ſpace between the two edges or brims, whereinto the edge of the lid may cloſe and enter in an inch deep. The lid muſt have a ring or handle, by which it may be taken off and put on again with a pair of tongs. The lid muſt have a deep edge anſwering to the hollow ſpace aforeſaid. The lower part muſt have three knobs or ſhoul-

ders thereby to reſt upon the wall of the furnace; the form whereof is no other, than that of a common diſtilling furnace with a ſand Copple; as the figure of it doth ſhew: but if you will not have the furnace, then it needeth no knobs or ſhoulders, if ſo be the diſtilling veſſel be flat at the bottom, or elſe have legs, for to ſtand upon them: Beneath the edge of the veſſel there comes forth a ſpout or pipe of a ſpan in length, and one or two inches wide, and ſomewhat narrower before than behind, through which the ſpirits are conveyed into the Receiver.

See the fourth Figure before the firſt part, wherein the Letter *A.* repreſents the Furnace, with the Iron diſtilling Veſſel faſtned into it, whereunto a Receiver is applied.

B. The Diſtiller, with his left hand taking off the lid, and with his right hand caſting in his prepared matter.

C. The external form of the diſtilling veſſel.

D. The internal form of the veſſel.

E. Another diſtilling veſſel, which is not faſtned to a furnace, but only ſtandeth upon Coals.

The way or manner to perform the Diſtillation.

WHen you intend to diſtil, then firſt make a fire in the Furnace, that the diſtilling veſſel come to be very hot. But if it be not faſtned to the Furnace, then ſet it upon a grate, and lay ſtones about it, and coals between, and ſo let it grow hot, and lay melted lead in the ſpace between the two edges or brims, to the end, that the lid, when it is put on, may cloſe exactly, ſo that no ſpirit can get through. This done, take a little of the matter you intend to diſtil, and caſt it in, and preſently put on the lid, and there will be no other paſſage left but through the pipe, to which there muſt be applyed and luted a very big receiver. As ſoon as the ſpecies caſt in come to be warm, they let go their ſpirit, which doth come forth into the receiver: and becauſe there was but little of the matter caſt in, it hath no power to force through the lute, or to break the receiver, but muſt ſettle it ſelf. This done, caſt in a little more of your matter, cover it and let it go till the ſpirit be ſettled; continue this proceeding ſo long, until you have ſpirits enough: but take heed, that you caſt in no more at once, than the receiver is able to bear, elſe it will break. And when your veſſel is full, the diſtillation not being ended, then take off the lid, and with an iron ladle take out the Caput Mortuum; and ſo begin again to caſt in, and ſtill but a little at a time, and continue this as long as you pleaſe.

Thus in one day you may diſtil more in a ſmall veſſel, than otherways you could do in a great retort; and you need not fear the leaſt loſs of the ſubtile ſpirit, nor the breaking of the receiver by the abundance of the ſpirits: and you may ceaſe or leave off your diſtilling, and begin it again when you liſt: alſo the fire cannot be made too ſtrong, ſo that it might cauſe any hurt or damage; but by this way you may make the moſt ſubtile ſpirits, which is impoſſible to be done by any Retort. But if you will diſtil a ſubtil ſpirit by a Retort, as of Tartar, Harts-horn, Salarmoniack, or the like, you cannot do it without prejudice (though there were but half a pound of the matter in it) the ſubtleſt ſpirits coming forth with force, ſeek to penetrate through the lute, if that be not good, but if that be good, ſo that the ſpirits cannot paſs through it, then they break the receiver, becauſe it cannot poſſibly hold ſuch a quantity of ſubtle ſpirits at once. For when they are coming, they come ſo plentifully, and with ſuch a force, that the receiver cannot contain them, and ſo of neceſſity muſt flye aſunder, or muſt paſs through the lutum; All which is not to be feared here, becauſe there is but a little caſt in at once, which cannot yield ſuch a quantity of ſpirits, as to force the receiver to break: And when there comes forth no more ſpirits, and the former is ſettled, then more of the matter is to be caſt in; and this is to be continued ſo long, until you have ſpirits enough. Afterward take off the receiver, and put the ſpirit into ſuch a Glaſs (as in the fifth part of this book, amongſt the Manuals, ſhall be diſcovered) wherein it may be kept ſafely without waſting or evaporating.

In this manner all things, Vegetable, Animal, or Mineral, may be diſtilled in this Furnace, and much better, than by means of a Retort: eſpecially ſuch ſubtile ſpirits (as by the other way of diſtilling cannot be ſaved, but paſs through the lutum) are got by this our way; and they are much better than thoſe heavy oyles, which commonly are taken for ſpirits, but are none, being only corroſive waters. For the nature and condition of a ſpirit is to be volatile, penetrating and ſubtile, and ſuch are not thoſe ſpirits of ſalt, Vitriol, Allome and Nitre, which are uſed in Apothecary ſhops, they being but heavy oyles, which even in a warm place do not evaporate or exhale.

But a true ſpirit, fit for Medicinal uſe, muſt riſe or aſcend before the phlegm, and not after; for whatſoever is heavier than phlegm, is no volatile ſpirit, but a heavy ſpirit or (rather called) a ſowre heavy oyl. And it is ſeen by experience, that the Apothecaries ſpirit of vitriol will cure no falling ſickneſs, which vertue is aſcribed to that ſpirit, and indeed juſtly: for the true ſpirit of vitriol performeth that cure out of hand. Likewiſe their ſpirit of Tartar (as they call it) is no ſpirit, but only a ſtinking phlegm or vinegar.

The way to make ſuch true ſpirits, I will now ſhew, becauſe much good may be done by them in all manner of Diſeaſes. And this way of diſtilling ſerveth only for thoſe which ſeek after good Medicines: but others which care not whether their medicines be well prepared or no, need not take ſo much pains as to build ſuch a furnace, and to make their ſpirits themſelves, for at any time they can buy for a ſmall matter, a good quantity of dead and fruitleſs ſpirits at the common ſellers and Apothecaries.

Hence it is no marvel, that now adaies ſo little good is done by Chymical medicaments, which of right ſhould far out-ſtrip all the Galenical in goodneſs and vertue. But alas! it is come to that paſs now, that a true Chymiſt, and honeſt Son of *Hermes*, is forced almoſt to bluſh, when he heareth men talk of Chymical medicines, becauſe they do no ſuch miracles, as are aſcribed unto them. Which infamy is occaſion'd by none more, than by careleſs Phyſicians, which though they make uſe of Chymical medicines, (becauſe they would fain be eſteemed to know more than others) yet they do take greater care for their kitchen, than for the welfare of their Patients; and ſo buying ill-prepared Medicines of unskilful ſtillers, and withal uſing them undiſcreetly

creetly (whereby they many times do more hurt than good to the ſick) they lay ſuch foul aſpertions upon the noble Art of Chymiſtry.

But an induſtrious and accurate Phyſician is not aſhamed to make his Medicines himſelf, if it be poſſible, or at leaſt to have them made by good and well-exercis'd Artiſts: whereupon he may better rely, and get more credit, than one that knoweth not whereof, nor how his Medicine which he doth adminiſter to his patients is prepared. But ſuch wicked and ignorant men will one day fall ſhort of their anſwer before the Judgment of the righteous Samaritan.

How to make the Acid Oyl and the volatile ſpirit of Vitriol.

HItherto I have taught, how to diſtil in general, and to get the ſubtle ſpirits. There remaineth now to deſcribe what Manuals or Preparations are fitting for every matter in particular; and firſt,

Of Vitriol.

TO diſtil Vitriol, there needs no other preparation, but only that it be well viewed, and if there be any filth amongſt it, that the ſame be carefully pickt out, leſt being put together with the Vitriol into the diſtilling veſſel, the ſpirit be corrupted thereby. But he that will go yet more exactly to work, may diſſolve it in fair water, then filtrate it, and then evaporate the water from it till a skin appear at the top, and then ſet it in a cold place, and let it ſhoot again into Vitriol; and then you are ſure that no impurity is left in it.

Now your veſſel being made red hot, with an Iron ladle caſt in one or two ounces of your Vitriol at once, put on the lid, and preſently the ſpirits together with the phlegm will come over into the receiver, like unto a white cloud or miſt; which being vaniſhed, and the ſpirits partly ſettled, carry in more Vitriol, and continue this ſo long, until your veſſel be full: Then uncover your veſſel, and with a pair of tongs or an iron ladle take out the Caput Mortuum, and caſt more in; and continue this proceeding as long as you pleaſe, ſtill emptying the veſſel when it is filled, and then caſting in more matter, and ſo proceeding until you conceive that you have got ſpirits enough. Then let the fire go out, and let the furnace cool; take off the receiver, and pour that which is come over into a retort, and ſet the retort in ſand, and by a gentle fire diſtil the volatile ſpirit from the heavy oyl; having firſt joyned to the retort the receiver, which is to receive the volatile ſpirit, with a good lutum, ſuch as is able to hold ſuch ſubtle ſpirits, the making whereof ſhall be taught in the fifth part of this Book, amongſt the Manuals.

All the volatile ſpirit being come over, which you may know by the falling of bigger drops, then take off the receiver, and cloſe it very well with wax, that the ſpirit may not make an eſcape; then apply another (without luting it) and ſo receive the phlegm by it ſelf, and there will remain in the retort a black and heavy corroſive oyl, which if you pleaſe, you may rectifie, forcing it over by a ſtrong fire, and then it will be clear; if not, let all cool, then take out your Retort together with the black oyl, and pour upon it the volatile ſpirit, which in the rectifying went over firſt; put the retort into the ſand, and apply a receiver, and give it a very gentle fire, and the volatile ſpirit will come over alone, leaving its phlegm behind with the oyl, which by reaſon of its dryneſs doth eaſily keep it. Thus the ſpirit being freed from all phlegm, is become as ſtrong as a meer fire, and yet not corroſive. And if this ſpirit be not rectified from its own oyl, it will not remain good, but there doth precipitate a red powder after it hath ſtood for ſome ſpace of time, and the ſpirit loſeth all its vertue, inſomuch that it is not to be diſcerned from ordinary water, which doth not happen when it is rectified. The reaſon of this precipitation is no other than the weakneſs of the ſpirit, which is accompanied with too much water, and therefore not ſtrong enough for to keep its ſulphur, but muſt let it fall: but after it is rectified by its own oyl, it can keep its ſulphur well enough, becauſe then it is freed from its ſuperfluous moiſture. However the red powder is not to be thrown away, but ought to be kept carefully; becauſe it is of no leſs vertue than the ſpirit it ſelf. And it is nothing elſe but a Volatile ſulphur of Vitriol. It hath wonderful vertues, ſome of which ſhall be related.

The Uſe and Doſe of the Narcotick ſulphur of Vitriol.

OF this ſulphur 1, 2, 3, 4. or more grains (according to the condition of the patient) given at once mitigates all pains, cauſeth quiet ſleep; not after the manner of Opium, Henbane, and other the like medicines, which by ſtupifying and benumbing cauſe ſleep, but it performeth its operation very gently and ſafely, without any danger at all, and great Diſeaſes may be cured by the help thereof. *Paracelſus* held it in high eſteem, as you may ſee, where he doth write of *Sulphur embryonatum.*

Of the Uſe and Vertue of the volatile ſpirit of Vitriol.

THis ſulphurous Volatile ſpirit of Vitriol, is of a very ſubtle and penetrating quality, and of a wonderful operation; for ſome drops thereof being taken and ſweated upon, doth penetrate the whole body, openeth all obſtructions, conſumeth thoſe things that are amiſs in the body, even as fire. It is an excellent medicine in the Falling ſickneſs, in that kind of madneſs or rage which is called *Mania*, in the Convulſion of the Mother, called *Suffocatio Matricis*, in the Scurvy; in that other kind of madneſs which is called Melancholia Hypochondriaca; and other Diſeaſes proceeding from Obſtructions and Corruption of the Blood: It is alſo good in the Plague, and all other Feavers: mingled with ſpirit of wine, and daily uſed, it doth wonders in all external accidents: Alſo in the Apoplexy, ſhrinking and other diſeaſes of the Nerves, the diſtreſſed limb rubbed therewith, it doth penetrate to the very marrow in the bones; it doth warm and refreſh the cold ſinews, grown ſtiff: In the Cholick, beſides the internal uſe, a little thereof in a clyſter applyed, is a preſent help: Externally uſed in the Gout, by anointing the places therewith, aſſwageth the Pains, and taketh away all tumours and inflammations: It doth heal ſcabs,

tetters and ring-worms, above all other medicines; it cureth new wounds and old ſores, as Fiſtulaes, Cancers, Wolves, and what name ſoever elſe they may have: It extinguiſheth all inflammations, ſcaldings, the Gangrene, diſſipateth and conſumeth the knobs and excreſcencies of the skin. In a word, this ſpirit, which the wiſe men of old called *Sulphur Philoſophorum*, doth act univerſally in all diſeaſes, and its vertue cannot ſufficiently be praiſed and expreſſed: And it is much to be admired, that ſo excellent a Medicine is no where to be found.

If it be mingled with Spring water, it doth make it pleaſantly ſowriſh, and in taſte and vertue like unto the natural ſowre water of wells.

Alſo by this ſpirit, many diſeaſes may be cured at home; ſo that you need not go to bathes afar off, for to be rid of them.

Here I could ſet down a way, how ſuch a ſpirit may be got in great abundance for the uſe of bathing, without diſtillation, whereby miraculous things may be done, but by reaſon of the ungratefulneſs of men, it ſhall be reſerved for another time.

Of the vertue and uſe of the corroſive oyl of Vitriol.

THis oyl is not much uſed in Phyſick, although it be found almoſt in every Apothecaries ſhop, which they uſe for to give a ſowriſh taſt to their ſyrups and conſerves. Mingled with ſpring water and given in hot diſeaſes, it will extinguiſh the unnatural thirſt, and cool the internal parts of the body. Externally it cleanſeth all unclean ſores, applyed with a feather; it ſeparateth the bad from the good, and layeth a good foundation for the cure.

Alſo if it be rectified firſt, ſome metals may be diſſolved with it and reduced into their Vitriols, eſpecially Mars and Venus; but this is to be done by adding common water thereunto, elſe it will hardly lay hold on them. The way of doing it is thus.

How to make the Vitriol of Mars and Venus.

TAke of your heavy oyl, juſt as it came over, *viz.* together with its phelgm (but that the Volatile ſpirit be drawn off from it firſt) as much as you pleaſe, put it into a glaſs body together with plates of copper or iron, ſet it in warm ſand, and let it boyl until that the oyl will diſſolve no more of the metal, then power off the liquor, filtre it through brown paper, and put it into a low gourd glaſs, and ſet it in ſand, and let the phlegm evaporate until there appear a skin at the top, then let the fire go out, and the glaſs grow cool; then ſet it in a cold place, and within ſome days there, will ſhoot fair Cryſtals; if of Iron, greeniſh; if of Copper, then ſomething blewiſh; take them out and dry them upon filtering paper, the remaining liquor, which did not ſhoot into Vitriol, evaporate again in ſand, and then let it ſhoot as before; continue this proceeding, until all the ſolution (or filtred liquor) be turned to Vitriol. This Vitriol is better and purer than the common; for it yieldeth a better Volatile ſpirit, and for that reaſon I did ſet down the way how to make it. There may alſo be made a good Vitriol of both theſe metals by the means of ordinary yellow brimſtone; but becauſe the making of it is more tedious, than of this here ſet down, I think it needleſs to deſcribe its preparation in this place.

The way to make a fair blew Vitriol out of Luna *(that is, ſilver.)*

DIſſolve the ſhavings or filings of ſilver with rectified oyl of Vitriol, adding water thereunto, but not ſo much as to Iron and Copper: Or elſe, which is better, diſſolve calcined ſilver, which hath been precipitated out of Aqua fortis either with Copper or ſalt water; the ſolution being ended pour it off and filtre it, and drop into it of ſpirit of urin or Sal armoniac, as long as it doth hiſs, and almoſt all the ſilver will precipitate again out of the oyl, and ſo there will fall a white powder to the bottom; This precipitated ſilver together with the liquor pour into a phiall-glaſs, ſet it to boyl in ſand for twenty four hours, and the liquor will diſſolve again almoſt all the precipitated ſilver-calx and become blew thereby. Then pour off the ſolution (or liquor) and filtre it through brown paper, and abſtract the moiſture till a skin ariſe at the top; then in a cold place let it ſhoot to Vitriol. With the remaining liquor proceed further, as above in the preparation of the Vitriol of Iron and Copper hath been taught.

By this way you will get an excellent Vitriol out of ſilver, which from 4, 5, 6, to 10. grains uſed only of it ſelf, will be a good purge, eſpecially in diſeaſes of the brain.

If you have a good quantity of it, that you may diſtill a ſpirit thereof, you will get not only an acid (or ſowre) but alſo a volatile ſpirit, which in the infirmities of the brain is moſt excellent; that which in the diſtilling remains behind, may be reduced again into a body, ſo that you loſe nothing of the ſilver, ſave onely that which is turned into ſpirit.

Moreover, the acid (or ſowre) oyl of common Vitriol, doth precipitate all metals and ſtones of beaſts or fiſhes; alſo pearls and corals, they being firſt diſſolved in ſpirit of ſalt or of Nitre, and maketh fair light powders of them (which by the Apothecaries are called Magiſteries) much fairer than by precipitation with ſalt of Tartar is done, eſpecially of corals and pearls, ſuch a fair gliſtering and delicate powder is made; and likewiſe alſo of mother of pearl, and other ſhels of ſnailes, that it giveth as fair a gloſs to them, as the faireſt oriental pearls have; which way hath not been made common hitherto, but being known only to few, hath been kept very ſecret by them, as a ſingular Art Such Magiſteries commonly were precipitated out of vinegar only by ſalt of Tartar, which for lightneſs, whiteneſs and fair gloſs are not comparable at all to ours: But if inſtead of the oyl of Vitriol you take oyl of ſulphur, then theſe powders will be fairer than when they are done by the oyl of Vitriol, in ſo much, that they may be uſed for painting for a black skin.

Having made mention of Magiſteries, I cannot forbear to diſcover the great abuſe and error, which is committed in the preparing of them.

Paracelſus in his Archidoxes teacheth to make Magiſteries, which he calleth extracted Magiſteries: but ſome of his diſciples teach to make precipitated Magiſteries which are different from the former. *Paracelſus* is clean of another opinion in the preparing of his Magiſteries, than others in the making of theirs: doubtleſs *Paracelſus* his Magiſteries were

good

good cordial living medicines, whereas the other are but dead carkaſes, and although they be never ſo fair, white and gliſtering, yet in effect they prove but a groſs earthy ſubſtance, deſtitute of vertue.

I do not deny, but that good medicines may be extracted out of pearls and corals, for I my ſelf alſo do deſcribe the preparations of ſome of them; but not at all after ſuch a way as theirs is. For what good or exalting can be expected by ſuch a preparation, where a ſtony matter is diſſolved in corroſive waters, and then preciptated into ſtone again? Can its vertue be increaſed thereby? ſurely no, but rather it is diminiſhed, and made much the worſe thereby. For it is well known, that the corroſive ſpirits (no leſs than fire) do burn ſome certain things; for not all things are made better by fire or corroſives, but moſt of them are abſolutely ſpoyled by them. Some perchance will ſay, that ſuch preparations of Magiſteries are onely for to be reduced into a finer powder, that ſo much the ſooner they may perform their operation. To which I anſwer, that pearls, corals, and other things of the like nature, if they be once diſſolved by corroſive waters, and then precipitated and edulcorated, never or hardly can be diſſolved again by acid ſpirits. Whence it is evident that by ſuch preparations they are not opened or made better, but rather cloſed or made worſe. And we ſee alſo by daily experience that thoſe Magiſteries do not thoſe effects, which are aſcribed unto them. By which it appeareth clearly, that to the Archeus of the ſtomach they are much leſs grateful than the crude unprepared corals and pearls; whoſe tender eſſence being not burnt up by corroſives, do oftentimes produce good effects. For our Anceſtors have aſcribed unto corals and pearls, that they purifie the impure and corrupt blood in the whole body, that they expel Melancholly and ſadneſs, comforting the heart of man, and making it merry, which alſo they effectually perform: whereas the Magiſteries do not. And this is the reaſon, why unprepared corals, pearls and ſtones of fiſhes have more effect, than the burnt Magiſteries. For it is manifeſt and well known, that the aboveſaid diſeaſes for the moſt part do proceed from obſtructions of the ſpleen, which obſtructions are nothing elſe, but a tartarous juice or a ſowre flegme which hath poſſeſſed and filled up the entrals, and coagulated it ſelf within them. By which obſtruction not only head-ach, giddineſs, panting of the heart, trembling of the limbs, a ſpontaneous laſſitude, vomits, unnatural hunger; alſo, loathing of victuals; then cold, then hot fluſhing fits, and many more ſtrange ſymptomes are cauſed; but alſo a moſt hurtful rottenneſs and corruption is introduced into the whole maſs of blood, from whence the leproſie, ſcurvey, and other loathſome or abominable ſcabs do ſpring.

Of which evil the onely cauſe (as hath been ſaid) is a crude acid Tartar, from which ſo many great diſeaſes do riſe.

This to be ſo may eaſily be proved; for it is notorious, that melancholick folks, hypocondriaques, and others do often caſt up a great quantity of acid humor, which is ſo ſharpe that no vinegar is comparable to it, and doth ſet their teeth on ſuch an edge, as if they had eaten unripe fruit.

What remedy now? take away the cauſe and the diſeaſe is taken away. If you could take away the peccant matter by purgings, it would be well, but it remaineth obſtinate and will not yield to them. By vomit it may be diminiſhed in ſome meaſure. But becauſe that not every one can abide vomiting, it is therefore no wiſdome to turn evil into worſe. Shall then this tartar be killed and deſtroyed by contraries, which indeed in ſome ſort may be effected; as when you uſe vegetables or animals, whoſe vertue conſiſteth in a volatile ſalt: ſuch are all ſpecies or ſorts of creſſes, Muſtard-ſeed, horſe-radiſh, ſcurvy graſs, alſo the ſpirit of Tartar, of Harts-horn, and of urine and the like, which by reaſon of their penetrating faculty paſs through all the body, finding out the Tartar thereof, deſtroying the ſame, as being contrary unto it; and in this combat two contrary natures is kindled, a great burning heat, whereby the whole body is throughly heated and brought to ſweating; and whenſoever by theſe contraries a ſweating is cauſed, there is always mortified ſome of this hurtful Tartar. But becauſe that of that acid humor but a little at a time can be mortified and edulcorated by contrary volatile ſpirits, and that therefore it would be required to uſe them often, for to kill and expell all the Tartar; and becauſe alſo (as hath been mentioned before) a ſtrong ſweat always is cauſed by every ſuch operation, whereby the natural ſpirits are much weakened, ſo that the patient would not be able to hold out long thereby, but by taking away of one evil, another and greater one would be occaſioned.

And therefore ſuch things muſt be offered to that hungry acid humour, by which the corroſive nature thereof, may be mortified and grow ſweet, with that proviſo nevertheleſs, that thoſe things be ſuch as are not contrary or hurtful to the nature of man, but grateful and friendly, as are corals, pearls and crabs eyes, *&c.*

For amongſt all ſtones none are more eaſily to be diſſolved than Pearls, Corals, Crabbs-eyes, and other ſtones of fiſhes.

But the truth of this, *viz.* that every corroſive is killed by feeding upon pearls and corals, and thereby can be made ſweet; and beſides, how a ſowre coagulated Tartar, by the help of corals or pearls may be reduced to a ſweet liquor (a pleaſant and acceptacle medicine to the nature of man) which never can be coagulated again by any means, ſhall be afterwards proved and taught when I ſhall come to treat of Tartar.

Now in tartareous coagulations and obſtructions of the internals proceeding from the predominancy of an acid humor there is no better remedy, than to give the patient every morning faſting from ℈ſs. to ℥i. (more or leſs, according to the condition of the patient) of red corals and pearls made into powder, and to let him faſt two or three hours upon it, and ſo to continue daily until you ſee amendment: By this means the hurtful acid humor is mortified, and dulcified by the corals and pearls, ſo that afterwards it may be overcome by nature, whereby the obſtructions are removed, and the body freed from the diſeaſe.

This my opinion of the abuſe of Magiſteries and the good uſe of Corals I could not conceal, although I do know for certain, that it will take but with few, in regard that it will ſeem very ſtrange to moſt. However, happily there may be ſome yet, that will not be unwilling to ſearch into the truth, and to conſider further of it, and at laſt will find this not to be ſo ſtrange, as it ſeemed to them at the firſt: but he that cannot believe or comprehend it, may keep to his Magiſteries.

And if it ſeem ſo ſtrange unto any, that corals or pearls made into powder ſhall be concocted in the ſtomach, and ſo put forth their vertue, what will you ſay then, if I do prove, that even whole pearls, crabs eyes, and corals being ſwallowed, are totally conſumed by the Melancholy humor, ſo that nothing cometh forth again among the excrements ? and which is more, even the like may be ſaid of hard and Compact metals, as Iron,and Speaucer or Zinck : But this muſt be underſtood only of thoſe that are of a Melancholick conſtitution but not ſo in others, *viz*, thoſe that are of a ſanguine,and thoſe that are of a phlegmatick conſtitution, to whom ſuch like things are ſeldom preſcribed. For I have ſeen many times, that againſt obſtructions, to ſtrong bodies there hath been given at once from ℈ſs. to ℥ i. of the ſhavings or filings of Iron, and they found much good by it, yea more help then by other coſtly medicines of the Apothecaries, whereof they had uſed many before, but to no purpoſe, by reaſon whereof their excrements came from them black, juſt as it uſeth to fall out with thoſe that make uſe of medicinal ſowre waters, which run through iron mines, and thereby borrow a ſpiritual mineral vertue.

Now if thoſe filings of iron had not been conſumed in the ſtomach, how come it that the excrements are turned black ? ſo then it is ſufficiently proved, that even a hard unprepared metal can be conſumed in the ſtomach: and if ſo, why not as well ſoft pearls and corals ?

Which is alſo to be ſeen by children, that are troubled with worms, if there be given unto them 4, 6, 8. to 12. or 16. grains of the fineſt filings of ſteel or iron, that all the worms in the body are killed thereby, their ſtomach and guts ſcowred very clean, and their ſtools alſo turned black. But this muſt be obſerved by children, when the worms are killed, and yet remain in the guts (becauſe that the iron in a ſmal quantity is not ſtrong enough for to expel them, but only make the body ſoluble) that a purge muſt be uſed after, for to carry them out ; for elſe if they do remain there, others will grow out of their ſubſtance. But to thoſe that are more in years, you may give the Doſe ſo much the ſtronger, as from ℈ i. to ℥i. that the worms alſo may be carryed out, they being better able to endure it than little children, and although ſometimes a vomit doth come, yet it doth no hurt, but they will be but ſo much the healthier afterward.

And thus Iron may be uſed, not only againſt worms, but alſo againſt all ſtomach-agues, head-ach, and obſtructions of the whole body, without any danger and very ſucceſsfully, as a grateful or very acceptable medicine to Nature ; for after a powerful magnetical way it doth attract all the ill humors in the body, and carrieth them forth along with it. Of whoſe wonderful vertue and nature, there is ſpoken more at large in my Treatiſe of the Sympathy and Antipathy of things. Which ſome Phyſitians perceiving and ſuppoſing by Art to make it better, they ſpoiled it, and made it void of all vertue: for they taking a piece of ſteel, made it red-hot, and held it againſt a piece of common Sulphur, whereby the ſteel grew ſubtle, ſo they did let it drop into a veſſel filled with water ; then they took it out, and dryed it, and made it into powder, and uſed it againſt obſtructions, but to no effect almoſt ; for the Iron was ſo altered by the ſulphur, and reduced to an inſoluble ſubſtance (which ought not to have been ſo) that it could perform no conſiderable operation: But if they had made the ſteel more ſoluble (whereas they made it more inſoluble) than it was of it ſelf before, then they had done a good work : for he that knoweth ſulphur, doth know well enough, that by no *Aquafortis* or *Aqua Regis* it can be diſſolved ; and how how could it then be conſumed by an animal humor ?

Hitherto it hath been proved ſufficiently, that in ſome men, eſpecially in thoſe that are of a Melancholick conſtitution there is an acid humor, which can ſufficiently diſſolve all eaſily ſoluble metals and ſtones : and that therefore it is needleſs to torture, and diſſolve pearls, corals and the like with corroſive waters before they be adminiſtred to patients : but that the Archeus of the ſtomach is ſtrong enough by the help of the ſaid humors to conſume thoſe eaſily ſoluble things, and to accept of that which ſerveth his turn, and to reject the reſt.

But it is not my intent here, that this ſhould be underſtood of all metals and ſtones ; for I know well, that other metals and ſtones (ſome excepted) before they are duly prepared, are not fit for Phyſick, but muſt be fitted firſt, before they be adminiſtred or given unto patients.

For this relation I made only for to ſhew, how ſometimes good things (though with intent to make them better) are made worſe, and ſpoiled by thoſe that do not make an exact ſearch into nature and her power.

I hope this my admonition will not be taken ill, becauſe my aim was not vain-glory, but only the good of my neighbour.

Now let us return again to Vitriol.

Of the ſweet oyl of Vitriol.

THE Ancients make mention of a ſweet and green oyl of Vitriol, which doth cure the falling ſickneſs, killeth worms, and hath other good qualities and vertues beſides: and that the Oyl is to be diſtilled *per deſcenſum*. To attain unto this oyl the later Phyſitians took great paines, but all in vain : becauſe they did not underſtand at all the Ancients about the preparing of this oyl, but thought to get it by the force of fire, and ſo uſing violent diſtillation, they got no ſweet oyl, but ſuch as was very ſowre and corroſive, which in taſte, efficacy and vertue, was not comparable at all to the former.

However they aſcribed unto it (though falſely) the ſame vertues, which the ancients (according to truth) did unto theirs. But daily experience ſheweth, that the oyl of vitriol as it is found ordinarily, cureth no falling ſickneſs, nor killeth worms, whereas this Philoſophical doth it very quickly. Whence it appeareth, that the other is nothing like unto the true medicinal oyl of vitriol, neither is it to be compared to it.

I muſt confeſs indeed, that *per deſcenſum* out of common vitriol, by the force of the fire, there may be got a greeniſh oyl, which yet is not better than the other, becauſe it proveth as ſharp in taſt, and of as corroding a quality, as if it had been diſtilled through a Retort.

Thoſe that found out this oyl, as *Paracelſus*, *Baſilius*, and ſome few others, did always highly eſteem it, and counted it one of the four main pillars of Phyſick. And *Paracelſus* ſaith expreſly in his writings, that its viridity or greenneſs muſt not be taken away or marred (which indeed a very little heat can do) by the fire,for (ſaith he) if it be deprived of its greenneſs, it is deprived alſo of its efficacy

cy

cy and pleaſant eſſence. Whence it may be perceived ſufficiently, that this ſweet green oyl is not to be made by the force of the fire as hitherto by many hath been attempted, but in vain.

And it is very probable, that the ancients, which did ſo highly praiſe the oyl of vitriol, happily knew nothing of this way of diſtilling, which is uſed by us now a days: for they only ſimply followed Nature, and had not ſo many ſubtle and curious inventions and ways of diſtilling.

But however it is certain, that ſuch a ſweet and green oyl cannot be made of vitriol by the force of the fire, but rather muſt be done by purification, after a ſingular way; for the Ancients many times underſtood purification for diſtillation: as it is evident, when they ſay, diſtill through a filtre, or through filtring paper: which by us is not accounted for diſtillation, but by them it was.

However, this is true and very ſure, that a great Treaſure of health (or for the health of man) lyeth hidden in Vitriol: yet not in the common, as it is ſold every where, and which hath endured the heat of the fire already; but in the Oare as it is found in the earth, or its mine. For as ſoon as it cometh to the day light, it may be deprived by the heat of the Sun of its ſubtle and penetrating ſpirit, and ſo made void of vertue; which ſpirit, if by Art it be got from thence, ſmelleth ſweeter then muſk and amber, which is much to be admired, that in ſuch a deſpicable mineral and groſs ſubſtance (as it is deemed to be by the ignorant) ſuch a royal medicine is to be found.

Now this preparation doth not belong to this place, becauſe we treat here only of ſpirits, which by the force of fire are driven over. Likewiſe alſo, there doth not belong hither the preparation of the green oyl, becauſe it is made without the help of fire. But in regard, that mention hath been made of it here, I will (though I kept it always very ſecret) publiſh it for the benefit of poor patients, hoping that it will do much good to many a ſick man.

For if it be well prepared, it doth not only cure perfectly every Epilepſie or Convulſion in young and old; and likewiſe readily and without fail killeth all worms within and without the body, as the Ancients with truth aſcribed unto it; but alſo many Chronical diſeaſes and ſuch as are held incurable, may be happily overcome and expelled thereby, as the plague, pleureſie, all ſorts of feavers and agues, what ever they be called, head-ach, collick, riſing of the mother; alſo all obſtructions in the body, eſpecially of the ſpleen and liver, from whence *Melancholia Hypochondriaca*, the ſcurvy, and many other intolerable diſeaſes do ariſe: Alſo the blood in the whole body is by the means thereof amended and renewed, ſo that the Pox, Leproſie, and other like diſeaſes proceeding from the infection of the blood are eaſily cured thereby: Alſo it healeth ſafely and admirably all open ſores and ſtinking ulcers turned to fiſtula's in the whole body, and from what cauſe ſo ever they did proceed, if they be anoynted therewith, and the ſame alſo be inwardly uſed beſides.

Such and other diſeaſes more (which it is needleſs here to relate) may be cured ſucceſsfully with this ſweet oyl; eſpecially, if without the loſs of its ſweetneſs it be brought to a red colour; for then it will do more then a man dare write of it, and it may ſtand very well for a *Panacea* in all diſeaſes.

Sa T. Holland de ☉ & ☽ Metallm

The preparation of the ſweet oyl of Vitriol.

COmmonly in all fat ſoyles or clayie grounds, eſpecially in the white, there is found a kinde of ſtones, round or oval in form, and in bigneſs like unto a pigeons or hens-egg, and ſmaller alſo, *viz.* as the joynt of ones finger, on the outſide black, and therefore not eſteemed when it is found, but caſt away as a contemptible ſtone. Which if it be cleanſed from the earth, and beaten to pieces, looks within of a fair yellow and in ſtreaks, like a gold Marcaſite, or a rich gold Oare, but there is no other taſte to be perceived in it, then in another ordinary ſtone; and although it be made into powder, and boyled a long time in water, yet it doth not alter at all, nor is there in the water any other taſte or colour, than that which it had firſt (when it was poured upon the ſtone) to be perceived. Now this ſtone is nothing elſe, but the beſt and pureſt Minera (or Oare) of Vitriol, or a ſeed of Metals; for Nature hath framed it round, like unto a vegetable ſeed, and ſowed it into the earth, out of which there may be made an excellent medicine, as followeth.

French Jays these are the Copperas stones pa: 108.

Take this Oare or Minera beaten into pieces, and for ſome ſpace of time, lay or expoſe it to the cool air, and within twenty or thirty days it will magnetically attract a certain ſaltiſh moyſture out of the air, and grow heavy by it, and at laſt it falleth aſunder to a black powder, which muſt remain further lying there ſtill, until it grow whitiſh, and that it do taſte ſweet upon the tongue like vitriol. Afterward put it in a glaſs-veſſel, and pour on ſo much fair rain water, as that it cover it one or two inches; ſtir it about ſeveral times in a day, and after a few days the water will be coloured green, which you muſt powre off, and powre on more fair water, and proceed as before, ſtirring it often until that alſo come to be green: this muſt be repeated ſo often, until no water more will be coloured by ſtanding upon it. Then let all the green waters which you poured off, run through filtring paper, for to purifie them; and then in a glaſs-body cut off ſhort let them evaporate till a skin appear at the top: then ſet it in a cold place, and there will ſhoot little green ſtones, which are nothing elſe but a pure vitriol: the remaining green water evaporate again, and let it ſhoote as before: and this evaporating and Cryſtalliſing muſt be continued until no vitriol more will ſhoote, but in warm and cold places there remain ſtill a deep green pleaſant ſweet liquor or juyce: which is the true ſweet and green oyl of Vitriol, and hath all the vertues above related.

French says the Crystals are to the ☉ & ☽: & the ☉ is the ☌

But now this green oyl further without fire may at laſt (after the preparing of many fair colours between) be reduced to a blood red, ſweet and pleaſant oyl, which goeth far beyond the green both in pleaſantneſs and vertue, and is in compariſon to it like a ripe grape to an unripe: Hereof happily ſhall be ſpoken at another time, becauſe occaſion and time will not permit me now to proceed further in it. And therefore the Philo-Chymical Reader is deſired for the preſent to be contented with the green oyl, to prepare it carefully, and to uſe it with diſcretion; and doubtleſs he will get more credit by it, and do more wonderful things then hitherto hath been done by the heavy corroſive oyl.

The uſe and Doſe of the ſweet oyl of Vitriol.

OF this green oyl, there may be taken from 1. 2. 4. 8. 10. or 12. drops at once, according to the condition of the patient and the diſeaſe, in fit Vehicles, in Wine or Beer, in the morning faſting, as other medicines are uſually taken: Alſo the Doſe may be increaſed or leſſened, and as often reiterated as the diſeaſe ſhall require.

This Oyl expelleth all ill humors, not only by ſtoole and vomits, but alſo by urin and ſweating, according as it doth meet with ſuperfluities; and this very ſafely, and without any danger at all; whereby many diſeaſes radically or perfectly may be cured.

Let no man wonder that I aſcribe ſuch great vertues unto this oyl, it coming from ſuch a deſpicable ſtone, and its preparation requiring no great Art or paines, as thoſe intricate deceitful proceſſes do, that are every where extant in books quite filled up with them. And it is no marvel, that men are in love with ſuch falſe and coſtly proceſſes; for the moſt of them do not believe, that any good is to be found in things that are not in eſteem; but only make great account of dear things, far fetcht, and requiring much time and paines for to be prepared.

Such men do not believe the word of God, teſtifying, *That God is no reſpecter of perſons*, but that all men that fear and love him, are accepted of him. If this be true (which no good Chriſtian will doubt) then we muſt believe alſo, that God created Phyſick or the matter of Phyſick as well for the poor as for the rich. Now if it be alſo for the poor, then certainly ſuch will be the condition thereof, that it may be obtained by them, and eaſily prepared for uſe. So we ſee that Almighty God cauſeth not only in great mens grounds to come forth good Vegetables, Animals and Minerals, for the curing of the infirmities of mankind, but that the ſame alſo are found every where elſe. Whereby we perceive, that it is alſo the will of God, that they ſhall be known by all men, and that he alone, as the Maker of all good, may be praiſed and magnified by all men for the ſame.

I doubt not but that there will be found ſelf-conceited ſcoffers, that will deſpiſe this ſo little regarded ſubject, as if no good thing could be made of it, becauſe they could find nothing in it themſelves. But be it known to them, that neither to me nor them all things have been diſcovered, but that yet many wonderful works of Nature are hidden to us: and beſides that I am not the firſt that writ of Vitriol and its medicine. For the Ancients, our dear Anceſtors, had always Vitriol in very great eſteem, as the following Verſe doth prove.

Viſitabis Interiora Terræ, Rectificando
Invenies Occultum Lapidem, Veram Medicinam.

Whereby they would give us to underſtand, that a true medicine is to be found in it. And the ſame alſo was known to the latter Philoſophers: for *Baſilius* and *Paracelſus* have always highly commended it, as in their writings is to be found.

It is to be admired, that this Oare or Metallical ſeed, which may juſtly be called the gold of Phyſitians (in regard that ſo good a medicine can be made of it) is not changed or altered in the earth, like other things that grow in it, but keepeth always the ſame form and ſhape, until it cometh to the air, which is its earth or ground, wherein it putrefieth and groweth. For firſt it ſwelleth and groweth like as a vegetable ſeed doth in the earth: and ſo taketh its increaſe and grows out of the air, juſt as a ſeed of an hearb in the earth; and the air is not only its Matrix, wherein it groweth and doth increaſe like a vegetable, but it is alſo its Sun which maketh it ripe. For within four weeks at the furtheſt it putrefieth and groweth black: and about a fourtnight after it groweth white, and then green; and thus far it hath been deſcribed here: But if you proceed further Philoſopher-like therewith, there will come forth to light at the laſt the faireſt red, and moſt pleaſant Medicine, for which God be praiſed for ever and ever, Amen.

Of the Sulphureous volatile and Acid ſpirit of common Salt, and of Allome. p. 17

THe ſame way, which above hath been taught for the making of the volatile ſpirit of vitriol, muſt be likewiſe uſed in the making of the volatile ſpirits of common ſalt and allome.

The manner of preparing.

ALlome is to be caſt in as it is of it ſelf, without mixing of it, but ſalt muſt be mixed with bole, or ſome other earth, to keep it from melting: with the ſpirit volatile, there goeth alſo along an acid ſpirit, whoſe vertue is deſcribed in the firſt part. The Oyl of Allome hath almoſt the like operation with the oyl of vitriol. Alſo the ſpirit volatile of both theſe, is of the ſame nature and condition with that which is made of vitriol: but common ſalt, and allome, do not yield ſo much, as vitriol; unleſs both, *viz.* ſalt and allome be mixed together, and ſo a ſpirit diſtilled of them.

Of the ſulphureous volatile ſpirit of Minerals and Metals, and of their preparation.

SUch a penetrative ſulphureous ſpirit may be made alſo of Minerals and Metals, which in vertue goeth beyond the ſpirit of vitriol, that of common ſalt, and that of allome, *viz.* after the following manner.

The preparation of the volatile ſpirits of Metals.

DIſſolve either Iron or Copper, or Lead or Tin with the acid ſpirit of vitriol, or of common ſalt: abſtract or draw off the phlegm; then drive the acid ſpirit again from the Metal, and it will carry along a volatile ſpirit, which by rectifying muſt be ſeparated from the corroſive ſpirit. And ſuch Metallical ſpirits are more effectual than thoſe that are made of the ſalts.

The preparation of the volatile ſpirit of Minerals.

TAke of Antimony made into fine pouder, or of golden Marcaſite, or of ſome other ſulphureous Mineral, which you pleaſe, two parts, mix therewith one part of good purified Salt nitre, and caſt in of that mixture a ſmall quantity, and then another, and ſo forth after the manner above deſcribed; and there will come over a ſpirit which is not inferiour to the former in efficacy and vertue; but it muſt alſo be well rectified. *Ano-*

Another way.

CEment what laminated or granulated Metal you pleaſe, (except gold) with half as much in weight of common ſulphur, cloſed up in a ſtrong melting pot or crucible, ſuch as doth not let the ſulphur go through, for the ſpace of half an hour, until that the ſulphur hath penetrated and broken the plates of Metal: Then beat them into powder, mix them with the like quantity in weight of common ſalt, and ſo diſtil it after the way above mentioned, and you will get a volatile ſpirit of great vertue: and every ſuch ſpirit is to be uſed for ſuch ſpecial part or member of the Body, as the Metal is proper for, out of which the ſpirit is made. So ſilver for the brain; Tinn for the lungs, Lead for the ſpleen, and ſo forth.

The ſpirit of Zinck.

OF Zinck there is diſtilled both a volatile and alſo an acid ſpirit, good for the heart; whether it be made by the help of the ſpirit of vitriol, or of ſalt, or of allome: or elſe by the means of Sulphur; for Zinck is of the nature of gold.

The volatile ſpirit of the Droſs of Regulus Martis.

THe black ſcoria of the *Regulus Martis*, being firſt faln aſunder in the air, yields likewiſe a very ſtrong ſulphureous volatile ſpirit, not much unlike in vertue unto the former.

The like Sulphureous volatile ſpirits may be made alſo of other minerals, which for brevities ſake we omit, as alſo in regard, that they are almoſt the ſame in vertue.

How to make a white acid, and a red volatile ſpirit out of ſalt nitre.

Jacob. p. 79.

TAke two parts of Allome, and one part of ſalt nitre, make them both into powder, mix them well together, and caſt into the ſtill a little and a little thereof, as above in the making of other ſpirits hath been taught, and there cometh over an acid ſpirit together with the volatile ſpirit; and ſo many pounds as there is of the materials, which are to be caſt in, ſo many pounds of water muſt be put into the receiver, to the end that the volatile ſpirits may ſo much the better be caught and ſaved. And when the diſtillation is performed, the two ſpirits may be ſeparated by the means of a gentle rectification made in *Balneo*; and you muſt take good heed, that you get the volatile ſpirit pure by changing the receiver in good time, ſo that no flegme be mixed with the red ſpirit, whereby it will be weakened and turn white. The mark whereby you may perceive, whither the ſpirit or the flegme doth go forth is this: when the volatile ſpirit goeth, then the receiver looketh of a deep red: and afterward when the flegme doth come, the receiver looks white again: and laſtly, when the heavy acid ſpirit goeth, then the receiver to be red again, but not ſo as it was, when the firſt volatile ſpirit came over.

This ſpirit may alſo be made and diſtilled after another way, *viz.* mixing the ſalt nitre with twice as much bole or brick duſt, and ſo framed into little balls to prevent melting: but no way is ſo good as the firſt; eſpecially when you will have the red volatile ſpirit.

Of the uſe of the red volatile ſpirit.

THis volatile ſpirit, which (being quite freed from flegm) remaineth always red, and doth look like blood, in all occaſions may be accounted like in vertue unto the former ſulphureous ſpirits, eſpecially in extinguiſhing of inflammations and Gangreens it is a great treaſure, clothes being dipt in it, and laid upon the grieved place; Alſo it goeth almoſt beyond all other medicines in the Eryſipelas and colick: and if there be any congealed blood in the body (which came by a fall or blow) this ſpirit outwardly applyed with ſuch waters as are proper for the grief, and alſo taken inwardly, doth diſſolve and expell it: and being mingled with the volatile ſpirit of urin it doth yield a wonderful kind of ſalt, as hereafter ſhall be taught.

The uſe of the white acid ſpirit of ſalt nitre.

THe heavy and corroſive ſpirit of ſalt nitre is not much uſed in Phyſick, though it be found almoſt in all Apothecaries ſhops, and there is kept for ſuch uſe, as above hath been mentioned of the ſpirit of vitriol, *viz.* to make their conſerves, and cooling-drinks taſt ſowriſh. Alſo it is uſed by ſome in the colick, but it is too great a corroſive, and too groſs to be uſed for that purpoſe; and although its corroſiveneſs may be mitigtated in ſome meaſure, by adding of water thereto, yet in goodneſs and vertue it is not comparable at all to the volatile ſpirit, but is as far different from it, as black from white, and therefore the other is fitteſt to be uſed in Phyſick; but this in dealing with metals and minerals, for to reduce them into vitriols, calxes, flores, and crocus.

Aqua Regis.

IF you diſſolve common ſalt (which hath been decrepitated firſt) in this acid ſpirit of ſalt nitre, & rectifie it by a glaſs retort in ſand) by a good ſtrong fire, it will be ſo ſtrong, that it is able to diſſolve gold, and all other metals and minerals, except ſilver and ſulphur; and ſeveral metals may by the means thereof be ſeparated much better than by that Aqua regia which hath been made by adding of Salt Armoniack. But if you rectifie it with *lapis calaminaris* or Zinck, it will be ſtronger yet, ſo as to be able to diſſolve all metals and Minerals (ſilver and ſulphur excepted) whereby in the handling of Metals, much more may be effected, than with common ſpirit of ſalt nitre or Aqua fortis, as hereafter ſhall be taught: and firſt in the preparing of gold.

The Preparation of Aurum Fulminans, or Aurum Tonitruans.

Jacob. p. 57.

TAke of fine granulated or laminated gold (whither it be refined by Antimony or *Aqua fortis*) as much as you pleaſe: put it in a little Glaſs body, and pour four or five times as much of *Aqua regis* upon it, ſet it ſtopt with a Paper in a gourd in warm ſand; and the *Aqua regis* within the ſpace of one or two hours will diſſolve the gold quite into a yellow water: but if it have not done ſo, it is a ſign that either the water was not ſtrong enough, or that there was too little of it for to diſſolve it. Then pour the ſolution from the gold,

which is not diſſolved yet, into another glaſs, and pour more of freſh *Aqua Regia* upon the gold: ſet it again to diſſolve in warm ſand or aſhes, and the remaining gold will likewiſe be diſſolved by it, and then there will remain no more, but a little white calx, which is nothing elſe but ſilver, which could not be diſſolved by the *Aqua Regia* (for the *Aqua Regia*, whether it be made after the common way with ſalt Armoniack, or elſe with common ſalt, doth not diſſolve ſilver) ſo in like manner common *Aqua fortis*, or ſpirit of ſalt nitre diſſolveth no gold; but all other metals are diſſolved as well by ſtrong *Aqua fortis* as by *Aqua Regia*. And therefore you muſt be careful to take ſuch gold as is not mixed with Copper, elſe your work would be ſpoiled: for if there were any Copper mixed with it, then that likewiſe would be diſſolved and precipitated together with the gold; and it would be a hindrance to the kindling or fulminating thereof: but if you can get no gold, that is without Copper, then take Ducats or Roſe-nobles, which ought to have no Addition of Copper, but only of a little Silver, which doth not hurt, becauſe that it cannot be diſſolved by the *Aqua Regia*, but remaineth in the bottom in a white powder. Make thoſe Ducats or Roſe-nobles red hot, and afterward bend them and make them up in Rolls, and throw them into the *Aqua Regia* for to diſſolve. All the gold being turned into a yellow water, and poured off, pour intoit by drops a pure oyl made of the Salt of Tartar, *per deliquium*, and the gold will be precipitated by the contrary liquor of Salt of Tartar into a brown yellow powder, and the ſolution will be clear. But you muſt take heed, to pour no more oyl of Tartar into it than is needful for the precipitation of the gold; elſe part of the precipitated gold would be diſſolved again, and ſo cauſe your loſs. The gold being well precipitated, pour off the clear water from the gold calx by inclination, and pour upon it warm rain or other ſweet water, ſtir it together with a clean ſtick of wood, and ſet it in a warm place, until the gold is ſettled, ſo that the water ſtandeth clear upon it again; then pour it off, and pour on other freſh water, and let it extract the ſaltneſs out of the gold calx: and this pouring off, and then pouring on of freſh water again, muſt be reiterated ſo often, until no ſharpneſs or ſaltneſs more be perceived in the water that hath been poured off: Then ſet the edulcorated gold into the Sun or another warm place for to dry. But you muſt take heed that it have no greater heat than the heat of the Sun is in *May* or *June*, elſe it would kindle or take fire, and (eſpecially if there be much of it) give ſuch a thunder-clap, that the hearing of thoſe that ſtand by, would be much endangered thereby, and therefore I advice you to beware, and cautious in the handling of it, leſt you run the hazard both of your gold and of your health by your over-ſight.

There is alſo another way for to edulcorate your precipitated gold, *viz.* thus, Take it together with the ſalt liquor, and pour it into a funnel lined with brown Paper laid double, and ſo let the water run through into a glaſs veſſel, whereupon the funnel doth reſt, and pour on other warm water, and let it run through likewiſe; do this again and again, until that the water come from it as ſweet as it was poured on. Then take the Paper with the edulcorated gold calx, out of the funnel, lay it, together with the paper, upon other brown paper lying ſeverally double together, and the dry paper will attract all the moiſtneſs out of the gold calx, ſo that the gold will be dryed the ſooner. Which being dry, take it out of the filtering paper, and put it into another that is clean, and ſo lay it aſide, and keep it for uſe. The ſalt water that came through by filtering, may be evaporated in a little glaſs body (ſtanding in ſand) to the dryneſs of the ſalt, which is to be kept from the air: for it is likewiſe uſeful in Phyſick; becauſe ſome vertue of the nature of gold is yet hidden in it: though one would not think it, in regard that it is ſo fair, bright and clear, which for all that may be obſerved by this, that when you melt it in a clean covered crucible or pot, and pour it afterward into a clean Copper morter or baſon (being firſt made warm) you get a purple-coloured ſalt, whereof 6, 9, 12, to 24. grains given inwardly, doth cleanſe and purge the ſtomach and bowels, and eſpecially it is uſeful in feavers and other diſeaſes of the ſtomach. But in the crucible, out of which the ſalt hath been poured, you will find an earthy ſubſtance, which hath ſeparated it ſelf from the ſalt, and looketh yellowiſh; this being taken out and melted in a little crucible by a ſtrong fire, turneth to a yellow glaſs, which is impregnated with the Tincture of Gold, and doth yield a grain of Silver in every regard like unto common cupellated ſilver, wherein no gold is found, which is to be admired: becauſe that all Chymiſts are of opinion, that no *Aqua regia* can diſſolve ſilver which is true. The queſtion therefore is, from whence or how this ſilver came into the ſalt, ſince no *Aqua Regia* doth diſſolve ſilver? whereupon ſome perchance may anſwer, that it muſt have been in the oyl of Tartar, in regard that many do believe, that the ſalts likewiſe may be turned into metals, which I do not gainſay, but only deny that it could have been done here; for if that ſilver could have been exiſtent in the *Aqua Regia*, or ſalt of Tartar (whereas *Aqua Regia* cannot bear any) it would have been precipitated together with the gold. But that it was no common ſilver, but gold which turned to ſilver after it was deprived of its Tincture, I ſhall briefly endeavour to prove. For that the ſalt waters (of *Aqua Regia* and ſalt of Tartar) out of which the gold hath been precipitated, is of that nature, before it be coagulated to ſalt, though it be quite clear and white, that if you put a feather in it, it will be dyed purple within few days, which purple colour comes from the gold, and not from ſilver, in regard that ſilver doth dye red or black: and hence it appeareth, that the ſalt water hath retained ſomething of gold.

Now ſome body peradventure may ask, if that the ſaid ſalt water hath retained ſome gold, how is it then, that in the melting, no gold comes forth, but only ſilver? To which I anſwer, that ſome ſalts are of that nature, that in the melting, they take from gold its colour and ſoul; whereof if the gold be truly deprived, it is then no more gold, nor can be ſuch; neither is it ſilver, but remaineth only a volatile black body, good for nothing, which alſo proveth much more unfixt than common Lead, not able to endure any force of fire, much leſs the cupel: But like *Mercury* or *Arſenick* vaniſheth (or flyeth away) by a ſmall heat. Hence it may be gathered, that the fixedneſs (or fixity) of gold doth conſiſt in its ſoul or Tincture, and not in its body, and therefore it is credible, that gold may be anatomized,

mized, its beſt or purer part ſeparated from the groſſer (or courſer) and ſo that a Tingent medicine (or Tincture) may be made of it. But whether this be the right way, whereby the univerſal medicine of the ancient Philoſophers (by whoſe means all metals can be changed or tranſmuted into gold) is to be attained unto, I will not diſpute; yet I believe that peradventure there may be another ſubject, endued with a far higher Tincture than gold is, which obtained no more from nature, than it doth need it ſelf for its own fixedneſs. However, we may ſafely believe, that a true Anima or Tincture of gold, if it be well ſeparated from its impure black body, may be exalted and improved in colour; ſo that afterwards of an imperfect body a greater quantity, than that was from which it was abſtracted, may be improved and brought to the perfection of gold. But waving all this, it is true and certain, that if the gold be deprived of its Tincture, the remaining body can no more be gold; as is demonſtrated more at large in my Treatiſe (*de Auro potablili vero*) of the true potable Gold: And this I mentioned here onely therefore, that in caſe the lover of this Art, in his work ſhould meet perchance with ſuch a white grain, he may know, from whence it doth proceed.

I could have forborn to ſet down the preparation of the fulminating gold, and ſo ſave paper and time, in regard that it is deſcribed by others: but becauſe I promiſed in the firſt part to teach how to make the flores of gold, and that thoſe are to be made out of fulminating (or thundring) gold, I thought it not amiſs to deſcribe its preparation, that the lover of this Art need not firſt have his recourſe to another book for to find out the preparation, but by this my book may be furniſhed with a perfect inſtruction for the making of the flores of gold, and this is the common way for to make *Aurum fulminans*, known unto moſt Chymiſts; but in regard that eaſily an error may be committed in it, either by pouring on too much of the liquor of Tartar (eſpecially when it is not pure enough, ſo that not all the gold doth precipitate, but part of it remaineth in the ſolution, whereby you would have loſs; or elſe, the gold falling or precipitating into a heavy calx, which doth not fulminate well, and is unfit for to be ſublimed into flores.

Therefore I will here ſet down another and much better way, whereby the gold may be precipitated quite and clean out of the *Aqua Regia* without the leaſt loſs, and ſo that it cometh to be very light and yellow, and doth fulminate twice as ſtrong as the former, and there is no other difference between this and the former preparation, but only that inſtead of the oyl of Tartar, you take the ſpirit of urine, or of ſalt armoniack for to precipitate the diſſolved gold thereby; and the gold (as before ſaid) will be precipitated much purer, than it is done by the liquor of the ſalt of Tartar, and being precipitated, it is to be edulcorated and dryed, as above in the firſt preparation hath been taught.

The uſe of Aurum fulminans.

THere is little to write of the uſe of *Aurum fulminans* in phyſick; for becauſe it is not unlockt, but is only a groſs calx and not acceptable to the nature of man, it can do no miracle. And although it be uſed to be given *per ſe* from 6, 8, 12. grains to ℈ i. for to provoke ſweating in the Plague, and other malignant feavers, yet it would never ſucceed ſo well as was expected. Some have mixed it with the like weight of common ſulphur, and made it red hot (or calcined it) whereby they deprived it of its fulminating vertue, ſuppoſing thus to get a better medicine, but all in vain, for the gold calx would not be amended by ſuch a groſs preparation. But how to prepare a good medicine out of *Aurum fulminans*, ſo that it may be evidently ſeen, that the gold is no dead body, nor unfit for phyſick, but that it may be made quick and fit for to put forth or ſhew forth thoſe vertues which it pleaſed God to treaſure up in it, I ſhall here briefly diſcover.

Firſt, get ſuch an inſtrument (as above hath been taught) made for you out of Copper, but not too big, nor with a lid at the top, but only with a pipe, unto which a receiver may be applyed, which muſt not be luted to it; but it ſufficeth, that the pipe enter far into the belly of the receiver; and at the lower part it muſt have a flat bottom, that it may be able to ſtand: over the bottom there muſt be a little hole with a little door, that cloſeth very exactly: and there muſt be alſo two little plates or ſcales of ſilver or copper, as big as the nail of ones finger, whereupon the *Aurum fulminans* is to be ſet into the Inſtrument; which is to ſtand upon a Trevet, under which you are to lay ſome burning Coals for to warm or heat the bottom withal. The Inſtrument together with the glaſs Receiver being ſo ordered, that it ſtands faſt, and alſo the bottom thereof being warmed or heated, then with little pincers one of the little ſcales, containing 2, 3, or 4. grains of *Aurum fulminans* muſt be conveyed upon the Inſtrument ſet upon the warm bottom, and then ſhut the little door, and when the gold doth feel the heat, it kindleth and giveth a clap, and there is cauſed a ſeparation, and eſpecial unlocking of the gold; for as ſoon as the clap is done, the gold doth go through the pipe like a purple coloured ſmoak into the receiver, and ſticks on every where like a purple coloured powder. When the ſmoak is vaniſhed, which is ſoon done, then take the empty ſcale out of the Inſtrument or Oven, and ſet it with the gold, which will likewiſe fulminate and yield its flores. Then the firſt being cooled in the mean time, is to be filled again and put in, inſtead of that which is empty, and taken out, putting in one ſcale after another by turns, continue it ſo long till you have got flores enough: After the ſublimation is performed, let the Copper Veſſel grow cool, and then ſweep or bruſh the gold powder which is not ſublimed with a haires foot, or gooſe feather out of the veſſel, which powder ſerves for nothing, but to be melted with a little borax, and it will be good gold again, but onely ſomewhat paler than it was before it was made into fulminating gold. But the flores in the receiver cannot be bruſhed out thus, eſpecially when they are caſt in with an addition of ſalt Nitre, as by the flores of ſilver hereafter ſhall be taught, becauſe they are ſomething moiſt, and therefore pour in as much of dephlegmed Tartariſed ſpirit of wine unto it, as you think to be enough, for to waſh off the flores with. This done, pour out the ſpirit of wine,

together with the burnt Phœnix into a clean glaſs, with a long neck, ſet it (being well luted firſt) into a gentle Balneum, or into warm aſhes for ſome dayes, and the ſpirit of wine in the mean time will be coloured with a fair red, which you muſt pour off and then pour on other freſh ſpirit and ſet it in a warm place for to be diſſolved, this being likewiſe coloured, put both the extracts together in a little glaſs body, and abſtract the ſpirit of wine (in Balneo) from the Tincture, which will be a little in quantity, but of a high red colour and pleaſant in taſte. The remaining flores from which the Tincture is extracted, may be with water waſhed out of the glaſs, and then dryed if they are to be melted; and they will yield a little pale gold, and the moſt part turneth into a brown glaſs, out of which perchance ſomething elſe that is good may be made, but unknown to me as yet.

N. B. If you mix the *Aurum fulminans* with ſome ſalt nitre, before fulmination, then the flores will be the more ſoluble, ſo that they yield their Tincture ſooner and more freely, than alone of themſelves; and if you pleaſe, you may adde thereto thrice as much ſalt nitre, and ſo ſublime them in flores, in the ſame manner, as ſhall be taught for the making of the flores of ſilver.

The uſe of the Tincture of Gold.

THe extracted Tincture is one of the chiefeſt of thoſe medicines, which comfort & cheer up the heart of man, renew and reſtore to youthfulneſs, and cleanſe the impure blood in the whole body, whereby many horrible diſeaſes, as the leproſie, the pox, and like may be rooted out.

But whether this Tincture by the help of fire may be further advanced into a fixed ſubſtance I do not know: for I have not proceeded further in it, than here is mentioned.

Of the flores of ſilver and of its medicine.

HAving promiſed in the firſt part of this book (when I was deſcribing the preparation of flores out of Metals) to teach in the ſecond part to make the flores of gold and ſilver, thoſe of gold being diſpatcht; there followeth now in order after the gold, to ſpeak alſo of ſilver and of its preparation, which is to be thus performed.

Take of thin laminated or ſmall granulated fine ſilver as much as you pleaſe, put it into a little ſeparating glaſs body, and pour upon it twice as much in weight of rectified ſpirit of ſalt nitre, and the ſpirit of ſalt nitre will preſently begin to work upon the ſilver and to diſſolve it. But when it will not diſſolve any more in the cold, then you muſt put the glaſs body into warm ſand or aſhes, and the water will preſently begin to work again; let the glaſs ſtand in the warm aſhes, until all the ſilver be diſſolved. Then put the ſolution out of the little glaſs body, into another ſuch as is cut off at the top, and put on a little head or Limbeck, and in ſand abſtract the moity of the ſpirit of ſalt nitre from the diſſolved ſilver; then let the glaſs body remain in the ſand till it be cool; after take it out, and let it reſt for a day and a night, and the ſilver will turn into white foliated cryſtals, from which you muſt pour off the the remaining ſolution which is not turned; and from thence abſtract again the moity of the ſpirit, and let it ſhoot or turn in a cold place; and this abſtracting and cryſtalliſing you are to reiterate, until almoſt all the ſilver is turned to Cryſtals; which you muſt take out and lay upon filtring paper to dry, and ſo keep it for ſuch further uſe, as hereafter ſhall be taught. The remaining ſolution, which is not cryſtalliſed, you may in a copper veſſel by adding of ſweet water thereto, precipitate over the fire into a calx, and then edulcorate and dry it, and keep it for other uſe, or elſe melt it again into a body. Or elſe you may precipitate the ſame with ſalt water, and ſo edulcorate and dry it; and you will have a calx, which doth melt by a gentle fire, and is of a ſpecial nature. and in the ſpirit of urin, of ſalt Armoniack, of Harts-horn, of Amber, of Soot, and of hair it doth eaſily diſſolve; and it may be prepared or turned into good medicines, as ſhortly in our treating of the ſpirit of urin ſhall be taught. Or elſe, you may chooſe not to precipitate the remaining ſolution of ſilver, but with the ſpirit of urin to extract an excellent Tincture, as hereafter ſhall be taught.

If you keep them, they must be put into a Glaſs Bottle well ſtopt

Of the uſe of the cryſtals of ſilver.

THeſe cryſtals may ſafely be uſed in Phyſick alone by themſelves 3, 6, 9, 12. graines thereof being mixed with a little ſugar, or elſe made up into pills; they do purge very gently and without danger; but by reaſon of their bitterneſs they are ſomewhat untoothſome to take; alſo, if they be not made up into pills, they colour the lips, tongue and mouth quite black (but the reaſon of that blackneſs belongeth not to this place to treat of, but ſhall by and by follow hereafter) Alſo if they touch metals, as Silver, Copper and Tin, they make them black and ugly, and therefore they are not much uſed. But if you put into the ſolution of ſilver (before it be reduced into Cryſtals) half as much quickſilver as there was of the ſilver, and ſo diſſolve them together and afterwards let them ſhoot together, there will come forth very fair little ſquare ſtones like unto Allome, which do not melt in the air, as the former foliated ones uſe to do; neither are ſo bitter, and they purge alſo quicker and better, than thoſe that are made only of ſilver.

How to ſublime the Cryſtals of ſilver into flores, and then to make a good Medicine of the flores.

TAke of the foliated Cryſtals of Silver as many as you pleaſe, and upon a grinding ſtone made warm firſt, grind as much purified and well dryed ſalt nitre amongſt it, then put into your Iron diſtilling veſſel (to the pipe whereof there is to be applyed and luted a great receiver) coles made into powder two inches high, and make a fire under it, that the veſſel every where together with the coles that are in it, become red hot. Then take off the lid, and with a ladle throw in at once of your Cryſtals of ſilver 3 i. more or leſs, according as you think that your receiver in regard of its bigneſs is able to bear. This done, preſently put on the lid, and the ſalt nitre together with the cryſtals of ſilver will be kindled by the coles that lye on the bottom of the veſſel, and there will come forth a white ſilver fume through the pipe into the receiver, and after a while when the cloud is vaniſhed in the receiver, caſt in more, and continue this ſo long, and until all your prepared ſilver is caſt in; then let it cool, and take off the receiver, and pour into it

good

good Alcolized ſpirit of wine, and waſh the flores with it out of the receiver, and proceed further with them, as above you have been taught to proceed with the gold, and you will get a greeniſh liquor, which is very good for the brain.

Take the coles out of the diſtilling veſſel, and make them into fine powder, and waſh them out with water, to the end that the light cole-duſt may be got from it, and you will find much ſilver duſt (or a great many little ſilver grains) which the ſalt nitre could not force over, which you may reduce, for it will be good ſilver.

There may alſo be made a very good medicine out of the cryſtals of ſilver, which will be little inferior to the former, whereby the diſeaſes and infirmities of the brain may be very well remedied, which is done thus.

How to make a green oyl out of Silver.

POur upon Cryſtals of ſilver twice or thrice as much (in weight) of the ſtrongeſt ſpirit of Salt Armoniack, put it in a glaſs with a long neck well cloſed, into a very gentle warmth for the ſpace of 8. or 14. days in digeſtion, and the ſpirit of ſalt Armoniack will be tinged with a very fair blew colour from the ſilver, then pour it off, and filtre it through brown paper, and then put it in a little glaſs retort or glaſs body, and abſtract in Balneo by a gentle fire, almoſt all the ſpirit of ſalt Armoniack (which is ſtill good for uſe) and there will remain in the bottom a graſs-green Liquor, which is to be kept for a Medicine.

But in caſe that you ſhould miſs, and abſtract too much of the ſpirit from the Tincture of ſilver, ſo that the Tincture be quite dry and turned to a green Salt, then you muſt pour upon it again as much of the ſpirit of Salt Armoniack, as will diſſolve the green ſalt again to a green Liquor, but if you deſire to have the Tincture purer yet, then abſtract all moiſtneſs from it, to a ſtony dryneſs: upon which you muſt pour good ſpirit of Wine, which will quickly diſſolve the ſtone, and then filtre it, and there will remain feces, and the Tincture will be fairer: from which you muſt abſtract moſt of the ſpirit of wine, and the Tincture will be ſo much the higher in vertue. But if you pleaſe, you may diſtil that green ſalt or ſtone (before it be extracted again with that ſpirit of wine) in a little glaſs retort, and you will get a ſubtile ſpirit and a ſharp oyl, and in the bottom of the retort there remaineth a very fuſile ſilver which could not come over.

It is to be admired, that when you pour ſpirit of ſalt Armoniack, or ſpirit of wine upon that ſtone, for to diſſolve it, that the glaſs comes to be ſo cold by it, that you hardly are able to endure it in your hand, which coldneſs in my opinion cometh from the ſilver (being ſo well unlockt) which naturally is cold.

The Uſe of the green Liquor in Alchymy, and for Mechanical Operations.

THis green Liquor ſerveth not only for a medicine, but alſo for other Chymical operations (for both Copper and glaſs may be eaſily and very fairly ſilvered over therewith) very uſeful for thoſe that are curious and love to make a ſhew with fair houſhold-ſtuff; for if you get diſhes, trencher-plates, ſalters, cups and other veſſels made of glaſs, after the ſame faſhion as thoſe of ſilver uſe to be made, you may very eaſily and without any conſiderable charge ſilver them over therewith within and without, ſo that by the eye they cannot be diſcerned from true ſilver plate.

Beſides the above-related good Medicines, there may be made another and eſpecial good one out of the cryſtals of ſilver, *viz.* diſſolving and digeſting them (for a ſpace of time) with the univerſal water, which hath been diſtilled by nature it ſelf; and is known to every body: and after its digeſting for a ſhort time, and change into ſeveral colours, there will be found a pleaſant eſſence, which is not ſo bitter as the above-deſcribed green liquor, which is not brought yet by heat to ripeneſs and maturation. ℞

N. B. In this ſweet univerſal Menſtruum, may alſo all other metals by a ſmall heat and the digeſtion of a long time be ripened and fitted for Medicines (having firſt been reduced into their vitriols and ſalts) and then they are no more dead bodies, but by this preparation have recovered a new Life, and are no more the metals of the covetous, but may be called the metals of the Philoſophers, and of the Phyſicians.

Beſides Phyſick or phyſical uſe.

LAſtly, there may be many pretty things more effected (beſides the medicinal uſe) by means of the Cryſtals of ſilver, *viz.* when you diſſolve them in ordinary ſweet rain water, you may dye beards, hair, skin, and nails of men or beaſts into carnation or pink red, brown and black, according as you have put more or leſs thereof in the water; or elſe, according as the hair was more or leſs times wetted therewith, whereby the aſpect of Man and Beaſt (which ſometimes in ſeveral occaſions may not be contemned) is changed, ſo that they cannot be known.

This colouring or dye may be alſo performed with Lead or Mercury no leſs than with ſilver, but otherwiſe prepared, whereof in the fourth part.

Now I have taught how to make flores and tinctures of gold and ſilver by help of the acid ſpirit of Nitre. There may be many other medicines taught to be made out of them, but in regard that they belong not to this place, they ſhall be reſerved for other places of this ſecond, and alſo for the other following parts.

As by the help of the ſpirit of Nitre, good Medicines may be made out of gold and ſilver, ſo the like may be done out of other inferiour metals. But in regard that their deſcription is fitter for other places of this Book, I omit them here. Yet nevertheleſs, I thought good to deſcribe one preparation of every metal; after Silver therefore followeth now Copper.

A medicine out of Copper externally to be uſed.

DIſſolve burnt plates of Copper in ſpirit of ſalt, and abſtract the ſpirit again from thence to a dryneſs, but not too hard, and there will a green maſs remain behind, which you may caſt in by little and little, and ſo diſtil it, as of ſilver hath been taught. It doth yield a ſtrong and powerful ſpirit, and flores alſo for outward uſe in putrid

wounds, to lay a good ground thereby for the healing.

A medicine out of Iron or Steel.

IN the ſame manner you may proceed with iron and ſteel, and there will remain behind a good crocus of a great ſtipticity or aſtringency, eſpecially out of iron or ſteel, and may with good ſucceſs be mixed with oyntments and plaiſters.

Of Tin and Lead.

IF Tin or Lead be diſſolved therein, after the abſtracting of part of the ſpirit, they will ſhoot into clear and ſweet cryſtals. But Tin is not ſo eaſily diſſolved as Lead; both may ſafely be uſed for medicines. Alſo there may be ſpirits and flores got out of them by diſtilling. The rehearſing of the Preparation is needleſs, for what for the preparing of ſilver hath been taught, is to be underſtood alſo of other metals.

The uſe of the Cryſtals of Lead and Tin.

THE Cryſtals of Lead are admirably good to be uſed in the plague for to provoke ſweating and expel the venome out of the body; they may alſo with credit be uſed in the bloody flux. Externally diſſolved in water, and clothes dipt therein and applied, they excellently cool and quench all inflammations, in what part of the body ſoever they do befal. Likewiſe the ſpirit thereof uſed *per ſe* (and the flores mixed among oyntments) do their part ſufficiently.

But the cryſtals of Tin do not prove altogether ſo quick in operation, though they do act their part alſo, and they are more pleaſant than thoſe that are made of Lead; for in Tin there is found a pure ſulphur of gold; but in Lead a white ſulphur of ſilver, as is proved in my *Treatiſe of the generation and nature of Metals*.

Of Mercury.

WHen you diſſolve common Mercury in rectified ſpirit of Nitre, and abſtract the ſpirit from it again, then there will remain behind a fair red gliſtering precipitate; but when the ſpirit is not rectified, it will not be ſo fair, becauſe that the impurity of the ſpirit remains with the Mercury and pollutes it. This calcinated Mercury is called by ſome *Mercurius præcipitatus*, and by others *Turbith minerale*, wherewith the Surgeons, and ſometimes other unskilful Phyſicians do cure the Pox; they give at once 6, 8, 10. grains, (more or leſs) according to its preparation and force in operation to the patient; for if the ſpirit be not too much abſtracted from it, it worketh much ſtronger, than when by a ſtrong fire it is quite ſeparated from it; for the ſpirits that remain with the Mercury make it quick and active, which elſe without the ſpirits would not be ſuch.

The other metals alſo, if they be not firſt made ſoluble by ſalts or ſpirits, can perform either none or but very ſmall operation, unleſs it be Zink or Iron, which being eaſily ſoluble, are able to work without any foregoing diſſolution, as hath been ſhewn above, when we treated of the oyl of vitriol. But that the ſharp ſpirits are the cauſe of that operation, may hence be perceived, and made manifeſt; that although you take ℥ ſs. of quick-ſilver and pour it down into the ſtomach, yet it would run out again beneath, as above it was poured in. But if it be prepared with ſpirits or ſalts, then but few grains of it will work ſtrongly, and the more it is made ſoluble, the ſtronger it worketh; as you may ſee when it is ſublimed from ſalt and vitriol, that it groweth ſo ſtrong thereby, that one grain doth work more than eight or ten grains of Turbith Mineral, and three or four grains thereof would kill a man, by reaſon of its mighty ſtrength. Alſo it worketh extreamly, and much more than the ſublimate, when it is diſſolved in ſpirit of Nitre and cryſtalized, ſo that you cannot well take it upon your tongue without danger. Which ſome perceiving, evaporate the *Aqua fortis* by a gentle heat from it, ſo that the *Mercurius* remained yellow, which in a ſmaller doſe wrought more than the red, from which the ſpirits were quite evaporated. And they uſed it only externally, ſtrewing it into impure ſores, for to corrode or fret or away the proud fleſh, not without great pain to the patient: but alſo without diſtinction of young or old gave it inwardly for to purge; which is one of the moſt hurtful Purges that can be uſed. For this evil gueſt, however he be prepared, cannot leave his tricks, unleſs he be reduced into ſuch a ſubſtance, as that it never can be brought back to a running Mercury, for then much good can be done in phyſick without any hurt or prejudice to the health of man, whereof perchance ſomething more ſhall be ſaid in another place.

I cannot omit for the benefit of young innocent Children, to diſcover a great abuſe. For it is grown very common almoſt among all that deal in phyſick, that as ſoon as a little child is not well before they know whether it will be troubled with worms, or with any thing elſe, they preſently fall upon Mercury, ſuppoſing that in regard it hath no taſte, it is ſo much the better for to get the Children to take it for to *kill* the Worms.

But thoſe men do not know the hurtful nature of it, which it doth ſhew againſt the ſinews and Nerves: For ſome are of opinion, that if they know to prepare Mercury ſo, that it can be given in a greater doſe (as is to be ſeen in ſublimed *Mercurius dulcis*) that then it is excellently prepared: but they are in a great errour, and it were much better, it were not ſo well prepared, that the leſs hurt might be done to Man, in regard that then they durſt not give it in ſo great a doſe. For if that which is prepared with *Aqua fortis* or ſpirit of ſalt nitre be uſed in the pox to men that are advanced in years, it cannot do ſo much hurt, becauſe it is given in a ſmall doſe, and doth work with them, whereby nature gets help for to overcome and expel that hurtful venome, and its malignity is abated by the ſtrong ſalivation, which provident nature hath planted in it, ſo that not ſo much miſchief can come by it, as by *Mercurius dulcis*, whereof is given to little weak Children from ten to thirty grains at once, which commonly (unleſs they be of a ſtrong nature, and do grow it out) doth cauſe a weakneſs and lameneſs in their limbs, ſo that (if they do not come to be quite lame at laſt) they have a long time to ſtruggle withal, till they overcome it.

In like manner thoſe alſo do err, which do ſhake Mercury in water or beer ſo long, until the water come to be gray-coloured, and ſo give that water or beer to little children to drink for the Worms, pretending that they do not give the ſubſtance or body of Mercury, but only its vertue. But this groſs

preparation

Preparation is no better than if they had miniſtred the running Mercury it ſelf. Neither have I ever ſeen that the uſe of *Mercurius dulcis*, or of the gray coloured water was ſeconded with good ſucceſs in killing of the Worms. But it is credible, that it may be done by yellow or red precipitate, in regard of its ſtrong operation. But who would be ſuch an Enemy to his Child, as to plague and torture it with ſuch a hurtful and murthering medicine; eſpecially there being other medicines to be had, which do no harm to the children, as is to be found in iron or ſteel, and the ſweet oyl of vitriol.

And ſo much of the abuſe of Mercury: I hope it will be a good warning unto many, ſo that they will not ſo eaſily billet ſuch a tyrannical gueſt in any ones houſe, whereby the ruine thereof of neceſſity muſt follow. And that cure deſerveth no praiſe at all, whereby one member is cured with the hurt of two or three other members. As we ſee by the Pox, when one infected member is cured by Mercury, and that but half, and not firm at all, that all the reſt of the body is endangered thereby for the future. And therefore it would be much better that ſuch crude horſe-phyſick might be ſevered from good medicaments, and ſuch uſed inſtead of them, as may firmly, ſafely, and without prejudice to other parts perform the cure, of which kind ſeveral are taught in this book. But in caſe that you have Patients, which have been ſpoiled by ſuch an ill-prepared Mercury, then there is no better remedy to reſtore them, than by medicines made of metals, wherewith Mercury hath great affinity, as of gold and ſilver: for when they are often uſed, they attract the Mercury out of all the members, and carry it along with them out of the body, and ſo do rid the body thereof. But externally the precipitated Mercury may more ſafely be uſed, than internally, in caſe there be nothing elſe to be had, *viz.* to corrode or eat away the proud fleſh out of a wound. But if inſtead of it there ſhould be uſed the corroſive oyl of Antimony, Vitriol, Allome or common ſalt it would be better, and the cure much the ſpeedier; and it would be better yet, that in the beginning good medicaments were uſed to freſh wounds, and not by careleſneſs to reduce them to that ill condition, that afterwards by painful corroſives they muſt be taken away. But ſuch a Mercury would ſerve beſt of all for ſouldiers, beggers, and children that go to ſchool; for if it be ſtrewed upon the head of children, or into their cloathes, no louſe will abide there any longer. In which caſe Mercury muſt by his preparation not be made red, but onely yellow, and it muſt be uſed warily, and not be ſtrewed on too thick, leſt the fleſh be corroded, which would be the occaſion of great miſchief.

Of Aqua fortis.

OUt of Salt nitre and vitriol, taking of each a like quantity (or if the water is to be not altogether ſo ſtrong) two parts of vitriol to one part of ſalt-nitre, a water diſtilled is good to diſſolve metals therewith, and to ſeparate them from one another; as gold from ſilver, and ſilver from gold, which in the fourth part punctually ſhall be taught.

The *Aqua fortis* ſerveth alſo for many other Chymical operations to diſſolve and fit metals thereby, that they may be reduced the eaſier into medicaments: but becauſe the ſpirit of ſalt nitre and *Aqua fortis* are almoſt all one, and have like operations: for if the *Aqua fortis* be dephlegmed and rectified, you may perform the ſame operations with it, which poſſibly may be performed with the ſpirit of ſalt nitre; and on the other ſide the ſpirit of ſalt nitre will do all that can be done with the *Aqua fortis*, whereof in the fourth Part ſhall be ſpoken more at large.

Now I know well that ignorant laborators (which do all their work according to cuſtome, without diving any further into the Nature of things, will count me an Heretick (becauſe I teach, that the *Aqua fortis* made of vitriol and ſalt nitre is of the ſame nature and condition with the ſpirit of ſalt nitre, which is made without vitriol) ſaying that the *Aqua fortis* doth partake likewiſe of the ſpirit of vitriol, becauſe vitriol alſo is uſed in the preparation of it. To which I anſwer, that although vitriol be uſed in the preparation of it, yet for all that in the diſtilling, nothing or but very little of its ſpirit comes over with the ſpirit of ſalt nitre, and that by ſo ſmall a heat it cannot riſe ſo high, as the ſpirit of ſalt nitre doth: and the vitriol is added onely therefore unto the ſalt nitre that it may hinder its melting together, and ſo the more facilitate its going into a ſpirit. And the more to be convinced of this truth, the unbelieving may add to ſuch ſpirit of ſalt nitre, as is made by it ſelf, a little of oyl of vitriol likewiſe made by it ſelf, and try to diſſolve ſilver guilded with it, and he will find that his ſpirit of ſalt nitre by the ſpirit of vitriol is made unfit to make a ſeperation; for it preyeth notably upon the gold, which is not done by *Aqua fortis*.

Of the ſulphuriſed ſpirit of ſalt nitre.

THere may alſo be made a ſpirit of ſalt nitre with ſulphur, which is ſtill in uſe with many, *viz.* they take a ſtrong earthen retort, which hath a pipe at the top, and faſten it into a furnace, and having put ſalt nitre into it, they let it melt, and then through the pipe they throw peeces of ſulphur of the bigneſs of a pea, one after another, which being kindled, together with the nitre doth yield a ſpirit called by ſome ſpirit of ſalt nitre, and by others oyl of ſulphur, but falſely; for it is neither of both, in regard that metals cannot be diſſolved therewith as they are done with other ſpirit of ſalt nitre or ſulphur; neither is there any great uſe for it in phyſick, and if it were good for any Chymical operations, by the help of my diſtilling inſtrument might eaſily be made and in great quantity.

N. B. But if ſalt nitre be mixed with ſulphur in due proportion, and in the firſt furnace be caſt upon quick coles, then all will be burnt, and a ſtrong ſpirit cometh over, whoſe vertue is needleſs here to deſcribe; but more ſhall be mentioned of it in another place.

Of the Cliſſus.

AMong the Phyſitians of this latter age, there is mention made of another ſpirit, which they make of Antimony, Sulphur, and ſalt nitre, a like quantity taken of each, which they call *Cliſſus*, and which they have in high eſteem, and not without cauſe, becauſe it can do much good, if it be well prepared.

The inventor, for the making thereof uſed a retort with a pipe, as was mentioned by the ſulphurized ſpirit of ſalt nitre, through which pipe he threw in his mixture. And it is a good way if no better be known: but if the Author had known my invention and way of diſtilling, I doubt not but he would have ſet aſide his, that hath a noſe or pipe retort, and made uſe of mine.

The materials indeed are good, but not the weight or proportion; for to what purpoſe ſo great a quantity of ſulphur, it being not able to burn away all with ſo ſmall a quantity of ſalt nitre. And if it doth not burn away, but only ſublime & ſtop the neck of the retort, whereby the diſtillation is hindered, how can it then yield any vertue? Therefore you ought to take not ſo much ſulphur, but only ſuch a quantity as will ſerve to kindle the ſalt nitre, *viz.* to ℔ i. of ſalt nitre four drams of ſulphur: but becauſe Antimony alſo is one of the ingredients, which hath likewiſe much ſulphur (for there is no Antimony ſo pure, but it containeth much combuſtible ſulphur, as in the fourth part of this book ſhall be proved:) therefore it is needleſs to add ſo much ſulphur unto Antimony, to make it burn, becauſe it hath enough of it ſelf. And therefore I will ſet down my compoſition, which I found to be better than the firſt.

Take Antimony ℔ i. ſalt nitre ℔ i j. ſulphur ʒ i i j. the materials muſt be made into ſmall powder and well mixed, and at once caſt in ʒ i j. thereof, and there will come over a ſulphureous acid ſpirit of Antimony, which will mix it ſelf with the water, which hath been put before in the receiver; which after the diſtillation is finiſhed muſt be taken out and kept cloſe for its uſe. It is a very good diaphoretick (or ſweat provoking) medicine eſpecially in feavers, the plague, epilepſie, and all other diſeaſes, whoſe cure muſt be performed by ſweating. The *Caput Mortuum* may be ſublimed into flores in that furnace, which is deſcribed in the firſt part.

Of the Tartariſed ſpirit of nitre.

IN the very ſame manner there may alſo be diſtilled a good ſweat-provoking ſpirit out of ſalt nitre and Tartar, a like quantity taken of each, which is very good to be uſed in the plague and malignant feavers.

The *Caput Mortuum* is a good melting powder for to reduce the calxes of metals therewith; or elſe you may let it diſſolve in a moiſt place to oyl of Tartar.

Of the Tartariſed ſpirit of Antimony.

A Much better ſpirit yet may be made of Tartar, ſalt nitre, and Antimony, a like quantity being taken of each and made into fine powder, and mixed well together, which though it be not ſo pleaſant to take, is therefore not to be deſpiſed. For not only in the plague and feavers, but alſo in all obſtructions and corruptions of blood it may be uſed with admiration of its ſpeedy help.

The *Caput Mortuum* may be taken out, and melted in a crucible, and it will yield a *Regulus*, the uſe whereof is deſcribed in the fourth part. Out of the ſcoria or droſs a red Tincture may be extracted with ſpirit of wine, which is very uſeful in many diſeaſes. But before you extract with ſpirit of wine, you may get a red lixivium out of it with ſweet water, which lixivium may be uſed externally for to mend the faults of the skin and to free it from ſcabbineſs.

Upon this lixivium if you pour Vinegar or any other acid ſpirit, there will precipitate a red powder, which if it be edulcorated and dryed may be uſed in phyſick. It is called by ſome ſulphur *auratum diaphoreticum*: but it is no Diaphoretick, but maketh ſtrong vomits, and ſo in caſe of neceſſity, when you have no better medicine at hand, it may be uſed for a vomitory from 6, 7, 9, 10, 15.

Alſo out of the ſcoria there may be extracted a fair Sulphur with the ſpirit of urin and diſtilled over the Limbeck, which is very good for all diſeaſes of the lungs.

Of Stone-coles.

IF you mix ſtone-coales with a like quantity of ſalt nitre, and diſtill them, you will get an admirable ſpirit and good to be uſed outwardly; for it cleanſeth and conſolidateth wounds exceedingly, and there will alſo come over a metallical vertue in the form of a red powder, which muſt be ſeparated from the ſpirit, and kept for its uſe. But if you caſt in ſtone-coles alone by themſelves, and diſtill them, there will come over not only a ſharp ſpirit, but alſo a hot and blood red oyl, which doth powerfully dry and heal all running ulcers; eſpecially it will heal a ſcald head better than any other medicine, and it doth conſume alſo all moiſt and ſpongious excreſcencies in the skin, where ever they be: but if you ſublime ſtone-coles in the furnace deſcribed in the firſt part, there comes over an acid metallical ſpirit, and a great deal of black light flores, which ſuddenly ſtanch bleeding, and uſed in plaiſters, are as good as other metallical flores.

Of the Sulphureous ſpirit of ſalt nitre or Aqua fortis.

IF you take one part of ſulphur, two parts of nitre, and three parts of vitriol, and diſtill them, you will get a graduating *Aqua fortis*, which ſmelleth ſtrongly of ſulphur; for the ſulphur is made volatile by the ſalt nitre and vitriol. It is better for ſeparating of metals, than the common *Aqua fortis*.

If ſilver be put in, it groweth black, but not fixed; ſome of it poured into a ſolution of ſilver a great deal of black calx will precipitate, but doth not abide the tryal. You may alſo abſtract a ſtrong *ſulphureous* volatile ſpirit from it, which hath like vertue as well internally as externally for bathes, and may be uſed like unto a volatile ſpirit of Vitriol or Allome.

Of the Nitrous ſpirit of Arſenick.

IF you take white Arſenick and pure ſalt nitre of each a like quantity ground into fine powder, and diſtill them, you will get a blew ſpirit, which is very ſtrong, but no water muſt be put into the receiver, elſe it would turn white, for the Arſenick, from which the blew cometh, is precipitated by the water. This ſpirit diſſolveth and graduateth copper as white as ſilver, and maketh it malleable but not fixed. The remaining *Caput Mortuum* maketh the copper white, if it be cemented therewith, but very brittle and unmalleable, but how to get good ſilver out of Aſenick and with profit, you ſhall find in the fourth part. In phyſick the blew ſpirit ſerveth for all corroding cancrous ſores, which if they be anointed therewith, will be killed thereby, and made fit for healing.

To make a ſpirit of Sulphur, crude Tartar and Salt nitre.

IF you grind together one part of Sulphur, two parts of Crude Tartar, and four parts of ſalt nitre, and diſtill it Philoſopher-like, you will get a moſt admirable ſpirit, which can play his part both in Phyſick and Alchymy. I will not adviſe any body to diſtill it in a retort; for this mixture, if it groweth warm from beneath, it fulminateth like Gunpowder; but if it be kindled from above, it doth not fulminate, but onely burneth away like a quick fire: metals may be melted and reduced thereby.

To make a ſpirit out of Salt of Tartar, Sulphur, and Salt-nitre.

IF you take one part of ſalt of Tartar, and one part and a half of Sulphur, with three parts of ſalt nitre, and grind them together, you will have a commpoſition, which fulminateth like *Aurum fulminans*, and the ſame alſo (after the ſame manner as above hath been taught with gold) may be diſtilled into flores and ſpirits, which are not without ſpecial Vertue and Operation. For the corruption of one thing is the generation of another.

How to make a ſpirit of ſaw-duſt, ſulphur and ſalt nitre.

IF you make a mixture of one part of Saw-duſt made of Tilia or Linden-wood, and two parts of good ſulphur, and nine parts of purified and well dryed ſalt nitre, and caſt it in by little and little, there will come over an acid ſpirit, which may be uſed outwardly, for to cleanſe wounds that are unclean. But if you mix with this compoſition minerals or metals made into fine powder, and then caſt it in and diſtill it, there will come not only a powerful metallical ſpirit, but alſo a good quantity of flores, according to the nature of the mineral, which are of no ſmall vertue: for the minerals and metals are by this quick fire deſtroyed and reduced to a better condition, whereof many things might be written: but it is not good to reveal all things. Conſider this ſentence of the Philoſopers. *It is impoſſible to deſtroy without a flame, The combuſtible Sulphur of the Calx, which the digged Mine doth doe.*

Alſo fuſible minerals and metals may not only be melted, therewith, but alſo cupellated in a moment upon a Table in the hand or in a nut-ſhell; whereby ſingular proofs of oares and metals may be made, and much better, than upon a Cupel, whereof further in the fourth part of this book. Here is opened unto us a gate to high things; if entrance be granted unto us, we ſhall need no more books to look for the Art in them.

To make metallical ſpirits and flores by the help of ſalt-nitre and linnen cloth.

IF metals be diſſolved in their appropriated Menſtruums, and in the ſolution (wherein a due proportion of ſalt nitre muſt be diſſolved) fine linnen rags be dipt and dryed, you have a prepared metal, which may be kindled, and (as it was mentioned above concerning the ſaw-duſt) through the burning away and conſuming of their ſuperfluous ſulphur, the mercurial ſubſtance of the metal is manifeſted. And after the diſtillation is ended, you will find a ſingular purified calx, which by rubbing coloureth other metals, as that of gold doth guild ſilver, that of ſilver ſilvereth over copper, and copper calx maketh iron look like copper, *&c.* which colouring though it cannot bring any great profit, yet at leaſt for to ſhew the poſſibility, I thought it not amiſs to deſcribe it; and perchance ſomething more may be hid in it, which is not given to every one to know.

Of Gun-powder.

OF this miſchievous compoſition and diabolical abuſe of Gunpowder much might be written: but becauſe this preſent world taketh only delight in ſhedding innocent blood, and cannot endure that unrighteous things ſhould be reproved, & good things praiſed, therefore it is beſt to be ſilent, and to let every one anſwer for himſelf, when the time cometh that we ſhall give an account of our ſtewardſhip, which perhaps is not far off; and then there will be made a ſeparation of good and bad, by him that tryeth the heart, even as gold is refind in the fire from its droſs. And then it will be ſeen what Chriſtians we have been. We do all bear the name, but do not approve our ſelves to be ſuch by our works; every one thinketh himſelf better than others, and for a words ſake which one underſtandeth otherwiſe, or takes in another ſenſe than the other (and though it be no point, whereon ſalvation doth depend) one curſeth and condemneth another and perſecuteth one another unto death, which Chriſt never taught us to do, but rather did earneſtly command us that we ſhould love one another, reward evil with good, and not good with evil, as now a dayes every where they uſe to do; every one ſtandeth upon his reputation, but the honor of God and his command are in no repute, but are trampled under foot, and Lucifers pride, vain ambition, and Phariſaical hypocriſie or ſhew of holineſs, hath ſo far got the upper-hand with the learned, that none will leave his contumacy or ſtubbornneſs, or recede a little from his opinion, although the whole world ſhould be turned upſide down thereby. Are not theſe fine Chriſtians? By their fruit you ſhall know them, and not by their words. Woolves are now clothed with ſheeps skins, ſo that none of them almoſt are to be found, and yet the deeds and works of Woolves are every where extant.

All good manners are turned into bad, women turn men, and men women in their faſhion and behaviour, contrary to the inſtitutition and ordinance of God and Nature. In brief, the world goeth on crutches. If *Heraclitus* and *Democritus* ſhould now behold this preſent world, they would find exceeding great cauſe for their lamenting and laughing at it. And therefore it is no marvel, that God ſent ſuch a terrible ſcourge as gun-powder is upon us; and it is credible, that if this do not cauſe our amendment, that a worſe will follow, *viz.* thunder and lightning falling down from Heaven, whereby the world ſhall be turned upſide down for to make an end of all pride, ſelf-love, ambition, deceit and vanity. For which the whole Creation doth wait, fervently deſiring to be delivered from the bondage thereof.

Now this preparation, which is the moſt hurtful poyſon, a terror unto all the living, is nothing elſe but a *fulmen terreſtre* denouncing unto us the wrath and coming of the Lord. For Chriſt to judge the

world is to come with thundering and lightning: and this earthly thunder perchance is given us for to put us in mind and fear of that which is to come, but this is not ſo much as thought on by men, who prepare it only for to plague and deſtroy mankind therewith in a moſt cruel and abominable manner, as every one knoweth.

For none can deny but that there is no nimbler poyſon, than this gunpowder. It is written of the Baſiliske, that he killeth man only by his look, which a man may avoid, and there are but few (if any at all) of them found: but this poyſon is now prepared and found every where.

How often doth it fall out, that a place wherein this powder is kept is ſtricken with thunder as with its like, in ſo much that all things above it are in a moment deſtroyed, and carryed up into the air? Alſo in ſieges, when an Ordnance is diſcharged, or Mines blown up, all whom it lays hold on, are ſuddenly killed, and moſt miſerably deſtroyed. What nimbler poyſon then could there be invented? I believe there is none, who will not acknowledge it to be ſuch.

And ſeeing that the ancient Philoſophers and Chymiſts were always of opinion, that the greater the poyſon is, the better medicine may be made of it, after it is freed from the poyſon, which with us their poſterity is proved true by many experiences; as we ſee by Antimony, Arſenick, Mercury, and the like minerals, which without preparation are meer poyſon, but by due preparation may be turned into the beſt and moſt effectual medicaments, which though not every one can comprehend or believe, yet Chymiſts know it to be true, and the doing of it is no new thing to them. And becauſe I treat in this ſecond part of medicinal ſpirits, and other good medicaments, and finding that this which can be made out of gunpowder, is none of the leaſt, I would not omit in ſome meaſure, and as far as lawfully may be done, to ſet down its preparation: which is thus performed.

How to make a ſpirit of Gunpowder.

YOur diſtilling veſſel being made warm, and a great receiver with ſweet water in it, being applyed to it without luting, put a diſh with gunpowder, containing about 12. or 15. grains a piece, one after another into it; in the ſame manner as above was taught to do with gold. For if you ſhould put in too much of it at once, it would cauſe too much wind and break the receiver.

As ſoon as you have conveighed it into the veſſel, ſhut the door, and the gunpowder will kindle, and give a blaſt that it maketh the receiver ſtir, and a white miſt or ſteam will come over into the receiver. As ſoon as the powder is burnt, you may caſt in more before the miſt is ſettled, becauſe elſe the diſtilling of it would coſt too much time, and ſo you may continue to do until you have ſpirit enough. Then let the fire go out, and the furnace grow cool, and then take off the receiver, pour the ſpirit with the water that was poured in before (the flores being firſt every where waſhed off with it) out of the receiver into a glaſs body, and rectifie it in a B. through a limbeck, and there will come over a muddy water, taſting and ſmelling of ſulphur: which you muſt keep. In the glaſs body you will find a white ſalt, which you are to keep likewiſe. Take out the *Caput Mortuum*, which remained in the diſtilling veſſel, and looks like gray ſalt, calcine it in a covered crucible, that it turn white, but not that it melt; and upon this burnt or calcined ſalt, pour your ſtinking water, which came over through the limbeck, and diſſolve the calcined white ſalt with it, and the feces which will not diſſolve caſt away. Filtre the ſolution, and pour it upon the white ſalt, which remained in the glaſs body, from which the ſulphureous ſpirit was abſtracted before, and put the glaſs body (with a limbeck luted upon it) into ſand, and abſtract the ſulphureous water from it, which will be yellowiſh, and ſmell more of ſulphur than it did before. This water if it be abſtracted from the ſalt ſeveral times, will turn white, almoſt like unto milk, and taſt no more of ſulphur, but be pleaſant and ſweet. It is very good for the diſeaſes of the lungs. Alſo it doth guild ſilver, being anointed therewith, although not firmly, and by digeſtion it may be ripened and reduced into a better medicine.

The ſalt which remained in the glaſs body, urge with a ſtrong fire, ſuch as will make the ſand, wherein the glaſs ſtandeth red hot, and there will ſublime a white ſalt into the limbeck, in taſte almoſt like unto ſalt Armoniack, but in the midſt of the glaſs body, you will find another, which is yellowiſh, of a mineral taſte and very hot upon the tongue.

The ſublimed ſalts, as well the white which did aſcend into the limbeck, as the yellow, which remained in the glaſs body are good to be uſed in the plague, malignant feavers and other diſeaſes, where ſweating is required; for they do mightily provoke ſweating, they comfort and do cleanſe the ſtomach, and cauſe ſometimes gentle ſtools.

But what further may be done in Phyſick with it, I do not know yet.

In Alchymy it is alſo of uſe, which doth not belong to this place. Upon the remaining ſalt which did not ſublime you may pour rain water, and diſſolve it there in the glaſs body, (if it be whole ſtill) elſe if it be broken, you may take out the ſalt dry, and diſſolve and filtre and coagulate it again, and there will be ſeparated a great deal of fæces. This purified ſalt, which will look yellowiſh, melt in a covered crucible, and it will turn quite blood red, and as hot as fire upon the tongue, which with freſh water you muſt diſſolve again, and then filtre and coagulate; by which operation it will be made pure and clear, and the ſolution is quite green before it be coagulated, and as fiery as the red ſalt was before its diſſolution.

This graſs green ſolution being coagulated again into a red fiery ſalt, may be melted again in a clean and ſtrong crucible, and it will be much more red and fiery.

N. B. And it is to be admired that in the melting of it many fire ſparks do fly from it, which do not kindle or take fire, as other ſparks of coals or wood uſe to do. This well purified red ſalt being laid in a cold and moiſt place, will diſſolve into a blood red oyl, which in digeſtion diſſolveth gold and leaveth the ſilver: this ſolution may be coagulated, and kept for uſe in Alchimy.

There may alſo a pretious Tincture be extracted out of it with alcolized ſpirit of wine, which Tincture guildeth ſilver, but not firmly.

And as for uſe in Phyſick, it ought to be kept as a great Treaſure. But if the red fiery ſalt be extracted with ſpirit of wine before gold be diſſolved

ed therewith, it will yield likewiſe a fair red Tincture, but not ſo effectual in Phyſick as that unto which gold is joyned. And this Tincture can alſo further be uſed in Alchymy, which belongeth not hither, becauſe we only ſpeak of medicaments.

Of the uſe of the Medicine or Tincture made of Gunpowder.

THis Tincture whether with or without gold, made out of the red ſalt, is one of the chiefeſt that I know to make, if you go but rightly to work, and prepare it well; for it purifieth and cleanſeth the blood mightily, and provoketh alſo powerfully ſweat and urine; ſo that it may ſafely and with great benefit be uſed in the Plague, Feavers, Epilepſy, Scurvy, in *Melancholia Hypochondriaca*, in the Gout, Stone, and the ſeveral kinds of them; as alſo in all obſtructions of the Spleen and Liver, and in all diſeaſes of the Lungs, and it is to be admire that of ſuch a hurtful thing ſuch a good medicine can be prepared. Therefore it would be much better to prepare good medicaments of it, to reſtore the poor diſeaſed to health therewith, than to deſtroy with it thoſe that are whole and ſound.

I know a Chymiſt, that ſpent much time and coſt to ſearch this poyſonous dragon, thinking to make the univerſal medicine or ſtone of the ancient Philoſophers out of it. Eſpecially becauſe he ſaw, that ſo many ſtrange changes of colours appeared, whereof mention is made by the Philoſophers when they diſcribe their medicine and the preparation thereof.

The Dragons blood, Virgins milk, Green and Red Lyon, Black blacker than Black, White whiter than White and the like, more needleſs here to relate, which eaſily may perſwade a credulous man as it hapned alſo unto him. But afterward he found, that this ſubject in which he put ſo much confidence, was leprous and not pure enough, and that it is impoſſible to make that tingent ſtone of it, for to exalt men and metals, and ſo was glad to be contented with a good particular medicine and to commit the reſt unto God.

And ſo much of that poyſonous dragon, gunpowder: but that there is another and more purer dragon, whereof the Philoſophers ſo often made mention, I do not deny; for nature is mighty rich, and could reveal to us many arcana by Gods permiſſion: But becauſe we look only for great honor and riches, and neglect the poor, there is good reaſon why ſuch things remain hidden from wicked and ungodly men.

To make ſpirits and flores of Nitre and Coals.

IF you diſtill Nitre (well purified from its ſuperfluous ſalt) mixed with good coals, the Egyptian Sun bird doth burn away, and out of it doth ſweat a ſingular water, uſeful for men and metals. Its burnt aſhes are like unto calcined Tartar, and for the purging of metals not to be deſpiſed.

To make flores and ſpirits of flints, cryſtals or ſand, by adding of coals and ſalt nitre to them.

TAke one part of flints or ſand, and three parts of Linden coals, with ſix parts of good ſalt nitre mixed well together, and caſt of it in, and the combuſtible ſulphur of the flints will be kindled by the piercing and vehement fire of the ſalt nitre, and maketh a ſeparation, carrying over with it part thereof, which it turneth into ſpirits and flores, which muſt be ſeparated by filtring. The ſpirit taſteth as if it had been made of ſalt of Tartar and flints, and is of the ſame nature and condition; and the remaining *Caput Mortuum* alſo yieldeth ſuch an oyl or liquor in all like unto that, and therefore its condition is not deſcribed here, but you may find it where I ſhall treat of the ſpirit made of ſalt of tartar by adding of flints.

To make a ſpirit and oyl out of Talck with ſalt nitre.

TAke one part of Talck made into fine powder, and three parts of Linden-coals, mixe them with five or ſix parts of good ſalt nitre, caſt in of that mixture one ſpoonful after another, and there will come over a ſpirit and a few flores, which muſt be ſeparated as hath been taught above concerning flints.

The ſpirit is not unlike unto the ſpirit of ſand: the *Caput Mortuum*, which looks greyiſh, muſt be well calcined in a crucible, ſo that it melt, and then pour it out, and it will yield a white tranſparent Maſs, like as flints and cryſtals do, which in a cold moiſt cellar will turn to a thick liquor, fatter in the handling than the oyl of ſand. It is ſomething ſharp like unto oyl of Tartar; it cleanſeth the Skin, Hair and Nails, and makes them white; the ſpirit may be uſed inwardly for to provoke ſweat and urine: externally uſed, it cleanſeth wounds, and healeth all manner of ſcabs in the body out of hand. What further may be done with it, I do not know yet: But how to bring Talck, pebles, and the like ſtony things to that paſs, that they may be diſſolved with ſpirit of wine and reduced into good medicaments ſhall be taught in the fourth part.

To make a ſpirit, flores, and oyl out of Tin,

IF you mix two parts of the filings of Tin, with one part of good ſalt nitre, and caſt it in, as you were taught to do with other things, then the ſulphur of Tin will kindle the ſalt nitre, and make a flame, as if it were done with common ſulphur, whereby a ſeparation is made, ſo that one part of the Tin cometh over in flores and ſpirit, and the reſt ſtayeth behind, which if it be taken out, ſome of it in a moiſt place will turn into a liquor or oyl, which externally may be uſed with good ſucceſs in all ulcers for to cleanſe them. It hath alſo the vereue, if it be pertinently applyed to graduate and exalt wonderfully all the colours of vegetables and animals, which would be uſeful for dyers. The ſpirit of it mightily provoketh ſweating: the flores being edulcorated and uſed in plaiſters, do dry and heal very ſpeedily.

To make a ſpirit, flores and a liquor out of Zinck.

IN like manner as hath been taught with Tin, you may alſo proceed with Zinck, and it will yield a good quantity of flores, and alſo a ſpirit and oyl, almoſt of the ſame vertues with thoſe made of Tin: and theſe flores corrected with ſalt nitre, are better than thoſe which are taught to be made by themſelves in the firſt part of the book.

To make a ſpirit, flores and oyl of Lapis Calaminaris.

MIx two parts of ſalt nitre with one part of *lapis calaminaris* and caſt it in, and it will yield a ſharp ſpirit very uſeful for ſeparating of metals, and there will come over alſo a few yellow flores. The reſt remaining behind is a dark green Maſs very fiery upon the tongue, like ſalt of Tartar, and if it be diſſolved with rain water, yieldeth a graſs green ſolution, which being not preſently coagulated into ſalt, the green ſeparateth it ſelf from the fixed ſalt nitre, and there falleth to the bottom a fine red powder, and if it be edulcorated and dryed, and given from one grain to ten or twelve it cauſeth gentle ſtools and eaſy vomits, better than prepared Antimony; for *lapis calaminaris* and Zinck are of the nature of Gold, as in the fourth part ſhall be proved: the white *lixivium* or lye, from which the green is precipitated, may be coagulated into white ſalt, like unto ſalt of Tartar; but if you coagulate the green ſolution, before the green be ſeparated from the ſalt nitre, then you will get a very fair green ſalt, high in colour and much more fiery than ſalt of Tartar, whereby ſpecial things may be done in Alchymy, which doth not belong hither. And if you deſire to make ſuch a green ſalt for to uſe it in Alchymy, you need not take ſo much pains, as firſt to diſtil a ſpirit out of the mixture, but take three or four parts of good ſalt nitre, and mix it with one part of *lapis calaminaris*, and let this mixture boyl together in a wind furnace, till the ſalt nitre be coloured green by the *lapis calaminaris*, then pour it out and ſeparate the green goldiſh ſalt from it, and make ſuch good uſe of it as you think fit.

But if you will extract a good Tincture and medicine, make it into powder, and extract it with ſpirit of wine, and it will yield a blood red Tincture, both in Phyſick and Alchymy of good uſe.

Further you are to take notice, that among all metals and minerals, which I know (except gold and ſilver) there is none found, out of which can be extracted a greenneſs which is of fire-proof, but only out of *lapis calaminaris*, which deſerves to be well conſidered and further thought upon.

To make a ſpirit of ſalt nitre, ſulphur and common ſalt.

TAke one part of ſalt, two parts of ſulphur, and four parts of ſalt nitre, grind all together, and caſt in one ſpoonful after another to diſtil, and it will yield a ſharp yellow ſpirit, which if it be put among common water, ſo that the water be not made too ſharp of it, it is a good bath, good for many diſeaſes; eſpecially it healeth all ſcabs very ſuddenly. The *Caput Mortuum* may alſo be diſſolved in water and uſed among bathes, and it is good likewiſe, but the ſpirit is penetrating, and doth opperate ſuddenly in ſhrinkings and other defects of the nerves; of ſuch kind of bathes there ſhall be ſpoken more in the third part. Alſo the remaining fixed yellow ſalt is good to be uſed in Alchymy; for it graduateth ſilver by cementing.

To make a ſpirit, flores and oyl out of ſalt nitre and Regulus Martis.

TAke one part of *Regulus Martis ſtellatus* (made of one part of Iron or Steel, and three parts of Antimony, whoſe preparation is deſcribed in the fourth part) and three parts of pure ſalt nitre, mix and grind all together, and caſt it in by little and little to diſtil, and there will come over a ſpirit together with a white ſublimate, which muſt be ſeparated with water, as hath been taught above with other flores, and both the ſpirit and the flores are good to provoke ſweat. The remaining *Caput Mortuum*, (as they uſually call it) is not dead, but full of life and vertue, whereby much good may be done both in Phyſick and Alchymy, as followeth. The remaining Maſs, which looks white, and is very ſharp and fiery (if the *Regulus* have been pure, if not, then it will look yellowiſh) may be edulcorated with freſh water, and it will yield a *lixivium* or lye in all things like unto calcined Tartar, but ſharper and purer, and may be uſed almoſt in all operations inſtead of ſalt of Tartar (but firſt the *Regulus Antimonii* muſt be precipitated from it by the help of water) and afterward it may be coagulated into ſalt and kept for its uſe; the edulcorated, as alſo that which was precipitated with water is a white and fine powder, uſeful in the plague, feavers, and other diſeaſes to provoke ſweating thereby, and may very ſafely be uſed, and although if it be given in a greater quantity than uſual, it cauſes ſome vomits alſo, yet for all that it doth no hurt. It is eaſily taken becauſe it hath no taſte. It is given to children from 3, 4, to 12. grains: to elder folks from ℈ ſs. to ʒ ſs. they work ſucceſsfully in all diſeaſes, where ſweating is needful. This *Antimonium Diaphoreticum*, may alſo be melted into glaſs, and ſo extracted and diſſolved with ſpirit of ſalt, and it may be prepared into ſeveral good medicaments: and if all that which may be done with it, ſhould be deſcribed at large, it would require too much time. The *lixivium*, if it be coagulated, hath wonderful vertues, ſo that if one ſhould deſcribe them, he would hardly be credited by any body, becauſe it is not made of coſtly things; and truly the life of man is too ſhort to find out by experience all that lies hid in it: and it would be but a laughing matter to a proud fool, if one ſhould reveal it: therefore it is better to keep counſel, than to ſow ſtrife. *Baſilius Valentinus* in his Triumphant Chariot of Antimony, where he writeth of the ſigned ſtar, hinted it ſufficiently, but very few take notice of it. *Paracelſus* alſo, here and there in his books under an unknown name, makes frequent mention of it; but its true preparation and uſe, by reaſon of the unthankful was never deſcribed by the Philoſophers, which for inſtruction of Good Honeſt Men we do here mention.

Before you edulcorate the *Regulus* (made by fulmination) you may extract of it a good medicinal Tincture with ſpirit of wine, and if you diſſolve it with ſpirit of ſalt, there will ſhoot a white foliated Talck in all things like unto the Mineral Talck: whereof a liquor may be made, which coloureth the skin very white, but if this calx of Antimony, before it be extracted with ſpirit of wine or diſſolved with ſpirit of ſalt be made into fine powder, and expoſed to the moiſt air, it will diſſolve into a fat liquor, which though it be ſomething ſharp, yet doth no hurt to the skin, if it be uſed with diſcretion, but rather cleanſeth it more then any other thing, and ſo it doth likewiſe to the hair and nailes; but as ſoon as the liquor hath been ap-

plyed

plyed for that purpoſe, it muſt be waſhed off again with water, leſt it do not onely take away the groſs and unclean skin, but alſo work upon the tender white skin and do hurt, and therefore I give warning, that you uſe it diſcreetly: for according to the old proverb, you may miſuſe even that which elſe is good in it ſelf. If you put ſome of it into warm water and bath your ſelf in it, the groſs skin will peal off all the body, ſo that you will almoſt ſeem to be another body. And this bath alſo is good for many diſeaſes: for it openeth the pores mightily, and cleanſeth all the blood in the body, by drawing many ill humors out of it, which maketh a man light and ſtrong, eſpecially if he be purged firſt, before he uſeth the bath. It is alſo good for Melancholy, ſcurvy and leproſie, eſpecially when the red Tincture drawn out of it with ſpirit of wine, be uſed beſides. It is alſo good to be uſed in a foot bath for thoſe that are troubled with corns and other excreſcencies upon their feet, or with nailes that cut the fleſh; for it ſofteneth them and makes them fit for cutting, and as tractable as wax. For there is nothing known under the Sun, which ſofteneth more a hard skin, hair, nailes and other excreſcencies, than this oyl. And this I did ſet down therefore, becauſe I know, that many are ſo tormented therewith, that they cannot well endure their ſhoes upon their feet. But if you coagulate this oyl into ſalt, and melt it in a crucible, and powre it out into a flat braſs baſon, that it flow at large and may be broken, then you have the beſt Cauſticum, to open the skin withal where is need. If you diſſolve crude Tartar with it and coagulate it again, you will get a ſalt which is uſed in many Chymical operations; and there may be extracted out of it a blood red Tincture with ſpirit of wine, which proveth very effectual againſt all obſtructions.

Alſo every combuſtible ſulphur may be eaſily diſſolved with it, and uſed among bathes, it acteth his part admirably. If any oyl of ſpices be boyled therewith, then the oyl will diſſolve in it, and they turn together to a balſome, which doth mingle it ſelf with water, and is good to be taken inwardly for ſome infirmities: but women with child muſt not meddle with it, becauſe it makes them miſcarry. But after their delivery, it is good to expel after burthen and other reliques. But if you boyl *Oleum ligni Rhodii* with this liquor and roſe water ſo long till the oyl do incorporate with the liquor and waters and then ſeparate the watery ſubſtance from it, you will get a ſope as white as ſnow, which may be uſed for to waſh the hands with it, and it doth ſmell very well. You may alſo waſh the head with it; for it ſtrengtheneth the brain and cleanſeth the head and hair. This ſope may be diſtilled, and it will yield a penetrating oyl, very good for the ſinews and nerves.

Now as this liquor of *Regulus Antimonii* ſoftneth the skin, nailes, hair, feathers, horns, and the like, and diſſolveth them more than any thing in the world: In the like manner alſo it hath power to diſſolve not only metals, but alſo the hardeſt ſtones, but not in that manner which is done by boyling, as was mentioned of ſulphur, but after another way, which is not proper for this place. It ſufficeth that I hinted it. The fiery fixed ſalt nitre may be diſſolved with ſpirit of ſalt or vinegar, and ſublimed into a *Terra foliata*. What further can be effected with it, doth not belong to this place, and perchance ſome where elſe more ſhall be ſpoken of it.

To diſtil a Butyrum out of Antimony, Salt and vitriol, like unto that, which is made out of Antimony and Mercury ſublimate.

TAke one part of crude Antimony, two parts of common ſalt, and four parts of vitriol calcined white, beat all to powder and mix them well, and ſo caſt it in as you were taught to do with other materials, and there will come over a thick oyl of Antimony like butter, which may be rectified like any other oyl, that is made after the common way with Mercury ſublimate, and is alſo the ſame with it in uſe, which uſe you may ſee in the firſt part: the ſame alſo may be made better and in a greater quantity in the furnace deſcribed in the firſt part, and alſo with leſs coals and time by the help of the open fire, becauſe it endureth greater heat than in the ſecond furnace.

To diſtil Butyrum of Arſenick and Orpiment.

AFter the ſame manner as was taught with Antimony, there may alſo out of Arſenick and Auripigment together with ſalt and vitriol a thick oyl be diſtilled, which not only outwardly but alſo inwardly is ſafe to be uſed, and may be ſo corrected, that it ſhall be nothing at all inferior in vertue unto the *butyrum Antimonii*, but rather go beyond it: which perchance will ſeem impoſſible to many. But he that knows the nature and condition of minerals, will not be aſtoniſhed at my words, but they will be to him as a light in a dark place.

To make a rare ſpirit of vitriol.

IF common vitriol be diſſolved in water, and you boyle granulated Zinck in it, all the metal and ſulphur contained in the vitriol will precipitate on the Zinck, and the ſolution will turn white, the precipitated matter is nothing elſe, but iron, copper, and ſulphur, which the ſalt of vitriol did contain, and now is drawn from it by the Zinck. The reaſon why the metal precipitateth out of the ſalt upon the Zinck, belongeth to the fourth part, where you will find it ſufficiently explained; The white ſolution, from which the metallical matter is ſeparated, muſt be coagulated to the dryneſs of ſalt, and ſo by it ſelf a ſpirit diſtilled of it, which riſeth eaſily, and is in taſte and vertue not unlike unto common oyl of vitriol, but only that this is a little purer than the common.

Here perchance many may object: you take the green from the vitriol, which *Paracelſus* doth not teach, but bids us to keep it. To which I anſwer, that I do not teach here to make the ſweet red oyl of vitriol, whereof *Paracelſus* hath written, but the white acid oyl; which is as good, or rather much better than the common, which is made of the common impure vitriol. To what purpoſe is it, that you take green vitriol to diſtil, whereas the green doth not come over, and although that green ſhould come over, why ſhould that oyl be better than the white? for the green in the common vitriol is nothing elſe but copper and iron, which the ſalt water running through the paſſages of Metals did diſſolve and take into it ſelf, and as ſoon as ſuch a green vitriol feeleth the fire, the green turneth into red, which is nothing elſe but

a calcined iron or copper, which in the reducing by a ſtrong fire and by melting is made manifeſt.

Pag. 20

Paracelſus hath not taught us, that we ſhould drive over the green by the force of the fire into a red and ſweet oyl, but he hath ſhewed us an other way, which is found out by few men, whereof in the beginning of the ſecond part already hath been made mention.

This ſpirit or acid oyl diſtilled out of the purified vitriol, is of a pleaſant ſowreneſs, and ſerveth for all thoſe uſes, which above by the vitriol were deſcribed. And this proceſs is ſet down onely for that end, that we may ſee, that when the vitriol is purifyed, that then it is eaſier diſtilled, and yieldeth a more pleaſant ſpirit, than if it be yet crude and impure.

And that ſuch a purifying of the vitriol is nothing elſe but a precipitating of the metal, which the water (as before ſaid) running through the veins thereof hath aſſumed, is thus to be proved; diſſolve any metal in its appropriate Menſtruum, whether it be done with diſtilled acid ſpirits or ſharp ſalts, adding common water to them, or elſe dry by the fire in a crucible, according as you pleaſe, and then put into that ſolution another metal, ſuch as the diſſolvent doth ſooner ſeize on, then upon that which it hath aſſumed, and then you will find, that the diſſolvent doth let fall the aſſumed metal or mineral, and falls upon the other, which it doth ſooner ſeize on, and diſſolveth it as being more friendly to it; of which precipitation in the fourth Part ſhall be ſpoken more at large.

This one thing more is worthy your obſervation, that among all metals there is none more ſoluble than Zinck, and therefore that all the other (as well in the dry as in the wet way) may be precipitated thereby and reduced into light calxes, in ſo much that the calx of gold or ſilver precipitated in this manner (if ſo be you proceed well) retaineth its ſplendor or gloſs, and is like a fine powder wherewith you may write out of a pen.

To make a ſubtle ſpirit and pleaſant oyl of Zinck.

BEcauſe I made mention here of Zinck, I thought good not to omit, that there may be made a penetrating ſpirit and wholeſome oyl out of it by the help of vinegar, which is thus to be done. Take of the flores (which were taught to be made in the firſt part) one part, put them into a glaſs (fit for digeſtion) and pour upon them 8, or 10. parts of good ſharp vinegar made of honey; or in want thereof take wine vinegar, and ſet the glaſs with the flores and vinegar in a warm place to diſſolve, and the ſolution being performed, pour off the clear, which will look yellow and after you have filtred it abſtract the phlegm, and there will remain a red liquor or balſome, to which you muſt add pure ſand, well calcined, and diſtill it, and firſt there will come over an unſavory phlegme, afterward a ſubtle ſpirit, and at laſt a a yellow and red oyl which are to be kept by themſelves ſeparated from the ſpirit, as a treaſure for to heal all wounds very ſpeedily. The ſpirit is not inferior unto the oyl, not only for inward uſe to provoke ſweat thereby, but alſo externally for the quenching of all inflamations, and doubtleſs this ſpirit and oyl is good for more diſeaſes, but becauſe its further uſe is not known to me yet, I will not write of it, but leave the further tryal to others.

To diſtill a ſpirit and oyl out of Lead.

IN the ſame manner as was taught of Zinck, there may be out of lead alſo diſtilled a ſubtle ſpirit and a ſweet oyl, and it is done thus: Pour ſtrong vinegar upon *Minium*, or any other calx of lead, which is made *per ſe*, and not with ſulphur, let it digeſt and diſſolve in ſand or warm aſhes, ſo long till the vinegar be coloured yellow by the lead, and turned quite ſweet. Then pour off the clear ſolution, and pour on other vinegar, and let this likewiſe diſſolve, and this repeat ſo often, till the vinegar will diſſolve no more, nor grow ſweet; then take all theſe ſolutions, and evaporate all the moiſture, and there will remain a thick ſweet yellow liquor, like unto honey, if the vinegar was not diſtilled, but if it was diſtilled and made clear, then no liquor remaineth, but only a white ſweet ſalt. This liquor or ſalt may be diſtilled after the ſame manner as was taught with the Zinck, and there will come over not only a penetrating ſubtle ſpirit, but alſo a yellow oyl, which will not be much, but very effectual, in all the ſame uſes, as of the ſpirit, and oyl of the Zinck was taught.

N. B. This is to be obſerved, that for to make this ſpirit and oyl, you need no diſtilled ſpirit, but that it may be done as well with undiſtilled vinegar, and the undiſtilled yields more ſpirit than the diſtilled. But if you look for a white and clear ſalt, then the vineger muſt be diſtilled, elſe it doth not ſhoot into cryſtals, but remaineth a yellow liquor like unto honey, and it is alſo needleſs to make the ſolution in glaſſes, and by digeſtion continued for a long time, but it may as well be done in a glazed pot, *viz.* pouring the vinegar upon the Mineum in the pot, and boyling it on a coal fire; for you need not fear that any thing of the vinegar will evaporate, in regard that the lead keeps all the ſpirits, and lets only go an unſavory phlegm. You muſt alſo continually ſtir the lead about with a wooden ſpatulla, elſe it would turn to a hard ſtone, and would not diſſolve: the ſame muſt be done alſo when the ſolution is done in glaſſes; and the ſolution after this way may be done in three or four hours: and when both kind of ſolutions are done, there will be no difference betwixt them, and I think it providently done not to ſpend a whole day about that which may be done in an hour.

And if you will have this ſpirit and oyl better and more effectual, you may mix ℥ i. of crude Tartar made into powder with ℔ j. of diſſolved and purified lead, and ſo diſtil it after the ſame manner as you do diſtil it by it ſelf, and you will get a much ſubtler ſpirit and a better oyl than if it were made alone by it ſelf.

To diſtil a ſubtile ſpirit and oyl out of crude Tartar.

MAny think it to be but a ſmall matter to make the ſpirit of Tartar; for they ſuppoſe, that if they do but only put Tartar into a retort, and apply a receiver, and by a ſtrong fire force over a water, they have obtained their deſire: and they do not obſerve, that in ſtead of a pleaſant ſubtle ſpirit, they get but a ſtinking vinegar or phlegm; the pleaſant ſpirit being gone. Which ſome careful operators perceiving, they cauſed great receivers to be made, ſuppoſing by that means to get the ſpirit.

Now

Now when they after the diſtillation was done, weighed their ſpirits together with the remainder, they found, that they had ſuffered great loſs, wherefore they ſuppoſed it to be an impoſſible thing, to get all the ſpirits, and to loſe none, and indeed it is hardly poſſible to be done otherwiſe by a retort: for although you apply a great receiver to a ſmall retort, and that there be alſo but a little Tartar in it, and the joynts being well luted, ſo that nothing can paſs through, and though you make alſo the fire never ſo gentle, hoping to get the ſpirit by that way, yet for all that you cannot avoid danger and loſs. For at laſt the retort beginning to be red hot, and the black oyl going, then and but then the ſubtleſt ſpirits will come forth, which either ſteal through the joynts, or elſe do break the retort or receiver, becauſe they come in abundance and with great force, and do not ſettle eaſily: wherefore I will ſet down my way of making this moſt profitable, and excellent ſpirit.

The preparation and uſe of the ſpirit of Tartar.

TAke good and pure crude Tartar, whether it be red or white, it matters not, make it into fine powder, and when the diſtilling veſſel is red hot, then caſt in with a ladle half an ounce and no more at once, and ſo ſoon as the ſpirits are gone forth and ſetled, caſt in another ℥ ſs. and this continue, till you have ſpirit enough, then take out the remainder, which will look black, and calcine it well in a crucible, and put it in a glaſs retort, and pour the ſpirit that came over together with the black oyl, upon it, drive it in ſand at firſt gently, and the ſubtleſt ſpirits will come over, and after them phlegme, at laſt a ſowre vinegar together with the oyl, whereof you muſt get each by it ſelf. But if you deſire to have the ſubtle ſpirit which came over firſt, more penetrating yet, then you muſt take the *Caput Mortuum* that ſtaid in the retort, and make it red hot in a crucible, and abſtract the ſpirit once more from it, and the calcined Tartar will keep the remaining moiſtneſs or phlegm, and only the ſubtleſt ſpirit will come over, which is of a moſt penetrating quality, whereof from half a dram to an ounce taken in wine or any other liquor provoketh a quick and ſtrong ſweat, and it is a powerful medicine in all obſtructions, and moſt approved and often tryed in the plague, malignant feavers, ſcurvy, *Melancolia Hypochondriaca*, collick, contracture, epilepſy and the like diſeaſes. And not only theſe mentioned diſeaſes, but alſo many others more, which proceed from corrupt blood under God may ſucceſsfully be cured with it.

The phlegm is to be caſt away, as unprofitable: the vinegar cleanſeth wounds: the oyl allayeth ſwelling and pains, and doth cure ſcabs, and diſperſeth knobs that are riſen upon the skin, as alſo other excreſcencies of the ſame, if it be uſed timely, and the uſe thereof be continued.

N. B. If the black ſtinking oyl be rectified from the calcined *Caput Mortuum*, it will be clear and ſubtle, and it will not only aſſwage very ſpeedily all pains of the gout, but alſo diſſolve and expel the conglobated gravel in the reines, applyed as a plaiſter or unguent. In like manner it will diſſolve and extract the coagulated Tartar in the hands, knees and feet, ſo that the place affected will be freed and made whole thereby: becauſe in ſuch a deſpicable oyl there lyes hid a volatile ſalt which is of great vertue. But if you deſire experimentally to know whether it be ſo, then pour upon this black ſtinking oyl an acid ſpirit, as the ſpirit of common ſalt, or of vitriol or ſalt nitre, or only diſtilled vinegar, and the oyl will grow warm and make a noyſe and riſe, as if *Aqua fortis* had been powred upon ſalt of Tartar, and the acid ſpirit will be mortified thereby, and turn to ſalt. And this well purified oyl doth diſſolve and extract the Tartar out of the joynts (unleſs it be grown to a hard ſtony ſubſtance) even as ſope ſcowres the uncleanneſs out of cloths, or to compare it better, even as like receiveth its like, and is eaſily mixed with it, and doth love it; but on the contrary, nothing will mix it ſelf with that wherewith it hath no affinity at all. As if you would take pitch out of cloth by waſhing it with water, which never will be done by reaſon of the contrary nature; for common water hath no affinity with pitch or other fat things, nor will it ever be taken out therewith without a mediator, partaking of both natures, *viz.* of the nature of pitch and that of the water, and ſuch are ſulphureous ſalts, and nitrous ſalts, whether they be fixed or volatile. As you may ſee at the ſoap boylers, who incorporate common water by the help of ſulphureous ſalts with fat things, as tallow and oyl. But if you take warm oyl or any thin fat ſubſtance, and put it upon the pitch or rozin, then the oyl eaſily accepteth of and lays hold on its like, and ſo the pitch is diſſolved and got out of the cloth, and the remaining fatneſs of the oyl may be fetcht out of the cloth with lye or ſope and common water, and ſo the cloth recovereth its former beauty and pureneſs. And as it falleth out with ſulphureous things, ſo it doth likewiſe with Mercurial. For example, if you would take the ſalt out of powdered fleſh or pickled fiſh with a lixivium it would not ſucceed, becauſe that the nitrous and acid ſalts are of contrary natures.

But if upon the powdered fleſh or pickled fiſh you pour on water wherein ſome of the ſame ſalt (wherewithall the fleſh was powdered) is diſſolved, that ſalt water will extract the ſalt out of the fleſh, as being its like, much more than common ſweet water, wherein there is no ſalt.

In this manner the hardeſt things alſo, as ſtones and metals, may be joyned or united with water, whereof more in my other books are extant; it is needleſs here therefore to relate. I gave a hint of it, only for to ſhew, that always like with like muſt be extracted. True it is that one Contrary can mortifie another, and take the corroſiveneſs from it, whereby the pains for a time are aſſwaged, but whether the cauſe of the diſeaſe it ſelf be eradicated thereby, is a queſtion.

Here may be objected, that I make a difference between the ſulphureous and Mercurial ſalts, whereas neither Mercury nor ſulphur apparently is to be ſeen in either. It is true, he that doth not underſtand nor know the nature of ſalts, is not able to apprehend it. And I have not time now to demonſtrate it, but the ſame is ſhewed at large in my book *de Natura ſalium*, that ſome of them are ſulphureous, and ſome Mercurial: but he that looks for a further direction yet, let him read my book *de Sympathia & Antipathia rerum*, wherein he ſhall find it demonſtrated that from the Creation of the World to the time preſent, there were always two contrary natures fighting one againſt the other,

which fight will continue ſo long till the Mediator betwixt God and Man, the Lord Jeſus Chriſt ſhall put an end unto this ſtrife, when he ſhall come to ſeparate the good from the bad, by whoſe lightning and fire flame the proud and hurtful ſuperfluous ſulphur ſhall be kindled and conſumed: the pure Mercurial being left in the center.

How to make pretious ſpirits and oyls out of Tartar joined with minerals and metals.

TAke any metal or mineral, diſſolve it in a fit menſtruum, mix it with a due proportion of crude Tartar, ſo that the crude Tartar being made into powder together with the ſolution make up a pap a it were; then at once caſt in one ſpoonful of it, and diſtil it into a ſpirit and oyl, which after the diſtillation muſt be ſeparated by rectification, for to keep each by its ſelf for its proper uſe.

The uſe of the metallized ſpirit and oyl of Tartar

THis Tartarized ſpirit of metals is of ſuch a condition, that it readily performeth its operation according to the ſtrength of the ſpirit, and the nature of the metal or mineral, whereof it is made. For the ſpirit and oyl of Gold and Tartar is good for to corroborate the heart, and to keep out its enemies: the ſpirit of ſilver and tartar doth ſerve for the brain; that of Mercury and Tartar, for the liver: of lead and tin for the ſpleen and lungs: of iron and copper for the reins and ſeminary veſſels: that of Antimony and Tartar for all accidents and infirmities of the whole body; and theſe metallical ſpirits made with Tartar, provoke ſweat exceedingly, whereby many malignities are expelled out of the body. Likewiſe alſo the oyl hath its operation, though this of ſeveral metals, as of Mercury and Copper, is not well to be uſed inwardly, becauſe it cauſeth ſalivations and ſtrong vomits. But externally they are very good for to cleanſe all putrid ulcers, and to lay a good and firm ground for healing them.

The remainder, whereof the ſpirit and oyl is diſtilled, you may take out, and reduce it in a crucible into a metal, ſo that what is not come over, may not be loſt, but made to ſerve again.

And as you were taught to diſtil ſpirits and oyls out of diſſolved metals and crude Tartar; ſo you may get them likewiſe out of common vitriol and Tartar, *viz.* thus, take one part of Tartar made into powder, two parts of good pure vitriol, mix them well together, and diſtil a ſpirit of them, which though it be unpleaſant to take, for all that in all obſtructions and corruption of blood whatſoever it is not to be deſpiſed, but very ſucceſsfully performeth its operation; eſpecially when it is rectified from its *Caput Mortuum*, and ſo freed from its phlegm; and its beſt vertue, which conſiſteth in the volatility, be not loſt in the diſtilling.

N. B. But if you will have this ſpirit more effectual, then you may join Tartar and vitriol by boyling them together in common water, and cryſtallizing; and then caſt it in, and diſtil it, and there will come over a much purer and more penetrating ſpirit; becauſe that in the ſolution and coagulation of both, many fæces were ſeparated: but if to one part of vitriol you take two parts of Tartar, and diſſolve it together, and ſo filter and coagulate it, then the Tartar with the vitriol will ſhoot no more, but there remaineth a thick liquor like unto honey, out of which with ſpirit of wine there may be extracted a good tincture againſt obſtructions. This liquor taken from ℈ i. to ʒi. doth purge very gently, and ſometimes it cauſeth a vomit, eſpecially if the vitriol was not pure and good: and it may be alſo diſtilled into a ſpirit not inferiour unto the former in vertue. Beſides the way above taught, there is yet (for to diſtil a metallized ſpirit of Tartar) another way, whereby ſeveral metals and minerals may be reduced into pleaſant ſpirits and oyls, and of more vertue, and it is done in this manner.

Take of the Tartar of white Rheniſh wine made into powder, pour upon it ſweet rain or running water, ſo that to ℔ j. of tartar there be ℔ x. or ℔ xij. of water, or ſo much that the tartar may be diſſolved by it in the boyling, and then boyl the mixture with the water in a tinned kettle, or which is better, in a glazed pot, until it be quite diſſolved, and in the mean while take off the skum (with a wooden skimmer) ſtill as it riſeth in the boyling: and when no more skum riſeth, and all the tartar is diſſolved, then pour the ſolution thus hot through a linnen cloth, tyed ſtraight on an earthen glazed veſſel, that the remaining ſlimineſs may be ſeparated. The tartar water being ſtrained, let it ſtand for 24. or 30. hours without ſtiring, and there will ſtick a cryſtallized tartar to the ſides of the veſſel, which after the water is poured off may be taken out, and waſhed with cold water, and then dryed. This purified tartar keep, until I ſhall teach you, what further is to be done with it; and this tartar is pure enough for the above ſaid purpoſe, *viz.* to reduce metals into oyl with it, as ſhall follow anon. It is alſo good taken of it ſelf for an abſterſive to make the body ſoluble. But if you deſire to have it yet whiter and fairer and in great Cryſtals, you muſt proceed thus.

You muſt know this that all ſalts, if they ſhall ſhoot into great cryſtals, there muſt be a great quantity of them, for of little there comes but little. And if you will make great and fair white cryſtals of tartar, which will be no better than the former, but only pleaſant to the eye, then you muſt proceed in this manner.

Take of white tartar made into powder about ten or thirty ℔. pour ſo much water upon it, as is needful for to diſſolve it, and boyl it by a ſtrong fire in a tinned kettle, until all the tartar be diſſolved, which you may know by ſtirring in it with a wooden ladle, and skim off diligently all the filth riſing on the water; and you muſt take heed, that you take neither too much nor too little water to it; for if you take too little, part of the tartar will remain undiſſolved, and ſo will be caſt away and loſt among the ſlime: but if you take too much of it, then the tartar is too much diſſperſed in the water, and cannot ſhoot well, and ſo will likewiſe be loſt, being caſt away afterwards with the water. For I have heard many a one complain, that they could get but little of a pound, and therefore ſuppoſed the tartar to have been naught, whereas the fault was not in the tartar, but in the workman, that managed not well his work, pouring away one half which did not ſhoot with the water: but if you proceed well, then four pound of common tartar will yield ℔ iij. of pure white cryſtals. The ſolution being well made, and no skim more

riſing

riſing at the top, cover the kettle, and let it cool without removing from the warm place it ſtands in, which will be done within three or four dayes, if the kettle be bigg. But the fire muſt be taken away from under the kettle, and ſo let it ſtand for the time mentioned. In the mean while the Tartar will cryſtalliſe to the ſides of the kettle, which cryſtals after the time is expired, and the water poured off, are to be taken out and waſhed and boyled again with freſh water, and ſo skimmed and cryſtalliſed; and this proceeding muſt be ſtill reiterated, untill (which is done the third or fourth time) the cryſtals are white enough: then take them out, dry and keep them for uſe; whereof from ℥ j. to ℥ j. made into powder, and taken in wine, beer, warm broth or other liquor, will give ſome gentle ſtooles, and ſerveth for thoſe, which cannot endure ſtrong phyſick. This tartar may be ſharpned with Diagridium or any other purging drug, that ſo you need not take it in ſo great a quantity at once, but a leſſer doſe may ſerve turn. But if you do not look for great cryſtals, but only for Tartar well purified, then you may uſe this following manual, and you will get exceeding fair and gliſtering little cryſtals, which need no beating into powder, but by the working come to be ſo pure and fine, as if they had been ground upon a ſtone, and looking not like a dead powder, but having a gloſs, like unto ſmall gliſtering ſnow that fell in very cold weather, and it is done thus: when the cryſtals are come to be pure enough by often diſſolving and coagulating, then diſſolve them once again in pure water, and pour the ſolution into a clean veſſel of wood, copper, or earth being glaſed; and let it not ſtand ſtill (as above taught with the cryſtals) but as ſoon as it is powred in, with a clean wooden ſtick ſtirr about continually without ceaſing, till all be cold, which will be done in half an houre. In this ſtirring the Tartar hath no time to ſhoot into cryſtals, but doth coagulate into the ſmalleſt gliſtering powder, pleaſant to behold, and like unto frozen ſnow ſettleth at the bottom of the veſſel; then pour off the water, and dry the powder, and keep it for uſe. The waters which you poured off, in regard that they contain yet ſome Tartar, ought not to be caſt away (as others do) but evaporated, and the Tartar contained in them will be ſaved, and ſo nothing will be loſt, and in this manner not only white Tartar may be reduced into clear cryſtals, but alſo the red being ſeveral times diſſolved and cryſtallized, loſeth its redneſs, and turneth white and clear. Beſides the aboveſaid, there is another way to reduce the Tartar into great white cryſtals at once by precipitation; but theſe being good enough for our purpoſe, *viz.* to make good medicines out of metals, I hold it needleſs to looſe more time by the relation of it, and ſo I will acquieſce.

Another way to make a metalliſed ſpirit of Taratr.

TAke of purified Tartar diſſolved and coagulated but once, as much as you pleaſe, pour ſo much rain or other ſweet water to it as will ſerve to diſſolve it; in which ſolution you muſt boyl plates of metals, until the Tartar have diſſolved enough of it, ſo that it will diſſolve no more; the ſign whereof is, when the ſolution is deep coloured of the metal, and during your boyling you muſt often ſupply the evaporated water with pouring on of other, leſt the Tartar come to be too dry and burn; and this ſolution may be done beſt of all in a metallical veſſel; as when you will make the ſolution of iron, you may do it in an iron pot; and for copper you may take a copper kettle, and ſo forth for other metals, a veſſel made of the ſame is to be taken. But you muſt know that gold, ſilver, and crude Mercury, unleſs they be firſt prepared cannot be diſſolved like iron and copper, but when they are prepared firſt for the purpoſe, then they will alſo be diſſolved. In like manner ſome minerals alſo muſt be firſt prepared, before they can be diſſolved with Tartar and water. But if you can have good glaſſes or glazed veſſels of earth, you may uſe them for all metals and minerals for to diſſolve them therein, and the ſolution you may not only uſe of it ſelf for a medicine, but alſo diſtill it, and make a very effectual ſpirit and oyl of it as followeth.

To diſtill the ſpirit and oyl of Lead and Tin.

TAke the filings of Lead and Tin, and boyl them with the water or ſolution of Tartar in a leaden or tin veſſel, untill the Tartar be ſweetned by the water, ſo that it will diſſolve no more, to which paſs it will be brought within twenty four hours, for both theſe metals will be diſſolved but ſlowly, but if you would perform this ſolution ſooner, then you muſt reduce the metals firſt into a ſoluble calx, and then they may be diſſolved in leſs time than an hour. The ſolution being done, you muſt filtre it, and in B. abſtract all the moiſture to the thickneſs or conſiſtency of honey, and there will remain a pleaſant ſweet liquor, which of it ſelf with out any further preparation may ſafely be uſed inwardly for all ſuch diſeaſes, for which other medicaments, made of theſe metals are uſeful. Eſpecially the ſweet liquor of lead and tin doeth much good in the Plague, not only by driving the poyſon from the heart by ſweating, but alſo by breaking or allaying the intolerable heat, ſo that a happy cure doth follow upon it: but externally the liquor of lead may be uſed ſuccesfully in all inflammations, and it healeth very ſuddenly, not only freſh wounds, but alſo old ulcers turned to fiſtulaes; for the Tartar cleanſeth, and lead conſolidates.

The liquor of tin is better for inward uſe than for outward whoſe operation is not ſo fully known yet, as that of lead. But if you will diſtil a ſpirit thereof, then caſt it in with a ladle by little and little, as above in other diſtillations oftentimes was mentioned, and there will come over a ſubtle ſpirit of tartar, carrying along the vertue and beſt eſſence of the metal, and therefore doth alſo prove much more effectual than the common ſpirit of tartar, which is made alone by it ſelf, and this ſpirit as well that which is made of tin, as that of lead, if it be well dephlegmed firſt, may be uſed and held for a great treaſure in all obſtructions, eſpecially of the Spleen; and few other medicines will go beyond them; but beſides there muſt not be neglected the uſe of good purging medicines, if need require them. With the ſpirit there cometh over alſo an oyl, which is of a quick operation, eſpecially in wounds and ſores of the eye, where other oyntments and plaiſters may not ſo fitly be uſed, for it doth not only allay the heat and inflammation, a common ſymptome of the eye wounds, but alſo doth hinder and keep back all other ſymptomes which few other medicaments, are a-

ble to do; and for the reſidue, if it be driven further by the ſtrongeſt fire, then there will come over a ſublimate, which in the air diſſolveth into oyl, which is alſo of a powerful operation, not only in phyſick, but alſo in Alchymy.

And the Lead runeth together into a fair white *Regulus*, which is much whiter, purer and fairer than other common lead: but the tartar retaines the blackneſs, and raiſeth it ſelf to the top as a fuſible droſs, which is impregnated with the ſulphur of lead, wherewith you may colour hair, bones, feathers and the like, and make them to be, and remain brown and black.

I made tryal once of ſuch a diſtillation in an iron veſſel, whereby the ſame in the inſide was ſo whitened by the purified lead, that it was like unto fine ſilver in brightneſs: which afterwards trying again, it would not fall ſo fair as at firſt; whereat none ought to wonder, for I could write ſomething more (if it were fit) of tartar, knowing well what may be effected with it, if I did not ſtand in fear of ſcoffers, which vilify all what they do not underſtand. I durſt preſume to call tartar the Sope of the Philoſophers; for in the cleanſing of ſome metals, by long experience I found it of admirable vertue; though I would not be underſtood thus, as if I did count it to be the true *Azoth univerſalis Philoſophorum*, whereby they waſh their Laton: but I cannot deny, but that it is of particular uſe for the waſhing and cleanſing of ſeveral metals; for it is indued with admirable vertues for the uſe of metals, whereof in other places more ſhall be ſaid hereafter.

How to make a Tartariſed ſpirit and oyle out of Iron or Steel and Copper.

IF you intend to make a good medicine out of iron or ſteel or copper joyned with tartar, then for the iron or ſteel take an iron pot, and for copper a kettel of copper, make them very clean and put in it the filings of iron, or ſteel, or copper, which you pleaſe, and twice as much of pure tartar made into powder, and ſo much water, that the tartar may be diſſolved well by it in the boyling, and ſo boyl the metal with the tartar-water ſo long, till it be deeply coloured by the metal, as red by the iron, and deep green by the copper; and when the water in the boyling doth waſte, you muſt ſtill ſupply it with other, that the tartar may not burn; for there muſt be alwayes ſo much water, that no skin of the tartar may riſe at the top, but that it remain always open, and there muſt not be too much water neither, leſt it be too ſweet, and not able to diſſolve the metal. The ſolution of iron or ſteel being come to be red and ſweet, and in taſte like unto vitriol, but green and bitter of copper, pour it off warm by inclination into an other clean veſſel, and let it ſtand ſo long again in a very gentle heat of coals, till almoſt all the water be evaporated, and the diſſolved metal with the tartar remain in the conſiſtency of honey.

Which metallical liquor may be uſed inwardly and outwardly (eſpecially that of iron) which doth purge gently, and openeth the obſtructions of the Liver and Spleen: cleanſeth the Stomach, and killeth Worms: externally uſed it is a good wound balſome, and goes far beyond all ſuch as are made of vegetables. It is a ſingular treaſure, not only for to cure new wounds; but alſo for to cleanſe and heal old corrupt exulcerated ſores, turned to fiſtulaes; but the liquor of copper is not ſo ſafe for to be uſed inwardly, for it is not only very unpleaſant in taſte, but alſo cauſeth vehement vomits: and therefore I would not adviſe any one to be forward to uſe it, unleſs it be for ſtrong folks and for to kill worms in them, for which purpoſe it is excellent good and ſurpaſſeth all other medicines whatſoever; but to little children it ought not to be given at all, in regard that it is of far too ſtrong an operation for them.

N. B. And if you will uſe it to ſtrong bodies againſt the worms or ſtomach-agues, you muſt obſerve that the patient (in caſe that he cannot get it up) thruſt his finger into the throat to further the vomiting, that it may not ſtay behind, but come forth again out of the body, which done health followeth upon it; but if it remain in the body, it cauſeth a loathſomeneſs to uſe it any more. And therefore you muſt take heed to uſe it warily: and in regard that this liquor is very bitter, you may mix it with ſome ſugar, to facilitate the taking thereof; but that of iron needeth no ſuch correction, it being ſweet enough of it ſelf, and therefore I commend and prefer it before the other: but if you will needs have that of copper (becauſe it worketh ſo ſtrongly) then the Patient muſt keep in from the cold aire, and not preſently after the operation load the ſtomach with ſtrong drink and ſuperfluity of meat, contenting himſelf with ſome warm broth and a little cup of wine or beer, and the next day his meat and drink will taſte the better with him, and do him ſo much the more good.

But externally, this liquor is of the ſame uſe with that of iron or ſteel, yea, proveth more effectual and ſpeedier in healing. It would be good that Surgeons knew how to prepare it, and would uſe it inſtead of their ſalves, wherewith many freſh wounds are ſpoyled and turned into horrid ulcers, eſpecially it requiring ſo little coſt and pains to make it. And if you would have theſe liquors purer yet, you muſt pour on ſpirit of wine, and extract them, and they will eaſily yield their tincture, and leave many fæces behind which are good for nothing: but the tincture will be ſo much the better, purer, and more effectual, ſo that you need uſe but four or five drops for purging, whereas of the groſs liquor you muſt have from 4, 6, 8. to 12. or 16. drops: and this extracted tincture worketh alſo much better externally, and keepeth longer than the balſome or liquor, which in time is corrupted, but the extraction is never ſpoiled. But if you will diſtil the liquor or balſome, it is needleſs that it be extracted firſt, but may be diſtilled ſo as the boyling made it, after the ſame manner, as above was taught for Lead, and there will come over a yellow ſpirit and oyl from iron or ſteel, and from copper a greeniſh ſpirit and oyl.

The ſpirit and oyl of iron may ſafely be uſed in the plague, feavers, obſtructions, and corruption of blood, from ℥ i. to ʒ i. It is much better to provoke ſweat, than that which is made of crude Tartar, without addition of a metal: the like doth that alſo which is made of copper and more effectually yet, and ſometimes cauſeth a vomit, if it be uſed in a greater quantity, than is fitting.

N. B. Although the Chymiſts do prefer copper before iron, as a more firm and ripe metal, nevertheleſs it is found by experience, that iron or ſteel

ſteel by reaſon of its ſweetneſs is better to be uſed for an inward medicine than copper. But for external uſe, copper (if it be well prepared) hath the preheminence, being an appropriate medicine for all ulcers and open ſores, in all the parts of the body, if the ſame inwardly be kept clean by fitting purges. For not only the now deſcribed medicine, but alſo many more beſides, are taught to be made out of copper in other places of my books.

A Country-phyſick and purge I will teach for thoſe, which either live far from Apothecary-ſhops, or have no money to ſpare for phyſick; and it is to be made out of iron and copper, whereby they may cleanſe their ſlimy ſtomachs, ſpoyled by a diſorderly dyet, whence head-aches, worms, agues, and other diſeaſes are occaſioned, warning withal thoſe that are either too old or too young, or elſe decayed and weak, and ſo not ſtrong enough for ſuch powerful phyſick, that they will forbear to uſe it, leſt beſides the worms, they kill and expel life it ſelf alſo; but thoſe that are of a ſtrong conſtitution, and a middle age, and of a ſound heart, may ſafely uſe this purge, whereby ſtomach-agues, belly-worms, and may other occult diſeaſes may be cured with good ſucceſs. The preparation is done thus: Take ℥ ſs. of pure tartar made into powder, & ℥ ſs. or ℥ j. of ſugar or honey, and ℥ v. or ℥vj. of ſpring or rain water, put all into a clean copper veſſel which is not greaſy, and boyl it upon a coal fire as long or ſomewhat longer than you uſe to boyl an egg, or at the furtheſt half a quarter of an hour; take off the skum in boyling, let it ſtand till it be milk-warm, ſo that it may be drunk. This potion taſting almoſt like warm wine ſweetned with ſugar, give unto the patient to drink, and let him faſt upon it, and within half an hour it will begin to work upwards and downwards; whereat you need not be amazed, but only keep the body warm, and within an hour it will have done working. But if you will drive out worms from little children by purging, then inſtead of the copper-veſſel, take a clean iron-veſſel, and put in a leſs quantity of tartar, ſugar and water, and boyl it as aboveſaid, and give it to them, and it will purge only downward, but ſometimes it will alſo give a gentle vomit, which will do them no hurt, but rather will cleanſe the ſtomach the better. But if the drink be too weak, ſo that it doth not work, it may be uſed again the next day (but you muſt take more of the ingredients, or elſe let them boyl longer) there is no danger in it at all, if you proceed aright, and it is much pleaſanter to take, than the bitter worm-ſeed, wherewith they uſually torment children.

The reaſon why this decoction works in this manner is, that the tartar and ſugar being boyled in metallical veſſels with water, work upon the metal, and extract vertue out of it, which cauſeth vomiting and purging (the Tartar alſo being helpful to it.)

How to make a Tartariſed ſpirit of Mercury.

VUlgar Mercury cannot be diſſolved like the former metals with tartar and water, without any foregoing preparation; but muſt be ſublimed firſt with ſalt and vitriol, or cryſtalliſed with *Aqua fortis*, and then it may be diſſolved by boyling with tartar and water, and reduced into a balſame, like other metals, but is not to be uſed inwardly, unleſs it be digeſted a ſufficient time, ſo that its fierceneſs be allayed: Externally it may ſafely be uſed in all deſperate, eſpecially venereal ſores, and it is a very effectual and profitable medicine for them. But moſt of all it doth ſerve for Alchymy, although few do know this gueſt, becauſe he will not be ſeen by every one. The ſpirit which comes over from it by diſtillation, is an admirable thing not only in phyſick, but alſo in Alchymy: yet you muſt take heed, that inſtead of a friend, you do not harbor a great enemy: for its force and vertue is very great and powerful.

How to make a Tartariſed ſpirit of Gold and Silver.

GOld and ſilver alſo can by no means be diſſolved with tartar in a wet way: but in a dry way adding its helper to it, it will eaſily diſſolve, which doth not belong hither; but if you will draw a ſpirit of it, then the gold and ſilver muſt firſt by diſſolving and coagulating be reduced to cryſtals, and then diſſolved with purifyed tartar and water, and of Gold you will get a yellow ſolution, and of ſilver a white inclining unto green, which being reduced to the conſiſtency of honey, may be uſed ſafely and without fear. The ſolution of Gold doth looſen and keep the body open; it effectually ſtrengtheneth the ſtomach, heart, lungs, and liver, and other principal members: and that of ſilver purgeth very forcibly, according to the quantity given, like another purge, but without harm or danger, ſo that in all diſeaſes where purging is neceſſary, it may be uſed ſafely from ℈ i. to ℥ ſs. but that of gold is uſed in a ſmaller quantity: and both the liquor of gold and of ſilver may very ſucceſsfully be uſed externally: but becauſe for external uſes inferiour metals will ſerve the turn, it is needleſs to uſe coſtly things thereto.

The ſpirit which is forced from it by diſtillation, is endued with great vertue: for the volatile part of the metal cometh over-joyned with the ſpirit of tartar, the remainder may be reduced, ſo as it was taught of other metals. This ſpirit, eſpecially that of Gold, is exceeding good in the plague and other diſeaſes, where ſweating is neceſſary: for it driveth not only by ſweating, all Malignities from the Heart, but alſo doth ſtrengthen the ſame, and preſerveth it from all hurtful ſymptomes. Likewiſe alſo that of ſilver is very commendable, eſpecially if it be firſt dephlegmed from its *Caput Mortuum*, as above was taught in the preparation of the common ſpirit of tartar. For any Phyſitian expert in Chymiſtry may eaſily gueſs what the ſpirit of tartar well rectifyed and impregnated with the vertues of gold may effect, and therefore it is needleſs to make any further mention of it, but it ſhall be left to the tryal thereof.

To make a Tartariſed ſpirit of Antimony,

CRude Antimony cannot be diſſolved in ſuch a manner as above hath been taught: but if it be firſt prepared into flores, or a *vitrum*, it yieldeth eaſily its vertue in boyling, and it is done thus: Take to one patt of the flores or of ſmall ground *vitrum Antimonii* made *per ſe*, three parts of pure tartar, and 12. or 15. parts of clean water, boyl the Antimony with the tartar and wa-

ter in a glazed pot for three or four hours, and the evaporated water muſt be ſtill ſupplyed with other that the tartar may not burn for want of water, and the *vitrum* muſt be ſometimes ſtirred about with a wooden ſpatula (which the flores being light do not need): This done, the tartar water will be deep red coloured by the Antimony, and leave the remaining Antimony ſettled in the bottom, from which pour off the ſolution, and after having filtred it, evaporate the water from it, and then extract it once more with ſpirit of wine, and you will get a blood-red *Extractum*, whereof 1, 2, 3. to 10. or 12. drops given at once, cauſeth gentle vomits and ſtools, which may be ſafely uſed by old and young in all diſeaſes that have need of purging, and you need not fear any danger at all: For I know no vomit, which purgeth more gently than this, and if you pleaſe, you may make it work only (*per inferiora*) downward, ſo that it ſhall cauſe no vomits at all: and you need do nothing elſe but make a toaſt of brown bread, and hold it hot to your noſe and mouth, and when this is almoſt cold, have another hot in readineſs, and ſo uſe one after another by turns, till you feel no more loathing, and that the vertue of Antimony hath begun to work downward: This is a good ſecret for thoſe that would uſe Antimonial phyſick, but that they are affraid of vomiting, which they are not able to endure. But if you will not ſpend ſo much pains, as to make ſuch an Extract, then do as you was taught above to do with the copper, and take ten or twelve grains of prepared Antimony for an old body, but for a young one 5, 6. grains or more or leſs according to the condition of the perſon, and ℥ ſs. or ℥ vj. of pure tartar, and together with ℥ iiij. or ℥ v. of water put it in a little pipkin, and boyl it a quarter of an hour, then pour the ſolution only into a cup, and diſolve a little ſugar in it, whereby the acidity of the Tartar will be ſomewhat qualified. The *decoctum* drink warm, and keep your ſelf as it is fit, and it will work much better, than it if had been ſteeped over night in wine, which not every one can abide to take faſting; but this *decoctum*, becauſe it taſteth like warm and ſweet wine, is much pleaſanter to take.

N. B. It is to be admired, that well prepared Antimony is never taken in vain: for although it be given in a very ſmall quantity, ſo that it cannot cauſe either ſtools or vomits, yet it worketh inſenſibly, *viz.* it cleanſeth the blood, and expelleth malignities by ſweat, ſo that mighty diſeaſes may be rooted out thereby without any great ſenſible operation. Which many times hapned unto me, and gave me occaſion to think further of it; and therefore I ſought how to prepare Antimony ſo, that it might be uſed daily without cauſing of vomits or ſtools, which I put in execution accordingly, and found it good, as afterward ſhall follow.

Of the ſolution above deſcribed, *viz.* of the flores of Antimony with tartar make a good quantity, and after the evaporation of the water diſtill a ſpirit of it, and there will alſo come over a black oyl, which muſt be ſeparated from the ſpirit, and rectified *per ſe*; and externally applyed it will not only do the ſame wonderful operations, which above have been aſcribed to the ſimple oyl of tartar, but it goeth alſo far beyond it, for the beſt eſſence of Antimony hath joyned it ſelf thereunto in the diſtilling and ſo doubled the vertue of the oyl of Tartar; and this oyl may with credit be uſed not only for all podagrical tumors to allay them very readily, but alſo by reaſon of its dryneſs it doth conſume all other tumors in the whole body, whether they be cauſed by wind or water: for the volatile ſalt by reaſon of its ſubtlety, conveyeth the vertue of Antimony into the innermoſt parts of the body in a marvellous and incredible way, whereby much good can be performed in Chyrurgery.

As for the ſpirit, you may not only uſe it very ſucceſsfully, in the Plague, Pox, Scurvy, *Melancholia Hypochondriaca*, Feavers, and other obſtructions and corruptions of blood, but alſo if you put ſome of it into new wine or beer, and let it work with it, the wine or beer comes to be ſo vertuous thereby, that if it be daily uſed, it doth ſtay and keep off all diſeaſes proceeding from ſuperfluous humors and corrupted blood, ſo that neither Plague, Scurvy, *Melancholia Hypochondriaca*, or any other diſeaſe of that kind can take root in thoſe that daily uſe it, wherein no metal or mineral (except gold) can be parallel'd with it: but in caſe you have no conveniency to make that ſpirit, and yet you would willingly have ſuch a medicinal drink made of Antimony, then take but of the ſolution made with tartar, before it be diſtilled, and put ℔ j. or ℔ j ſs. of it into 18. or 20. gallons of new wine or beer, and let it work together, and the vertue of the Antimony by the fermentation of the wine will grow the more volatile and efficacious to work. And if you cannot have new wine (in regard that it doth not grow every where) you may make an artificial wine of Honey, Sugar, Pears, Figs, Cherries or the like fruit, as in the following third part ſhall be taught, which may ſtand in ſtead of natural Wine.

Theſe medicinal wines ſerve for a ſure and ſafe preſervative, not only to prevent many diſeaſes, but alſo if they have poſſeſſed the body already, effectually to oppoſe and expel them. Alſo all external open ſores (which by daubing and plaiſtering could not be remedied) by daily drinking thereof may be perfectly cured. For not only *Baſilius Valentinus*, and *Theophraſtus Paracelſus*, but many more before and after them knew it very well, and have written many good things of it, which few did entertain, and (becauſe their deſcription was ſomewhat dark) moſt deſpiſed and defamed them for untruths.

In like manner, and much more may this my writing be lightly eſteemed of, becauſe I do not ſet down long and coſtly proceſſes, but only according to truth, and in ſimplicity do labour to ſerve my neighbour, which doth not ſound well in the ears of the proud world, which rather tickle and load themſelves with vain and unprofitable proceſſes, than harken unto the truth; and it is no wonder, that God ſuffereth ſuch men, which only look after high things, and deſpiſe ſmall things, to be held in Error.

Why do we look to get our Medicines by troubling our brains, & by ſubtle and tedious works, whereas God through ſimple nature doth teach us otherwiſe. Were it not better to let ſimple nature inſtruct us? ſurely if we would be in love with ſmall things, we ſhould find great ones. But becauſe all men do ſtrive only for great and high things, therefore the ſmall alſo are kept from them; and therefore it would be well, that we could fancy this maxim, that alſo things of ſmall account can do ſomething, as we may

may ſee by Tartar and deſpicable Antimony, and not only ſo many coals, glaſſes, materials, and the like, but alſo the pretious time would not be waſted ſo much in preparing of medicaments: for all is not gold that gliſtereth, but oftentimes under a homely coat ſome glorious thing is hid; which ought to be taken notice of.

Some may object why do I teach to joyn the Antimony firſt with the Tartar by the help of common water before its fermentation with the wine: whether it would not be as good to put it in of it ſelf in powder, or to diſſolve it with ſpirit of ſalt (which would be eaſier to do than with Tartar) and ſo let it work? To which I anſwer, that the working wine or drink, receiveth no metallical calx or ſolution, unleſs it be firſt prepared with tartar or ſpirit of wine. For although you diſſolve Antimony, or any other metal or mineral in ſpirit of ſalt, or of vitriol, or of ſalt nitre, or any other acid ſpirit, and then think to let it work with wine or any other drink, you will find that it doth not ſucceed; for the acid ſpirit will hinder the fermentation, and let fall the diſſolved metals, and ſo ſpoyl the work; and beſides, Tartar may be uſed among all drinks, and doth more agree with ones taſte and ſtomach, than any corroſive ſpirit.

In the ſame manner as was taught of Antimony, other minerals and metals alſo may be fitly joyned with wine or other drink, and the uſe of ſuch Antimonial wine is this, *viz.* that it be drank at meals and betwixt meals like other ordinary drink to quench thirſt, but for all that, it muſt not be drank in a greater quantity, than that Nature be able to bear it. For if you would drink of it immoderately, it would excite vomits, which ought not to be, for it is but only to work in an inſenſible way, which if it be done, it preſerveth not only the body from all diſeaſes proceeding from corrupted impure blood, as the Plague, Leproſy, Pox, Scurvy, and the like, but by reaſon of its hidden heat, whereby it doth conſume and expel all evil and ſalt humors (as the Sun dryeth up a pool) by ſweat and urine, and ſo doth unburthen the blood from all ſuch ſharp and hurtful humors, *&c.* It doth not only cure the aboveſaid diſeaſes, but alſo all open ſores, ulcers, fiſtulaes, which by reaſon of the ſuperfluity of ſalt humors can admit of no healing, and it doth diſpatch them in a ſhort time in a wonderful manner, and ſo firmly that there is no relapſe to be feared.

This drink is not only good for the ſick, but alſo for the whole (though in a ſmaller quantity) becauſe that it wonderfully cleanſeth the whole body, and you need not fear the leaſt hurt either in young or old, ſick or healthy. And let no man ſtumble at it, that many ignorant men do defame Antimony and hold it to be poyſon, and forbid it to be uſed; for if they knew it well, they would not do ſo; but becauſe ſuch men know no more, than what they get by reading, or by hear-ſay, they pronounce a falſe ſentence; and it might be replyed unto them, as *Apelles* did to the Shooe-maker; *Ne ſutor ultra crepidam*: but what what ſhall we ſay? *Non omnis fert omnia tellus.* When an Aſs after his death doth rot, out of the carcaſs groweth Beetles, which can fly higher than the Aſs from whence they came; In the like manner we wiſh it may fare with the haters of royal Antimony, *viz.* that their poſterity may get ſeeing eyes, and what they know not, they may forbear to deſpiſe and ſcoff at.

I muſt confeſs, that if Antimony be not well prepared, and beſides, be indiſcreetly uſed by the unskilful, that it may prejudice a man in his health, which even the vegetables alſo may do. But to reject it by reaſon of the abuſe, would be a very unwiſe act: If perchance a child ſhould get into his hand a ſharp-edged knife, and hurt himſelf or others, becauſe it doth not underſtand how to uſe a knife, ſhould therefore the uſe of a knife be rejected and forbidden to thoſe that are grown up and know how to uſe it? Good ſharp tools make a good workman; ſo good quick working and powerful medicines make a good phyſitian; and the ſharper the tool is, the ſooner a ſtone-carver or other craftsman may ſpoyl his work by one cut which he doth amiſs: which alſo muſt be underſtood of powerful medicines, for if they be uſed pertinently, in a ſhort time more good may be done with them, than with weak medicaments in a long time. Now as a ſharp tool is not to be handled but by a good workman, ſo likewiſe a powerful medicine ought to be managed by an underſtanding and conſcientious phyſitian, who according to the condition of the perſon, and the diſeaſe, knows to increaſe or abate the ſtrength of the medicine, and not by ſuch a one, as doth miniſter it ignorantly without making any difference at all.

Let no man marvail, that I aſcribe ſuch great vertues unto Antimony, it being abundantly enriched with the *primum ens* of gold. If I ſhould ſay ten times as much more of it, I ſhould not lye. Its praiſe is not to be expreſſed by any mans tongue; for purifying of the blood, there is no mineral like unto it; for it cleanſeth and purifieth the whole man in the higheſt degree, if it be well prepared firſt, and then diſcreetly uſed. It is the beſt and next friend to gold, which by the ſame alſo is freed and purified from all addition and filth, as we ſaid even now, of man. Every Antimony for the moſt part agreeth with gold and its medicine; for out of Antimony, by the cleanſing Art may be made firm gold, as in the fourth part ſhall be taught, and which is more, by a long digeſtion a good part of the ſame is changed into gold. Whereby it is evident, that it hath the nature and property of gold, and it is better to be uſed for a medicine than gold it ſelf, becauſe the golden vertue is as yet volatile in this, but in the other is grown fixed and compacted, and may be compared to a young child in reſpect of an old man. Therefore it is my advice, that in Antimony medicine ſhould be ſought, and not to trifle away time and coſt in vain and uſeleſs things.

Further note, That if you deſire to contract nearer together the vertue of Antimony or any other mineral or metal, as above was taught to be done with the Tartar, you muſt by exhalation of the ſuperfluous moiſture in Balneo, reduce the ſolution to a honey thick liquor, and pour ſpirit of wine upon it for to extract, and within few days it will be very red; then pour it off and pour on other, and let this likewiſe extract: continue this proceeding with ſhifting the ſpirit of wine, till the ſpirit of wine can get no more Tincture; then put all the coloured ſpirit of wine together into a glaſs with a long neck, and digeſt it ſo long in a warm Balneum, till the colour or beſt eſſence of Antimony be ſeparated from the ſpirit of wine, and ſettled to the bottom like a

blood red thick fat oyl, ſo that the ſpirit of wine is turned white again; which is to be ſeparated from the fair and pleaſant oyl of Antimony, which is made without any corroſive, and is to be kept as a great treaſure in phyſick. The ſpirit of wine retains ſomewhat of the vertue of Antimony, and may be uſed with ſucceſs of it ſelf both inwardly and outwardly. But the Tincture as a Panacea in all diſeaſes acteth its part with admiration, and as here mentioned of Antimony, ſo in the ſame manner all metals by the help of Tartar and ſpirit of wine may without diſtilling be reduced into pleaſant and ſweet oyles, which are none of the meaneſt in Phyſick: for every knowing and skilful Chymiſt will eaſily grant, that ſuch a metallical oyl, as without all corroſives out of the groſs metals is reduced into a pleaſant eſſence, cannot be without great and ſingular vertue.

How to make good ſpirit and oyles out of Pearls, Corals, Crabs-eyes, and other light ſoluble ſtones of beaſts and fiſhes.

TAke to one part of pearls or corals (made into fine powder three or four parts of pure Tartar, and ſo much water as will diſſolve the Tartar by boyling; put the corals, Tartar and water together into a glaſs body, which muſt ſtand in ſand, and give it ſo ſtrong a fire, that the water boyl in the glaſs body with the Tartar, and may diſſolve the corals. (This ſolution may be done alſo in a clean earthen pot that is glaſed, and the evaporated water muſt be ſupplyed with other, as above was taught to be done with the metals.) The corals being diſſolved, let them cool, filtrate the ſolution, and abſtract all the moiſture from it in Balneo, and there will remain a pleaſant honey-thick liquor, which may be uſed in Phyſick either of it ſelf, or elſe once more extracted with ſpirit of wine and purified, or elſe diſtilled, as you pleaſe.

The extract or Tincture is better than the liquor, and the ſpirit is better than the extract or tincture: and all three may well and ſafely be uſed; they ſtrengthen the heart and brain; eſpecially thoſe which are made of pearls and corals, they expel the urin and keep the body ſoluble. Thoſe of crabs eyes and of pearches and other fiſhes open and cleanſe the paſſages of the urin from all ſlime and impurity, and they powerfully expel the ſtone and gravel in the reins and bladder.

N. B. The diſtilled ſpirit of corals being well rectified, is good for the Epilepſy, Melancholy, and Apoplexy. It expelleth and driveth out all poyſon by ſweating, becauſe it is of a golden nature and quality, whereof in another place more ſhall be ſaid.

To diſtill a ſpirit out of ſalt of Tartar and crude Tartar.

IF you take a like quantity of crude Tartar and of ſalt of Tartar, and diſſolve it with clean water, and then evaporate the water ſtill skimming it, till no skin more do riſe, and then let it cool, there will ſhoot white cryſtals, which being diſtilled as common Tartar, they will yield a purer ſubtler and pleaſanter ſpirit, than the crude Tartar doth, in all to be uſed as above hath been taught of the ſimple ſpirit of Tartar: therefore it is needleſs here to deſcribe its uſe. Before you diſtill a ſpirit thereof, you may uſe them in ſtead of *Tartarus vitriolatus* for purging, they will cauſe gentle ſtools, and drive alſo the urin and ſtone, and are not unpleaſant to take. The doſe is from ℈ i. to ʒ i. in waters fit for your purpoſe. This ſalt diſſolved with water purifieth metals (if they be boyled therein) and maketh them fairer then common Tartar doeth.

How to get a powerful ſpirit out of the ſalt of Tartar, by the help of pure ſand, or peble-ſtones.

IN the firſt part of this book I taught how to make ſuch a ſpirit, but becauſe the materials, which are to be diſtilled in that furnace muſt be caſt upon quick coals, whereby the remainder is loſt, and that alſo not every one hath the conveniency to ſet up a furnace that requireth more room than this here doth: therefore I will ſet down how it may be got with eaſe in this our preſent furnace, without the loſs of the remainder, which is not inferior to the ſpirit it ſelf. And it is done thus:

Make a fair white ſalt of calcined Tartar by diſſolution, filtration aud coagulation, pulveriſe that ſalt in a warmed morter, and add to it a fourth part of ſmall pulveriſed cryſtal or flints or only of fine ſand, waſhed clean, mix it well, and caſt one ſpoonful thereof at once into your red-hot veſſel (which muſt be made of earth) and ſo cover it, and the mixture as ſoon as it is red hot, will riſe and boyl (as common Allome doth, when it cometh to a ſudden heat) and yield a thick white heavy ſpirit; and when it ceaſeth to come forth, then caſt in another ſpoonful, and ſtay out the time of its ſettling, and then another part again, till all your mixture be caſt in. When no more ſpirit goeth forth, then take off the lid from the diſtilling veſſel, and with an iron ladle take out that which ſtayed behind, whileſt it is yet red-hot and ſoft, and it will look like unto a tranſparent clear white fuſible glaſs, which you muſt keep from the air, for it will diſſolve in it, till I teach you what you are to do with it.

The ſpirit which came over, may either be kept as it is, or elſe rectified *per arenam* in a glaſs retort, and uſed in Phyſick; it is clean of another taſte than the ſpirit of common ſalt or vitriol, for it is not ſo ſharp; it ſmelleth of the flints after a ſulphureous manner, and taſteth urin-like, and it is very good for thoſe that are troubled with the gout, ſtone and Tiſick: for it provoketh urin and ſweat mightily, and (becauſe it cleanſeth and ſtrengthneth the ſtomach) it alſo maketh one have a good appetite to his Victuals What it can do elſe is unknown to me as yet, but it is credible that it may act its part in many other diſeaſes, which is left free for every one to try. In my opinion (ſince the ſpirit of the ſalt of Tartar is good to be uſed of it ſelf for the ſtone, and that here it is ſtrengthned by the ſand, which have the ſignature of the ſtone of the Microcoſme) there is hardly any particular medicine, which can go beyond it, but I leave every one to his own opinion and experience. Externally uſed, it quencheth inflammations and maketh a pure skin, *&c.* The remainder, which I bid you keep, and looks like a tranſparent clear glaſs, is nothing elſe but the moſt fixed part of the ſalt of Tartar and flints, which joyned themſelves thus in the heat, and turned to a ſoluble glaſs, wherein lyes hid a great heat and fire. As long at it is kept dry from the air, it cannot be perceived in it: but if you pour water upon it, then its ſecret heat will diſcover it ſelf. If you make it to fine powder in a warm morter, and lay it in a moiſt air, it will diſſolve and melt into

into a thick and fat oyl, and leave ſome fæces behind. This fat liquor or oyl of ſtints, ſand or cryſtal may not only be uſed inwardly and outwardly of it ſelf, but alſo ſerveth to prepare minerals and metals into good medicines, or to change them into better by Chymical art. For many great ſecrets are hid in the contemptible peble or ſand; which an ignorant and unexpert man (if they were diſcloſed to him) would hardly believe: for this preſent world is by the divels craft ſo far poſſeſſed with curſed filthy avarice, that they ſeek for nothing but money, but honeſt and ingenious ſciences are not regarded at all; and therefore God doth cloſe our eyes that we cannot ſee what lyeth before them, and we trample upon with our feet. That worthy man *Parcelſus* hath given it us ſufficiently to underſtand, when he ſaith in his book (containing the vexations of Alchymiſts) that many times a deſpicable flint caſt at a Cow is more worth than the Cow; not only becauſe that gold may be melted out of it, but alſo that other inferior metals may be purified thereby, ſo that they are like unto the beſt gold and ſilver in all tryals; and although I never got any great profit by the doing of it, yet it doth ſuffice me that I have ſeen ſeveral times the poſſibility and truth thereof, which in its proper place likewiſe ſhall be taught.

This liquor of flints is of that nature toward the metals, that it maketh them exceeding fair, but not ſo, as women do ſcowre their veſſels of tin, copper, iron, *&c.* with ly and ſmall ſand, till all filth be ſcoured off, and that they get a bright and fair gloſs: but the metals muſt be diſſolved therein by Chymical art, and then either after the wet or dry way digeſted in it for its due ſpace of time; which *Paracelſus* calleth to go into the mothers womb, and be born again: if this be done rightly, then the mother will bring forth a pure child. All metals are engendred in ſand or ſtone, and therefore they may well be called the mother of metals, and the purer the mother is, the purer and ſounder child ſhe will bear, and among all ſtones there is none found purer than the peble, cryſtal or ſand, which are of one nature (if they be ſimple and not impregnated with metals:) And therefore the peble or ſand is found to be the fitteſt bath to waſh the metal withall. But he that would take this bath to be the Philoſophers ſecret Menſtruum, whereby they exalt the King unto the higheſt purity, would be miſtaken; for their Balneum is more friendly to gold by reaſon of its affinity with it than with other metals, but this doth eaſier diſſolve other metals than gold. Whereby it is evident, that it cannot be *Benard* his fountain (*Bernhardi fontina*) but muſt be held only to be a particular cleanſer of metals. But omitting this, and leaving it to the further practiſe and tryal of thoſe that want no time nor conveniency for to ſearch what may be done with it, let us take notice of the uſe of this liquor in phyſick, for which uſes ſake this book is written. That which hath been ſaid, was only done to that end, that we may obſerve, that we muſt not always look upon dear and coſtly things, but that many times even in mean and contemptible things (as ſand & pebles) much good is to be found.

How to extract a blood-red Tincture with ſpirit of wine out of the liquor of peble-ſtones.

IF you will extract a tincture out of peble-ſtones, for uſe in Phyſick or in Alchymy, then in ſtead of the white take a fair yellow, green or blew peble or flint, whether it hold fixed or volatile gold, and firſt with ſalt of tartar diſtill the ſpirit thereof; or if you do not care for the ſpirit, then melt the mixture in a covered crucible into a tranſparent, ſoluble and fuſible glaſs, and in a warm morter make it into fine powder; put this powder in a long necked glaſs, and pour upon it rectified ſpirit of wine (it needeth not to be dephlegmed, it matters not if it be but pure) let it remain upon it in a gentle warmth, till it be turned red (the glaſs with the prepared peble or flints muſt be often ſtirred about, that the peble be divided, and the ſpirit of wine may be able to work upon it) then pour off the coloured ſpirit of wine, and pour on other, and let this likewiſe turn red: this pouring off and on muſt be iterated ſo often, till the ſpirit of wine get no more colour out of it. All the Tinctured ſpirit of wine put together, & abſtract in a Balneum through a Limbeck from the Tincture which will remain in the bottom of the glaſs body like a red juyce, which you muſt take out and keep for its uſe.

The uſe of the Tincture of pebles or flints in Phyſick.

THis Tincture if it be made of gold, pebles or ſand, is to be held for none of the leaſt medicines, for it doth powerfully reſiſt all ſoluble Tartareous coagulations, in the hands, knees, feet, reins and bladder; and although in want of thoſe that hold gold, it be extracted but only out of common white peble, it doth act its part however, though not altogether ſo well as the firſt. Let no man marvel, that ſand or pebles made potable, have ſo great vertue; for not all things are known to all; and this Tincture is more powerful yet, if firſt gold have been diſſolved with the liquor of pebles before the extraction. And let no man imagine that this Tincture comes from the ſalt of Tartar (which is taken to the preparing of the oyl of ſand) becauſe that of it ſelf alſo doth colour the ſpirit of wine, for there is a great difference betwixt this Tincture and that, which is extracted out of the ſalt of Tartar: for if you diſtill that of the ſalt of tartar in a little glaſs body or retort, there will come firſt a clear ſpirit of wine, then an unſavory phlegm, and a ſalt will remain behind, in all like unto common ſalt of tartar, wherein after its calcining not the leaſt colour appeareth, and becauſe none came over neither, it might be queſtioned where it remained then?

To which I anſwer, that it was not a true tincture, but only that the ſulphur in the ſpirit of wine was exalted or graduated by the corporeal ſalt of tartar, and ſo got a red colour, which it loſeth as ſoon as the ſalt of tartar is taken from it, and reaſſumeth its former white colour: even as it hapneth alſo, when the ſalt of urin, or of harts-horn or ſoot, or any other like urinous ſalt is digeſted with ſpirit of wine, that the ſpirit turneth red of it, but not laſtingly, but juſt ſo as it falls out with the ſalt of tartar, for if by rectification it be ſeparated again from the ſpirit of wine, each (*viz.* both the ſalt and alſo the ſpirit of wine) doth recover again its former colour, whereby it appeareth, that (as above ſaid) it was not a true tincture. He that will not believe it, let him diſſolve but ℥ i. of common white ſalt of tartar in ℔ i. of ſpirit of wine, and the ſpirit will turn as red of it, as if it had ſtood a long time upon ſeveral pounds of blew or green calcined ſalt of tartar; and if I had not tryed it my ſelf ſeveral times, I ſhould have alſo been of that opinion:

but becauſe I found it to be otherwiſe, therefore I would not omit to ſet down my opinion: though I know I ſhall deſerve ſmall thanks of ſome, eſpecially of thoſe which rather will err with the greater number, than to know and confeſs the truth with the leſs number. However, I do not ſay, that the ſuppoſed tincture of the ſalt of Tartar is of no vertue or uſeleſs; for I know well enough that it is found very effectual in many diſeaſes: for the pureſt part of the ſalt of Tartar hath been diſſolved by the ſpirit of wine, it being thus coloured thereby, and therefore that tinctured ſpirit of wine may very fitly be uſed. But as for the Tincture, which is extracted out of the prepared pebles, it is clean of another condition: for if you abſtract the ſpirit of wine from it, though it alſo cometh over white, yet there remaineth a deep tinctured ſalt, whoſe colour is laſting in the ſtrongeſt fire, and therefore may be counted a true Tincture.

How by the help of this liquor out of Gold its red colour may be extracted ſo that it remains white.

THis oyl or liquor of pebles is of ſuch a condition, that it doth precipitate all metals which are diſſolved by corroſives, but not after that manner as the ſalt of Tartar doth; for the calx of metals which is precipitated by this liquor; (becauſe that the pebles do mingle themſelves therewith) is grown much heavier thereby, than if it had been only precipitated with ſalt of Tartar.

For example, diſſolve in *Aqua Regia* as much Gold as you pleaſe, and pour of this liquor upon it, till all the Gold fall to the bottom like a yellow powder, and the ſolution turn white and clear, which you muſt pour off, and edulcorate the precipitated Gold with ſweet water, and then dry it (as you was taught to do with the *Aurum fulminans*) and you need not fear that it will kindle and fulminate in the drying, as it uſeth to do, when it is precipitated with ſalt of Tartar or ſpirit of urin, but you may boldly dry it by the fire, and it will look like yellow earth, and will weigh as heavy again as the Gold did weigh before the ſolution; the cauſe of which weight is, the peble ſtones, which did precipitate themſelves together with the Gold. For the *Aqua Regia* by its acidity hath mortified the ſalt of Tartar, and robbed it of its vertues ſo, that it could not chooſe but let fall the aſſumed pebles or ſand; on the other ſide, the ſalt of Tartar which was in the liquor of pebles, hath annihilated the ſharpneſs of the *Aqua Regia*, ſo that it could not keep the diſſolved gold any longer, whereby both the gold and the pebles are freed from their diſſolver.

This edulcorated and dryed yellow powder put into a clean crucible, and ſet it between live coals, that it begin to be red hot, but not long, and the yellow will be changed into the faireſt purple colour, which is pleaſant to behold, but if you let it ſtand longer, then the purple colour vaniſheth, and it turns to a brown and brick colour: and therefore if you deſire to have a fair purple coloured gold, you muſt take it off from the fire, as ſoon as it is come to that colour, and let it not ſtand any longer, elſe it loſeth that colour again.

This fair gold-powder may be uſed by the rich (which are able to pay for it) from ℈i. to ʒſs. in convenient vehicles; and in all diſeaſes, where ſweating is needful: for beſides the provoking of ſweat, it comforteth not only the heart, but alſo by the vertue of the peble it expelleth the ſtone in the reins and bladder (if it be not grown to the height of hardneſs) like ſand together with the urine: ſo that it may be ſafely uſed as well to prevent, as to cure the plague, gout and ſtone.

How to make further out of this purple coloured gold a ſoluble Ruby for medicinal uſe, ſhall be taught in the fourth part: for in regard that it muſt be done by a ſtrong fire in a crucible, it doth not belong hither, but to its proper place, where other like Medicaments are taught to be made.

If you will extract the colour out of this precipitated gold, then pour upon it (before it be put into the fire for to calcin) of the ſtrongeſt ſpirit of ſalt, and in a gentle heat the ſpirit will diſſolve part of the gold, which will be much fairer and deeper in colour, than if it had been done with *Aqua Regia*: upon this ſolution pour five or ſix times as much of dephlegmed ſpirit of wine, and digeſt both together its due time, then by the digeſtion of a long time, part of the Gold will fall out of the ſolution to the bottom like a fair white pouder, which may be reduced with Borax or ſalt nitre and Tartar; it is white like ſilver, and as heavy as other gold, and may eaſily get its colour again by the help of Antimony. The reſidue out of which the white gold is faln, *viz.* the ſpirit of ſalt mingled with the ſpirit of wine, muſt be abſtracted from the Tincture, and there will remain a pleaſant ſowre liquor coloured by the gold, upon the bottom of the glaſs body, which is almoſt of the ſame vertue, which above hath been aſcribed to other tinctures of gold. Eſpecially this liquor of gold ſtrengthneth the heart, brain, and ſtomach.

N. B. Sometimes there comes over with the ſpirit of wine a little red oyl, which the ſtrong ſpirit of ſalt hath ſeparated from the ſpirit of wine, and it is impregnated with the Tincture of Gold. It is an excellent cordial, few are found like unto it, whereby weak people decayed by ſickneſs or age, may be kept alive a long time, they taking daily ſome drops of it, who elſe for want of the *humidum radicale*, would be forced to exchange their life for death.

Here ſome body may ask, whether this Tincture is to be counted or taken for a true Tincture of Gold; or whether there be another better to be found?

To which I anſwer, that though many may hold it to be ſuch, and I my ſelf do call it ſo here, yet that after due examination it will not prove to be ſuch: for although ſome vertue is taken from the gold by this way, yet it doth ſtill keep its life, though it be grown weak and pale, becauſe it can ſo eaſily recover its former ſound colour by a contemptible mineral: if its true Tincture or ſoul were gone from it, ſurely an inferiour mineral could not reſtore it to life, but of neceſſity there would be required ſuch a thing for to do it, which hath not only ſo much, as it hath need of for it ſelf, but hath a tranſcendent power to give life unto dead things. As we may ſee by a man or any ſenſible beaſt, that if they have loſt their vigor by adverſities, in that no life more is perceived in them, yet by medicines fit for the purpoſe, they may be refreſhed, and brought to their former health, ſo that their former diſeaſe appeareth no more in them: but if their ſoul be once gone, the

dead

dead body can by no medicines be reſtored unto life again, but muſt remain dead ſo long, till he in whoſe power it is to give and to take life, have mercy upon it. So likewiſe it is to be underſtood of gold, when its colour is taken from it, and yet its life is left, which by the help of Antimony, being its medicine, as alſo by the help of iron or copper can be reſtored unto it, ſo that it recovereth its former fair colours, ſo that you cannot ſee at all, that it ailed any thing before. But if its life be gone from the body, it is impoſſible for any ordinary metal or mineral to reſtore it to life, but it muſt be done by ſuch a thing, which is more than Gold it ſelf hath been: for even as a living man cannot give life unto a dead man, but GOD muſt do it who hath created man; ſo Gold cannot reſtore to dead Gold, the life which hath been taken from it, and how could it then be done by an unfixt mineral? But there is required a true Philoſopher for to do it, ſuch a one as hath good knowledge of gold and its compoſition.

Now as we heard that like cannot help its like, but he that ſhall help, muſt be more, than he that looks for help from him: Hence it is evident, that the Tincture, whoſe remaining body (from which it is taken) is ſtill gold, can be no true tincture; for if it ſhall be a true tincture, it muſt conſiſt in its three principles, and how can it conſiſt therein, the body from whence it came being yet alive, and poſſeſſing inviſibly all its three principles? How can a mans ſoul be taken from him, and yet the body live ſtill? Some will ſay, that for all that, this may be counted a true tincture, although the body ſtill remain gold, and have kept its life: even as man may ſpare ſome blood out of his body, which though it will make him ſomewhat pale, yet he liveth ſtill, and the loſt blood may be ſupplyed again by good meat and drink. But what lame and ſenſeleſs objections are theſe? Who would be ſo ſimple as to think, that a handful of blood may be compared to a mans life? I believe no wiſe man will do it. Although life goeth forth with the blood, yet the blood is not the life it ſelf; elſe the dead could be raiſed thereby, if a cup full of it were poured into a dead body; but where was ſuch a thing ever heard or ſeen? With ſuch groundleſs opinions ſome did preſume to cenſure the truth, ſet down in my treatiſe *de Auro potabili vero*, ſaying, *Geber* and *Lullius* were alſo of opinion, that a true tincture can be extracted out of gold, the ſame nevertheleſs remaining good gold: but it may be asked, what it hath loſt then for to yield a true Tincture, ſince it remained good gold? Here no body will be at home for to anſwer I doubt. What are the Writings of *Geber* or *Lully* to me? What they have written I do not deſpiſe, they were highly enlightned and experienced Philoſophers, and would defend their writings ſufficiently, if they were alive: and what I write, I am alſo able to maintain.

Do thoſe men think, that the writings of *Geber* and *Lully* are to be underſtood according unto the bare letter? ſhew me a tincture of gold which was made by the writings of *Geber* or *Lully*? if it were ſo, then every idiot or novice, that could but read Latine, would not only by their writings be able to make the Tincture of gold, but alſo the Philoſophers ſtone it ſelf, whereof they have written at large; which doth not follow, becauſe it is ſeen by daily experience, that the moſt worldly learned men ſpent many years, and have been at vaſt charges, and taken great pains, and ſtudied in their books day and night, and found not the leaſt thing in them.

Now if ſuch Philoſophers were to be underſtood literally, doubtleſs there would not be ſo many poor decay'd Alchymiſts. Therefore the writings of ſuch worthies are not to be underſtood according to the letter, but according to the myſtical ſenſe hid under the letter.

But becauſe the truth is eclipſed in their books by ſo many ſeducing and ſophiſtical proceſſes, there will hardly any man be able to pick it out from ſo many ſeducements, unleſs a light from God be given to him firſt, whereby he may be able ſo to peruſe the dark writings of thoſe men, that he know how to ſeparate the parabolical ſpeeches, from thoſe that are true in the letter it ſelf: or if an honeſt Godly Chymiſt by the grace of God in his labours do hit upon the right ſteps, and yet do doubt, whether he be in the right way or no, then by reading of good and true Philoſophers books, he may at laſt learn out of them the firm and conſtant truth: elſe hardly any ones deſire may be obtained out of their books, but rather after the pretious time ſpent, means and health waſted, a man ſhall be forced to fall a begging at laſt.

In like manner, if the true tincture be taken from Copper, the reſt is no more a metal, nor by any Art or force of fire can be reduced to a metallical ſubſtance.

N. B. But if you leave ſome tincture in it, then it may be reduced into a brittle gray body, like unto iron, but brittle.

Another way to extract a good Tincture out of gold by the help of the liquor of ſand or pebles.

TAke of that gold calx (which was precipitated with the oyl of ſand) one part, and three or four parts of the liquor of cryſtals or of ſand, mix the gold calx in a good crucible with the liquor, and ſet this mixture into a gentle heat, ſo that the moyſtneſs may evaporate from the oyl of ſand which is not eaſily done; for the peble or ſand, by reaſon of their dryneſs keep and hold the moyſtneſs, and will not let it go eaſily; it riſeth in the pot or crucible, as borax or Allome doth when you calcine them; therefore the crucible, muſt not be filled above half, that the liquor together with the gold may have room enough, and do not run over the pot: and when it riſeth no more, then ſtrengthen the fire, till the pot be red-hot. The mixture ſtanding faſt, put a lid upon it, which may cloſe well, that no coals, aſhes, or other impurity may fall into it, and give it ſo ſtrong fire in a winde furnace, that the liquor together with the gold calx may melt like water; keep it melting ſo long, till the liquor and gold together be like unto a tranſparent fair ruby, which will be done in an hours time or thereabouts; then pour it forth into a clean copper morter, let it cool, and then make it into powder, and pour ſpirit of wine upon it for to extract, which will look like unto thin blood: and will prove more effectual in uſe, than the above deſcribed Tincture.

The reſidue from which the Tincture is extracted, muſt be boyled with lead, and precipitated and driven off as you do oares, and you will get the remaining gold, which went not into the ſpirit of

wine; but it is very pale and turned like unto ſilver in colour, which if it be melted by Antimony, it recovereth its former colour without any conſiderable loſs in the weight. How the melting in crucibles, and boyling of the remaining gold is to be done, ſhall be more punctually ſet down in the fourth part; I know ſeveral other fine proceſſes, for to extract the colour eaſily out of gold; but becauſe the gold muſt be firſt made fit for it by melting in a crucible, and that it is not pertinent to ſpeak of that operation here in this ſecond part, therefore it ſhall be reſerved for the fourth, where you ſhall be informed at large, not onely how to prepare Gold, Antimony and other minerals, and make them fit for extraction, but alſo how to reduce them into a tranſparent, ſoluble and fire-proof Ruby (which are none of the meaneſt medicines) and as it was done here with the gold, ſo you may proceed likewiſe with other metals and minerals for to extract their colours. And therefore being needleſs to deſcribe each metals tincture by it ſelf, all the proceſſes of them ſhall be diſcloſed in one, *viz.* in that of gold. The book would grow too big, if I ſhould deſcribe them ſeverally, which I count needleſs to do. Let this ſuffice for this Second part, that we have taught, how to extract out of the gold its colour after a common way. Which indeed are good medicines, but for ought I know of no uſe in Alchymy. But he that ſeeketh to have a true Tincture out of gold, let him endeavour firſt to deſtroy the gold by the univerſal Mercury, and to turn the inſide outward, and the outſide inward, and proceed further according unto art, then the ſoul of gold will eaſily joyn it ſelf with the ſpirit of wine, and come to be a good medicine, whereof more in my treatiſe *de auro potabili* is handled. If one know the *Chalybs* of *Sandivogius*, which is well to be had, he might with little labour quickly get a good medicine: but becauſe we ſhew our ſelves ſtill ungrateful children unto God, therefore it is no marvel, that he withdraweth his hand from us, and leaveth us in errors.

What further may be done with the liquor of pebles.

Many more profitable things, as well in Alchymy, as in medicine, may be compaſſed by the oyl of ſand; as for example, to make fair painting colours out of metals, which abide in all elements: Alſo to frame all ſorts of tranſparent hard ſtones out of cryſtal, which in beauty are like unto the natural, yea fairer ſometimes; alſo how to make many fair Amauſes or Enamels and the like profitable arts: but they belonging not to this ſecond part, ſhall be reſerved for the fourth, where all ſuch ſhall be taught very punctually with all the circumſtances thereunto relating.

How by the help of this liquor to make trees to grow out of metals, with their colours.

Although this proceſs in Phyſick may be of no great uſe: yet in regard that to a Chymical Phyſitian it gives good information of the condition of natural things, and their change. I thought it not amiſs to ſet it down here.

TAke of the above deſcribed oyl made of ſand, pebles or cryſtals as much as you pleaſe, mix therewith a like quantity of the lixivium of Tartar, ſhake both well together, ſo that the thick liquor may not be perceived in the lixivium, but be throughly incorporated therewith, both being turned to a thin ſolution, and then your water is prepared, wherein the metals do grow.

The metals muſt be firſt diſſolved in their proper corroſive *Menſtruums*, and the *Menſtruum* muſt be quite abſtracted from thence again, but not too near, that the calx of the metal may not grow red-hot, whereby its growing vertue would be taken from it. Then take it out of the little glaſs-body, and break it in pieces about the bigneſs of a pulſe, and put them in the above deſcribed liquor in a cleer bright glaſs, that the growing of the metals may be diſcerned through it; and as ſoon as the prepared metals are taken out of the glaſs body, they muſt be kept from the aire, elſe they loſe their growing vertue. Therefore thus dry they muſt be broken in pieces, and laid in the bottom of the glaſs (wherein the liquor is) a fingers breadth one from another aſunder, and muſt not be laid together on a heap. The glaſs muſt ſtand ſtill in a quiet place, and the metal will preſently ſwell in it, and thruſt forth ſome bulks, out of which branches and twigs do grow, ſo finely, that one ſhall admire at it; and let none think that this growing ſerveth only for to pleaſe the eye, for ſome ſpecial thing is hid in it; for all ſand or pebles, although they be white, inviſibly containeth a hidden tincture or golden ſulphur, which none without experience will be able to believe; for if for a time you digeſt the pure filings of lead in it, there will gold come to ſtick to the outſide thereof (which gold may be waſhed off with water) and the lead will look as if it were gilded. Which gold came from no where elſe but from the ſand or pebles, although they were white and clear, ſo that it could not be perceived in them. It ſheweth alſo its meliorating vertue, when the metals do grow therein, and for a certain ſpace of time are digeſted therewith. For it may be ſeen apparently, that the metals in the growing do increaſe from this liquor, and attract what is for their turn; which hence alſo may be perceived, that when but as much as the bigneſs of a pea groweth therein, it will grow twice or thrice as big, which is worthy to be conſidered of. Alſo the pebles or ſand-ſtones are the natural matrixes of metals, and there appeareth a great ſympathy between them, eſpecially between the unripe metals and them; as if nature ſhould ſay to ſuch raw or unripe metals, return into your mothers womb, and ſtay there the due time, till you have attained there to perfect ripeneſs, for you were taken thence too ſoon againſt my will. Further, out of this liquor there may be made a good borras to reduce the metals thereby. There may be made alſo with this liqour fair glaſed and firm colours upon earthen veſſels like unto Porcellan or China. Alſo by boyling it with water, a tender impalpable ſnow-white earth may be precipitated out of it, whereof there may be made veſſels like unto Porcellan.

Many other uſeful things may be brought to paſs thereby in mechanical buſineſſes, needleſs here to relate.

Alſo the unripe and volatile minerals may be fixed and ripened thereby, ſo that not only they may be the fitter to be uſed in Phyſick, but alſo the volatile gold and ſilver contained in them may be ſaved thereby, whereof more in the fourth part.

N. B. Hither belongs alſo the proceſs of the ſpirit of lead, Virgins-milk and Dragons blood

Of

Of the ſpirit of urine and of the volatile ſpirit of ſalt Armoniack.

OUt of urine or ſalt Armoniack, a powerful and penetrating ſpirit may be made ſeveral wayes, which not only is to be uſed in phiſick for many diſeaſes, but is alſo found very uſeful in mechanical and chymical operations, as followeth.

Take of the urine of ſound men living chaſt, gather a good quantity together in a wooden veſſel, let it ſtand for its time to putrefy, and diſtil a ſpirit thereof, which afterward in a great glaſs retort with a wide neck muſt be rectified from calcined tartar, and ſtill that which cometh over firſt, may be ſaved by it ſelf, and ſo the ſecond and third alſo, the ſtrongeſt may be uſed for the preparing of metallical medicines, and the weaker for a medicine alone by its ſelf, or elſe mingled with fit vehicles: The ſalt which in the rectification cometh over with the ſtrongeſt ſpirit; may be put to the weakeſt, to make it the ſtronger, or elſe it may be ſaved by it ſelf in a good ſtrong glaſs.

But becauſe the ſpirit of urine is tedious to make, therefore I will ſhew, how to get it eaſier out of ſalt Armoniack. The preparation is thus.

Take of ſalt armoniack, and *lapis calaminaris*, and make each by it ſelf into powder, and then mix them together, and caſt of it into the red hot veſſel at once no more than ʒ *ſs.* or ʒ i. Unto the veſſel there muſt be applyed a great receiver: for this ſpirit goeth with ſuch a force and power, that it were impoſſible to diſtil it in a retort without danger or loſs, for I broke more than one receiver with it, before I did invent this inſtrument. The ſpirits being well ſetled in the receiver, caſt in more of your mixture; this continue ſo long till all your matter is caſt in; then take off the receiver, and pour the ſpirit into a ſtrong glaſs, which muſt be well cloſed at the top, but not with wax and a bladder, becauſe it ſofteneth the wax, and doth penetrate through the bladder; but firſt ſtop it with paper, then melt Lacca or ſulphur, and pour it upon it, ſo that it come to be very well cloſed, and then it will not be able to exhale, or thou mayſt get ſuch glaſſes made, as in the fifth part ſhall be tanght, for to keep all the ſubtle ſpirits in them, for more ſecurity ſake. And this ſpirit, if no water have been mixt with it in the receiver, needeth no rectifying: but he that will have it ſtronger yet, may rectify it by a glaſs retort, and ſo keep it for uſe.

And this is the beſt way to make a ſtrong ſpirit out of ſalt armoniack: the ſame may be done alſo, by taking of filed Zinck, inſtead of *lapis calaminaris:* alſo by adding of ſalt of tartar, ſalt made of the Lee of wood aſhes, unquencht lime, and the like: but the ſpirit is nothing near ſo ſtrong (although all thoſe things may be done with it, that are done with the former) as that which is made with *lapis calaminaris* or Zinck.

The proceſs or the manner of making it, is this:

TAke ℔ i. of ſalt armoniack made into powder, and as much of ſalt of tartar, mix both together by the help of a lye made of tartar, or only with common water, ſo that all come to be like a pap, and caſt in one ſpoonful thereof at once into the diſtilling veſſel, then caſt in more till you have ſpirit enough.

N. B. The ſalt of tartar may alſo be mixed dry with the ſalt Armoniack without any lye or water, and ſo diſtilled: but it is not ſo good, as when the mixture is tempered with lye or water: for if it be caſt in dry, the ſpirit will come over in the form of a volatile ſalt: but if the mixture have been moiſtened, then moſt part thereof will come over like a fiery burning ſpirit: In like manner alſo the mixture of Lyme and ſalt Armoniack may be tempered moiſt, and it will yield more ſpirit than if it be diſtilled dry.

It may be asked: why *lapis calaminaris*, Zinck and unquencht lyme, calcined tartar, ſalt of potaſhes, fixed ſalt nitre or the like things prepared by the fire, muſt be added unto ſalt Armoniack, and whether it be not as good to add ſome bolus, or other earth (as uſually is done to other ſalts) and ſo to diſtil a ſpirit of it? To which I anſwer, that there are two ſorts of ſalt in ſalt Armoniack, *viz.* a common acid ſalt, and a volatile ſalt of urine, which without mortifying of one of them, cannot be ſeparated: for as ſoon as they feel the heat, the volatile ſalt of urine carrieth the acid ſalt upwards, and they both together yield a ſublimate, of the ſame nature and eſſence with common ſalt armoniack which is not ſublimed, onely it is purer than the common. And no ſpirit would come over from it, if it ſhould be mingled with bole, brick, duſt, ſand, or any other ſtrengthleſs earth, and ſo diſtilled, but the whole ſalt as it is of it ſelf (leaving its earthy ſubſtance behind) would ſublime thus dry: but that it falleth out otherwiſe with the *lapis calaminaris* (which is alſo like an earth) ſo that a ſeparation of the ſalts is wrought thereby, and a volatile ſpirit cometh over; the reaſon is, that the *lapis calaminaris* and Zinck are of ſuch a nature, that they have a great affinity with all acid things, and do love them, and are loved by them likewiſe (whereof ſome mention hath been made in the firſt part) ſo that the acid ſalt ſticks to it in the warmth, and uniteth it ſelf with it, and the volatile ſalt is ſet free, and diſtilled into a ſubtle ſpirit; which could not have been done, if the acid ſalt had not been kept back, by the *lapis calaminaris* or Zink. But that a ſpirit is diſtilled off by addition of fixed ſalts; the reaſon is that fixed ſalts are contrary unto acid ſalts, and (if they get the uperhand) do kill the ſame, and rob them of their ſtrength, whereby thoſe things which are mixed with them are freed from their bond: and ſo it falls out here with ſalt armoniack, that when by addition of a vegetable fixed ſalt, the acidity of the ſalt armoniack is killed; the ſalt of urine, which formerly was bound therewith, gets its former freedome and ſtrength, and being ſublimed turns into a ſpirit. Which could not have been done, if common ſalt had been added to the ſalt armoniack inſtead of ſalt of tartar; for the ſalt of urine would thereby (as by a far greater enemy be killed and kept back, ſo that it could yield no ſpirit. I thought fit to give notice hereof to the ignorant (not for thoſe, who knew it before) and to the unknowing it will do much good, and that they may have a light for other labours: for I have many times ſeen, and ſee it ſtill by daily experience, that the moſt part of vulgar Chymiſts, whatſoever they do

(having got it either by reading, ſeeing, or hearing) they hurle it over like botchers, and are not able to give any ſolid reaſon, why this or that muſt fall out in ſuch or another manner, not labouring to find out the natures and couditions of ſalts, minerals, and other materials, but contenting themſelves onely with the Receipt, ſaying this or that Author hath written ſo, and therefore it muſt be ſo, whereas many times ſuch books are patcht up out of all ſorts of authors. And thoſe that ſtick to ſo many books, will hardly ever come to get any good, but are led out of one Labyrinth into another, ſpending their life miſerably in watching and cares: but if they would firſt ſeriouſly conſider things, and learn to know nature, and then take their work in hand, then they would ſooner attain unto true knowledge; and ſo much of this matter by the way. I hope that he that hath been in error will be pleaſed with it, and the knowing will not grudge to have it imparted to the ignorant.

That which remains after the diſtillation is done, is alſo good for uſe; if the addition have been of ſalt of tartar, a melting powder may be made of it, to reduce metals. Of *lapis calaminaris* or Zinck, yields *per deliquium* a clear, white, and heavy ſharp oyl, for the ſharper part of ſalt armoniack, which did not turn to ſpirit, hath diſſolved the *lapis calaminaris*, and is almoſt of the ſame vertues for external uſe in Chyrurgery with that, which above in the firſt part which was taught to be made out of *lapis calaminaris*, and ſpirit of ſalt, ſave only that this in the diſtilling doth not yield ſo ſtrong a ſpirit as the other, but onely yields a ſharp ſublimate.

Of the uſe and vertue of the ſpirit of ſalt Armoniack.

THis ſpirit is of a ſharp penetrating eſſence, and of an airy, moiſt, and warm nature; and therefore may with credit be uſed in many diſeaſes, 8, 10, 12. (more or leſs) drops thereof uſed in a convenient vehicle, do immediately penetrate all the body over, cauſing ſudden ſweating, opening the obſtructions of the ſpleen, and diſperſing and expelling many malignities by ſweat and urine, it cureth the quartane, collick, the ſuffocation of the Matrix, and many more diſeaſes.

In brief, this ſpirit is a ſafe, ſure, and ready medicine for to diſperſe and expel all tough, groſs and venemous humors. Alſo, this ſpirit acteth his part externally, quenching all inflammations, curing the Eryſipelas and Grangrene; it allayeth the pains of the gout, clothes being dipt in it and applyed: and although it draw bliſters, it matters not; laid to the pulſe, it is good in ardent feavers, it aſſwageth ſwellings and pains; diſſcuſſeth congealed blood, helpeth ſtrained limbs, and benummed nerves: onely ſmelled unto, it cureth the megrim, and other Chronical diſeaſes of the head: for it diſſolveth the peccant matter, and evacuateth it through the noſtrils; it reſtoreth the loſt hearing, being externally laid on with a little inſtrument fit for the purpoſe. Alſo in the obſtructions of womens courſes applyed by a fit inſtrument in a ſpiritual way, openeth preſently, and cleanſeth the womb, and maketh women fruitful, *&c.* Mingled with common water, and held in the mouth, aſſwageth the tooth-ach, proceeding from ſharp humors which are falln in the teeth. A little of it applyed in a gliſter, killeth the wormes in the body, and allayeth the colick.

This ſpirit may alſo further be uſed to many other things, eſpecially by means thereof many pretious and effectual medicaments may be made out of metals and minerals, whereof ſome ſhall be deſcribed as followeth.

N. B. There is yet another matter, which is found every where and at all times, and is to be got by every one without diſtillation and charges, and is as good for the aboveſaid diſeaſes, as the diſtilled ſpirit, and if all men knew it, there would not be found every where ſo many ſick people, nor ſo many Doctors and Apothecaries.

To diſtill a blood red oyl of vitriol by the help of the ſpirit of urin.

DIſſolve Hungarian or other good vitriol in common water, and let it run through a filtring paper, pour of this ſpirit upon it ſo much, till all the green be vaniſht, and the water be made clear, and a yellow ſulphur be ſettled: then pour off the clear, and the reſt which is muddy, pour together in a *filtrum*, that the moiſture may run off, and the earth of the vitriol remain in the paper, which you muſt dry, and diſtil to a blood-red oyl, which will open the obſtructions of the whole body, and perfectly cure the epilepſie. The clear water muſt be evaporated dry, and there will remain a ſalt, which being diſtilled, yields a wonderful ſpirit. Before it be diſtilled, it is a *ſpecificum purgans*, whereof 8. 10. 12. to 24. grains taken, may ſafely be uſed in all diſeaſes.

The Tincture of Vegetables.

SPices, ſeeds or flowers being extracted therewith and digeſted and diſtilled, the eſſence of them will come over with it, in the form of a red oyl.

Vitriol of copper.

IF you pour it upon calx of copper, made by often heating the Copper red hot and quenching it again, it will extract within an hours time a fair blew colour, and having diſſolved as much thereof as it can pour it off and let it ſhoot in a cold place, and you will get a fair sky coloured vitriol, a ſmall quantity whereof will cauſe ſtrong vomits; the reſt of the vitriol remaineth a blew oyl, good to be uſed in ulcers.

The Tincture of crude Tartar.

IF you take common crude tartar, and pour of this ſpirit upon it, and ſet it in digeſtion, the ſpirit will extract a blood-red tincture, and if the ſpirit be abſtracted from it, there will remain a pleaſant red oyl, of no ſmall vertue and power.

To make the oyls or liquors of ſalts.

THis ſpirit alſo diſſolveth cryſtals and other ſtones, they being firſt diſſolved, precipitated and reduced to impalpable powders, turning them into oyles and liquors, good to be uſed in Alchymy and Phyſick.

The

To precipitate all metals with it.

ANy metal being diſſolved in an acid ſpirit may be precipitated better and purer therewith, than with the liquor of the ſalt of tartar; for *Aurum fulminans* which is precipitated with it fulminateth far ſtronger than if it were done with oyl of tartar.

R. Some juyce of Lemon and mix it with the ſolution of gold, before it be precipitated, and then not all the gold will precipitate, but ſome of it will remain in the ſolution, and in time many ſmall green ſtones (not unlike unto common vitriol) will appear; which in a ſmall doſe will purge all noxious humors.

The oyl and vitriol of ſilver.

IF you diſſolve ſilver in *Aqua fortis*, and pour ſo much of this ſpirit into it till it ceaſeth to make a noiſe, ſome of the ſilver will precipitate in the form of a black powder, the reſt of the ſilver remaineth in the liquor: the phlegm abſtracted from it in Balneo, till it get a skin at the top, and then ſet into a cool place, there will grow white cryſtals in it, which being taken out and dryed are a good purge in madneſs, dropſie, feavers and other diſeaſes, ſafely and without danger to be uſed to young and old. The reſt of the liquor which did not cryſtalliſe may be extracted with ſpirit of wine, and the fæces being caſt away the extraction will be pleaſanter. The ſpirit of wine abſtracted from it, there will remain a medicine of no ſmall value in all diſeaſes of the brain.

To extract a red Tincture out of Antimony or common ſulphur.

BOyl ſulphur or Antimony made into powder in a Lixivium of ſalt of tartar, till it turn red, and pour this ſpirit upon it, and diſtill gently in a *Balneum*, and there will come over a fair tincture with the volatile ſpirit, ſilver anointed therewith will be guilt, though not laſtingly. It ſerveth for all diſeaſes of the lungs.

How to ripen Antimony and common ſulphur, ſo that ſeveral ſorts of ſuch ſmels, as vegetables have, ariſe from thence.

DIſſolve Antimony or ſulphur in the liquor of pebles or ſand, coagulate the ſolution to a red maſs; upon this maſs pour ſpirit of urin, and let it extract in a gentle warmth. The ſpirit being coloured red, pour it off, and pour on other ſpirit, let it extract likewiſe, and this you muſt iterate ſo often, till the ſpirit will extract no more tincture; then pour all the extracts together and abſtract the ſpirit of urin from it in Balneum through a limbeck, and there will remain a blood red liquor, and if you pour upon this ſpirit of wine it will extract a fairer tincture then the former was, leaving the fæces behind, and this tincture ſmelleth like garlick: and if it be digeſted three or four weeks in a gentle warmth, it will get a very pleaſant ſmel, like unto the yellow prunes or plums: and if it remain longer yet in digeſtion, it will get a ſmel not inferior to muſk and ambar; This tincture having been digeſted a long time, and got ſeveral ſmels, is not only notably by the fire increaſed in pleaſantneſs of ſmel and taſte, but alſo in vertue: for ſo many and various ſweet ſmels are perceived in it, that it is to be admired, which variety and exaltation proceedeth only from the pure and ripening ſpirit of urin, for there is hid in it a fire, which doth not deſtroy but preſerve and graduate all colours, whereof in another place more ſhall be ſaid.

N. B. Betwixt the ſpirit of urin and the animal and mineral Copper their appeareth a great ſympathy; for it doth not only love copper above all other metals, and mingleth eaſily with it, and maketh it extraordinary fair, and of good uſe in Phyſick, but it prepareth it alſo to ſuch a medicine, whereby all venerous ſores (both by inward and outward uſe) how deep ſo ever they took root in the blood, without the uſe of any other medicaments, are perfectly cured; it maketh fruitful and barren, according as it is uſed; it cleanſeth the matrix, hindreth the riſing thereof, and miraculouſly furthereth womens courſes that have been ſtayed, above all other medicaments of what name ſoever.

If this ſpirit be mingled with the volatile (but not corroſive) ſpirit of vitriol or common ſalt there will come a ſalt out of it, which is inferior to none in fuſibleneſs, and uſeful both in Alchymy and Phyſick.

N. B. The liquor of the ſalt of tartar, and the ſpirit of wine do not mix without water, this being the mean partaking of both of their natures, and if you add unto it ſpirit of urin it will not mingle but keep its own place: ſo that theſe three ſorts of liquors, being put in the ſame glaſs, and though they be ſhaked never ſo much will not incorporate for all that: the liquor of the ſalt of tartar keepeth to the bottom, next to it will be the ſpirit of urin, and on the top of that is the ſpirit of wine: and if you pour a diſtilled oyl upon it, that will keep uppermoſt of all, ſo that you may keep four ſorts of liquors in one glaſs, whereof none is mingled with the other,

Although this be of no great profit, yet it ſerveth for to learn thereby the difference of ſpirits.

Of the ſpirit and oyl of Harts-horn.

TAke Harts-horn, cut it with a ſaw into pieces, of the bigneſs of a finger, and caſt in one at a time into the aforeſaid diſtilling veſſel, and when the ſpirits are ſettled, then another, and continne this until you have ſpirits enough: and the veſſel being filled with the pieces that were caſt in, take them out with the tongs, and caſt in others, and do this as often as is needful. The diſtilling being finiſhed, take off the receiver, and pour into it dephlegmed ſpirit of wine, which will cleanſe the volatile ſalt: pour the oyl with the ſpirit and volatile ſalt through a filtring paper made wet firſt and lying in a glaſs funnel, and the ſpirit of wine together with the ſpirit of Harts-horn and the volatile ſalt will run through the paper, and the blackiſh oyl will ſtay behind, but it muſt quickly be poured out, elſe it will paſs through after them. The ſpirit together with the volatile ſalt rectifie through a retort, and the beſt part of the ſpirit will come over together with the ſpirit of wine and volatile ſalt; and when the phlegme is coming, take of the ſpirit, which is come over, that the naughty phlegm may not come amongſt it; keep it well, for it is very volatile, the oyl may be mingled with ſalt of tartar, and rectified by a glaſs retort, and ſo it will be clear; if you will have it fairer, you muſt rectify it with ſpirit of ſalt.

The firſt, which is done with ſalt of Tartar, is of more vertue; it cureth the Quartane, and provoketh ſweat extremly, cureth all internal wounds and pains, which were cauſed by falls, blows, or other wayes: 6, or 8. 10, to 20. drops of it taken in wine and ſweated upon it in the bed. The ſpirit is very good for all obſtructions of the whole body, from ℈ ſs. to ʒ ſs. therefore taken in a fit vehicle, provoketh urine, and forceth down womens courſes, it cleanſeth the blood and maketh ſweat mightily. In the Plague, Pox, Leproſie, Scurvy, *Melancholia Hypochondriaca*, malignant Feavers, and the like where ſweating is neceſſary, it proveth a rare medicine.

To make the ſpirit of mans hair an excellent medicine.

AFter the ſame manner you may make ſpirits out of all kind of of horns and claws of beaſts: but ſince by reaſon of their ill ſmel the uſe of them is not liked of (though in ſeveral heavy diſeaſes, as in the fits of the mother and Epilepſie, they do admirably well:) therefore I will acquieſce. However it is worth obſerving, that the ſpirit made of mans hair is not to be rejected in metallical operations, for it diſſolveth common ſulphur, and reduceth it into a milk, which by further ripening may be turned into blood, the like whereunto no ſpirit is able to do. The ſame ſpirit may alſo of it ſelf, without addition of ſulphur be fixed into a ruby; but that which is ripened with ſulphur is the better; and if it be brought ſo far by the fire, that it have loſt its ſtink, and be made fixed than it will be able ſufficiently to pay for the pains and coals beſtowed upon it.

N. B. Hither belongeth the Proceſs to pour diſſolved metals upon filed hartſhorn, and ſo to diſtil them.

Of the oyl of Ambar.

AMbar yeildeth a very pleaſant oyl and of great vertue eſpecially the white Ambar: the yellow is not ſo good, and the black is inferior to this; for by reaſon of its impurity it cannot be well uſed inwardly; and there cometh over alſo along with it a volatile ſalt and an acid water, which muſt be ſeperated; the water (for ought that I know) is of little vertue; the ſalt if it be ſublimed from the ſalt of Tartar and purified, is a good diuretick, and in the Stone and the Gout, may ſucceſsfully be uſed both inwardly and outwardly. The oyl if it be rectified, eſpecially that which comes over firſt, is an excellent medicine againſt the Plague, Epilepſy, riſing of the Mother and Megrim, 6, 8, 10, to 20. drops being taken thereof at once, and the noſtrils alſo being anoynted therewith for to ſmell to it; and it is to be obſerved, that when it is rectified with ſpirit of ſalt, it proveth much clearer, than done by it ſelf without addition: but if it be rectified with ſalt of tartar, it is of much more vertue, though it fall not ſo clear, as that which is done by ſpirit of ſalt.

N. B. If it be rectified from a ſtrong *Aqua Regia* having before once already been rectified with ſpirit of ſalt, it will turn ſo ſubtle, that it is able to diſſolve iron or copper in ſome ſort, and to reduce them into good medicines; and in this ſecond rectification by *Aqua Regia* all will not come over, but part of it will be coagulated by the coroſive water, ſo that it turneth thick, like unto maſtich, which in the warmth is ſoft, and may be handled with owns fingers like wax, but in the could it is ſo hard, that it may be broken and made into powder, and gliſtereth like gold.

Of the oyl of ſoot.

OF the ſoot, which is taken from Chimneys, where nothing is burnt but wood, there may be diſtilled a ſharp volatile ſalt and a hot oyl. The ſalt is in vertue not unlike unto that which is made of hart-ſhorn or ambar, and it quencheth inflammation, from what cauſe ſo ever it do proceed: The oyl may without rectification externally be uſed very ſucceſſfully for all loathſome ſcabs, and for a ſcald head, *&c.* But if it be rectified, as hath been taught to be done with the oyl of Tartar, of Ambar, and of Hartſhorn; then it may ſafely be uſed inwardly, as the the above written oyls are uſed; for it doth as well as theſe, yea better in ſome ſpecial caſes.

How to make a good oyl out of ſoot without diſtilling.

BOyl the ſoot in common watter, till the water turn blood-red (urin is better than water) and ſet this ſolution (being in an earthen pot) in winter time into the greateſt froſt ſo long till all in the pot be frozen into one peice and turned white: then break the pot and the ice, and in the midſt thereof you will find the hot oyl unfrozen and liquid in colour like blood, which is not much inferior in vertue unto that which is diſtilled, yet afterward it may be rectified, and ſo exalted in its vertue, when you pleaſe, and it is to be noted, that this ſeparation doeth only ſucceed in the greateſt froſt and cold, and not elſe.

Of the ſpirit and oyl of honey,

OF honey there may be made a ſubtle ſpirit and a ſowre vinegar, if it be mingled with twice as much of pure calcined ſand and ſo diſtilled; and it falleth much better yet if it be made with the flores of Antimony, which were taught to be made in the firſt part, whereby the ſpirit is increaſed in its vertue, and its running over hindred thereby; and ſo diſtilling it, there will come over a pleaſant ſpirit, a ſharp vinegar and ſome red oyl alſo, which muſt be ſeperated: the ſpirit after the rectification inwardly uſed is good in all diſeaſes of the lungs. It openeth and inlargeth the Breaſt, ſtrengthneth the Heart, takes away all obſtructions of the Liver and Spleen; it diſſolveth and expelleth the Stone, reſiſteth all putrefaction of the Blood; preſerveth from, and cureth the Plague; all Agues, Dropſies, and many other diſeaſes, daily uſed from ℈ j. to ʒ j. taken with diſtilled water proper for the diſeaſes: the ſower vinegar coloureth hair and nails as yellow as gold: it cureth the itch and ſcabs of the skin; it cleanſeth and healeth old and new wounds, they being bathed and waſhed therewith.

The red oyl is too ſtrong to be uſed of it ſelf, it may be mingled with the ſubtle ſpirit which came over firſt and ſo uſed, and the ſpirit will be exalted thereby in its vertue.

Of

Of the oyl and ſpirit of ſugar.

IN the ſame manner as hath been taught of honey, there is alſo made a ſpirit and oyl of ſugar, *viz.* adding pure ſand to it; or (which is better) of the flores of Antimony, and then according to the rules of Art one ſpoonful after the other of this mixture caſt in, it will yeild a yellow ſpirit, and a little red oyl, which after the diſtillation muſt be digeſted in Balneo ſo long together, till the ſpirit have aſſumed the oyl and be turned thereby very red in colour; it needeth not to be rectified, but may daily be uſed either by it ſelf, or with ſuch vehicles as are proper for your purpoſe; in all it is like in virtue unto that which was made of honey; yet this of ſugar is more pleaſant than the other; it reneweth and reſtoreth all the blood in man, in regard that it received great vertue from the diaphoretical flores of Antimony; and this ſpirit may fitly be uſed in all diſeaſes, it can do no hurt, neither in cold nor hot diſeaſes; it doth help nature mightily, and doth ſo much good, that it is almoſt beyond belief. Eſpecially if for a time it be uſed daily from ℈ j. to ʒ j. The reſidue of it is black, and may be kept for the ſame uſe again, *viz.* for an addition to other honey or ſugar, or elſe you may ſublime it again into flores in the furnace deſcribed in the firſt part, or in the furnace deſcribed in the fourth part of this book, with an addition of iron or tartar, or ſalt nitre, reduces it into a *Regulas*, &c.

To diſtil an excellent ſpirit and a blood red tincture of corals and ſugar.

IF you mix ſugar with red corals made into powder and diſtil it, there will beſides the ſpirit come over a blood-red tincture like a heavy oyl, which is to be joyned with the ſpirit by digeſtion in Balneo, and it will be as vertuous as that which was made with Antimony diaphoreticum. It doth perfectly and laſtingly cure the epilepſie in young and old; it cleanſeth the blood from all filth, ſo that the Leproſie together with its ſeveral ſpecies may be cured thereby, *&c.* Its uſe is the ſame as was taught above of the Antimonized ſpirit of ſugar.

Of the ſpirit of Muſte or new Wine.

TAke ſweet Muſt or juice of grapes, as ſoon as it is ſqueezed out, boyl it to the conſiſtency of honey- and then mix it with ſand, corals, or (which is better) with flores of Antimony, and ſo diſtill it, and it will yield ſuch another ſpirit as that which is made of honey or ſugar, only that this is ſomewhat tarter than that of honey. With honey, ſugar and the juice of grapes, ſeveral metals may be diſſolved in boyling and ſo prepared and made up into divers medicaments, both with and without diſtillation, after the ſame manner as was taught above with tartar: for honey, ſugar, and the juice of grapes, are nothing elſe but a ſweet ſalt, which by fermentation and addition of ſome ſower thing, may be changed into a ſower Tartar, in all like unto that which is gathered in the wine veſſels. There may be made alſo a tartar out of cherries, pears, apples, figs, and all other fruit, yielding a ſweet juice; as alſo of rye, wheat, oats, barley and the like, whereof in the third part more ſhall be ſaid.

For every ſweet liquor of vegetables, if it be turned inſide out, by fermentation may be changed to a natural ſowre tartar; and it is utterly falſe, that (as ſome do ſuppoſe) only wine yields tartar, which by daily uſe made of it by thoſe that have very hungry ſtomachs (like Woolves) indiſtinctly together with the nouriſhment went into the limbs, and there turned to a ſtony matter. If this were true, than in cold Countries, where no wine groweth, men would not be troubled with the Gout or Stone; the Contrary whereof is ſeen daily: though I muſt confeſs, that among all vegetables none yeildeth more than the vine, the concurrent acidity being the cauſe thereof; for it turneth the ſweetneſs into tartar; for the ſowrer the wine is, the more tartar it yieldeth; and ſo much the ſweeter, ſo much the leſs tartar. By this diſcourſe an induſtrious Chymiſt may eaſily come to know the original nature and properties of tartar, and in default of wine, how to make it out of other vegetables; common ſalt or the ſalt of tartar may be diſtilled with honey, ſugar, or ſodden wine (*ſapa*) and it will yield ſuch ſtrong ſpirits, that metals may be diſſolved with them, and they are not to be deſpiſed in Phyſick and Alchymy.

Of oyl Olive.

OIlt of oyls made by expreſſion (as oyl olive, rape oyl, wallnut oyl, hempſeed oyl, linſeed oyl, and the like) there may be diſtilled a penetrating oyl, uſeful both out wardly and inwardly, which is done thus: Take common potters clay not mingled with ſand, frame little bals of it, as big as a pigeons or hens-egg, burn them (but not too ſtrong) to a hard ſtone, ſo that they may attract the oyl; and when they are no more quite red-hot, but pretty hot, then throw them into oyl olive which is the beſt; let them lye in it, till they be quite full and drunk of the oyl, which will be done in two or three hours (ſome caſt them red hot into the oyl, but amiſs, becauſe the oyl contracts thence an *Empyreuma*) then take them out, and caſt in one or two of them at once into your diſtilling-veſſel made red-hot, and let it go; and within a while after caſt in one or two more, and continue this till you have oyl enough. If the veſſel be full of the bals, take them out with the tongs or ladle, that you may proceed without let in your diſtillation, and in this manner you need not fear the breaking of your retort or receiver, or the burning of your oyle. The diſtillation being performed take off your receiver, pour the oyl that came over into a glaſs retort, and rectify it from calcined Allome or Vitriol, and the Allome will keep back the blackneſs and ſtink, and ſo the oyl will come over clear, which muſt be yet rectified once or twice more with freſh calcined Allome, according to the intenſneſs of penetrating which you look for; that which cometh over firſt, ought ſtill to be caught by it ſelf, and you will get a very fair, bright and clear oyl, which is very ſubtle; but that which cometh after is ſomewhat yellow, and not ſo penetrating neither as the firſt; and therefore it is but for external uſe to extract flores and herbs therewith, and to make pretious balſams for cold and moyſt ſores. Alſo you may diſſolve with it Amber, Maſtick, Myrrh, and the like attractive things, and with Wax and Colophony reduce it to a plaſter, which will be very good in venemous ſores and boyls, for to attract the poyſon, and to heal them out of hand. If you diſſolve in it common yellow ſulphur made into powder, you will get a blood red balſom, healing all

manner of ſcabs, and other like defects of the skin; eſpecially when you add to it purified verdegreaſe, and in hot ſores *Saccharum Saturni*, which in a gentle heat and by continual ſtirring about do eaſily melt and mingle therewith. It needeth not to be done in glaſſes, but may be done in an ordinary earthen pot or pipkin.

The uſe of the bleſſed oyl.

THe firſt and clear is of a very penetrating nature: ſome drops thereof given in ſome *Aqua vitæ*, preſently ſtays the collick, proceeding from winds that could not be vented; as alſo the riſing of the mother, the navil being anointed therewith: and a cold humour being faln upon the nervs, whereby they are lamed; if you do but anoint them with this oyl, and rub it in with warm hands, it will quickly reſtore them, and therefore in regard of its preſent help, may well be called *Oleum ſanctum*. If you extract plates of iron or copper with this oyl, it will turn deep red or green, and is a ſoveraign remedy for to warm and dry up all cold and watery ſores. It conſumeth alſo all ſuperfluous moiſture in Wounds and ulcerous Sores, as alſo all other excreſcencies of the skin: it healeth tettars and ſcald-heads, and other like defects proceeding from ſuperfluous cold and moiſture. You may alſo diſſolve in it Euphorbium and other hot gums, and uſe them againſt great froſt, for what limb ſoever is anointed therewith, no froſt how great ſoever can do it any hurt. The balſames made with gum or ſulphur may be alſo diſtilled by a retort, and in ſome caſes they are more uſeful than the undiſtilled balſame.

Of the oyl of Wax.

IN the ſame manner may be diſtilled alſo the oyl of wax, the uſe whereof is in all like unto the former; and for all cold infirmities of the nerves, this is found more effectual yet than the former,

A Spirit good for the Stone.

OUt of ſtones which are found in grapes, there may be diſtilled a ſowre ſpirit, which is a certain and ſpecifical remedy for the ſtone in the kidneys and bladder, and alſo for all pains of the gout. It is not onely to be uſed internally, but alſo externally, wetting clothes in it, and applying them to the places affected, and it will aſſwage and drive away the pains.

Of the ſpirit or acid oyl of Sulphur.

TO reduce ſulphur into a ſowre ſpirit or oyl hath been ſought hitherto by many, but found by few. Moſt of them made it in glaſs-bells, but got very little that way; for the glaſſes being quickly hot, could not hold the oyl, ſo that it went away in a ſmoak. Some thought to get it by diſtilling, others by diſſolving, but none of all theſe would do the feat. Which is the reaſon why now-adayes it is found almoſt no where right, and in the Drugſters and Apothecaries ſhops they uſually ſell oyl of Vitriol inſtead of it, which by far is not to be compared in vertue to the oyl of ſulphur. For this is not onely of a far pleaſanter ſowre taſte, but in efficacy alſo much exceeds the other. And therefore being of ſo great uſe both in Phyſick and Alchymy, as in all hot diſeaſes, mingling the patients drink therewith, till it get a pleaſant ſowre taſt, for to quench the intolerable drowth, to ſtrengthen the ſtomach, to refreſh the lungs and the liver: Alſo externally for to cure the gangreen: Alſo for to Chryſtalliſe ſome metals thereby, and to reduce them into pleaſant vitriols, uſeful as well in Alchymy as Phyſick: I thought good to ſet down the preparation, though it be not done in this our diſtilling furnace, but in another way by kindling and burning it as followeth.

Make a little furnace with a grate, upon which a ſtrong crucible muſt be faſtned reſting on two iron bars, and it is to be ordered ſo that the ſmoak be conveighed (not above by the crucible, but) through a pipe at the ſide of the furnace: the crucible muſt be filled with ſulphur even to the top; and by a coal-fire without flame be brought to burn and kept burning. Over the burning ſulphur, a veſſel is to be applyed of good ſtony earth like unto a flat diſh with an high brim, wherein is alwayes cold water to be kept, and whereunto the burning ſulphur doth flame: which thus burning, its fatneſs conſumeth, and the acid ſalt is freed and ſublimed to the cold veſſel, where it is diſſolved by the air, and in the form of a ſharp oyl runs from the hollow veſſel into the receiver, which muſt be taken off ſometime, and more ſulphur ſupplyed inſtead of that which hath been conſumed, to the end that the ſulphur may ſtill burn in the crucible: and beat with the flame to the cold head: and within few dayes you will get a great quantity of oyl, which elſe by the (*campana*) glaſs-bell in many weeks could not have been done.

N. B. Such a ſowre ſpirit or oyl may alſo be got by diſtillation together with the flores, *viz.* thus: If you take pieces of ſulphur as big as hens eggs, and caſt them one after another into the hot diſtilling veſſel, a ſowre oyl together with flores, will come over into the receiver, which muſt with water be ſeparated out of the flores, and the water abſtracted from it again in a cucurbit, and in the bottome of your glaſs body you will find the oyl, which in vertue and taſte is equal to the former, but you get nothing near ſo much in quantity by this way, and if you do not look for the oyl, you may leave it with the flores, which by reaſon of their pleaſant acid taſte are much toothſomer to take than the ordinary ones.

To the Courteous Reader.

THus I conclude this ſecond part; I could have ſet down more medicinal proceſſes in this Treatiſe: but having as many as will be a ſufficient guide for the diſtilling of other things alſo, I thought it good here to acquieſce; and whatſoever hath been here omitted, ſhall be ſupplyed in the following parts.

FINIS.

THE

THIRD PART

OF

Philosophical Furnaces:

In which is described the Nature of the Third Furnace; by the help whereof, and that without Stills, and Caldrons, and other Copper, Iron, Tin, and Leaden Instruments, various Vegetable burning Spirits, Extracts, Oyls, Salts, &c. by the help of a certain little Copper Instrument, and Wooden Vessels are made for Chymical and Medicinal Uses.

A Preface of the Copper Instrument and Furnace.

NOW this Instrument is made of strong Copper plates after the following manner. You must make two strong hemispheares of Copper or Latten of the bigness of a mans head (or thereabout) and join them together with a most strong soder, and that without tin, whereof the one must have a pipe: Now the pipe must be of a most exact roundness, that it may most accurately fit the hole that is made with an auger or wimble to keep the water from flowing out like to a tap, of the length of one span at least, wider on the hinder part towards the globe, than on the forepart, which also must be according to the bigness of the globe, greater or lesser, and be exactly joined with the best soder to its hemisphear, and the diameter of the forepart being very round like a tap, and most exactly filling the round hole must be of two fingers breath. Now there is required to the foresaid instrument or globe, a certain peculiar little furnace made of iron or copper, viz. most strong copper plates, covered within with stones or the best lute, into which is put that globe like a retort, so that it may ly upon two iron bars of the distance of a span, or span and half from the grate; the neck whereof (that pipe) goeth forth of the furnace one span at least. The furnace also must have below a place for the ashes, and above a cover with its hole for the letting forth of the smoke, and for regulating the fire, as you may see by the annexed figure. It must also below have a treefoot, on which the furnace must be set, and on the sides two handles by the help whereof it may be removed from place to place; the which is very necessary; for it is not only used for the distilling of burning spirits by wooden Vessels instead of coppor, but also for such distillation, and digestion that is performed in gourds, bolt-heads, and other instruments of glass, stone, copper, tin, &c. which are to be set in Balneo: also in the boyling of beer, metheglin, wine, and other drinks, which are to be performed by the help of wooden Vessels.

Of Wooden Instruments that are to be used instead of Stills, Baths, and Cauldrons.

In the first Figure, A represents the Furnace with a Copper Globe. *B.* The Copper Globe. *C.* The distilling Vessel. *D.* The Refrigeratory with a Worm. *E.* The Receiver. *F.* Stools on which the Vessels stand. *The Second, A* Balneum with a Cover having Holes in it for the Glasses, set upon a Tree-foot. *The Third,* A Wooden Vessel for the making of Beer. *The Fourth,* A Tub for a moist Bath, which is to be warmed by the Copper Globe. *The Fifth,* A wooden Box for a dry Bath to provoke sweat with Volatile Spirits.

IN the first place I shall speak of wooden Vessels that are to be used instead of Copper stills, in the distilling of burning spirits out of wine, beer, lees, malt, wheat, meal, roots, hearbs, flowers, seeds, and other vegetables, as also oyls of vegetables.

See that thou hast an oken barrel, like to those wherein wine and beer are kept, of a just bigness, *viz.* answerable to the bigness of the globe, as is sufficient for the coction: for a barrel that is too big will make the coction slow, and tedious. A greater globe may be fitted to a lesser barrel, but not on the contrary, a great barrel to a little globe: For by how much the bigger the globe is, and the less the barrel, so much the sooner is the work hastned. Now seeing that this Art was invented for the saving of costs, which otherwise would have been expended in providing of stils, cauldrons, furnaces, *&c.* it is best not to have too great a globe, which requires a greater furnace, and

is more hardly to be carryed, becauſe it is to be covered within with lute, or a wall; for it is ſufficient if it be big enough for the coction. Wherefore I will give you a juſt and due proportion of both, *viz.* of the globe, and veſſel, which in diſtillations and other operations, the curteous reader may imitate.

A globe of the bigneſs of a mans head, containing three or four cannes, whereof each containeth four pints, is ſufficient for the heating of a barrel of 30, 40, 50, 60. and 100 gallons, which by how much the more remote from 100 and nearer to 30, ſo much the ſooner is it heated, and the coction furthered; and on the contrary, by how much the nearer it is to 100 and more remote from 30, ſo mueh the ſlower is the coction. I do not therefore adviſe that a huge barrel be choſen for a ſmall globe, by reaſon of a long and tedious operation: And if all and every thing be not ſo accurately obſerved to a hair, yet it matters not much, becauſe it ſufficeth to do the ſame thing by the help of one ſmall copper inſtrument of divers forms. For in this way of diſtilling, wooden veſſels that are requiſite to the diſtilling of ſpirits, and boyling of Bear, and for baths are more eaſily provided, then ſo many copper veſſels in the common way. For by this means not only coſts are ſpared, but alſo it is in ſtead of building of furnaces, becauſe when any barrel hath been uſed, you may remove it, and ſet another in the place of it for another operation, the which cannot be done with ſtills and cauldrons faſtened into a furnace. And this invention is for thoſe that want Artificers, as Copperſmiths, *&c.* becauſe wooden inſtruments are more eaſily provided: alſo by the help of this globe may moſt ſecret operations be performed.

For the furnace with the copper globe may be built in one place, and in another place the *Balneum*, *viz.* the places divided with a wall, ſo that he that looks to the fire may not know what is done in the Elaboratory; for oftentimes the care of the fire is committed to heedleſs ſervants, that break glaſs inſtruments by their careleſſeneſs, by which means oftentimes a moſt pretious medicine is loſt; which danger this invention is without.

Wherefore this copper globe with its wooden veſſels is more convenient then thoſe copper ſtills and cauldrons. But this I would have thee know that this new invented diſtillation is ſlower, then the common way which is performed by ſtills, and conſequently requires a long fire. I deſire therefore the rich that dwell in large and ſpacious houſes, that they would uſe the old way of diſtilling; but the poor, who have but little houſhold conveniences, and the covetous, that they would uſe this little copper globe with its wooden veſſels: for although there be a longer fire required, yet theſe are not to be compared to thoſe coſts which are otherwiſe expended upon ſo many copper veſſels of ſo many divers forms. Let him therefore keep to his copper veſſels, who cannot underſtand me, for it concernes not me. Without doubt there are ſome whom this my new invented way of diſtilling will pleaſe, before other, being communicated for the ſake of the poor labouring houſe-keepers, that cannot boyl Beer, and diſtill burning ſpirits for lack of veſſels: for a globe of five or four pound is more eaſily provided, then other copper veſſels of 60, 80, 100 pound: alſo thoſe wooden veſſels are more eaſily provided then furnaces, which ſome for want of place only cannot build. Chooſe therefore which way thou wilt, for theſe things which I have wrote, I have wrote for the poors ſake rather than for the rich. Certainly rich men that have ſpacious Elaboratories need not to be aſhamed to follow this way, for it is free for every man to go a ſhorter way, unleſs they had rather prefer the old way before a new and compendious, whom I cannot help, being contented with a publication which is made for the ſake of my neighbour, whether it be taken well or ill, with a good minde, certainly knowing that more profit then diſprofit may be obtained by the help thereof. It ſhall not therefore repent him of his labor, who knows rightly to prepare and uſe this copper, and wooden veſſels.

There follows now the preparation of the veſſel.

THE veſſel being made is to be placed with one bottom, upon a ſtool that is fitted for it, which being done, make a hole with a wimble neer the bottom, for the receiving of the neck of the copper globe, which is to be covered over with a linnen cloth: make alſo about the lower bottom another hole for a tap, by the help whereof the remainder of the diſtillation is drawn forth: alſo you muſt make a large hole in the upper bottom, the diameter whereof muſt be one ſpan for to pour in the water to be diſtilled, with a funnel. Alſo there muſt be made a hole near the upper bottom of two or three fingers breadth, into which is to be put a copper pipe of a ſpan long, which is to be faſtened cloſely therein; and to this pipe another oaken veſſel with a copper worm and cold water like to other refrigeratories, muſt be applyed. Alſo the joints of the aforeſaid ſhort pipe, *viz.* of the firſt barrel, and of the ſecond barrel, *viz.* the refrigeratory muſt be ſtraightly, and cloſely united together, which afterward may be the better joyned together with a fit lute for the diſtilling. And this is the form and faſhion of the wooden veſſel, that is to be uſed in the place of copper veſſels, in the diſtilling of burning ſpirits and oyls. But thou wilt object that theſe kind of wooden veſſels are porous, and drink up great part of the ſpirit and oyls.

I anſwer; none of the ſpirits ſeeketh a violent paſſage out, in caſe the ways be open There is no danger therefore, when there is paſſage enough given them by a pipe that is wide enough. Neither doth oyl ſtick to them in diſtillation, for whatſoever is by force of the boyling water to be ſeparated from the ſpices, and ſeeds that alſo is ſublimable by the force of the ſeething water, ſo as to diſtill in, ſo that in the refrigeratory no more is loſt than in the ſtills. Diſtillation being made, the aforeſaid ſpirits may be rectified in theſe wooden veſſels, (being firſt waſhed) as well as in copper ſtills.

The making of a wooden veſſel for a Balneum, which is to be uſed in ſtead of copper and leaden Cauldrons for digeſtion, and diſtillation by glaſs veſſels.

MAke an oaken veſſel as big or as little as you pleaſe, according to the greatneſs, or littleneſs, multitude, or fewneſs of the veſſels, of two or three ſpans high, a little narrower above then below, and ſo faſhioned above, that a cover of wood, copper, or lead, may moſt cloſely be joyned to it: the cover muſt have holes greater or leſſer, according

ing to the glaſſes, as is wont to be in the making of a *Balneum*, as you may ſee by the the annexed figure. This veſſel alſo muſt be placed upon a ſtool of the height of an ell, or ſuch height as is required for the joyning of the copper globe with the *Balneum*, which muſt have a hole near the lower bottom, for the receiving of the neck of the aforeſaid globe. In defect of ſuch a veſſel, which yet you may provide eaſily enough, take a wine or bear veſſel divided in the middle, and make a hole near the bottom for the neck of the globe, make alſo a wooden cover with holes, &c. He that will be curious may provide all things according to the beſt Art.

A wooden veſſel ſerving for boyling of bear, metheglin, vinegar, &c. as well as copper, iron, and tin veſſels.

MAke a wooden veſſel, which ſhall be more high than broad, a little wider above than below, as you pleaſe: or take a wine or bear barrel divided in the middle, and near the bottom make a hole for the neck of the globe, which is to be covered with boards, which ſerves as well for the boyling of bear, *&c.* as thoſe of copper.

A wooden veſſel for a bath for ſweet, or mineral water, which may be according as you pleaſe, kept warm, for the preſerving of health.

MAke a long wooden tub convenient to ſit in, which is to be ſet upon a ſtool of a juſt height, *viz.* that the bottom of the veſſel may anſwer the neck of the globe which is put into the furnace: you may alſo have a cover, that may cover the whole tub, which may be divided and united in that place where the head goes forth, as appears by the annexed figure, or you may cover it with a cloth, laying it upon ſmall crooked ſticks faſtned to the tub, yet ſo that the head may have its liberty, eſpecially in a vaporous bath of common ſweet, or medicinal water; or make a high wooden cover ſhutting very cloſe, for a dry ſweat, where it is no matter whether the head be ſhut in or no.

Of the uſe of wooden veſſels in diſtilling, boyling, bathing, &c. And firſt of the diſtilling veſſel.

HE that will diſtill any burning ſpirit by help of the diſtilling veſſel, out of wine, metheglin, bear, barley, wheat, meal, apples, pears, cherries, figs, *&c.* alſo out of flowers, ſeeds, and other vegetables, hath need ſo to prepare his materials, that they may yield their ſpirit. Where I thought it convenient, and indeed neceſſary to ſay ſomething of the preparation of each vegetable, for better information ſake, or elſe a profitable diſtillation is not to be expected, but labour in vain to be feared.

And firſt of the preparation of the lees of wine, bear, hydromel, and other drinks.

THe lees of wine, bear, hydromel, *&c.* have no need to be prepared, becauſe they do eaſily enough of themſelves yield their ſpirit, unleſs haply having loſt all their humidity they be dryed, which you may make moiſt again by the admixion of common water, leſt they be burnt in diſtilling & ſtick to the veſſel; of which thing more in the diſtillation it ſelf. Now flowers, roots, hearbs, ſeeds, fruits, apples, pears, cannot be diſtilled without a foregoing preparation. You muſt therefore firſt prepare them, as followeth.

Of the preparation of all kind of corn, as Wheat, Oats, Barly, &c. which muſt go before the diſtilling of the ſpirit.

AND firſt of all a malt muſt be made of the corn, as it is wont to be in the making of bear. Now the manner of making of malt is known almoſt to all, wherefore I need not ſpeak much of that, becauſe in all places that have no wine, there is ſcarce any houſe found in which Malt and Bear is not made, as well in the country as cities. But however, there is a great deal of difference of making of it, for a long knife doth not make a good Cook, nor all drinkers of wine are good planters. For many have perſwaded themſelves, that, if they follow the footſteps of their fathers, they have done well (although they have been in an errour) and being ſcornful, refuſe inſtruction. Wherefore ſomething is to be ſaid of the difference of malting. Although I never exerciſed the Art of making Beer, yet I am certain I do in that excel all other Diſtillers, and Brewers. For I often ſaw, and indeed with admiration, the ſimplicity of many in their operations, although common, and dayly, to whom though an age ſhould be granted, yet they would never be more thrifty, being content with their ancient cuſtomes. Good God! How perverſe is the world, where no body labours to find out any good, neither is there any one that thinks of perfecting, and amending things already found out: Where all things run to ruin, and all manner of vice increaſe: for now almoſt every one ſeeks only after riches *by right or wrong*; for it is all one with them, if they have them, not thinking that things ill gotten ſhall periſh, and that the third heir ſhall not injoy them, and that unjuſt riches ſhall devour thoſe that have been honeſtly gotten, with danger alſo of eternal damnation. I pray you, if our Anceſtors had been ſo negligent, and had left nothing to us: I pray you, I ſay, what Arts and Sciences ſhould we have had now? It is come to this paſs now, that vertues decreaſe, and vices increaſe.

Of the difference of malting.

THe difference of malt, by reaſon whereof it yields better or worſe beer, and ſpirit, conſiſts for the moſt part in the preparation thereof: for being made after the vulgar way it retains its taſt, wherefore it cannot yield good ſpirit, nor good beer, which is obſerved of very few, wherefore they could not draw forth good ſpirit out of corn, but ſuch as ſavours of the taſt and ſmell of the malt. Which is not the fault of the corn, but of the artificer not operating aright in the preparation of his malt, in diſtilling and rectifying. For if it were prepared a right in all things, corn yields a very good ſpirit, not unlike to that which is made out of the lees of wine, in taſt, odour, and other vertues. Which Art, although it be not known to all, yet it doth not follow that it is impoſſible: Now I did not ſay that it is that common way, whereby that ſpirit, which is like to the ſpirit of wine, is diſtilled, but another which is more ſubtil, and witty. Out of all vegetables is drawn a burning ſpirit, yet ſuch as is perceived by ſome difference of the taſt,

aud odour, but that is not the ſpirits faults, but of the vegetable, as of hearbs, ſeeds, corn, *&c.* communicating their vertues, taſt, and odour to the ſpirit: whence that ſpirit deſerves to be called not ſimple, but compounded, for elſe all the burning ſpirit (being rightly rectified from its flegm) is made out of any thing, having the ſame vertues with the ſpirit of wine, although it ſeem improbable to ſome. I do not deny that one ſimple may yield more or leſs ſweet ſpirit than another. For ſweeter wines yields ſweeter ſpirits: Alſo clear wine yields a ſweeter ſpirit than the lees of wine, although they come forth out of one and the ſame veſſel: For clariſied wine, and that which is ſeparated from the fæces yields a ſweeter ſpirit than the Lees, and impure and heterogeneal ſediment, which corrupts the ſimple, and ſweet ſpirit, with a ſtrong taſt and ſmell: ſo that that may deſervedly, being as it were ſimple, be preferred before this which is accidentally corrupted. And this is to be underſtood of all other ſpirits. What hath hitherto been ſaid, hath been ſpoken for the ſakes of them, who have perſwaded themſelves that they could not perform chymical operations ſo well by the ſpirit of corn, as with the ſpirit of wine, for I never found any difference of them in the extraction of minerals or vegetables. Let him therefore that can, receive my opinion, and experience, ſeeing I will have nothing to do with contradicting Carpers: Without hurt to others I dare not reveal the Art of diſtilling a ſweet ſpirit with great profit out of corn, in all things like to that which is made of the fæces of wine, *viz.* without the preparation or grinding of the malt, which ſhall haply be [* *See Explicat. Mirac. Mundi*] communicated elſewhere at ſome time or other. For this Book is not written for the publiſhing of ſecrets, but of a new invented diſtillation. But thou that wilt make a ſweet burning ſpirit out of malt or honey; know this, that the corn muſt be brought after a certain peculiar manner into malt, and loſe its ungrateful ſavour before its diſtilling, and fermentiug, or elſe after the wonted manner a certain ungrateful ſpirit will be drawn from thence, that cannot be compared to the ſpirit of wine. The whole Art thereof conſiſts in a true preparation; for ungrateful things are by Art brought into gratefulneſs, and on the contrary grateful things are made ungrateful by negligence. And thus much for information ſake.

Of the fermentation of Malt.

TAke of Malt ground in a Mill as much as you pleaſe, upon which in a wooden veſſel ſet up right, pour cold water, as much as will moyſten it, and ſerve for mixtion and comminution; then alſo pour as much warm water as will ſuffice for the making the mixture moiſt and thin, and alſo warm; for it muſt be neither hot nor cold: which being done mix with it ſome new barm, and cover it with a cloth, and in a ſhort ſpace, being expoſed to heat, it will begin to ferment (wherefore the veſſel is not to befilled to the top) and leave it ſo long in fermentation, until the mixture deſcends, which for the moſt part is wont to be done the third day, and the malt will be ready for diſtillation.

Of the fermentation of Honey.

NEither hath honey any need of a ſingular Art in its fermentation, becauſe being mixed with 6, 7, 8, or 10. parts of warm water, it is diſſolved, and unto the ſolution is added ferment, as has been ſpoken concerning malt, which afterward is left covered in ſome heat for to be fermented, being fit for diſtillation when it becomes to wax hot. Now know that too great a quantity of honey makes a very ſlow fermentation, *viz.* of ſome weeks and months; wherefore for acceleration ſake, I adviſe that a greater quantity of water be added; although otherwiſe it yields plenty of ſpirits, but ungrateful, which therefore I adviſe no body to diſtil as being unprofitable, unleſs any one know how to take away the * ungratefulneſs thereof. [* *See the Conſolat. of Navigators.*]

Of the preparation of Fruits, Seeds, Flowers, Herbs, Roots, &c.

THe fruits of trees, as Cherries, Plumbs, Apples, Pears, Figs, Juniper-berries, Elder-berries, Dwarf-elder, and Mulberries, *&c.* are bruiſed in wooden veſſels, with wooden peſtils; and upon them being bruiſed, is poured warm water, and ferment added to quicken it, as hath been above ſaid of malt. Seeds are broken in a mill; flowers, hearbs and roots, are cut ſmall, and are ſtirred up to fermentation by mixing of warm water, and barm or yeſt.

An Annotation.

BEfore thou diſtil the aforeſaid vegetables prepared by the help of fermentation, diligently weigh, and accurately obſerve whether the mixture be ſufficiently fermented, for ſometimes there is too much cold, or hot water put to it; ſometimes the veſſel is not well covered, by which means the cold air is let in, whence the fermentation is hindred, and conquently the diſtillation of the ſpirit: For by the help of fermentation the burning ſpirit of the vegetables is ſet at liberty, without which it cannot be done; alſo the diſtillation is hindred by too much haſt, as well as by too much delay; for if you begin to diſtill before the time, *viz.* fermentation not being yet perfected, thou ſhalt have but few ſpirits; wherefore alſo the better part is, by many that are unskilful, caſt to the ſwine, but without any great loſs, if the matter were malt, becauſe that ſwine are fed therewith; but not ſo if other vegetables were the matter of the diſtillation. Alſo too much flowneſs where the matter begins to be ſowre before it be diſtilled, yields very few ſpirits, that which often happens, whilſt hearbs, and flowers, *&c.* are out of ignorance left in fermentation 3, 4, 5. and more weeks, before they be diſtilled, for the greateſt part of the ſpirit is then turned to vinegar, which would not be ſo very ill done, if ſo be theſe men knew how to clariſie the remainders, and turn it into vinegar, that nothing thereof might be loſt; for the vinegars of hearbs, flowers, ſeeds, and roots are not to be contemned. And ſo often times (a thing to be lamented) the better part, if they be ſpices, and pretious things, is loſt.

The matter of the diſtillation, and other choice things, as ſeeds and hearbs are caſt away with loſs; wherefore for admonition ſake I was willing to add

Of ſuch

ſuch things that the operators may have an opportunity to conſider the matter a little more profoundly with themſelves, or at leaſt of learning the art of diſtilling from countrymen, who do not ſuffer their malt to putrefy, grow ſower or mouldy, before they fall upon their diſtillations, but preſently fermentation being made (the third or the fourth day) begin their diſtillation.

But ſome one will object, that my vegetable ſpirits are not pure by reaſon of the ferment that is mixed, having in it ſelf a ſpirit. I anſwer, there is not ſo great a portion of the ferment mixed which can corrupt the vegetable ſpirit. For although ſome ſpoonfuls of ferment yielding but a few drops of ſpirits be added to a great quantity of the vegetables; yet there can come no hurt or detriment to ſo many quarts of the vegetable ſpirit. I have ſeen ſome ſupercilious men that would not add ferment to the matter of their ſpirit, but ſugar or honey, by which they would promote fermentation, and ſo have thought to get a pure ſpirit, not conſidering that honey and ſugar, after fermentation are made to yield their ſpirit alſo, whereof one ſpoonful yields more than ten or twenty of Barm: But hony and ſugar fermenting not without difficulty themſelves, how can they promote the fermentation of other things? Who alſo have had experience, that the addition of their ferment hath been ſuperfluous, whilſt their flowers and hearbs have ſtood ſome weeks in maceration, before they begun to ferment, and that often times they have contracted an acidity, muſtineſs and ſtink, the reaſon of which was an unſutable ferment. There are indeed the fruits of ſome trees that have a ſweet and full juice, as grapes, cherries, apples, pears, figs, *&c.* which need not the addition of any ferment, having a natural ferment of their own, but other vegetables not ſo, being lean, as hearbs, flowers and roots. It is neceſſary there to promote the fermentation of them by the addition of a ſutable ferment, leſt in length of time theſe hearbs and ſeeds loſe their ſpirit exhaling in maceration. And thus much I was willing to ſay for information ſake, and indeed for the ſake of them who ſeek after the beſt and choiceſt medicines, wanting a good burning ſpirit as a companion applicable to them. For this ſpirit came not only by it ſelf, as *Aqua vitæ*, into a medicinal uſe as well internal as external, eſpecially that which is prepared of cordial, and cephalick hearbs; but alſo being united with the proper oyls of thoſe hearbs in many deſperate diſeaſes, where it could put forth its vertues eminently.

And thus much ſufficeth concerning the preparation of vegetables that goes before the diſtillation of burning ſpirits.

The manner of diſtilling in general followeth.

HE that is going to diſtil, hath need to ſtir his fermented matter very well with a ſtick, that the thicker parts may be well mixed with the thinner, and then he muſt fill therewith his diſtilling veſſel ſet upon a treefoot, and joyned to the copper globe in the furnace on one ſide, and to the refrigeratory on the other, the joints in all places being well cloſed either with Oxe-bladders, or with ſtarch and paper. Alſo the interiour part of the globe in the diſtilling veſſel muſt be fenced with a copper or wooden basket, that the herbs, ſeeds, and other things enter not into the globe, into which only water muſt come. Alſo the upper hole muſt be cloſe ſtopped with a fitting ſtopple wrapt about with linnen clouts, (*viz.* that hole by which the matter to be diſtilled is put in) like to veſſels of wine that are ſtopped. Which being well done, you muſt kindle the fire in the furnace under the globe, until all the matter in the whole veſſel boyl well, and that burning ſpirit riſe, and go out, through the refrigeratory (where it is condenſed) into the glaſs receiver that is ſet under it, no leſs than that diſtilled out of a ſtill; and you muſt continue the fire till all the ſpirit be come forth, which you may know by the taſte. Which being done, and all things being cold, let the remainders be taken out by the lower large tap-hole, for meat for ſwine, or other uſes. The ſpirit that is drawn off may be exalted, and rectified at your pleaſure in the ſame veſſel, being firſt made clean together with the refrigeratory. Note well, that ſometimes there is left a fat oyl with the flegm in rectifying of the ſpirit, proceeding from that hearb of which that was the ſpirit, which did diſtil off with the ſpirit from the matter with a ſtrong fire in the firſt diſtillation, but in the rectifying could not aſcend with the ſpirit in a gentle fire, but is conſtrained to remain with the inſipid flegm. And this oyl alſo hath its vertues, eſpecially that which is rectified by a glaſs gourd in Balneo, with the ſpirit of ſalt, and clarified. Now the like oyl is got almoſt from all hearbs, roots, ſeeds, flowers, and fruits, but out of one ſubject more than another, according to the hot and cold temper thereof. Eſpecially the ſediment of wines yields a good quantity of ſuch oyl, which being rectified is a medicinal true oyl of wine, but not before endued with a ſweet ſavour, and it is an excellent cordial, although I know no body that knew this before.

And thus I have ſhewed the general way of diſtilling, burning ſpirits, by help of the aforeſaid wooden diſtillatory. Now alſo follows,

The manner of diſtilling Spices, Seeds, Flowers, Hearbs, Roots, Woods, &c.

FIrſt, the ſeeds muſt be broken in a mill, flowers, hearbs, and roots cut ſmall, the woods broken or raſped, upon which afterwards a good quantity of water (in which they may ſwim) muſt be poured for the maceration of them, ſo that when the diſtillation is ended there may remain ſome water, leſt for want of water they be burnt in the diſtilling, and yield an oyl ſavouring of an *empyreuma*, and not ſweet. Neither is too great a quantity to be poured upon them, but as much as ſhall ſerve to prevent the burning of the aforeſaid vegetables in the diſtilling of the oyl thereof. And indeed freſh vegetables may preſently without any foregoing maceration, being put with their proper waters into the diſtilling veſſel be diſtilled. But they that be dry may for the ſpace of ſome dayes be macerated before they be diſtilled. Alſo the water appointed for maceration muſt be ſalted, for the better mollifing, and opening the aforeſaid materials, that they may ſooner yield their oyl. Now green and freſh need not any ſalt water, yet it will not be hurtful to mix ſome therewith, becauſe ſalt helps the boyling water, ſo as to make the oyl more eaſily to aſcend. It alſo helps and furthers diſtillation as doth Tartar and Allome, if they be rightly mixed and ordered. Which being all rightly done, the materials that are macerated muſt be put by a

funnel into the diſtilling veſſel, and fire muſt be given as hath been ſpoken concerning the burning ſpirit, and the oyl of the ſeed, or wood macerated in the water will come forth in the diſtillation together with the water. And although by this way more oyl comes forth, *viz.* Maceration being made by the addition of ſalt, than without ſalt, by the help of the ſweet water alone, as is the faſhion in all places almoſt to diſtill oyls of ſpices; yet much remaines inſeparable by the water, and conſequently not to be ſublimed with the water. Therefore the better way is that which I ſhewed in the firſt part to be performed with the ſpirit of ſalt, which if you pleaſe you may follow. All the oyl being come forth (which is perceived by the changing of the receivers) the fire is to be extinguiſhed, and the remainder is to be taken out, which if it be of ſeeds, hearbs, or fruits, may, being yet warm, be fermented by the addition of ferment for the diſtilling of the ſpirit, of which there cannot be ſo great a quantity by reaſon of taking away of the oyl, as otherwiſe is drawn out of things that have not loſt their oyl: For all burning ſpirit partakes of much oyl, of the eſſence, and nature whereof more a little after. Now ſpirits muſt be made without the addition of any ſalt, for ſalt hinders the fermentation, without which the burning ſpirit cannot be had. But the water that is diſtilled together with the oyl, is to be ſet in a certain temperate place, until the oyl aſcend, and ſwim upon the water, from whence it is to be ſeparated with a Tunnel (of which in the fifth part,) alſo there are ſome oyls which do not aſcend, but fall to the bottom, which are alſo to be ſeparated with a Tunnel, and kept for their uſes. Now how theſe oyls may be kept clear long, and not contract any clammineſs, ſhall be taught in the fifth part: but how they may after they have loſt their clearneſs by long ſtanding, and are become tenacious, be reſtored and clarified again, is taught in the firſt part, wherefore I need not here repeat it.

How Oyls are to be coagulated into Balſames.

IT hath been the cuſtom a long time to turn aromatical oyls into Balſams, where always one hath been willing to excel another in this Art, which nevertheleſs was nothing hitherto, but for a waſhing and cleanſing; for they could not be uſed inwardly, but only outwardly for their odour to comfort the heart and brain. Now the aforeſaid oyls are coagulated many ways, and are made portable in Tin, Silver, and ivory boxes.

Some have mixed the fat of a lamb with them by help of heat, and have turned them into a liniment, which they have coloured with divers colours; as for example, they have corrupted the oyls of green hearbs; as roſemary, marjoram, lavender, rue, ſage, with a green colour, by the admixtion of verdigreaſe (which is noxious to the head and heart) where one corroborates and refreſheth, another deſtroys. They have tinged the Balſam of Cinnamon, and *lignum Rhodium* with a red colour by the help of a poyſonous Cinnabar. Others that are more induſtrious, have tinged their Oyls with extracted colours of vegetables, which balſams are more ſafely taken inward: But they are not durable, acquiring a ſlimineſs and ſtink; wherefore they have mixed white wax to coagulate them: By which means they are become more durable without ſtinking; but yet in length of time ſo tenacious, that being ſmeared or rubbed upon the skin, they ſtick faſt by reaſon of the wax that is mixed with them: at laſt others have found out a better way of coagulating aromatical oyls, and other things, *viz.* by the addition of the oyl of Nutmeg made by expreſſion, having loſt its odour and colour by ſpirit of wine; which they called the *Mother of Balſames* And this way hath been a long time concealed by Apothecaries as a great ſecret, until at length it is become common, ſo that balſames prepared after this manner are ſold almoſt in all ſhops: But although that be the beſt way, yet they are not durable balſames that are made that way, becauſe they lack ſalt. I do not contemn and diſapprove of Balſames made after this way, for if a better way had been known, better had been made, for no man is obliged beyond his power. Wherefore they are not only to be excuſed, that have uſed Lambs fat, Wax, and the oyl of Nutmegs in the making of their Balſames, but alſo to be honoured for their communication. Now ſeeing the aforeſaid Balſames cannot be taken inwardly, nor be ſo well outwardly adminiſtred by reaſon of their unctuoſity, others have conſulted to congeal the Oyls by the admixtion of their own proper fix-ſalts: And Balſames prepared after this manner are made free from clammineſs, or tenaciouſneſs, and may be diſſolved in wine, beer, or any liquor.

Wherefore they may be not only conveniently taken inward, but alſo more fitly than thoſe old, be rubed outwardly for the odours ſake, becauſe they are eaſily waſhed off again with water. They do not only give a moſt ſweet odour being rubbed, but alſo by reaſon of the admixtion of the fixed ſalt, having the nature of ſalt of Tartar, do beautify the skin. Wherefore they are to be commended, being diſſolved in fair warm water for a lotion for the head, and face; not only becauſe they beautify, but corroborate with their excellent odour; which thoſe fat Balſames cannot do. Wherefore this way is to be preferred far before the other.

Let him therefore that will, receive what I have ſaid, for *rare and new things are not alwayes accepted*, eſpecially *being obſcure:* but I hope for the approbation of the age to come.

The manner of preparing follows.

TAke the remains of the burning ſpirit, and being put into a ſack, preſs it hard: reduce the water preſſed out into vinegar, and of roſes thou ſhalt have a roſe vinegar, and of other things another, being the beſt in a Family for to ſeaſon meats: then take the remains out of the ſack, and reduce it to white aſhes in a potters furnace, upon which pour the flegm of its own burning ſpirit (being ſeparated) to extract the ſalt, from which evaporate again all the humidity in a glazed earthen pot: calcine the coagulated ſalt gently in a clean crucible, and it will be white and be like to ſalt of tartar in taſt; from which abſtract, ſometimes its own proper burning ſpirit, calcining the ſalt firſt every time; and the ſpirit will be ſo exalted by its proper ſalt, that it will preſently aſſume its proper oyl, and will, being poured upon it, aſſociate it to it ſelf ſo as to be perceived no more in the ſpirit, which will remain very clear: Which being done, calcine the ſalt yet once

once more very well in a crucible, and diſſolve ſo much of it in its proper flegm, as ſufficeth for the coagulation of the oyl, then mix this ſolution with the burning ſpirit, mixed with its oyl, and ſet it in a vial of a long neck well ſtopt, in Balneo, that the ſpirit may not exhale, in the coction of it, and in the ſpace of a few hours there will be an union of the mixture which will be as white as milk. Which being done, let the glaſs cool, for there is a conjunction of the ſpirit, oyl, and ſalt, ſo that neither can be diſcerned from another, which is to be poured into a veſſel of a wide mouth, and it will be congealed in the cold like a white ointment, not only to be anointed withal, but alſo to be diſſolved in any liquor, being of an excellent odour, which may alſo be given inwardly very conveniently, and being uſed outwardly it makes the skin beautiful and ſweet; wherefore this is that moſt deſired balſame of Princes and Ladies. And by this way the three principles of vegetables, being ſeparated, and purified, are again reunited, in which union there is found the whole vertue, taſt, and odour of the vegetable.

Note well, That he that will colour balſames, muſt draw the colour out of vegetables with ſpirit of wine, which he muſt make to be coagulated together with it. After this aforeſaid manner, therefore you may draw out of any vegetable that hath in it ſalt, ſpirit and oyl, ſoluble and well ſmelling balſomes without the addition of any other ſtrange thing, which are not to be contemned.

And becauſe here alſo is taught that moſt odoriferous balſame of roſes, for roſes yield but a little oyl, without which that cannot be done, know that not only roſes or roſe leaves alſo are to be taken for the making the aforeſaid balſome, but alſo together with the leaves thoſe whole knots; for that yellow that is in them yields that oyl, not the roſe leaves, *&c.* And let what hath been ſaid ſuffice concerning our preparation of balſames, which if they be rightly made, are not I ſuppoſe, to be contemned, neither do I reject thoſe that are made without ſalt: Let him that hath better communicate them, and not carp at ours. And ſo I would that all and each proceſs ſhould be comprehended under ſome one general, *viz.* of diſtilling burning ſpirits, and oyls, by the help of a wooden diſtilling veſſel, and their conjunction by the help of their proper fixed ſalt, I could here add more things concerning the uſe, and vertues of ſpirits of wine, and of thoſe moſt ſweet vegetable oyls; but becauſe they are clearly enough ſpoken of by others, I account it a ſuperfluous thing to repeat the ſayings of others, being contented with the deſcription of one only general proceſs, which you may imitate in other particulars.

There follows now the uſe of the ſecond wooden veſſel, which is to be uſed inſtead of thoſe of copper or lead, ſerving for diſtillations, digeſtions, extractions, and fixations.

THe veſſel being made ready according to the preſcription ſet down before, there is nothing elſe to do, than to fit the furnace with the globe, and at your pleaſure to heat water in it, with a government of the fire in the furnace. Now all things may here be done, which otherwiſe are done in a common *Balneo*; where there is no other difference but of veſſels; here is uſed a wooden veſſel, there a copper, leaden, or iron, *&c.* In this operation alſo is uſed the ſame furnace with the ſame globe, which was uſed above in the diſtillation, wherefore you need add nothing elſe beſide, for nothing is more common than a *Balneum* in diſtillation; let the demonſtration therefore of the uſe of the copper globe ſuffice. Now I thought it worth while to ſet down ſome Chymical medicinal extracts, not common, which may be made by the help of this *Balneum*, which being rightly prepared do many things in many diſeaſes.

And firſt of a vomitive Extract.

TAke an ounce of the flowers of Antimony, of purifyed Tartar ℥ ij. of ſugar-candy ℥ vj. of rain water two pints, being mixed together, ſet them in a ſtrong vial in *Balneo* for to be cocted, and make them to boyl ſtrongly the ſpace of ten or twelve hours. Then the *Balneum* being cold, take out the glaſs, and pour forth the decoction, and filter it through a brown paper put into a tunnel; the filtred water will be reddiſh betwixt ſweet and ſowre, which take (the fæces in the filtre being caſt away) and in a ſmall gourd glaſs draw off all the moiſture with a gentle fire in *Balneo* unto the conſiſtency of honey of a browniſh colour, upon which again pour a pint of ſpirit of wine, poured forth into a vial with a long neck; and ſet it in *Balneo* with a moderate heat the ſpace of eight or ſixteen hours, and then the ſpirit of wine will ſeparate, and extract the eſſence, which will be more pure and noble, the fæces being left in the bottom; which after all things are cold are to be ſeparated by the Help of Filtration through a double brown paper. Then take the red tincture that is filtred, and in a gourd glaſs in a gentle Balneo draw off almoſt all the ſpirit of wine until there remain a matter like a very ſweet ſyrup, which being taken out keep as a moſt excellent vomitive, moſt profitable in many diſeaſes, where other Catharticks can do nothing. For this medicine works moſt gently, wherefore it may be given to children of a year and half old without danger, and alſo to old men. This medicine purgeth and attracts all humors from the nerves, and veins, opens all obſtructions of the liver, ſpleen, lungs, and kidneys, by which means many moſt grievous diſeaſes are cured.

I never found a vomitive comparable to this, which works quickly and ſafely. The doſe of it is from grain 1, 2, 3, 4. to 10. and 30. according to the age and ſickneſs. It may be taken by it ſelf, or in wine, beer, *&c.* and it will within a quarter of an hour begin to work, and ceaſeth within two hours. Sometimes it doth not provoke vomit at all, but only ſtools, where a glyſter is very helpful if it be given a little before the adminiſtring of the aforſaid medicine, being made of two or three ſpoonful of oyl Olive, and ſalt water; for the glyſter prepares the way below, ſo that it ſeldome then works by way of vomit: when alſo the patient may preſently after the taking of the medicine hold hot toſted bread to his mouth and noſe, which hinders vomiting and promotes the operation by ſtool, But in my judgment it is better not to hinder the medicine ſeeking a ſpontaneous way of operation, and not forced: For vomiting is more convenient for ſome, than purging by ſtool.

Now theſe things I have ſpoken for the ſake of thoſe, who although they abhor vomiting, yet deſire to be purged by the eſſence of Antimony, which is of all that I know the moſt ſafe, and ſweet Cathartick. For it ſearcheth the whole body far better than all others, and frees it from many occult diſeaſes, the which all other vegetable Catharticks could not do. It hath alſo this commodity in it, that although by littleneſs of the doſe, or the ſtrong nature of the patient it doth not work by vomit or ſtool, yet it doth not like other medicines hurt the body, but works either by ſweat or urine, ſo that Antimony being rightly prepared is ſeldome adminiſtred without profit. When as on the contrary, vegetable Catharticks being given in leſs doſe or by reaſon of ſome other cauſes do not work, although they do not make the body ſwell, and produce manifeſt diſeaſes, yet they threaten to the body occult ſickneſſes.

Now the *Arcanum* of Antimony doth not onely not do hurt, if it do not ſenſibly operate, but by inſenſible working doth much good to the body of man. Wherefore there is a great difference betwixt purging minerals, and vegetables. For minerals are given in a leſs doſe without nauſeouſneſs, but vegetables with a great deal of nauſeouſneſs, and ſometimes with danger to the ſick in a greater doſe. Now that nauſeouſneſs alſo proceeding oftentimes from the great doſe of the ungrateful bitter potions does more hurt than the potion it ſelf. I wiſh that ſuch kind of groſs medicines were aboliſhed, and the ſweet Extracts of Vegetables and Eſſences of Minerals were ſubſtituted in their place.

A purging Extract.

TAke of the roots of black Hellebore gatherd in fit time, and dryed in the air, one pound, the roots of Mechoacan, Jallap, of each four ounces; Cinnamon, Anniſſeed, and Fennelſeed, of each one ounce; of Engliſh Saffron a dram, powder all theſe Ingredients, then pour upon them the beſt rectified ſpirit of Wine, in a high glaſs gourd, and upon this put a blind Alembick, and ſet it in digeſtion; in Balneo until the ſpirit of wine be tinged red, which then decant off: and pour on freſh, and ſet it again in digeſtion; until the ſpirit be red, then pour on freſh again, and do this ſo often until the ſpirit will no more be tinged red, which commonly is done at three Times. Mix theſe tinged ſpirits, filter them, and in Balneo by a glaſs Alembick, with a gentle heat draw them off from the Tincture, and a thick juice will remain at the bottom of a browniſh colour, which you muſt take out whilſt it is yet hot, and keep it in a clean glaſs for its uſes. The Spirit of Wine drawn off from the extract may be reſerved for the ſame uſe. Now this extract is given from grains 3, 6, 9, 12. to 31. according to the age, and ſtrength, being mixed with Sugar, it hath not an ungrateful taſt, and it works gently, and ſafely, if it be not given in too great a doſe. And if thou wilt have it in the form of a Pill, mix with it being yet hot, an ounce of clear Aloes, and half an ounce of Diagridium powdered, being mixed bring it into a maſs for Pills, and keep it for your uſe. The doſe is from grain 1. to a ſcruple. It evacuates all ſuperfluous humors, but it is not to be compared with the medicine of Antimony. And this extract I put down for the ſakes of thoſe that fear Minerals, and abhor Vomits, which in my judgment is the beſt of all vegetable Catharticks.

A Diaphoretical Extract.

TAke the wood Saſſafras, Sarſſaparilla, of each ſix ounces; Ginger, Galengal, Zedoary, of each three ounces; long Pepper, Cardamoms, Cubebs, of each an ounce; Cinnamon, Mace, of each half an ounce; Engliſh Saffron, Nutmeg, Cloves, of each a dram: Let the woods be raſped, the roots and ſpices poudered, pour upon them, being mixed, the ſpirit of wine, and let the tincture be drawn forth in Balneo, as hath been aboveſaid of the purging Extract, evaporate away the ſpirit to the conſiſtency of honey, which keep for your uſe. It is good in the Plague, Feavers, Scorbute, Leproſie, Frenchpox, and other diſeaſes proceeding, from the impurity of the blood, curing them by ſweat. The Doſe of this Extract is from a ſcruple to a dram with proper vehicles: it provoketh ſweat preſently, driveth away all venenoſities from the heart, and mundifies the blood.

And although it be a moſt effectual vegetable Diaphoretick yet it may not be compared to thoſe ſubtile ſpirits of minerals, of which in the ſecond part. Alſo animal diaphoreticks have their commendations, as the fleſh of vipers, the fixed ſalt of ſpiders and toads, in their peculiar operations, where each alone without the mixture of any other thing puts forth and ſheweth its operations; neither are animal and vegetable diaphoreticks to be compared to the mineral, as *Bezoarticum minerale*, *Antimonium diaphoreticum*, and *Aurum diaphoreticum*.

A Diuretical Extract.

TAke the ſeeds of Saxifrage, Carraway, Fennel, Parſly, Netles, of each 3. ounces, the root of liquoriſh, the greater burr, of each an ounce, the powder of woodlice half an ounce. Let theſe being mixed and powdered be extracted with ſpirit of Juniper according to art: then mix theſe following things with the extracted matter: Take the ſalt of Ambar, Soot, Netles, of each half a dram, purified Nitre a dram: Let theſe be powdered, and mixed with the extract and this mixture be kept for uſe. The doſe is from a ſcruble to a dram, in the water of parſly fennel, *&c.* This extract forceth urin, opens the ureters, purgeth the reines, and bladder from all viſcous flegme (the mother of all tartareous coagulation) *viz.* if it be uſed timely: In this caſe is commended alſo the ſolution of flints, and cryſtals, made with ſpirit of ſalt. A greater commendation have ſalts of nephritick hearbs made by expreſſion, and cryſtalliſation, without calcination, the preparation whereof ſhall not here, but elſewhere be taught,

A ſomniferous Extract.

TAke of *Thebaic opium* four ounces, of Spirit of Salt two ounces, purified Tartar one ounce, ſet them being mixed in maceration in Balneo in a glaſs veſſel for a day and night, and the ſpirit of ſalt with Tartar will open the body of the *opium*, and prepare it for extraction, upon which pour half a pint of the beſt ſpirit of wine, ſet it in a gentle Balneo to be extracted. Decant off the ſpirit

that

that is tinged, and pour on freſh, ſet it in digeſtion till the ſpirit be coloured. Then mix the axtractions together, and put to them in a glaſs gourd two drams of the beſt Saffron, of oyl of Cloves a dram, and draw off the ſpirit of wine in Balneo, and there will remain a thick black juice, which is to be taken out, and kept in a clean glaſs veſſel. The doſe thereof is from one grain, to five or ſix, for thoſe of a mans age, but to children the ſixth or eighth part of a grain. It may be uſed in all hot diſtempers without danger. It provoketh quiet ſleep, mitigates pains as well outward as inward, it cauſeth ſweat; but eſpecially it is a ſure remedy for the epilepſie in children that are new-born; for as ſoon as it is given to them to the quantity of the eighth part of a grain in wine, or womans milk, there preſently follows reſt, and ſweat with ſleep, by whis means the malignity is expelled, the children are refreſhed, and deſire victuals, and the fit returns no more afterwards. Although haply the like ſymptomes may be preceived again, yet if the aforeſaid doſe be adminiſtred again, the children are refreſhed, and cured wholly, whereas otherwiſe they would have dyed, *&c.* whereof I have not reſtored few with this medicine. Moreover alſo there are very effectual anodine medicines, as thoſe volatile ſpirits of vitriol, allome, Antimony, and other minerals, with which, as alſo with that narcotick ſulphur precipitated from the volatile ſpirit of vitriol, nothing may be compared.

A Cordial Extract.

TAke red roſes four ounces, of the lilly of the valley two ounces, the flowers of borage, roſemary, ſage, of each an ounce; cinnamon, lignum aloes, of each two drams; cloves, mace, nutmeg, galangal, cardamoms the leſſer, of each half an ounce; the ſhavings of ivory, hartſhorn, of each an ounce; of *Engliſh* ſaffron a dram, of *nuxvomica* a dram: Mix them and reduce, them to a fine powder, and let the tincture be extracted with ſpirit of wine in Balneo, which is to be drawn off again, unto a juſt conſiſtence. Let the extract be kept for uſe. It may be uſed in almoſt all faintings, and other affects that are not joyned with a preternatural heat. The doſe thereof is from grains 3, 6, 9. to a ſcruple with proper vehicles; being often adminiſtred it refreſheth the ſpirit, corroborates the brain, and other parts of the body. It is made more efficacious by the adding of the eſſences of minerals, eſpecially of gold, of which thing ſee the firſt part concerning the ſweet oyl of gold.

Of an odoriferous Extract.

I Need not teach the making of any odoriferous vegetable extract, becauſe the manner of drawing forth, or diſtilling oyls of vegetables that have ſweet odores, hath been ſhewed a little before, as of hearbs, flowers, and ſeeds, which are the moſt noble, and ſweet eſſences of vegetables, by the odour whereof the heart and brain are corroborated, which being reduced into balſams are made tranſportable. Better extracts therefore, and more excellent cannot in my judgment be made out of vegetables, then thoſe aforeſaid oyls, unleſs any one would mix aromatical extracts made with ſpirit of wine with metallick ſolutions, and being mixed digeſt them, then there will a certain moſt odoriferous oyl go from the extract not only more efficacious, but more excellent than that common diſtilled oyl by reaſon of the admixtion of the ſpirituall metallick vertue, eſpecially of gold and ſilver, diſſolved in the acid *Menſtruum* communicating its vertues to the Aromatical oyl. Moreover any vegetable oyl may be exalted in vertues and odour by the help of ſpirit of urine, or ſalt Armoniack, by the help whereof not only odoriferous oyls are exalted, but alſo the inodorous oyls of vegetables are made odoriferous, if they be a while digeſted in ſpirit of urine: and not this only but every mineral, and metallick ſulphur, although the odour thereof be bound up with moſt ſtrong bonds, is opened by the benefit thereof, and is reduced by digeſtion in a very little time into a moſt ſweet and odoriferous eſſence. Lixivial ſpirits exalt the odours, and colours of ſulphurs; acid purge ſulphurs, but change their colours and odours. Musk and Civet get the ſweetneſs, and excellency of their odour from the ſubtile urinous ſpirit of a certain Cat, digeſting ſome certain fat and converting it into ſuch a kind of moſt odoriferous matter.

And let this that hath been ſaid ſuffice concerning Extracts, which might have been omitted, becauſe many of theſe kind of Extracts are found in the writings of other authors in many languages: but I was willing to ſet down theſe, leſt this book might ſeem to contain in it nothing elſe beſides the new way of diſtilling, being furniſhed alſo with good medicines.

Of Baths

A Little before hath been given a deſcription of a Tub for a Bath in which any one may ſit with his whole body except his head, not only to be waſhed in ſweet warm water, whether medicinal and mineral, but alſo to ſweat in without water, where the veſſel is heated by warm vapours, either of ſweet waters, or minerals. And every one may provide ſuch Baths for himſelf according to his neceſſity at home, whereby the ſame diſeaſes are cured as thoſe that are cured by the help of natural Baths, ſo that he need not for the baths ſake go a great journey, but may ſtay at home with his family and follow his Calling without trouble, when he hath occaſion and need to uſed them.

And whereas it cannot be denyed, that by the uſe of the Baths moſt grievous diſeaſes which cannot be cured by Phyſitians, are happily cured; I was willing for the ſake of my neighbour to publiſh this inſtrument together with the preparation of mineral waters; which publiſhing will not without doubt be without profit, and advantage. Wherefore I will in brief ſhew you the preparation of mineral, and ſweet waters, and their uſe, and firſt,

Of a Bath of ſweet or common water.

THere is no art to make a Bath of ſweet water, for you have nothing elſe to do, then to fill your veſſel with river or rain water, and to make a fire, which by the help of the copper globe will heat the water, which being ſufficiently heated, you may ſit in it, and cover the Tub, that the hot vapors evaporate not, nor the cold air enter in, and cool the exteriour parts of the body: Wherefore alſo you muſt apply a clean linnen cloth about your neck, leſt the warm vapors evaporate there: which being

rightly obſerved, you may ſit the ſpace of 1. 2. 3. hours, or as long as you pleaſe or your ſickneſs require. You muſt keep a continual heat as much as is neceſſary, which may be done by the help of that globe. If you be thirſty in the mean time you may drink ſome proper diſtilled drink according to the nature of your diſeaſe, of which thing nothing now, becauſe I am reſolved to write a peculiar *book de Balneis*, and here only to ſhew the uſe of that copper globe in heating of Baths. And although there be not a perfect inſtruction of all, yet of ſome Baths, and their uſes there ſhall a ſhort inſtruction be given in this place.

Of the nature, and property of natural Baths.

KNow that the greateſt part of medicinal waters in *Germany*, and other countries as well hot as cold carry with them from the earth a certain ſulphureous acidity more or leſs: in which acidity conſiſts that medicinal faculty and vertue of this or that water. And if thoſe waters loſe their odour and taſt by the exhaling of their ſubtile ſpirits, then alſo they looſe their vertues; although alſo there be found ſome waters, which have not only a ſpiritual ſulphur, but alſo are impregnated with a certain mineral, or metallick body mixed with Allome, or Vitriol, which comes not elſewhere then from the common water running through the mines. There are found alſo other baths, the power and vertue whereof conſiſts not in any ſpiritual ſulphur, nor in any metallick body mixed with ſalt, but only in a certain ſpiritual ſalt mixed with a certain ſubtil fixed earth, which waters do not run through metallick mines as others do, but rather ſtones of the mountaines calcined with a ſubterraneal fire, whence alſo they borrow their ſubtil acidity with their inſipid earth. And this no man will deny that hath the knowledge of volatile and fixed ſalts of minerals, and metals: the which I am able to demonſtrate with very many, and moſt evident reaſons, if time and occaſion would permit; but it ſhall be done ſometime or other as hath been ſaid in a peculiar treatiſe. Now therefore I will only teach how by ſalts, minerals, and metals, artificial Baths may be made, which are not only not inferiour to the natural in vertue, but alſo oftentimes far better, and that without much coſt or labour, which any one may uſe at home in ſtead of the natural for the expelling of diſeaſes, and recovering of health. And although I am reſolved to ſet forth a book that ſhall treat largely of the nature, and original of Baths, and of their uſe; yet I am willing now alſo to ſay ſomething in brief concerning it, and that from the foundation, ſeeing that there are ſo many different opinions of learned men, and thoſe for the moſt part uncertain.

As concerning therefore the original of the acidity as well volatile, as corporeal, as alſo the heat of Baths, know that is not one, and the ſame; for elſe each would have the ſame properties, but daily experience teſtifies the contrary: For it is manifeſt that ſome Baths help ſome diſeaſes, and others are hurtful for them, which comes from nothing elſe but from the difference of the properties of the mineral waters proceeding from a diverſity of mines impregnating thoſe waters. In a word, ſweet waters attract their powers, and vertues in the caverns of mountains from ſome metal and minerals of divers kinds, that have naturally a moſt acid ſpirit of ſalt, as are divers kinde of marcaſites containing copper and iron, and ſometimes gold and ſilver; alſo kinds of vitriol and Allome called by the ancients *Miſii*, *Rarii*, *Chalcitis*, *Melanteria*, and *Pyritis*, whereof ſome are found white like metals, but others diſperſed in a fat earth, of a round figure in greater or leſſer pieces: which ſulphureous ſalt mines whileſt the water run through, and humectates, that ſpirit of ſalt is ſtirred up, having got a *vehiculum*, and falls upon the mines by diſſolving them, in which ſolution the water waxeth warm, as if it had been poured on quick lime, or like ſpirit of vitriol, or ſalt mixed with water, and poured on iron, and other metals; where continually and daily that water running through the mines whoſe nature and properties it imitates, carrys ſomething with it: wherefore there are ſo many, and ſuch various kinds of Baths as are the mines by which the water is heated. Let him that will not believe take any mineral of the aforeſaid quality, and wrap it up in a wet linen cloth for a little while, and he will ſee it experimentally that the mineral ſtone will be heated by the water, and ſo heated, as if it were in the fire, ſo as thou canſt ſcarce hold it in thy hand, which at length alſo by a longer action will cleave in ſunder and be conſumed like quick lime.

I will publiſh ſome time or other (God willing) more fully, and clearly in a peculiar treatiſe this my opinion, which I have now delivered in very few words. Although to the ſick it be all one, and it matters not them, from what cauſe the baths come, and whence they borrow their vertues, if ſo be they may uſe them; this controverſie being left to natural Philoſophers that will controvert it, which none of them can better decide than a skilful Chymiſt, that hath the knowledg of minerals, metals, and ſalts.

And firſt of ſulphureous Baths that have a ſubtil acidity.

IN the ſecond Treatiſe I have demonſtrated the manner of diſtilling ſubtil, volatile, ſulphureous ſpirits, *viz.* of common ſalt, vitriol, allome, nitre, ſulphur, antimony, and other ſalts of minerals, and metals, and their vertues, and intrinſecal properties, now alſo I will ſhew their extrinſecal uſe, as they are to be mixed with waters for Baths. The vertues therefore of Baths proceed not from inſipid water, but from thoſe moſt ſubtile, volatile, ſulphureous, and ſalt ſpirits; but theſe being of themſelves not mixed with water unfit for Baths, to be uſed for recovering of health, by reaſon of their too great heat, and ſubtilty; the moſt high God hath revealed to us unworthy and ungrateful men his fatherly providence ſhewing to us by nature the uſe of them, and the manner of uſing of them for the taking away of diſeaſes; which (nature) being never idle, works unceſſantly, and like a handmaid executes the will of God, by ſhewing to us the various kinds of diſtillations, tranſmutations, and generations. From which teacher we muſt learn all arts and ſciences, ſeeking a certain, and infallible information, as it were out of a book writ with a divine hand, and filled with innumerable wonders, and ſecrets. And this is a far certainer knowledg then that empty, and imaginary Philoſophy of thoſe vulgar diſputing Philoſophers. Doſt thou think that that true Philoſophy can be ſold for a hundred Royals? How can any one judge of things hid in the earth, who is willfully blind in things expoſed to the light of the

the Sun, hating knowledge? I wiſh knowledge were ſutable to the name: how can any one that is ignorant of the nature of fire, know how to work by fire? fire diſcovers many things, in which you may as in a glaſs ſee things that are hid; The fire ſhews to us how every thing, waters, ſalt, minerals, and metals, together with other innumerable things are generated in the bowels of the earth by the reflexion of that central, and aſtral fire: for without the knowledge of fire all nature remains vailed, and occult. Fire (always had in great eſteem by Philoſophers) is the key for the unlocking of the greateſt ſecrets, and to ſpeak in a word, he that is ignorant of fire is ignorant of nature with her fruits, and he hath nothing, but what he hath read, or heard, which oftentimes is falſe, according to that; *He eaſily ſpeaks untruths that ſpeaks what he hath heard.*

He that is ignorant knows not how to diſcern betwixt the truth and falſhood, but takes the one for the other. I pray thee, thou that art ſo credulous, doſt thou think that thy teacher writ his books from experience, or from reading other Authors? May they not be corrupted and ſophiſticated by antiquity, and frequent deſcription? Alſo doſt thou underſtand the true, and genuine ſenſe of them? It is better to know, than to think; for many are ſeduced by opinions, and many are deceived by faith that is without knowledge.

And thus much for youths ſake I was willing to ſay, that they would not ſpend their tender years in vanities, but rather would make tryal in the fire, without which no man obtains a true knowledge of natural things; which although it ſeem hard in the beginning, yet it is pleaſant in old age.

Now follows the mixture of thoſe ſubtile mineral, ſulphureous, and ſalt ſpirits with water.

AS concerning the weight of the aforeſaid ſpirits that are to be mixed with ſweet water, giving it the nature, and property of natural baths, I would have thee know, that of thoſe, which in the ſecond part I ſhewed to be various, and divers, being, *viz.* not equal in vertue, the ſame weight cannot always be ſo accurately obſerved: ſeeing alſo there is a conſideration to be had of their ſtrength, and of the ſtrength of the patient.

Now you may at the beginning mix one or two pound of the ſpirits with a ſufficient quantity of the water, and then by ſitting in it make tryal of the ſtrength of the artificial Bath, which if it be too weak is to be increaſed by adding a greater quantity of the ſpirits, but if too ſtrong, then it is to be diminiſhed by abſtraction; of which more at large in *Arte noſtra Balneatoria*. Now this obſerve, that it is beſt to make Baths in the beginning weak, then ſtronger by little and little by degrees, as the nature of the ſick is accuſtomed to them, that it be not overcome by the unaccuſtomed uſe of them being too ſtrong. Wherefore Baths are to be uſed with diſcretion, and cautiouſly, for which matter I refer the reader to my *Artem Balneatoriam*, in which he ſhall find plain, and perfect inſtruction; let it ſuffice therefore that I have ſhewed the uſe of the Copper Globe, in heating Baths, which let the ſick take in good part, untill more come. Now follows the uſe.

Of Sulphur Baths.

APply the furnace with the Copper Globe to the Tub after the manner aforeſaid, and pour in a ſufficient quantity of ſweet water, which make hot with the fire kindled in the furnace by the help of the globe: which being ſufficiently warmed make the patient ſit in it, and pour into it ſo much of the ſulphureous ſpirit as is ſufficient; which being done cauſe that the tub be covered all over, that the volatile ſpirit vaniſh not, and as neceſſity requires, continue the heat till the patient come forth. Know alſo that the water is to be changed every time, and freſh ſpirits to be mixed. And this is the uſe of the Copper globe, in heating baths of ſweet or medicinal water, and that either of vegetables, or mineral, aud this made ſulphureous by art or nature; whereby moſt grievous, and otherwiſe incurable diſeaſes are happily cured: Of which enough now in this Treatiſe.

The uſe of the Copper Globe in dry Baths, which are more excellent than the moiſt in many caſes.

I Might have put off this matter unto its proper Treatiſe, where all things ſhall be handled more largely, and clearly: yet by reaſon of ſome unthought of impediments for a while procraſtinating the edition of the promiſed Treatiſe, I am reſolved to ſay ſomething of their uſe, after I have made mention of the humid, and indeed not only of the uſe of thoſe ſubtile, ſulphureous, and dry ſpirits, but alſo of the uſe of ſubtile, vegetable and animal ſpirits which are medicinal, becauſe in ſome diſeaſes dry baths are more commodiouſly uſed, than moiſt. He therefore that will provoke ſweat by a dry bath without water, let him provide a wooden box, or wooden inſtrument convenient to ſit in, ſtanding upon a ſtool boared through that you may raiſe it up more or leſs according as you pleaſe, and having boards appointed for the armes and feet to reſt upon. This box alſo beſides the great dore muſt have alſo a little dore ſerving for the putting in of a burning lamp with ſpirit of wine, or of any earthen veſſel with coals for to heat it. [*See the ſixth figure.*] The box being well warmed, let the patient go in, and ſit upon a ſtool, let the box be very cloſe ſhut all about, and the furnace with the Copper Globe be fitted thereunto, under which let there be a ſmall fire kindled, by help whereof the volatile ſpirit growing warm, goeth forth into the box like a moſt ſubtile vapour, penetrating all about the patient. But when this ſpirit is not ſufficient to heat the box, ſet in it a burning lamp with ſpirit of wine, or ſome earthen pot with coals (the beſt whereof are made of Juniper or the vine, eſpecially of the roots as being ſuch that will endure long, and cannot eaſily be extinguiſhed by the vapours of thoſe ſpirits) that the patient take not cold, and the vapours of the ſpirits may the better penetrate the body of the patient. Let the wick for the ſpirit of wine in the burning lamp be incombuſtible made of the ſubtle threads of gold, of which thing more in *Arte Balneatoria*. In the mean time that volatile ſpirit penetrates, and heats the whole body, and performs its office, being this way uſed better than by being mixed with water. When the patient hath ſate there long enough let him come forth, and

go into a warm bed to ſweat. Now before he go into the box let him take a doſe of that volatile ſpirit, inwardly which is uſed outwardly to ſprovoke ſweat, and accelerate the action. And by this means not only thoſe volatile ſulphureous ſpirits of ſalts, minerals and metals, are uſed outwardly without water to procure ſweat, but alſo the ſpirits of many vegetables, as of muſtard ſeed, garden creſſes, crude tartar, alſo of animals, as harts-horn, urin, ſalt Armoniack, *&c.* for the expelling of moſt grievous, and deſperate diſeaſes, Now the aforeſaid ſpirits have divers properties, the volatile ſpirits of ſalt, minerals, and metals have ſome, thoſe of vegetables and animals have others; thoſe have a ſulphureous and fiery eſſence; theſe a mercurial, and aerial; wherefore they ſerve for different uſes. In ſome diſeaſes thoſe ſulphureous are preferred; but in others vegetable and animal, where alſo a conſideration is to be had of the ſickneſs, and bath it ſelf, that one be not uſed for the other, to the great dammage of the ſick. For almoſt all natural baths, and volatile ſpirits of ſalts, minerals, and metals, partake of ſome moſt ſubtle, penetrating, heating, and drying ſulphureous ſalt ſpirit; but the ſpirits of vegetables, and animals partake of a certain volatility that is moſt ſubtle, penetrating, heating, opening, cutting and attenuating, both urinous and nitrous, *viz.* contrary to the former; as appears by the pouring on of any volatile ſulphureous ſpirit, as of common ſalt, vitriol, allome, minerals, and metals, upon the rectified ſpirit of Urin, or ſalt Armoniack: where preſently the one mortifies the other, and takes away its volatility, and ſubtilty: ſo that of both ſubtle ſpirits of divers natures there cometh a certain ſalt of no odour and efficacy. Whence it is manifeſt that all ſpirits partaking of divers natures, and eſſences have not the ſame faculties. Therefore be thou cautious in giving moſt potent ſpirits, leſt thou give an enemy inſtead of a friend, and learn their natures, vertues, and eſſences, before thou uſeſt them in medicine. But thou doſt ask, whether is that great force of thoſe ſpirits gone as it were in a moment? Did it evaporate in that duel? No I ſay, but tranſmuted into a corporeal ſubſtance, for of a moſt pure, mineral, ſubtle, and moſt volatile ſulphur, and a moſt penetrating animal *Mercury* is made a certain corporeal ſalt, which is wonderful, and deſerves to be called *Aquila Philoſophorum*, becauſe it is eaſily ſublimed with a gentle heat, in which many things lye: for it doth not only conduce to the ſolution of metals, eſpecially of gold, but alſo of it ſelf by the power of maturation doth become a moſt efficacious medicine: Of which no more at this time, becauſe I will only adviſe the reader, that he be diligent in ſearching out the nature of ſpirits, which although they change their bodies, yet are not therefore to be called dead, but rather reduced to a better perfection. And let this ſuffice concerning the dry uſe of baths in provoking ſweat for the expelling of diſeaſes: now for what diſeaſes this or that ſpirit ſerves, thou ſhalt find in its proper Treatiſe, of which there hath been mention above, but in a word, know that thoſe volatile ſulphureous ſpirits of ſalts, minerals, and metals, are good in all obſtructions of the inward parts, *viz.* of the ſpleen, lungs, and liver, but eſpecially are moſt excellent in heating the cold nerves, becauſe they do moſt efficaciouſly heat, attennuate, cut, expel, and mundify, wherefore they are good in Contractures, Palſies, Epilepſy, Scurvy, Hypochondriacal Melancholy, Morbus Gallicus, Itch, and other corroſive ulcers, and Fiſtulaes, *&c.*

But the ſpirits of another kind, as of Tartar, Harts-horn, ſalt Armoniack, Urine, *&c.* are hot alſo, but not ſo dry, and beſides the heating vertue, have alſo a penetrating, cutting, mollifying, attenuating, abſterging, and expelling power; wherefore alſo they work wonderfully in all obſtructions of the inward and outward parts: for they do better than all others, open the pores of the skin, and provoke ſweat, mollify, and open the hemorrhoides; provoke the *menſes* of young and elder women, purge and heat the womb, and therefore cauſe fruitfulneſs; they heat and purge a cold and moiſt brain, acuate the intellect, and memory, let they that be great with child take heed of them, and alſo they that have a Porous open skin. Such and other more properties, and that deſervedly are aſcribed to theſe ſpirits. Now thoſe two aforeſaid baths (in one whereof thoſe ſpirits are uſed in a humid way, being mixed with warm water, for the whole body to be bathed, and ſweat in, but in the other in a dry way where the vapours are by force of the fire made under the Globe, forced up into the ſweating box towards the patient, which being uſed after this manner do oftentimes penetrate, and operate more efficaciouſly than that humid way) are not to be ſlighted for the recovery of health, as doing things incredible. Now thoſe ſpirits not being found in ſhops, nor being made by any according to the manner that I have ſhewed in the ſecond Part, I would have thee know that there is yet another matter, which needs not to be diſtilled, and it is mineral; which being put into the Copper Inſtrument, doth of its own accord without fire yield ſuch a ſulphureous ſpirit, which penetrates very much, and goeth into the ſweating box, like in all things to that which is made out of ſalts, minerals, and metals. Nature alſo hath provided us another matter that is to be found every where, which being in like manner put into the Inſtrument doth by it ſelf, and of its own accord without fire yield a ſpirit, in vertue not unlike to that which is made out of crude Tartar, or ſalt Amoniack, Soot, Urine, *&c.* Of which in the ſecond Part, doing, *viz.* the ſame things with that which is made with coſts and labours. Thoſe foreſaid two matters therefore can do the ſame things, which are required for a bath and ſweating, which thoſe two foreſaid kinds of ſpirits, *viz.* mineral and ſulphureous, vegetable and animal can do, *&c.* Now what thoſe two matters which are eaſily every where to be found are, thou deſireſt to know; but I dare not if I would, for the ſake of the pious to reveal them becauſe of the ungrateful, and unworthy. For it is an offence to caſt pearl before ſwine, which yet the pious may, by the bleſſing of God find out by the reading of the reſt of my Writings.

Now follows a wooden veſſel which is to be uſed inſtead of a Cauldron in boyling of Beer, Metheglin, Vinegar, &c.

MAny things might be ſaid concerning this matter, for although men may be found in any

Place this Part I. before Page 67.

any part of the world, who know how to make malt of corn, and of this beer and vinegar; yet many things may be ſaid of this matter for the correcting of it; but becauſe it is not my purpoſe to ſhew ſuch things now, yet I ſhall ſay ſomething of the uſe of the copper globe which any one may provide inſtead of Caldrons, and which is to be uſed with a certain wooden veſſel in the boyling of Beer, which by this way he may, as hath been ſpoken above concerning the operations, make as well as by the help of Caldrons. Moreover I could here alſo teach ſome other moſt profitable ſecrets, *viz.* [*ſee Conſolat. of Seamen*] how honey may be freed from its ungrateful odour, and taſt by the help of precipitation; and how afterwards a moſt ſweet ſpirit is to be drawn out of it very like in all things to the ſpirit of wine: alſo how the beſt and ſweeteſt wine clear, and durable like to Mallago, may be made thence: alſo how after purging it is to be cryſtalliſed, ſo as to reſemble Sugar-candy in goodneſs and taſt: alſo how the ſweetneſs thereof may be converted into Tartar, very like to the natural: [*See Explicat. Mirac. Mundi.*] Alſo how out of fruits of trees, as cherries, apples, pears, *&c.* a very good, and durable wine in goodneſs, colour, taſt, and vertue, like to the natural, may be made; alſo how out of unripe grapes, that are not maturated either by the inclemency of the country, or air, their acidity being changed into ſweetneſs, very good Wines like to the Rheniſh may be made: alſo how out of ſorrel, and other vegetables, a very good Tartar may be made, and that in a great quantity without much coſts, reſembling the Rheniſh in colour, taſt, and other vertues: Alſo how out of Corn, (whether malted, or ground in a Mill) a very good ſpirit is to be made, and alſo a very good vinegar like to the Rheniſh; alſo how out of Corn, (ground in a mill) or Meal, a very good ſpirit is to be diſtilled without any loſs of the Meal, continuing yet fit to make bread. Such and more of this ſort might be taught in this place, but becauſe it is not good to divulge all things together, and at once, and this book would by this means grow bigger than I am willing it ſhould, if ſuch things ſhould be here taught, I ſhall make an end of this Book (omitting other excellent poſſible ſecrets of nature) which although it be but little, yet will without doubt be profitable to many. And ſo Reader farewel.

THE

FOURTH PART

OF

Philoſophical Furnaces:

In which is deſcribed the Nature of the Fourth Furnace; by the help whereof, Minerals and Metals are tryed, and examined after a more compendious way, than hitherto after the common manner; alſo the ſeparation of Metals by the force of Fuſion, and other neceſſary things that are done by the power of Fuſion or Melting. Moſt profitable for Chymiſts, Tryers, and Diggers of Minerals.

Of making the Furnace.

In the firſt Figure, A. *repreſents the Aſh-hole with its door.* B. *The Regiſter appointed for governing the Fire.* C. *The Hole with its door aſſign'd to receive the Crucibles and Coals.* D. *The Hole with the door of the Firſt Story.* E. *The long Pipe of Iron in the top of the Furnace.*
The ſecond Figure, *A Cone or Caſting Veſſel belonging to this Furnace.*

THis Furnace may be made greater, or ſmaller, as you pleaſe, according to the matter to be tryed: and if the *Diameter* thereof within, be but of one foot, you may ſet in it a crucible containing two or three pound; but greater crucibles require a greater furnace. Now this furnace muſt be quadrangular, and be built of ſtones, and lute, ſuch which abide the fire, of the height of one or two foot from the bottom to the grate, which muſt be ſuch as may be cleared from the droſs mixed with coals, or ſuch as was the grate of the firſt furnace, conſiſting of too ſtrong croſs iron bars faſtned in the furnace with certain diſtances for the receiving of 5, 6, or 7. other leſſer iron bars which are to be moveable, ſo that when they are obſtructed they may be removed, and cleared from the droſs; the lower part of the furnace muſt have near the bottom a hole (in the forepart) of the heighth, and breadth of a little ſpan, with an iron or copper door, ſhut-

ting close: the lower part also must have another hole near the grate on the other side with its register for the government of the fire, and for the attracting of wind. Above the grate, and a hand breadth from the grate must be another hole for putting in of coals, and crucibles, sutable to the proportion of the furnace, and the height thereof must be of one foot, and the latitude of half a foot, if the inward Diameter of the furnace be of one foot, whereby the crucibles may be the more conveniently handled, and the coals be cast in with a fire-pan: Let this hole also have a very strong door of stone covered over with lute, either of which may endure the fire, and shut very close, that the fire may thereby (when the crucible is placed in the fire) attract air, but only from the collateral hole under the grate. Let the height of the furnace (being coated above) from the hole appointed for the putting in of coals and crucibles, be of one great span: Let there also be a round hole in the furnace, having the third part of the intrinsecal diameter of the furnace, appointed for the flame and smoke; to which if you will use a very violent fire, put to it a strong iron pipe of the height of 5, 6, 8, or 12. foot, for by how much the higher you set your pipe, the stronger fire may you give, and if you will you may erect above the furnace 1, 2, or 3.. partitions with their doors serving to divers uses according to the flame that is gathered into them, by reason of divers degrees of fire, which is in them, for the lowest is so hot, that it can easily contain in flux fusible metals, minerals, and salts; and serve for cementation, calcinations, and reverberations; also for burning of crucibles, and other earthen vessels, made of the best earth (of which in the Fifth part) and for vitrifications, and sometimes for trials and burnings, *&c.* The second division of heat, which is more remiss, serves for the burnings of minerals and metals as of lead, tin, iron and copper, that are necessary for calcinations; also for the necessary calcination of Tartar, and the fixed salt of other vegetables, that is required in chymical operation, as also the calcining of bones, and horns for cuples, and the ashes of wood. The third division or chamber is yet more remiss, and serves for the drying of crucibles, and other vessels that are made of the best earth, and afterwards to be burnt in the first partition. There may also other things be done by the help of these partitions, so that thou needest not for their sakes kindle a peculiar fire. But if thou wilt give a melting fire the strongest of all, put a long pipe to the lower hole appointed for drawing wind, and having a register; for by how much the fire attracts the air more remotely and another flame is forced to beat upon the metals, so much the greater power of the heat is there in the fusion of them. For which busines sake thou hast need to have as that inferiour pipe, so also that superiour pipe in the top of the furnace. And if thou hast a fit chamber, in which another may go up from below by the proper chimney, thou mayest build another furnace in the superiour chimney, and perforate the wall with the applying of a register, that the fire may be forced to attract the air from below through the collateral chimney, where you need not that long pipe but only may open a door, or window of the lower chamber, that the air may come into the chimney; and the fire attract the wind out of the collateral chimney, which it doth very vehemently, yea and stronger, than if it were helped with bellows, so that even the furnace, unless it were built of very good and fixed earth, would by too great a heat be destroyed; for oftentimes the strongest crucibles melt with too much heat, wherefore a register is made for the governing of the fire.

And by the help of this furnace, with Gods blessing, I found out my choisest secrets. For before, and indeed from my youth I underwent the trouble of those vulgar labours performed by bellows, and common vents, not without loss of my health, by reason of the unavoidable malignant and poysonous fumes, which danger this furnace was without, not only of poysonous and malignant fumes, but also of all excessive heat: For our furnace sends forth no fume (but above, so drawing, that the door being opened for the putting in of coals, it attracts by the vehemency of the fire, another fume, that is remote by the distance of half an ell. And because the fire doth so vehemently attract, it keeps its heat within it self, so that there is no fear of burning; yet you must cover your hand that holds the tongs with a linnen glove twice double, and wet in water, and with the other hand a wooden fence that is perspectible to preserve your eyes; otherwise it wants all danger of vapours, or fumes, as hath been said, and all excessive heat; the which is a great benefit in Art. I do ingenuously confess, if I had not found this a few years since, I had not without loss left off all Alchymy together with its tedious labours. For I had spent many years of my life in great misery of labours, in superfluous cares, and watchings, as also in stinks, so that going into my Elaboratory with loathing, I should behold so many materials in so many, aud such various pots, boxes, and other vessels, and also as many broken as whole instruments of earth, glass, iron, and copper, and did judg my self so unhappy that I had made my seif a slave to this Art, and especially because scarce one of 100, whereof I was one, did get his victuals and cloths thereby. For these reasons I was determined to bid farewel to Chymistry, and to apply my self to Physick, and Chirurgery, in which I was always happy. But what? Whilest I thought to do as I resolved, and to cast forth of the doors all and each vessel of divers kinds, I found some crucibles broken, and in them many grains of gold and silver, formerly melted in them, which together with others gathered together, I thought to melt; but seeing I could not melt such things being very hard to be melted, without the help of bellows (which I had sold) I began to consider the matter with my self more seriously, and so I found out this furnace, and being invented, I presently built and proved it, which in tryings I found so good, that I did again take hope of my labours, and would no more despair.

Seeing therefore an easie, and compendious way of melting metals, I began to work, and to begin a new search, and every day I found more and more in nature, *viz.* the greatest and most pleasant secrets of nature; wherefore I did without ceasing seek, until God had opened mine eyes to see that which I sought a long time for in vain. Where also I observed, that although I had before had more knowledge of nature, yet without this furnace I could scarce have done any thing that had been singular. And so God willing, by the help of this furnace, I found out more and more dayly, for which blessing I give to the immortal God immortal

tal thanks, reſolving to communicate this new invention candidly, and faithfully for the ſake of my neighbour. Judge therefore O Chymiſt! whether this, or that which is made by the help of bellows and common vents, be the beſt? For how long doth he that will melt a hard metal in a wind furnace give fire to it before it will flow, and with what loſs of time, and coals? He that doth melt by the help of bellows hath need of a companion to blow, with great danger of breaking the crucible with the winde, and of making it fall when the coals are abated, or of impurities falling into the crucible in caſe the cover thereof ſhould fall off, although there can be no detriment by impurities falling in, if the matter be metallick, but not ſo if it be a ſalt or mineral, (without which that cannot be perfected in the fire) not induring the impurities of the coals, but boyling over by reaſon of them. Now our furnace is free from this danger, becauſe the wind comes from beneath and crucibles come always into ſight, not being ſo overwhelmed with coals as in the common way, *&c.* For by this means the matter to be melted is flowed, although the crucibles be not covered over with coals, nor with a cover, and although thou haſt not a companion to blow, for you may at pleaſure give any degree of fire by the direction of the regiſter. When therefore thou makeſt any trial in the fire have this furnace which is recommended to thee, which build rightly with its regiſter for the governing of the fire, and for the drawing of wind, and without doubt this labour ſhall not be in vain.

How minerals are to be tryed.

THe manner of trying minerals hath been already made known, wherefore it is not needful here to write many things, becauſe divers Authors, as *Georgius Agricola*, *Lazarus Ercker*, and others have ſufficiently wrote thereof, to whoſe writings I refer thee, eſpecially to that moſt famous *Lazarus Ercker* which is ſo much commended, *De Probatione Mineralium*, as well maglignant (obſtinate) as mild. But thus much know, being that which experience hath alſo taught us, that neither he nor his predeceſſours had a perfect knowledge of all things, nor would reveal all things they knew. For many excellent things do yet lye hid, and perhaps ſhall yet for a while lye hid by reaſon of the ingratitude of the world; although the moſt famous Philoſophers do with one conſent affirm that imperfect metals, as lead, tin, iron, copper, and Mercury, are intrinſecally gold, and ſilver, although it may ſeem very improbable to many that are not curious, but contented with the opinions of their parents; ſuppoſing thoſe minerals to be barren that leave nothing in the cuple, when they are tryed with lead: when as yet that proof by cuples although famous, is not yet that true Philoſophical trial of metals, but only vulgar, according to the teſtimony of Philoſophers, as of *Iſaac Hollandus*, and others, eſpecially of *Paracelſus* in many places treating of metals, but eſpecially in his book *Vexationum Alchymiſtarum*, containing a true deſcription of the properties, and perfection of metals. Which although not being to be underſtood by all, matters not; for a very eaſie art is not to be communicated to all, according to *Paracelſus* ſaying. Imperfect metals being freed from their impurities have in them abundance of gold, and ſilver. But how metals are to be purged, and ſeparated he doth not teach, but only commends *lead* to be the Author; which made the Alchymiſt believe that it was common lead, not knowing that the water thereof (lead) did not only purge other metals, but alſo lead it ſelf; ſuppoſing alſo that the trial of tin, copper, and iron, made in a cuple with lead to be that true genuine bath thereof; not obſerving that lead hath no affinity with iron, and tin in a ſtronger fire, but to reject what is black, and unclean, without any perfection. Now this lead can do, if *viz.* it be mixed with a mineral that hath gold or ſilver in it, and be melted in the fire being incorporated with it, it may together with their impurities enter into the Cuple, the good gold and ſilver being left in the Cuple, which is the proof of minerals that are digged, and uſed; and it is done upon this account, *viz.* gold and ſilver may be naturally purged of their ſuperfluous ſulphur, ſo as never to be any more radically united, and mixed with thoſe that be imperfect, as being polluted with abundance of crude, impure ſulphur, although they may be melted together in the fire; yet that mixture being retained in the fire, the combuſtible ſulphur of common metals, acts upon its own proper argent vive, and turns it into droſs, which being ſeparated from the metals enters into the porous matter of the cuples, that which doth not happen in teſts, fixed in the fire, which that droſs being ſeparated from the metals cannot enter into, being made of an earth that is durable in the fire, the droſs remaining in them, which otherwiſe was wont to enter into thoſe cuples that are made of the aſhes of bones, or wood. Wherefore by little and little it goes away into the cuple, *viz.* as much as the fire reduced into a Litharge, or droſs, until all the Lead mixed with the Gold and Silver together with other imperfect metals mixed with it go into droſs, and hide themſelves in the cuple, the pure gold and ſilver being left in the cuple. For Lead in a plain veſſel, feeling the heat from above, but beneath cold, is turned into a Litharge, which if it be in an earthen fixed veſſel, the Litharge remains, and goes into a yellow tranſparent glaſs at laſt, if it be not mixed with other metals, as iron, copper, tin; which being mixed therewith, give to the glaſs a green, red, black, or white colour, according to the quantity of the metallick matter: but in a porous cuple made of aſhes, the Litharge, or droſs finding pores, enters into the cuple by little and little, and ſucceſſively, until all the Lead be entred in, which could not be if it were not turned into Litharge. This vulgar trying is therefore nothing elſe but a tranſmutation of Lead, with the imperfect metals mixed with it, into droſs, which entring into the cuple leaves in the cuple pure gold, and ſilver, that cannot be turned into droſs by reaſon of their purity.

But perhaps this diſcourſe may ſeem to thee unprofitable, and ſuperfluous, becauſe this trial of metals is known all the world over: but for anſwer, I ſay that it is not ſuperfluous, becauſe many refiners erre, ſuppoſing that corporeal Lead together with the imperfect metals that are mixed with it, goes into the cuple, not being yet turned into Litharge, becauſe corporeal Lead is again melted from thence; for whoſe ſake this diſcourſe is not properly ordained, as being thoſe that operate out of uſe, and cuſtom only without diſcretion; but rather for their

ſakes, who do inceſſantly ſeek after, and ſearch into the ſecrets of nature, *viz.* ſeeking after that Philoſophical tryal, which is known to few, by the help whereof more gold and ſilver is obtained than by the common way, but it is not to be diſcovered in this place; for all muſt not have the knowledge thereof; It is ſufficient that I have demonſtrated the poſſibility thereof. Yet know this, if thou knoweſt how to prepare Lead, Tin, Copper, and Iron, and to fit them for a radical union, *viz.* that aforeſaid water of Saturn, ſo as they may endure the force of the fire together, thou mayſt ſeparate and attract gold, and ſilver from the aforeſaid imperfect metals, and with gain leaving them in the cuple, or elſe you ſhall draw little or nothing from thence [*See Explicat. Mirac. Mundi.*] And if you do intend to try them with Lead after the vulgar way, and bring them into droſs, yet you do nothing, becauſe tin and iron abounding with gold and ſilver, do not remain with the lead in a ſtrong fire, but are lifted up like a skin or droſs, by reaſon of their ſuperfluous ſulphur, ſwimming like fat upon water, without any ſeparation, unleſs it be tin or iron, which got gold or ſilver from the mine in their firſt fuſion.

And by this means it falls out ſometimes, that ſome may make a good proof, but out of ignorance, not knowing a reaſon of their operation, wherefore they cannot do the ſame again. For if Chymiſts, and Refiners did conſider the matter more profoundly, enquiring the cauſe, wherefore lead being tryed, deprived of its ſilver, and melted in a cuple, ſhould yet contain in it ſelf ſilver, without doubt they would hit upon a good foundation; without which knowledge all their labour in imperfect metals would be in vain. And let this ſuffice concerning that Philoſophical tryal, which is known to few; There is no need of ſpeaking any thing of that vulgar, being every where known, of which *Lazarus Ercker* wrote plainly and fully.

There is alſo another proof of minerals, which is without Lead, with Venice, or any other good fuſible glaſs, where one or two ounces of the powdered mineral are mixed with half an ounce of the powdered glaſs, and being mixed and covered in a crucible, are melted, and poured out; by which means the glaſs attracts, and diſſolves that mineral, and is thereby coloured, which ſhews what metal is contained in the mine, after which may be made another tryal by Lead, tryal being firſt made by the firſt proof. And this is the fitteſt proof for the hardeſt minerals, which are even invincible, as are the *Lapis hemititis*, *ſmiris*, granats, talck black and red, and thoſe which abound oftentimes with gold, and ſilver, which becauſe they cannot be mixed with Lead are not eſteemed, but are oftentimes caſt away, although they abound with gold and ſilver, and this becauſe they cannot be tryed, Which being tryed after the aforeſaid manner, and conſequently the treaſures lying therein being diſcovered, thou mayſt afterward with more confidence handle them, and reduce them to better profit. Now thoſe colours which follow, indicate the tenure of them. Glaſs reſembling the greenneſs of the Sea ſignifies meer Copper, but the greenneſs of graſs, ſignifys copper, and iron mixed together: glaſs of a ruſty colour ſignifys iron: yellowiſh glaſs ſignfys tin, glaſs of a yellow golden colour, or like a red ruby ſignifys ſilver: Blew glaſs like a ſaphir ſignifys pure gold; a ſmaragdine ſignifys gold mixed with ſilver: An Amethyſt colour ſignifys gold, ſilver, copper, and iron mixed together. Beſides theſe, glaſs ſometimes gets other colours, according to the diverſity of the weight of divers metals mixed together; which uſe will teach with a further practiſe that is to be made with Saturn.

There is alſo another precurſory tryal of minerals, and metals, which is made with Salt-peter; where eſpecially tin, iron, and copper do largely draw forth their treaſures hid in them, which they will not yield being tryed by Lead, the which is not a ſign of their poverty, but rather of not a true tryal made by Lead, which is not the true, and genuine judge, and tryer of metals. For otherwiſe (if it were) it would draw forth their treaſure as well out of a greater quantity of metallick matter, as out of a leſſer. Now follows the tryal by Nitre: Make a mixture of one part of ſulphur, of two parts of pure Tartar, and four parts of purified Nitre, then take an ounce of this mixture, and one dram of the mineral or metal ground ſmall, mix thoſe together, and being put into a crucible, put a red hot iron or burning coal to them, and that mixture will be inflamed, and yield a moſt vehement fire, reducing that mineral or metal into droſs: And what is not brought into droſs muſt again be mixed with the aforeſaid mixture, and be burnt as before, until the whole be conſumed by the fire. Then make that droſs or ſalt containing in it the metal that is deſtroyed, to flow ſo long in a ſtrong crucible, untill it be made glaſs; which being poured out there are found grains of gold or ſilver, which came from the mineral or metal that was tryed. And this opperation (if it be well done) will be a pleaſant ſight, but without profit, becauſe it cannot be done in a great quantity, and by reaſon of the price of the Nitre. Wherefore I ſet this way of tryal only for demonſtration ſake, that it might appear how almoſt all tin, iron, and copper, contain in them gold and ſilver, although they do not draw it forth in the Cuple.

Now do not ſuppoſe that this is tranſmutation, which is only ſeparation; wherefore thou muſt conſider with thy ſelf how that may be performed otherwiſe. But take heed that thou do not kindle this mixture from beneath, being put upon the coals, but from above, by reaſon of the danger of flaſhing: Alſo metals are eaſily fuſible by the following mixture. Take one part of the ſaw-duſt of the wood of the teil-tree being well dryed, two parts of ſulphur, eight or nine parts of pure Nitre. Make *ſtratum ſuper ſtratum* in a cruſible, and take to 11, or 12. parts of this mixture; one part of the metal ſubtilly ground, and kindle them, and the mine being melted will yield grains of pure Gold and Silver, if the mine were not too impure, the impurity thereof be conſumed by that moſt vehement fire. And if this tryal be not for thy profit, yet it is rational, and may be for thine inſtruction.

Of the melting of mines and metals.

THe melting of theſe in a great quantity is not for this place, becauſe they cannot be done by this furnace, but it is treated of plainly enough by others in their writings of minerals.

Of the ſeparation of metals.

THis is a moſt ancient and profitable Art, whereby one metal may be ſeparated from another: And it is for the moſt part done 4. ways, *viz.* by *Aqua Fortis*, by cement, by flux with ſulphur, and lead,

lead, and laſtly by Antimony; which ways that moſt witty *Lazarus Ercker*, hath clearly, and diſtinctly deſcribed, whoſe deſcription is not to be found fault with, although ſome neceſſary things may be added thereunto, which being but few, I thought it ſuperfluous to add them in this place.

And that ſeparation conſiſts in three chief metals, Gold, Silver, and Copper; he made no mention of other metals, and two of the aforeſaid four ways are in uſe, as very eaſie, for they are done with *Aqua Fortis* and Cement, the two others moſt commonly neglected, which are done by benefit of melting with Sulphur and Lead; and alſo by Antimony: that which is admirable, becauſe metals are eaſier ſeparated by benefit of theſe two ways, than by *Aqua fortis* and Cements, ſuſpected of waſt, whereas not Sulphur and Antimony, but the ignorant worker, not knowing the nature of Sulphur and Antimony, is rather to be blamed, becauſe he knows not how to order them, and withall leaves the nearer way of ſeparation: and I muſt needs confeſs it that without this furnace I would not ſeparate with them, becauſe with that common way of furnaces and bellows, the ſtink of Sulphur and Antimony hurtful to the Liver, Lungs, Brain, and Heart, is received by the Noſtrils to the hazard of health: for which cauſe I do not wonder that thoſe two wayes requiring greater diligence than thoſe two former by *Aqua fortis* and Cements are rejected. But this Furnace being known, with which without danger one may melt, I doubt not of excelling the two former ways hereafter as more profitable than them. For he who knows Antimony, may not only eaſily with ſmall coſt ſeparate Gold from the addition without any loſs of it, and ſpeedily refine it, but alſo eaſier ſeparate gilt ſilver, than by Sulphur, Lead, *&c.* in great ſtore without any loſs of Gold or Silver.

And this is the eaſieſt way of the ſeparation of Gold and Silver which is done by the benefit of melting, requiring no more charge than the coals; for there is Antimony which hath Gold in it as much as it is worth, which will be the ſeparators gain: I would have you know this, how Antimony may again be ſeparated from Gold and Silver, not by the common way, which is done by bellows, but by the ſpecial way of ſeparation wherewith the Antimony is preſerved, ſo that it may be uſed again for the ſame purpoſe; which I will treat of in another place. Beſides the four ways ſpoken of, there is alſo another way, beſt of all, by the nitrous ſpirit of ſalt, namely after this manner: ℞ the ſpirit of ſalt (prepared by our firſt and ſecond Furnace) acuated with Nitre diſſolved in it, to which add grain Gold mixed with Silver and Copper; put it in a glaſs vial in hot ſand to diſſolve, and the Gold together with the Copper will be diſſolved in it, and the Silver left in the bottom of the vial: decant off the ſolution, to which add ſomething, precipitating Gold, and make them boyl together, and the pure fine gold will be ſeparated and precipitated like the fineſt meal, ſerving Writers and Painters; the Copper being left in the water; which thou mayſt if thou wilt precipitate from the water, but it is better to take away the water, which will ſerve again for the ſame uſe. If the precipitated Gold be waſhed and dryed it gives in the melting (by which nothing is loſt) the beſt and pureſt Gold. For finer gold can neither be made by *Aqua fortis* nor by Antimony.

Therefore this is the beſt way of all, not only for the ſmall coſt, but alſo for the eaſineſs yielding the beſt Gold of all others.

Then take the calcin'd Silver left in the gourd, ſweeten and dry it, which done make a little ſalt of Tartar to melt in a crucible, to which by courſe put a little of the refined ſilver with a ſpoon, and it will be preſently made a body without any loſs. You may alſo boyl that Calx as yet moiſt newly taken out of the gourd with a Lixivium of Salt of Tartar, even to the evaporation of all moiſture: and melt the dry remnant, where alſo nothing is loſt. Without this medium the calx of Silver (drawn from *Aqua Regia*) is not fuſible of it ſelf, turning into a brittle matter, like horn that is white, or of a middle colour between white and yellow, called therefore of Chymiſts the *Horn of the Moon*; in reducing which many have tried much, which reduction we have already taught. For want of ſpirit of ſalt take *Aqua Regia* made of *Aqua Fortis* and ſalt Armoniack, which doth the ſame, but with greater charges. This alſo is to be preferred before other ways, which makes to the ſeparation of any Gold of any degree, if ſo be it exceed Silver in weight; which is neceſſarily required in the ſolution made with *Aqua Fortis*.

But that you may ſee the prerogative of this ſeparation, mark a little, when you ſeparate by the *Quarto* and by *Aqua fortis* you muſt put juſt two or three parts of refined Silver to one of courſe Gold, where firſt the coſt and labour of refining the Silver to be melted and grained with Gold are required: then a good quantity of *Aqua fortis* to diſſolve, precipitate, edulcorate, dry and melt a great deal of ſilver. Conſider then I pray, the labours and charges of my ſeparation and the vulgar. When thou ſeparateſt with Cements there is need of boxes, and continual fire of one degree, which labour is tedious for times ſake, and coſtly for coals, which labour you muſt twice or thrice take in regard of the mixt droſs. Now again conſider the labour and charges of both ſeparations. When thou ſeparateſt by Sulphur and Antimony, which is the beſt way, without great charges, if thou knoweſt to ſeparate Gold from Antimony without blowing, but this is tedious becauſe thrice greater labour than our way, tedious indeed by reaſon of the difficulty of a perfect ſeparation of Gold and Silver from the Antimonial droſs. Think therefore what way of ſeparation you will uſe to refine Gold ſpeedily, ſurely you will chuſe mine.

This way of ſeparation hath alſo this prerogative, that it hath no need of refined ſilver which is done by the benefit of burning, but only its granulation, ſolution or ſeparation by the uſe of *Aqua Fortis*, where though copper mixt with ſilver makes waſt, yet by the help of this ſalt it is ſoon precipitated. By this means gilt ſilver is ſoon ſeparated, the gold being diſſolved by the nitrous ſpirit, and precipitated with the aforeſaid matter precipitating. As for the ſeparation of gilt ſilver which is to be done by help of fuſion, and none is eaſier done than with Sulphur and Antimony, where when the neceſſary manual (ingredients) are known; a great deal is ſeparated in a ſhort time, but if thou knoweſt not how to handle Antimony and Sulphur (for which our Furnace very well befits) leave them, and uſe the common way; therefore lay not thy fault afterward on me, writing for thy good.

Of ſeparating the courſer metals.

THe manner of ſeparating Tin from Lead, and Copper from Iron, without loſs of both metals, by preſerving both, hath hitherto been unknown, which ſeems impoſſible to me by reaſon of the combuſtibility of both metals; and ſuperfluous for the ſmall profit, and ſaving charges. But how Gold and Silver may be ſeparated from Tin with which commonly this abounds, without any waſt, hath been long ſince ſought to no purpoſe: but a poſſibility will appear to a ſerious conſiderer; and though I never tryed in great quantity, being content with a precipitation made with a little; I am yet perſwaded this buſineſs will ſucceed in a great quantity and with much profit; namely by the help of a Furnace made on purpoſe where gold and ſilver precipitated with lead and *Halb Kopf* by extream heat of fire; that tin is extracted to the remanence of the tenth part, which remainder you muſt peculiarly take and keep. Which done you muſt precipitate new tin in the foreſaid Furnace, and ſo extract to the remainder of the *Regulus*, which being extracted from, is to be added to the firſt and reſerved; which labor is to be reiterated, till thou haſt a ſufficient quantity of *Regulus* filling the Furnace; which again thou muſt precipitate; for by this means gold and ſilver are brought together, ſo that they may eaſily afterward be ſeparated from the ſuperfluous tin. By this means I count the ſeparation profitable, where but little ſubſtance is loſt, which is turned into aſhes and ſmoak. Nor doth adding lead and *Halb Kopf* hinder, becauſe ſometime lead is mixt with tin, and the *Halb Kopf* is ſeparated again. It is good therefore to ſeparate pots and old diſhes, by reaſon of the mixture of lead, and to precipitate the gold and ſilver from them, by the adjection of *Halb Kopf* only, where the reſidue is no way altered by the *Halb Kopf*, therefore thou mayſt ſell it, or refine it again: which in my judgment will be to great advantage.

What is to be held concerning the perfection of Metals.

THis knot is ſcarce ſoluble, for ſo many and divers opinions of ſo many ages, ſo that moſt men ſlighting the teſtimonies of true Philoſophers, will not believe the truth, eſpecially, becauſe ſcarce one of an hundred can be found who is not impoveriſht with this art: the incredulous therefore is not to be blamed for his doubting, no ſigns of truth appearing, yet experience teſtifies a poſſibility by art and nature, though examples are rare. I pray with how great abſurdity ſhould one deny Heaven and Hell never ſeen? But thou ſaiſt we muſt believe this as revealed by God, his Prophets and Apoſtles; but ſo is not this, but the Philoſophick tradition of Heathens. I anſwer, though moſt Philoſophers were heathen (yet ſome have been Chriſtians) yet their works are not to be deſpiſed, becauſe not handling our ſalvation: to whom if CHRIST had Preached, ſurely they had believed him. For it appears by their books, that they were pious and honeſt Men; who though not Profeſſors of CHRIST, yet they did His Will indeed, which we, though not in words, in action deny; who if they had been wicked, why took they ſo much pains in making books for the good and profit of their Neighbour about Vertue and Piety? Why ſpent they not rather their life time in leiſure and pleaſure, as is the cuſtom now adaies with them who are appointed to inſtruct us? Why ſhould they gull poſterity with trifles and lyes, expecting from thence no profit? For moſt of them were not poor, but very rich Kings and Princes. Beſides theſe, there have been many Chriſtians ſerioully confirming the truth of the Art: Men indeed of ſpecial note, namely, Biſhops, Doctors, *&c.* Such were *Thomas Aquinas*, *Albertus Magnus*, *Lullius*, *Arnoldus*, *Roger Bacon*, *Baſil*, &c. Why ſhould very pious men deceive poſterity with their Works, and lead them into Errors? Although there ſhould not remain the Works of Famous Worthies, yet there would be a plain confirming the truth of this Art. For I am perſwaded there are ſome to be found having this knowledge, and privately poſſeſſing it. For who is ſo mad to reveal himſelf to the world, to receive nought but envy for his reward? Let no man therefore doubt of this ſecret Art's truth. But ſay you: Why ſtand you ſo much for the Art? Did you ever ſee or perform any thing in it? I reply, though I never made projections to perfect metals, nor ſaw tranſmutations; yet I am ſure of this, I have often from metals with metals, leaving no gold and ſilver in the cupel, extracted gold and ſilver by the help of fire: But I will not have you think that one imperfect metal will perfect another, or turn it into gold or ſilver, impure and droſſy without, in compariſon of gold and ſilver; for how can ſuch metals perfect another imperfect? Which thus underſtand. For as in the vegetable Kingdom, water cleanſeth water, or juice with ſeething as is wont to be done in purifying honey and ſugar, or any other vegetable juice, with common water, and white of eggs: ſo alſo you muſt underſtand of mineral juices or metal, of which if we know the water and white, ſurely we might refine the impurity, in which gold and ſilver lie hid, as in black ſhales, and powerfully extract gold and ſilver, which is not a tranſmutation of metals, but an eduction of gold and ſilver from the dunghil; Doſt thou ask how Gold and Silver can be educed from copper, iron, tin, and lead, to wit, by the help of lotion, out of which none is drawn with that beſt proof (as 'tis thought) of Cupels? To which we anſwered before of the proof of Cupels not to be ſufficient for all the ſeveral metals. I need therefore ſay no more, but I refer the ſtudious Reader to *Paracelſus* his Book, the *Vexation of Chymiſts*, where thou ſhalt find another lotion and purification of metals, which heretofore was unknown to Miners and Dealers in Minerals. As for example: A Miner finding the oar of copper, uſeth his skill delivered by the ancients to his utmoſt endeavour, whereby he may cleanſe it and reduce it to metal: where firſt he breaks it into pieces, and boyls it, for to take away the ſuperfluous ſulphur, then by vertue of melting, he brings it into a ſtone (ſo called) which afterward again he commits to fire, and freeth it by the addition of lead, of its gold and ſilver; which done, he blacks and redens it, turning it into copper, which is his laſt labour, whereby the copper is made malleable and vendible: which done, the Chymiſt coming, tries another ſeparation, by whoſe help gold and ſilver is extracted, as yet tryed of very few, of which mention is here made.

Paracelſus

Paracelſus alſo ſaith in the ſame plaee, that God hath given ſome an eaſier way of ſeparating gold and ſilver from courſer metals, and indeed without refining the oar, which is a ſpecial aud curious Art, which he teacheth not in plain tearms, but only ſaith it is ſufficiently taught in ſeven rules of that book, where he treats of the nature and propriety of metals; in which you may ſeek it. And this purification of courſer metals I count moſt eaſie, which I have often tryed in ſmall quantities: and I doubt not but God hath ſhewn other Artiſts alſo other purifications by which imperfect metals are perfected; for example, if one would purge the fruit of the earth by diſtillation, ſo that the dregs and impurities being taken away, it would grow up with a new clear clarified body: as if one diſtil black and impure Amber by a retort, the ſeparation would be made by Fire, of the water ſavouring of an *Empyreum*, of the oyl and volatile ſalt, and the *Caput mortuum* be left in the bottom of the retort; by which means, in a very ſhort time without great labour, is made a great alteration and emendation of Amber, though the oyl be black, impure, and ſtinking: but if it be again diſtilled by a retort with ſome mundifying water, as with the ſpirit of ſalt (namely through a freſh clean glaſs retort) there will be made a new ſeparation by that ſpirit of ſalt, and a far clearer oyl will be extracted; the dregs with the ſtink left in the bottom of the retort, which afterward may be twice or thrice rectifyed again with freſh ſpirit of ſalt, until it get the clearneſs of water, and ſweetneſs of ſent reſembling Amber and musk.

c. of Amber rectified

And this tranſmutation makes of a hard thing, a ſoft; unlike the former in ſhape, which though never ſo ſoft and liquid, oyly, may again be coagulated, ſo that it becomes as it was at firſt, after this manner following. Take the ſaid oyl very well clarifyed, add to it freſh ſpirit of ſalt, ſet it in digeſtion, and the oyl will attract from the ſpirit of ſalt, ſalt enough for its own recoagulation, and again it acquires the hardneſs of Amber, of an excellent clear and admirable colour; of which half an ounce is worth more than ſome pounds of black Amber; of which ſcarce the eight or tenth part remains in purifying, all the foul ſuperfluities caſt away.

By this means I think one may cleanſe and mend black metals, if ſo be the manner of their cleanſing were known by diſtillation, ſublimation and recoagulation. But thou ſay'ſt that metals cannot like vegetables be purified by force of diſtillation, to which I preſent our firſt furnace not given to peaſants, but Chymiſts, purifying metals; ſo alſo the poſſibility of their perfection is ſhewn by help of fermentation. For as freſh leaven can ferment the vegetables juices, which are perfected by fermentation, the dregs being caſt away as one may ſee in wine, ale, and other liquors, whoſe laſting and perfection proceeds from no other thing but fermentation purifying the vegetable juices, without which they could not otherwiſe withſtand the Elements, ſubject to corruption in a very ſhort time, which fermented laſt ſome years: ſo alſo if we knew the proper ferment of metals, ſurely we might refine and perfect them, ſo that they not being any more ſubject to ruſt, would be able to prevail againſt fire and water, and be nouriſhed and fed by them. For ſo the world heretofore periſhed with water, and ſhall at laſt periſh with fire, and our bodies muſt rot and be purified by fire before we come to the ſight of God. And thus far of the fermentation of metals, wherewith they are amended and perfected. Metals alſo are purify'd and amended like milk ſet on the fire; whoſe cream the better part (the ſubſtance of butter) in the top is ſeparation from the whey and cheeſe, and the hotter the place is, the ſooner the ſeparation is made even, ſo it is with the ſeparation of metals; where metals put into a Fitted hot place by themſelves without any addition of another thing (the metals being before reduced to a milky ſubſtance or curd) are ſeparated in time, by parting the nobler parts from the ignobler, opening a great treaſure: and as in winter time milk is hardly ſeparated with a weak heat; juſt ſo metals if not helped with Fire, as one may ſee in iron, which in a long time under the earth is turned into gold without Art. For often iron oar is found with golden veins very goodly to behold, ſevered from the courſe, earthy and crude ſulphur, by force of the central heat. And commonly in ſuch oar no vitriol is found, being ſeparated and bettered by its contrary. But a long time is required for that ſubterraneous ſeparation, which Art very ſpeedily performs; as is wont to be done with milk in winter when we preſently make butter of it, when we put it to the Fire to part the cream ſpeedily; which ſeparation is helped by the precipitation made with acid things, mortifying the urinous ſalt of the milk, by which means all principles are ſeparated by themſelves, as butter, cheeſe, whey: ſo in a quarter of an hour ſeparation is made by boiling, which elſe without acid things could not be done in ſome weeks. If then it be poſſible in vegetables and animals, why not in minerals? For what but gold and ſilver is found in lead, iron, tin and copper, though it doth not appear? Why is all goodneſs denyed to the courſer metals granted to vegetables and animals not equal to them for laſting? Whence is the natural perfection of lead, tin, iron, and copper to be proved? Nature ever ſeeks the perfection of her fruits; but courſe metals are imperfect; Why then is not nature helped with Art in perfecting them? But the bond of metallick parts is worth obſervation, which being broken, the parts are ſeparated. Urinous ſalt (as I may ſay) is the bond of the parts making milk, as of butter, whey, and cheeſe, which is to be mortifyed by its contrary acid for ſeparation. But in iron the parts are bound with a vitriolate ſalt, as with a bond, which is to be mortified with its contrary, urinous or nitrous ſalt for ſeparation. He therefore who knoweth to take away the ſuperfluous ſalt of iron, either by moiſt or dry means, doubtleſs ſhall have iron not ſoon ſubject to ruſt.

Fire alſo hath incredible force of it ſelf in changing metals. Is not ſteel made iron by force of Fire, and iron of ſteel by different proceeding? Experience dayly teacheth us alſo divers kinds of changes and refinings by Fire; why is it not poſſible in metals by an expert Chymiſt having skill in them? Who would believe that a live bird lurks in an egg, and an hearb having leaves, flowers, and odour, in the ſeed? Why may not then abortive metals, getting not yet perfection, be perfected by Art, with help of Fire? Is not an unripe apple or pear ripened by the heat of the Sun? Which ſome curious and induſtrious men obſerving, have imitated nature in their works; and have found ſome metals not deſtroyed with the heat of Fire, but enriched with a ſecret gainful heat; ſo that melted (digeſtion being made) they have yielded double weight of gold and

ſilver. Yea I my ſelf have ſeen the common oar of lead digeſted after the aforeſaid manner, which was not only inriched with ſilver thereby, but alſo partaked of gold which it wanted before in ordinary tryal. Beſides one might work this in great quantity, as with an hundred pounds; which work of minerals will without doubt bring great profit to the skilful triers of lead: But know this, that not every tryal of lead will be furniſhed with gold, but the oar to be ever enriched with ſilver, experience being witneſs.

Many ſuch things are found in Nature incredible to the ignorant, and thoſe that are unexerciſed. But if we mortals were more diligent in reading the book written with the hand of God in the pages of the four Elements, ſurely we ſhould Find more ſecrets and wonders in them, but skill and wealth is got with ſweat of face and not by ſloth; therefore *labour* and *pray*. Metals are alſo meliorated by the help of gradation like to germination.

For it is well known, that the ſhoot or graſs of ſome fruitful garden-tree implanted in a wood, makes that tree afterwards to bear not wild fruits, but very good and ſweet like them of the implanted ſhoot, as one may ſee in iron diſſolved in an acid ſpirit, fermented with Venus and turned into Copper: by which means doubtleſs copper is turned into ſilver, and ſilver into gold, if the true manner of fermentation were known.

Now this tranſmutation is like digeſtion, making beef or horſe fleſh of graſs in the ſtomach of oxe and horſe, and mans fleſh of beef, in the ſtomach of man.

The better parts alſo are ſeparated from the worſer by the attractive ſtrength of the like, as is to be ſeen in a metal abounding with ſulphur, to which if iron be added in fuſion, the ſulphur deſerts its native metal, (by which means it is more purifyed) and joins its ſelf to the iron, with which it hath more affinity and familiarity, than with its own metal; for example, if iron be added to lead oar full of ſulphur in the melting, this melted metal is made malleable, which elſe would be black and brittle. And if ſomething elſe to be put to the melted malleable metal were known to us, to take away in the melting, the redundant, crude, combuſtible ſulphur, queſtionleſs it would yet be made purer; which thing being unknown, metals remain in their impurity. And indeed God hath done well in this as in all other his works, that he hath concealed his knowledge from us: for if it were known to the covetous, they would buy up all lead, tin, copper and iron, to turn into gold, ſo that rurall and poor Labourers could hardly buy metallick inſtruments for their uſe, for the ſcarcity; but God will not have all metals turned into Gold.

A Similitude of taking away the ſuperfluous ſulphur of ſome metals in fuſion, being given to keep the purer parts; ſo likewiſe is there another manner of ſeparating, the purer parts from the impure, namely, by the attractive power of the like, where the purer parts are drawn together by their like, the impurer and heterogeneous part is rejected: and that may be ſhown as well by the moiſt as dry way: an example of the moiſt way followeth.

If quick Mercury be added to impure gold or ſilver diſſolved in its proper *menſtruum*, the mercury draws to it ſelf the inviſible gold and ſilver from the *Menſtruum* and mixt impurity and aſſociates what is pureſt to it ſelf, which ſeparation ſwiftly ſucceeds. Mercury performs the ſame likewiſe in the dry way: namely, when ſome earth having ſome gold and ſilver, is moiſtned with acid water, and they are ſo long bruiſed together, till the Mercury draws the better part; which done you muſt waſh the dead earth left, with common water, and ſeparate the Mercury being dryed from the attracted gold and ſilver, by trajecting them through a skin, but the Mercury draws but one metal from the earth, and indeed the beſt at one time; which being ſeparated, it draws another metal; for example, if in ſome one earth, gold, ſilver, copper and iron ly hid, the firſt time the mercury draws the gold, the ſecond the ſilver, but copper and iron hardly by reaſon of their droſs, but tin and lead eaſily, but eaſieſt of all gold by reaſon of its purity like to mercury.

Another Demonſtration by the dry way.

Put under a tile a cuple with lead, to which add a grain of very pure gold, moſt exactly weighed (for memories ſake) make the gold in the cuple to fulmimate, and the lead will enter the cuple, the gold being left pale in the cuple: of which pale colour there is no other cauſe than the mixture of ſilver, drawn from the lead by the gold. But thou wilt ſay, that thou knoweſt this, that gold fulminated with lead, is made paler and weightier, by reaſon of the ſilver in the lead, left with the gold in the trial, augmenting the weight, and thence making it pale: to which I reply, though lead leave ſome ſilver in trying in the cuple, mixt with the gold added to it, augmenting its weight, and changing the colour; yet it is proved by the weight, that lead leaves more being mixt with gold in the cuple, than when tryed without gold. Hence it is proved, that gold in the fire draws its like from other metals, augmenting its weight: and this alſo gold doth in the moiſt way: for if it be diſſolved in its own *menſtruum*, together with copper, and put in digeſtion, and then ſeparated, it attracts gold from the copper; which labour, though not done with profit, yet witneſſeth a poſſibility. But if the *menſtruum* of gold augmenting the attracting power of gold or multiplying the ſame were known, but diminiſhing the retentive power of copper, doubtleſs ſome gain were to be expected; and indeed more, if gold and copper, together be melted in fire with the dry mineral *menſtruum*; by which means the weight of gold would be increaſed according to *Paracelſus* ſaying Metals mixt together in a ſtrong fire, continued a pretty while, the imperfection vaniſheth and leaves perfection in its place.

Which ſurely well done, is a work not wanting gain. For I freely confeſs, that I would ſometime incorporate ſilver with iron, when as gold from iron gave me a good increaſe of pure gold, inſtead of fixt ſilver ſought after. And by this means often ſome not thought on thing happens to Artiſts, as to my ſelf with fixt ſilver, not rightly conſidering the buſineſs. Therefore medling with metals, be ſure when you find ſome encreaſe, to weigh well what it was at firſt. For many think long trying ſilver with iron, by the Blood-ſtone, Load-ſtone, Emraud, *lapis calaminaris*, Red-talck, Granats, Antimony Arſenick, Sulphur, Flints, *&c.* having ma-

ture

ture and immature, volatil and fixt gold in them, finding in the trying good gold; that this gold is made of the ſilver by the help and uſe of the foreſaid minerals, which is falſe, For the ſilver drew that gold out of thoſe minerals, in which before it lurked volatile. Yet I deny not the poſſibility of changing ſilver, as being inwardly very like gold, but not by help of cementation with the ſaid minerals, becauſe that gold proceeds not from the ſilver, but thoſe minerals, attracted by the ſilver. This labour is compared to ſeed caſt into good ground, where dying, by its own power it draws its like to it ſelf, whence it is multiplyed an hundred fold.

And it behoveth in this work now and then to wet the metallick earth, with proper metallick waters, being dryed up with heat (which operation is called of the Philoſophers inceration) elſe the earth will be barren, and it behoveth that this water be neer in kind to the earth, ſo that when they are united they yield a certain fatneſs. For as it appears from ſandy dry earth, moiſtened with rain water, not bringing forth fruit agreeable to its ſeed, for the ſmall heat alſo of the Sun conſuming the moiſture, and burning the ſeed in the earth, which mixt with cows dung or other, keeps the water ſo as that it cannot be ſo ſoon conſumed. By the ſame reaſon it is neceſſary that thy earth and water be mixt, leſt thy ſeed be burnt up. Which work if well handled, it will not be in vain, requiring the exceeding diligence of nouriſhing the earth with warmth and moiſture, when the earth is drown'd with too much moiſture, or hath too little, it cannot increaſe, and this is one of the beſt labours, with which I draw forth good gold and ſilver of baſer metals, requiring the beſt veſſels, retaining the ſeed together with its earth, and water in its proper heat. I doubt not but this work alſo in a greater quantity, may be performed, firmly beleiving that the courſer metals, eſpecially lead, the fitteſt of all not only to be perfected into gold and ſilver, but alſo into good medicine: which without queſtion is a Philoſophick labour granted from God, as a great comfort to the Chymiſt, but warily to be uſed. For that all and ſingular Gods gifts he will not have common: as indeed I have found, when I had invented a very excellent work, that I ſhewing it to a friend, neither could I afterwards teach it to him, nor do it again for my ſelf. Therefore indeed juſtly men are doubtful in writing ſuch matters: for many ſeek with idleneſs to get the inventions of others, performed with great coſts and labour. Therefore it is ſafer to be ſilent and give leave to ſeek, than to publiſh ſecrets, that they may undergo the pains and charges to be born in inventing high matters; nor any more hereafter may the ingrateful ſo impudently gape after others Labours. Therefore I would entreat all men both of high and low degree, that they would not moleſt and tire me hereafter with their Petitions and Epiſtles, and that they would not turn my good will of benefiting others to the ruin of my ſelf, but be contented with my writings publiſhed for the profit of my neighbour. Nor do you think that I poſſeſs and promiſe golden mountains. For what I have written, I have writ to diſcover nature, in theſe diſcourſes of the perfection of courſe metals in ſmall quantity; For I never made trial in a great quantity, trying truth and poſſibility in a leſſer only, in ſmall crucibles: therefore thoſe things which I have writ are written to that end that the poſſibility of the Art, may appear, of perfect metals to be wrought out of Imperfect, therefore he who hath occaſion may make trial in a greater quantity: but as for my part wanting opportunity, I expect Gods bleſſing, whereby upon occaſion I may make tryal in a greater quantity, and ſo receive the fruit of my labour and great charges.

Alſo metallick bodies are tranſmuted by another means, namely by the benefit of a tinging metallick ſpirit, as one may ſee in *aurum fulminans*, ſometimes kindled upon a ſmooth clean metallick plate, fixing a very deep golden tincture upon the plate, ſo that it may bear the Touch-ſtone. The ſame alſo happens in the moiſt way, where plated metals put into a gradatory ſpirit made of Nitre, and certain minerals, being pierc't by the ſpirit, obtain another kind agreeing to the ſpirit. But if one doubt of the metallick gradation, made with *aurum fulminans*; he may try the certainty from the often fireing of freſh *aurum fulminans*, upon the ſame plate; for he ſhall ſee that it is not the colour of the metal, and outwardly gilded, but deeply tinged. Likewiſe one may try the certainty by a humid ſpirit, if the transformed metals are tryed, whence the mutual action and paſſion of ſubtilized ſpirits plainly appears, for the power of ſpirits is very great, and incredible to one not exerciſed; and this gradation of inferiour metals, Philoſophers both ancient and modern, doe not only confirm, but alſo diggers of minerals taught by experience, that mineral vapours by penetration change courſer into purer metals, *Lazarus Ercker* being witneſs, that iron is changed into a good natural copper in green ſalt waters, & that he ſaw a pit, in which iron nailes and other things caſt in, by the penetration of a cupreous ſpirit were turned into a good copper. I do not deny that metallick diſſolutions of ſome metals do ſtick precipitated to the plates, and to make them of a golden, ſilver, or cupreous colour; for it is well known, that iron caſt into a vitriol water not to be turned into copper, but to draw copper out of the water, of which thing we treat not here, confirming the poſſibility of metallick tranſmutations by a tinging and piercing ſpirit; therefore I again maintain that great power is in metallick ſpirits; look only upon courſe and opake earth, and beſides that clear and limpid water with which the clearer and more powerful air proceeding from the water cometh from the earth. Are not whole Countries drowned with water, ſometimes Towns and Cities taken away? Cannot the air deſtroy the ſtrongeſt Houſes; eſpecially ſhut up in the Earth, ſhake the Land for ſome miles, and afterward demoliſh whole Cities and Mountains with the death of Men? all which things are done naturally. Wind artificially raiſed by Nitre threatens a far greater danger, which no man can deny. Although that corporeal Elements exerciſe ſo great power, yet they cannot pierce metals without hurt, nor ſtones and glaſs, and things ſoon penetrated by fire. Therefore not by an occult but a manifeſt power of Sun and Fire, which it hath over metals, ſtones and glaſs, which are eaſily pierc't by them without any impediment: and why ſhould not metals compact of a certain metallick ſubtile and piercing ſpirit be penetrated by help of fire, and changed into another ſpecies? As is already ſpoken of *Aurum fulminans* and *aqua gradatoria*. Therefore there is no doubt of the poſſibility of the metallick tingent ſpirit changing courſer metals into finer, both by the dry and moiſt

way; For Metals may be purified the ſame way as Tartar and Vitriol, and other ſalts, namely by the benefit of much water. For it is manifeſt that vitriol is purged with iron and copper mixt with it, namely diſſolved and coagulated in much water, ſo that it waxes as white as allom; which purification is but a ſeparation of the metal from the ſalt, made by the benefit of much water debilitating the ſalt, ſo that it cannot longer retain the mixt metal, which is precipitated like ſome ſlime, not unprofitable, becauſe the chiefeſt part of the vitriol, from which is the greenneſs, *viz.* Copper, Iron, and Sulphur. And as by help of ſeparation metals are drawn from vitriol, more perfect than ſalts; ſo alſo it is with metals when the perfecter and better part is ſeparated by help of precipitation: as for Tartar, it is purified by the addition of water, but its better part is not precipitated as in vitriol, but the courſer part which is its blackneſs and fæculency. As for example; Common Tartar by the often ſolution (made with a ſufficient quantity of water) and coagulation is made very pure and white, becauſe in every ſolution made with freſh clear water, it always becomes purer; and not only by this means white Tartar, but alſo red and feculent, is reduced into tranſparent cryſtals, and indeed very ſpeedily by vertue of a certain precipitation; whoſe limoſity is the cauſe of the obſcurity of the cryſtalline ſalt of tartar, and is nothing elſe but an unſavory thing, dead and uſeleſs, mixt with the tartar in its coagulation in Hogs-heads of Wine, and ſeparated again by power of ſolution.

And theſe examples of the two ſalts of Vitriol and Tartar, are not in vain ſet down, becauſe they ſhew the difference in precipitation: For in ſome Metals, by force of precipitation, the courſer part is ſeparated; but in other, the better and choicer, according to the prevalency of this or that part.

In Vitriol, the better part (Copper and Iron) is the leaſt, which is precipitated and ſeparated from the courſer and greater part, *viz.* Salt; But, in Tartar, the courſer and leſs part is precipitated and ſeparated from the greater and better part clarify'd: The like is in Metals. Therefore, let every one be wary in ſeparating; and conſider before, whether the better or courſer part of the Metal is to be precipitated; without which Knowledge, no Man can meddle with this Buſineſs. Let alſo the Workman be ware, who expects any profit from his labour, of Corroſive Waters; as *Aqua fortis*, *Aqua Regia*, Spirit of Salt, Vitriol, Allom, Vinegar, *&c.* in the Solution from which no Good proceeds, as utterly deſtroying and corrupting all and each of them; proving the ſame in theſe words, *From Metals, by Metals, and with Metals, Metals are made perfect.* Metals are alſo purified, maturated and ſeparated from their Vices, by Nitre burning up the ſuperfluous Sulphur.

And all the aforeſaid perfections of metals are but particular. For every particular medicine, as well humane, as metallick, purgeth, ſeparateth and perfecteth or amendeth by the taking away the ſuperfluity. For a univerſal medicine worketh its perfections and emendations, by ſtrengthening and multiplying the radical moiſture as well of animals as metals, expelling its enemy by its own natural vertue. But thou ſayſt excellent examples indeed are delivered by me, but not the manner of doing them. *R.* I ~~have~~ delivered more then you think, although you don't perceive it; for I am ſure after my death that my books will be in greater eſteem, from which it will appear that I have not ſought vain glory, but the profit of my neighbour to the utmoſt of my power. But do not, ſeeing my freeneſs of writing, think that you may wreſt many things from me. For aſſure your ſelf, that although I have written many things for the publick good, yet I intend not by this means to trouble my ſelf. For I cannot ſatisfy the deſires of all men, nor anſwer their Epiſtles, nor inrich all men, who neither am rich my ſelf, nor have ſought riches. For although I have gotten the knowledge of theſe things by Gods bleſſing, and have tryed the truth of it in ſmall quantity, yet have I never made experience in great ſtore for wealth ſake, being contented with Gods bleſſing.

And let this ſuffice concerning the ſeveral purifications of metals according to my experience; as for that univerſal medicine ſo famous, I cannot judge of it, being a thing unknown to me; but the poſſibility thereof I am forc't to affirm, being moved with the ſeveral tranſmutations of metals; which being unknown, it behoves us to be contented with that favour which God hath beſtowed on us. For oftentimes queſtionleſs it is better to know little, for Eternal Salvations ſake; for moſt commonly wealth and learning puff up. And pride brings to the Devil the Author of it, from whence God of his mercy preſerve us.

Of the Philoſophers Stone.

I Have undergon much charge and labour for many years, to extract the tincture or anima of gold, for a medicine to be made therewith, which at length I have obtained, where I have obſerved the remainder of the gold, the ſoul or better part being extracted to be no more gold, nor longer to endure fire. Whence I conjectured, that ſuch an extraction being fixt again, can perfect courſer metals and turn them to gold: But I could not hitherto try the truth of my conceived opinion living at this time in a forraign place; therefore againſt my will, although greedy of novelty, I have been forc't to abſtain from the work. In the mean time conſidering the opinions of the Philoſophers concerning their gold, not the vulgar, aſſerting the univerſal medicine to be prepared therewith. I have again affuſed a certain Philoſophical Vinegar to Copper for to extract the tincture, where almoſt all the Copper like whitiſh earth is ſeparated from the tincture in digeſtion, which earth by no Art I could again reduce into a metallick body.

Which experiment again confirmed me of a poſſibility of this Medicine. Which labour though I never followed, yet I doubt not but an humane medicine, though not alſo a metallick is attainable thence by a diligent workman. The ſoul therefore with all the metallick attributes, conſiſting in ſo ſmall a quantity, which is ſcarce the hundredth part of the weight, which being extracted and ſeparated, the remaining body is no more a metal, but a uſeleſs and dead earth; but it is not to be doubted but being fixt again, it may reaſſume and perfect another metallick body. Therefore I am confidently perſwaded by the aforeſaid Reaſons, that ſuch a medicine is to be made of mineral and metallick things, *viz.* in the flowing, changing baſer metals into better. But do not think that I writing theſe things make gold or copper the matter of this medicine, which I do not hold, well knowing that there

there are other ſubjects eaſily to be handled, abounding with tinctures.

So thou haſt heard now my opinion of the Univerſal Medicine, which my experience in Gold, Copper, and other Minerals and Metals hath cauſed: which I will not preach for *Goſpel*, becauſe it is human to erre.

Therefore no certainty is to be had, before its final and compleat perfection, and indeed once or twice tryed for certainties ſake. For an excellent way once found out, cannot alwaies be often repeated, which happens doubtleſs as well to others as to me. Therefore we muſt not triumph before the Victory; for unthought on impediments may fruſtrate Hope: but God is rather to be implored in our labours, that he would be pleaſed to bleſs our endeavours, that we may uſe well his gifts in this life as good ſtewards, and afterward beſtow the free reward of our labours, watchings, and cares on us ſinners, namely, everlaſting Reſt and Salvation out of his meer Mercy.

Whether Minerals, as Antimony, Arſenic, Orpin, Cobolt, Zinck, Sulphur, &c. may be tranſumuted into metals, and into what?

IT is long ſince debated among Chymiſts, whether the aforeſaid Minerals proceed from the ſame principles with Metals, and whether to be counted Metals; in which Controverſy they have not agreed to this day, when as one approves that which another denies; ſo that a ſtudent of Chymiſtry knows not to what ſide he had beſt aſſent.

But this knowledge not a little helping, concerning the purifying of metals, I would put my opinion alſo grounded upon experience, for the ſatisfying the doubtful, the ſimplicity of them is ſtrange who hold not one and the ſame beginning to be of minerals and metals, ſaying, if metals might be made by nature, of minerals ſurely it had long ſince been done; but it never was, experience witneſſing; for remaining minerals, they are never tranſplanted into metals. I Anſwer, metals grow one way, alſo vegetables another, ſoon budding, and again ſoon dying; but it is not ſo with metals; for all laſting things have long time of digeſtion, according to the ſaying, *That which is ſoon made, doth ſoon fade*; this is to be underſtood not only of vegetables and minerals, but alſo of animals, as appears from the budding of ſome vegetables, coming in ſix Months ſpace to their perfection, and then again periſhing: when as things requiring longer time of digeſtion and perfection are much more laſting. A Muſhroom in the ſpace of one or two nights grows out of rotten wood, again ſoon vaniſhing: not ſo the Oke. Oxen, and Horſes in the ſpace of two or three year come to perfection, ſcarce living the twentyeth, or twenty-fourth year: but a Man requiring twenty four years to his perfection, lives ſixty, eighty, or an hundred years. So alſo we muſt conceive of laſting metals requiring many ages, and alſo very long time of digeſtion and perfection; metals therefore requiring a very long time of digeſtion to their perfection, it is granted to no man ever to ſee the beginning, and end of them; the tranſplantation of minerals into metals by nature cannot be denyed; eſpecially, becauſe that in the oars of metals, eſpecially of courſe ones, minerals are alſo found; wherefore diggers of minerals, when they find them, conceive good hopes of finding metals, of which they are termed the *Coverlids*, for ſeldom metals are found without minerals, or minerals without metals; nor alſo are ever minerals found wanting gold or ſilver; therefore minerals are properly termed the *Embryo* of *Metals*; becauſe by art and fire a good part of gold and ſilver is drawn out of them by fuſion; which if they do not proceed from the metallick roots, whence proceeds that gold and ſilver? For an Ox is not born of an Infant, nor a man of a Calf; for alwaies like is produced of its like.

Therefore minerals are counted but unripe fruits in reſpect of metals, not yet obtaining their ripeneſs and perfection, nor ſeparated from the ſuperfluous earth; for how ſhould a bird be hatcht of an egg by an heat, not predeſtined for the generation of a bird? For ſo we muſt underſtand of minerals, which if they be deprived of their metallick nature, how ſhould by fire metals be produced from thence? But thou ſaiſt that thou never ſaweſt the production of perfect metals out of courſer; therefore that it is neither likely, nor credible to thee, to whom many things as yet lye hid, as from moſt men, perverſly and fooliſhly denying things unknown; for daily experience witneſſeth, that the viler minerals and metals by taking away the ſuperfluous ſulphur (however it be done) obtain a greater degree of perfection, therefore ſhould not thy heart believe, and thy tongue ſpeak what thou ſeeſt with thine eyes? For experience ſhews that good gold and ſilver might be drawn out by art almoſt out of all courſe minerals and metals, yet more out of ſome than of others, and ſpeedier; for there is not that dark night, that is altogether depriv'd of light, which may not be manifeſted by a hollow glaſs; nor is there an element (though never ſo pure) not mixt with other elements, nor any malignity depriv'd of all good, or on the contrary. And as it is poſſible to gather the hidden beams of the Sun in the aire, ſo alſo hidden perfect metals diſperſed in imperfect metals, and minerals by fire, and an expert Artiſt: if once they are placed in fire with their proper ſolvents, where the homogeneous parts are gathered, and the heterogeneous ſeparated; ſo that there is no need to go into the *Indies* to ſeek gold and ſilver in thoſe new Iſlands, which is poſſible to find plentifully here in *Germany*, if ſo be the merciful God would pleaſe to turn away thoſe preſent cruel Plagues, and bring them out of old metals, *viz.* Lead, Iron, Tin, and Copper, there left by the Dealers in minerals; indeed without the culture of minerals. Let no man therefore judge himſelf to be poor, becauſe he is only poor and in want (although otherwiſe very rich and abounding in wealth, which yet in a moment he is forc't to forſake) that being ungrateful, neither knoweth nor acknowledgeth God in his Works.

What I pray is in leſs eſteem in the world, than old Iron and Lead, which are acceptable to the wiſe to uſe in the Lotion of Copper and Tin with the mineral White? But how they are to be waſhed, is a difficulty to the unexerciſed in the fire, and ſhall be delivered by ſimilitudes: You ſee Antimony freſh digged out of the earth, very black and impure; which by fuſion ſeparated from its ſuperfluity (which, though nature gave to it not in vain, but as an help to its purification, according to that: *GOD and Nature do nothing in vain*)

vain) is made more pure, and endowed with a body nearer to metals than its mineral, which if afterwards melted with ſalt of Tartar, the crude and combuſtible ſulphur is mortified thereby, and is turned into droſs, and ſeparated from the pure mercurial part, ſo that hereby is made a new and freſh ſeparation of the parts, of which one portion being white and brittle, ſinks to the bottom, the other lighter, to wit, the combuſtible ſulphur is on the top with the ſalt of Tartar; which poured out into a Cone, when they are cold, may be ſeparated with the hammer; the inferior part of which is called by the Chymiſts *Regulus*, which is purer than Antimony caſt the firſt time out of its mineral; and this is the uſual purging of Antimony uſed by Chymiſts; to which (*Regulus*) if afterward any thing ſhould be added, for a third purification, without doubt it would not only be made purer but more fixt and malleable. For if white *Regulus* be preparable out of black Antimony, why not as well malleable metal out of the *Regulus*.

Another way of ſeparating the ſuperfluous Antimonial Sulphur,

℞ ANtimony powdred one part, Salt-peter half as much, mingle them, and kindle the mixture with a live coal, and let that Antimonial ſulphur, with the nitre be burnt up, the darkiſh maſs being left, to wit, of a brown colour; which melted for the ſpace of an hour in a ſtrong fire yeilds an Antimony like to that which is made with ſalt of Tartar, but ſomewhat leſs in quantity: in like manner the parts of Antimony are ſeparated, *viz.* if Antimony, Nitre, and crude Tartar be mingled in an equal weight, and being mixt are kindled and melted. There is alſo another ſeparation of the Antimonial parts; when of ſmall bits of Iron one part is put into a ſtrong crucible, in a wind Furnace, to which being red hot, caſt two parts of ground Antimony, for fuſion, and the ſuperfluous combuſtible ſulphur will forſake the Antimony, and joyn to the Iron, a metal more amicable to it; mixt with which, it forſaketh its own proper pure Mercury, and ſulphur or *Regulus*, which is almoſt the half part of the Antimony.

And theſe four ways, by which the ſuperfluous combuſtible ſulphur of Antimony is ſeparated are moſt common, not ſet down as ſecrets, but for demonſtration ſake, that it may appear how ſulphureous minerals are, to be perfected and purified, which are little amended; yet ſhewing a better way not only for Antimony, but alſo for Arſenick and Orpin, although theſe two cannot be ſo done with Iron, Nitre and Tartar, by reaſon of their volatility; but with Oyl, or other fat things in cloſe crucibles, giving a *Regulus* like to the Antimonial; and theſe *Reguli* make Tin hard, to ſound and be compact; if to one pound one ounce be added in fuſion, for making good houſhold ſtuff. And in tryal they give good Gold.

And as it is ſaid of purging Antimony, ſo alſo it is to be underſtood of the reſt, as *Wiſmuth*, *Zinck*, *Lapis calaminaris*, Lead, Tin, Iron and Copper, to be purged from their ſuperfluous ſulphur, if thou wilt draw more perfect metals, *viz.* Gold and Silver out of them with gain. And ſo I make an end of metallick lotions; recommending to Chymiſts, *Nitre*, *Tartar*, *Flints* and *Lead*; for who knoweth to uſe them, ſhall not loſe his labour in Chymiſtry; but 'tis to be lamented, that every where good earth and fixt in the fire, is not to be gotten, retaining Lead and Salts; for without our old Saturn little or nothing can be done in refining metals; therefore who goes to try any thing in this Art, let him ſeek the beſt earth retaining Lead twentyfour hours ſpace; afterward let him conſult with Tin, what *Vulcan* has to be done with Iron; who will tell him what he muſt ſuffer, before he obtain the Crown.

Of the tincture of Sol and Antimony.

SOmetimes an alteration happens to mans body, from the the attraction of mineral vapors (which cannot be done by my Furnace) in the tryal; therefore here I will ſet down a certain medicine for the Workmans ſake, as well for preſerving as curing, namely, a clear rubin fixt, and ſoluble of Gold and Antimony. Take of pure Gold half an ounce, diſſolve it in *Aqua Regia*; precipitate the ſolution with liquor of Flints, as before is ſaid in the Second part; edulcorate and dry the calx, and it will be prepared; take *Regulus Martis* (of which is ſpoken a little before) beaten fine, to which mix three parts of the pureſt Nitre; place the mixture in the crucible between burning coals, putting to fire by degrees: which done make a ſtronger, *viz.* for fuſion; for then the Maſs will be made purple; which taken forth and cooled grind very ſmall, of which take three or four parts and mix with one part of the aforeſaid golden calx; place it mixed in a ſtrong crucible covered over in the aforeſaid winde Furnace, and make the maſs to flow together like metal, and it will aſſume the Antimonial Nitre in the fuſion, and will diſſolve the Gold or the calx of Gold, and a maſs of an Amethyſt colour will be made therewith, which ſo long leave in the fire, till it get the clearneſs of a Ruby, which one may try with a clean wire or iron bowed and put therein, although in the mean time the maſs deprived of fuſibility, is thickened; it is meet to add ſome Nitre or Tartar, for ſpeeding fuſion, and that as often as ſhall be needful. Laſtly, pour the maſs, when it ſhall come to the utmoſt redneſs of a Ruby, hot into a clean copper morter, which there leave until it cool, and it will be in colour very like to an Oriential Ruby; then bruiſe it hot into powder, for taking air it would melt, and extract the tincture by the affuſion of the ſpirit of Wine in a Vial, and the Gold together with the Antimony will remain very white like the fineſt Talc, to be waſhed with clear water, in a glaſs, edulcorated and dryed; which melted with a ſtronger fire, gives a Yellow glaſs, in which no Gold appears, yet ſeparable by way of precipitation with the filings of Iron and Copper, from which it recovers its ancient colour, but without profit, by reaſon of the waſt, the tinged ſpirit is to be taken away from the tincture, which is a very ſoveraign medicine in may grievous diſeaſes.

Although thou mayeſt ſuſpect this not to be the ſimple tincture of *Sol*, but of Nitre and Tartar mixt, be ſure that the quantity of Nitre added not to exceed; and ſuppoſe that tincture of Tartar and Nitre, I pray what waſte is there? ſince that is ſo good a medicine by it ſelf, & I am perſwaded, this tincture of *Sol* to be better than thoſe ſet down in the Second part. That Ruby may be ſo uſed by it ſelf with proper vehicles, ſeeing it is a ſoveraign medicine of it ſelf; or elſe expoſed to the air and reſolved to a liquor; for the medicine is no leſs than a tincture, becauſe the

the Gold in it, and the purer part of Antimony are made potable without corroſives. Wonderful is the power of ſalts in metals to be deſtroyed, perfected and changed by fuſion; for it happened to me one time making this Ruby, placeing two other crucibles alſo with metals, by this containing gold with the prepared *Regulus* of Antimony (for eaſily two or three, or more crucibles may be placed in this furnace, to be ruled with one fire, which cannot be done in a common furnace by that means) about to put in a certain ſalt into the crucible next to the crucible of gold, that by a miſtake I caſt it into the crucible with gold only, whence ſo great a conflict aroſe, that there was danger of boyling over; therefore forced to remove it out of the furnace preſently with tongs, and to effuſe it, ſuppoſing that the Ruby was loſt by my raſh putting in of ſalt; therefore I would only ſave the gold. And I found the effuſed maſs red like blood, purer than a Ruby, but no Gold; but white grains like Lead diſperſed here and there in the ſalts, by reaſon of their ſmalneſs, not ſeparable but by the ſolution of the ſalts, which being ſeparated by the ſolution of water from the red tincture like blood, remained in the bottom of the glaſs, which afterward for fuſions ſake I placed in a new crucible in that furnace, but willing to try the fuſion, I found the crucible empty, and all the Gold vaniſhed, a little excepted ſticking on the top to the crucible and the cover, which I took away and melted for experience ſake in a new cloſe crucible, but all of it preſently feeling heat flew away like Arſnick, no ſign being left in the crucible; and ſo I was deprived of my Gold.

At length I took the red ſolution, and abſtracted the water from tbe ſalts, and I found the ſalt red like blood, which I put in a clean crucible in the furnace for to try whether any metallick body might thence be extracted; but I found the effuſed ſalt deprived of all tincture and redneſs, which ſeems ſtrange to me even to this day, that by help of this ſalt the whole ſubſtance of gold, *viz.* the tincture together with the remainder flew away, having ſo great volatility.

Which labour afterward I would reiterate, but it happened not ſo at all as at the firſt time; there was indeed ſome alteration of the gold made, but its volatilization was not ſo great, the cauſe of which thing, I think was the ignorance of the weight of the aforeſaid ſalt, caſt in at the firſt time againſt my will.

And two reaſons chiefly moved me to inſert this hiſtory, Firſt, that it may appear how ſoon one may miſtake in a ſmall thing fruſtrating the whole proceſs. Secondly, That the truth of the Philoſophers may appear writing that gold by art is reducible into a lower degree, equal to lead (which happened to me in this work) and that it is harder to deſtroy gold and make it like to an Imperfect metal, than to tranſmute an imperfect metal into gold; therefore I am glad in my heart that I ſaw ſuch an experiment; of which thing our phantaſtick Philoſophers will hear nothing, writing whole volumes againſt the truth, ſtifly affirming, gold to be incorruptible, which is an arrant lye; for I can ſhew the contrary (if need be) many ways. I wonder indeed what moves ſuch men to ſlight a thing unknown, I do not uſe to judg things unknown to me.

How dare they deny the tranſmutation of metals, knowing not how to uſe coals and tongs? truly I confeſs thoſe rude and circumforaneous Mountebanks, not a little to defile and diſgrace true Chymiſtry, every where cheating men by their fraud, being needy and oppreſt with penury; unleſs peradventure they find ſome credulous rich man giving them food and raiment for the conceived hope of Gain and Skill, of which alſo ſome being furniſht with gold, go clad like painted Parrots, whom I judg to be hated worſe than a Dog or a Snake; but innocent Chymiſtry is not therefore to be deſpiſed. Some covetous men beſotted with folly and madneſs, laying out their moneys with an uncertain hope of gain, who afterward the thing ill ſucceeding, are forced to live in poverty, whoſe caſe is not to be pityed, deſtroying their money out of covetouſneſs. Some ſeek wealth not out of covetouſneſs, but rather that they may have wherewith to live, and may ſearch nature, which are to be excuſed if they are deceived by knaves, yet not to be praiſed if they ſpend above their ability.

Another tincture and medicine of Gold.

DIſſolve gold in *Aqua Regia*, being diſſolved, precipitate it with liquor of the ſalt of flints, pour ſome more of the aforeſaid liquor to the precipitated gold, then place them in ſand to boyl for ſome hours ſpace, and the liquor of flints will extract the tincture of the gold, and be dyed with a purple colour; to which, pour rain water, and make it to boyl together with that purple liquor, and the flint will be precipitated, the tincture of an excellent colour with the ſalt of Tartar left; from which it is neceſſary to extract the water even to drineſs, and a very fine ſalt of a purple colour will remain in the bottom of the glaſs, out of which with the ſpirit of wine, may be drawn a tincture as red as blood, little inferior in vertue to potable gold; for many things lie hid in the purple ſalt, of which more things might be ſpoken if occaſion permitted; therefore let it ſuffice to ſhew the way of deſtroying gold, for that golden ſalt may in a very ſhort time, *viz.* an hour, be perfected with ſmall labour and tranſmuted into a wonder of nature; confuting the ſlanders of the noble Art of Alchimy; for which gift we ought to give immortal thanks to the immortal God.

Of Looking-glaſſes.

I Have made mention in the treatiſe of *Aurum potabile*, not only of the material heat of fire, but alſo of turning the fineſt beams of the Sun into a material bodily ſubſtance, by help of certain inſtruments by which they are collected. I have alſo mentioned there a concave Glaſs, whoſe preparation I will here give, it being not known to all men, the beſt that I know is as followeth. Firſt, patterns are to be made of the beſt matter, namely, hair and Potters clay, of which thing in the Fifth part, conformable to the glaſſes, in form and figure circularly round; for elſe they cannot gather the Sun-beams together, and again put them forth; the fault of which thing is to be aſcribed only to the pattern or mold; for the fuſion and poliſhing of glaſſes is no ſingular Art, being known even to Bell-founders, but to melt them when very well ſhap't of the beſt matter and rightly to poliſh them, this is Art: and firſt to cut the patterns round, being very well ſhaped by the uſe of a ſharp Iron Inſtrument cannot cannot briefly be demonſtrated; there-

therefore I will ſendthe Reader to Authors prolixly handling this thing, *viz. Archimedes* and *Johan. Baptiſt. Porta*, and others; but if thou wanteſt thoſe Authors, or doſt not underſtand them, ſee thou have a Globe exactly turned for making the Molds as followeth: firſt make a mixture of meal and ſifted aſhes, which ſpread equally between two boards, as the manner is to ſpread paſt made of Flower and Butter for Pyes and Tarts, anſwering in thickneſs to the glaſs to be ſhaped, then with a Compaſs make a circle as big a you pleaſe, which cut with a knife, and put it on the Globe, and ſprinkle quick lime on it out of a ſearce or ſive, and put clay well prepared with haire over it of the thickneſs of two fingers breadth; and if it be a great piece you muſt impoſe croſs wires ſtrengthning the Mold, leaſt it be bent or broken. Afterward one part being hardned with the heat of the Sun or fire, take away all that from the Globe, and put it on ſome hollow thing, on which it may on all ſides ſtand well, and alſo ſprinkle quick lime or the powder of coals on the other ſide, and put upon this the other part of the pattern, and again expoſe it by degrees, to be dryed by the heat of Sun or fire, leſt it crack; which done, take away the ends making thoſe parts of the Mold or pattern from the inward or middle, which ends ſet one againſt another to the inward parts, the diſtance at leaſt of a hands breadth, and put between in the top a few live coals to harden the Mold all over; to which put on other coals, and then more, and ſo by degrees even to the top, that they may be well kindled in their lighter parts; but if the Molds are very thick, one fire will not ſuffice, but it will be neceſſary to add more coals, until they be throughly kindled in the inner parts; afterward, let the fire go out by degrees, that the types may grow cold, but not altogether, but ſo that you may touch them; and preſently beſmear finely the ſifted aſhes mixt with water, with a pencil, to ſtop up the chincks ariſen from the burning the hair, and for ſmoothing the types; then again make both parts (after thou haſt firſt framed a hole in them for a Tunnel) clean, being wary leſt any foul thing fall upon them; and carefully bind them together with iron or copper wier; and very well lute over the joining with clay prepared with hair; and put on an earthen Tunnel, and place the Mold in dry ſand up to the top: And thou oughteſt in the mean while thou burneſt and prepareſt the Mold, to melt the metallick mixture, that it may be poured into the hot Mold, the Metal being well melted, caſt in a bit of ſearcloath, which burning, pour out the melted Metal into the hot Mold, being wary leſt coals or ſome other thing fall into the crucible, and be poured with the Metal into the Mold, ſpoiling the glaſs; then let the glaſs cool of it ſelf in the Mold, if the matter do not moulder in the cooling: And if it ſhould moulder in the cooling, which indeed would leſſen it, it behoves that the caſt glaſs be preſently taken out of the Mold, and covered over with a hot earthen or iron veſſel, that it may cool under it, which otherwiſe, cooling ſhut up in the Mold not being able to moulder, is broke in pieces, but a little below you ſhall perceive, what be thoſe mouldering metals.

And this is the common way (and the beſt) of melting, if ſo be thou art exerciſed; there are alſo other ways; firſt, when molds are made of wood or lead, agreeing to the glaſs, to be impreſſed with ſand, or the fineſt powder of tyles or other earth, as is the cuſtome of copper-ſmiths; and this way only ſerveth for leſſer glaſſes.

The third way which is the beſt of all, but hardeſt to one not exerciſed, is as follows; make a waxen Mold with a Cylinder to be placed between two boards, as is aforeſaid of the firſt way, which put upon the globe for to ſhape it, and let it be hardned in the cold; then take it away, and ſpread over it the following mixture with a pencil; which ſee that it be dryed in the ſhadow, then apply potters clay, prepared with hair, the thickneſs of one or two fingers breadth; then take away the wax in manner following from the earth: make a round hole in the earthen mold with a knife, coming even to the wax; wich done, place it near a coal fire, the mold being bending down, and the melted wax will run through the hole, into which pour the hot (not burnt) metal, *&c.* that liniment which is anoynted on the wax muſt be very well prepared leaſt while the wax melt, it fall and melt away with the wax, nor let the wax pierce the earthen mold and ſpoil it. Now the liniment follows: Burn potters clay well waſht in a Furnace even to redneſs; afterward grind it and take away its fineſt part with waſhing of water, ſo that you may have an impalpable powder, which dry, and again burn with a ſtrong fire: after grind it with rain water and ſalt Armoniack ſublimed, upon a ſtone, as Painters uſe to prepare their colours, bring it to the juſt conſiſtence of a paint, and the mixture will be made; the ſalt Armoniack keeps that fine powder, leſt it melt away with the wax: and the prepared earth makes a tender and fine fuſion.

The metallick mixture for the matter of the Looking-Glaſs.

THere are divers of theſe mixtures, of which one is alwaies better than the other, which by how much 'tis the harder, by ſo much the glaſs is the better; and by how much the harder the metal is, by ſo much the better it is poliſht; nor doth the hardneſs of the mixture ſuffice, but its whiteneſs is alſo required: for red proceeds from too much copper; black from too much iron, or duskie from too much tin, and doth not make the true repreſentations of things, but changeth the ſhape and colour of them: for example ſake, too much copper rendereth the Species redder than they are to be, and ſo of the reſt; let therefore the metallick mixture be very white; but if burning glaſſes are to be made, it is no matter what colour it be of, if ſo be that the mixture be hard. I will ſet down one of the beſt, ℞. of Copper plates the thineſt beaten to pieces one part, of white Arſnick a quarter part; firſt moiſten the plates with the liquor of the ſalt of Tartar, and make a Stratum ſuper Stratum, with plates and Arſnick powdred, by ſprinkling this on them, until the crucible be filled; to which pour the oyl of Linſeed, as much as ſufficeth to cover the copper and Arſnick; which done put on the cover with the beſt lute, then place the crucible (the lute being dryed) in ſand, ſo that only the upper part of the cover may ſtick out and adminiſter fire by degrees, at firſt little; ſecondly ſomewhat ſtronger, till at length it be hot, that all the oyl may evaporate; in the mean time, the oyl will prepare the copper, and retain the Arſnick, and will make it enter into the plates, like oyl piercing dry Leather;

ther: Or place the crucible upon a grate and put Fire to it, which adminiſter by degrees, until the oyl evaporate in the boyling. Laſtly, when it ſhall coole, break the crucible, and thou ſhalt find the copper of diverſe colours, eſpecially if thou ſhalt take Orpin in ſtead of Arſenick, and twice or thrice increaſed in magnitude, and brittle.

R. of this copper one part, and of latton [*Orichalcum*] two parts, melt it with a very quick Fire, and firſt indeed the latton, to which afterward add the friable copper; pour out the mixture melted and thou ſhalt have a very hard metal unfileable, yet not ſo brittle, but like ſteel, of which diverſe things may be formed ſerving in ſtead of iron and ſteel inſtruments; take of this hard metal three parts of the beſt tin without lead one part, melt and effuſe it, and the matter of looking-glaſſes will be made. This mixture is a hard white metal making the beſt looking glaſſes, but if this labor ſeem tedious, take of copper three parts, of tin one part, of white Arſenick half a part for the matter of looking-glaſſes, which are fine but brittle, as well in the melting as poliſhing, therefore carefully to be handled. I muſt here ſet down a thing worthy to be obſerved, and known to few; *viz:* a falſe opinion of many, eſpecially of thoſe who attribute knowledge to themſelves of the proprieties of metals. In the ſecond part (of ſubtile ſpirits) mention is made of the pores of metals, for experience witneſſeth, that thoſe ſubtile ſpirits as of harts-horn, tartar, ſoot, and ſometimes thoſe ſulphureous ones of ſalts and metals do evaporate through pewter veſſels, which at the firſt hearing every man cannot conceive, for whoſe ſake this diſcourſe is made. Make two balls of Copper, and two of pure Tin not mixt with lead, of one and the ſame form and quantity, the weight of which balls obſerve exactly, which done, again melt the aforeſaid balls or bullets into one, and firſt the copper, to which melted add the Tin, leſt much Tin evaporate in the melting; & preſently pour out the mixture melted into the mold of the firſt balls, and there will not come forth four nor ſcarce three balls, the weight of the four balls being reſerved; if then metals are not porous, whence I pray doth that great alteration of quantity proceed? therefore know that metals are porous more or leſs; gold hath the feweſt pores, ſilver hath more, Mercury more than that, Lead more than Mercury, Copper more than Lead, and Iron than copper, but tin hath moſt of all.

If we could deſtroy metals, and again educe them deſtroyed from power to act, ſurely they would not be ſo porous. And as a child without correction is unapt to any goodneſs, but corrected is endued with all kind of vertue and learning, ſo alſo we muſt underſtand of metals which left in their natural ſtate, namely drawn out of the earth without correction and emendation remain volatile, but corrupted and regenerated are made more noble, even as our bodies deſtroyed and corrupted, at length ſhall ariſe clarified before they come into Gods ſight. Well ſaid *Paracelſus*, that if in one hour metals were deſtroyed an hundred times, yet they could not be without a body, reaſſuming a new ſpecies and indeed a better, for it is rightly ſaid, *Unius corruptio, alterius generatio*; for the mortification of a ſuperfluous ſulphureous body is the regeneration of the Mercurial ſoul, for without a deſtruction of metals perfection cannot be; therefore metals are to be deſtroyed and made formleſs, that thereby the ſuperfluous earthy combuſtible ſulphur being ſeparated, the pure fine Mercurial ſpecies may ſpring forth. Of which thing more, when we ſpeak of Artificial ſtones.

Of the ſmoothing and poliſhing of looking-glaſſes

A Looking-glaſs, though it be very exactly melted and proportioned, yet is of no value if not rightly poliſhed and ſmoothed; for eaſily in the ſmoothing any part it may ſuffer ſome dammage hurtful to it, and it is neceſſary to take from them firſt, the groſſer part by the wheel, as the cuſtom is with Pewterers and Copper-ſmiths with a ſandy ſtone, then to apply to them a finer ſtone with water, until they are ſufficiently ſmoothed by grinding; which done, the looking glaſſes are again to be taken from the wheel and to be moved to the ſmall wooden wheel covered with leather, rubbed over with a fine prepared glazing ſtone until the creviſes contracted in the turning no more appear, having got a croſs line, afterward another ſmall wheel covered with leather is required, to which a blood-ſtone prepared and waſht with the aſhes of tin rubbed on, to which likewiſe by the aforeſaid means, according to the ſame line, the looking-glaſſes are ſo long to be moved till they get a ſufficient fineneſs and brightneſs. You muſt keep ſuch looking-glaſſes from the moiſt air, and breathing, and to wipe them when infected with air and breathing not with any woolen or linnen cloth, but with a Goats or Harts skin, and not any way, but according to the croſs line, with which the looking-glaſſes are ſmoothed. They may alſo be ſmoothed by lead artificially melted, by firſt rubing them with a ſmiris and water, and then with a finer ſmiris and lead; laſtly with a blood ſtone and aſhes of tin: likewiſe alſo with whetſtones, by changing for a finer every time, whence at length alſo they acquire a ſplendour by the aſhes of tin.

Alſo the outward part of the looking-glaſſes (convex) may be ſmoothed, which repreſents the ſpecies ſhort, and ſpreads the diſperſed rays: but the inward part (hollow) gathers and multiplies, and puts forth or expoſeth the Image.

Let theſe things ſuffice concerning the melting of looking glaſſes, & poliſhing requiſites, for the collection of the Sun beams, and although from the aforeſaid mixture other kinds of looking-glaſſes might be made repreſenting wonderful ſhapes and ſeveral excellent things, as Cylindrick, Pyramidal, Parabolick, *&c.* they are omitted as impertinent to this place, yet I could ſhew away to make them, becauſe I have undergone no ſmall labors and charges in the ſearching of their preparation and uſe, if it were neceſſary. But of all looking-glaſſes that is moſt uſeful whoſe preparation we have ſhewn, whoſe diameter is at leaſt two or three ſpans, if thou wilt perform any ſpecial thing; although it be but of one or two ſpans, yet it gathers abundance of beams, ſo that thou maiſt melt tin and lead with it, if it be well ſhaped: yet the larger are the better. Nor ought they to be too deep, that they may caſt their beams the further, and better perform their actions or functions, let them have the twentyeth or thirtyeth part of the ſphere (the ſection being exactly obſerved) which is the foundation of the Art.

Of Artificial Gems, and Metallick Glaſſes.

AS for metallick glaſſes pertaining to Alchymy, and much conducing to the perfection of metals, and eſteemed by the Ancient Philoſophers, I would not omit to ſay ſomewhat in this place, becauſe they are eaſily made by this furnace.

And indeed the Ancients have found theſe glaſſes queſtionleſs by chance, in reducing the calcined bodys into glaſs by a ſtrong fire, for very many ſecrets by this means not ſought for are found out. Oftentimes it happens to our labors, that paſt hope we find ſomthing better or worſe, than the thing ſought; and I think it hath thus happened with theſe glaſſes, but however it be, I am ſure theſe glaſſes have ſtood us in much ſtead; for *Izaak Holland* ſaith plainly, That vitrified metals being again brought to metals, by that reduction do give better and nobler metals than the firſt vitrified; and indeed gold gives a tincture, but ſilver gold, and copper ſilver; and ſo conſequently the glaſs of other metals give better metals in reduction, the truth of which experience proves, and although I have not yet made great tryal in this work, yet I know that metals brought into dead aſhes to be turned into clear glaſs cannot be again reduced into metals without great profit: yet one metal is more pliable than another, nor are our glaſſes the Artificial ſtones of gold-ſmiths fixed to other large ones for ornaments ſake, made by the addition of glaſs made of fuſile ſand; but ours are made of the juice of metals. But I do not deny the vertue of Venice glaſs, and others in the mundifying of metals, chiefly copper and tin, which yet is not comparable with metallick juices. I freely confeſs I have tryed this thing twenty times, and I never was deceived by it: but I know not whether it may prove ſo in a greater quantity, becauſe I never tryed it, doubting of my veſſels not fit to retain fuſible glaſſes a requiſit time: for I have ſpent much labor in making theſe kind of veſſels, but hitherto in vain. For there is very great hope of gain, if thou haſt very ſtrong crucibles, nor is this perfection of metals without reaſon, for whileſt the metal is burnt to aſhes, much of the ſuperfluous combuſtible ſulphur is burnt (as you may ſee in Lead, Tin, and Copper, from the ſparks appearing in their calcination whileſt they are ſtirred and ſeparating) which if again reduced (*viz.* being calcined) its better and heavier part (by benefit of melting) ſinketh to the bottom, the worſer flowing on the top is changed into droſs or glaſs. And ſo the ſeparation of metals is made by the help of the Fire alone, to the ignorant and unexpert incredible: but conſider gilt ſilver to be ſeparated in fuſion, which is as it were corrupted by the common ſulphur, and the metallick ſpecies, being loſt, it turns to a black droſs before that in melting it forſakes the gold: which way alſo ſilver is ſeparated from copper, and this from iron. Obſerve alſo that black and crude Antimony, being reduced into aſhes by calcination, and melted is ſeparated by a ſtrong Fire, the purer parts deſcending pure and white like ſilver, but the impure parts aſcending are changed into glaſs or droſs, which ſeparation would never be made without incineration although the Antimony ſhould have ſtood long influx.

Thou ſeeſt therefore the power of Fire alone in melting metals, wherefore believe thou that thy labor ſhall not be in vain if thou knoweſt how to help the Fire. Exerciſe thy ſelf therefore in it, for thou art ſufficiently inſtructed, and this furnace will help thee; without which it is impoſſible to manage ſuch things well, as experience teſtifies, confirming my words.

Mention being made of metallick glaſſes, which belongs to the perfection of metals, I am forced to ſay ſomthing alſo of other *Amauſa*, or coloured glaſſes, which are called Gems, and are worn for beautifying, which though it be not profitable, yet it is a delightful labour, which knowledge, as well noble as ignoble have long ſought, not for gain, but recreation ſake, erring from the true way (although prolixly deſcribed in many tongues) through ignorance of the art to render cryſtal or flint fuſible, and colouring it, being content with lead glaſſes made of one part of cryſtals, or flints, and three or four parts of minium or ceruſe, glaſs of no worth, as not only very ſoft and unapt for poliſhing, but alſo heavier than it ought by means of the lead, and having a yellow or green colour, for every glaſs made of cryſtal or flint, and minium or ceruſe by themſelves, *viz.* without the addition of other colours, gets a yellow colour from the Lead, hindering and altering other mixt colours; therefore a good ſtone is not made this way of lead and flint, but Leaden glaſſes of this ſort, Venice glaſs, Aſhes of tin, and colours being added to them, be uſed diverſly of the gold-ſmiths, namely to colour gold, otherwiſe of no moment.

Therefore I will give another preparation, namely out of flints *&c.* cryſtals alone without minium and ceruſe, with metallick colours, having the colour and elegancy of excellent ſtones; but not harder than glaſs; for although cryſtal is harder than iron, yet by melting it is deprived of its hardneſs in ſome meaſure, and is made like to glaſs, yet ſo much hardneſs reſerved, as ſerves to write on another glaſs, which glaſſes are eaſily poliſhed, and in all things and by all, moſt like, hardneſs excepted, to natural ſtones; with which not only various kinds of ſtones may be made, and other gold, ſilver, and wooden works or pictures adorned; but alſo diverſe ſupellectils, as ſalts, hafts or hilts, cups, *&c.* and alſo images and antiquities may be formed (by fuſion) like to thoſe cut out of gems by the hand of an ingenious workman, moſt delightful.

They are made after this manner: firſt you muſt look for flints and cryſtals not coloured, but very white, gathered out of ſand or ſtreams, which you muſt heat in a covered crucible, and quench them glowing hot in cold water, that they may crack and may be pulveriſed; otherwiſe they are ſo hard that when they are powdred, they take part of the morter and ſo are defiled; therefore it is worth your labor to handle them well. Afterward R of flints prepared, and the pureſt ſalt of Tartar, made in glaſed veſſels, but not in copper or iron, equal parts, mingle them and keep them for uſe.

And if thou wilt make this maſs into a gem, you muſt firſt mingle ſome colour (what you deſire) afterward ſo long place it (being put into a clean covered crucible ſcarce half full) in a very ſtrong fire, till all the ſalt of Tartar hath evaporated, and the flint together with the colour come into ſubſtance fuſible like glaſs: you muſt then put a ſmall clean iron wier, and draw out a little of the melted maſs for tryal; whether it have ſtood long enough in the fire, whether there be yet puſtles and little ſands, or whether it being

ing exactly melted, it ſhall deſcend to the bottom, which done, you muſt take off the crucible, and place it under ſome hot iron or earthen veſſel, that it may wax cold with the melted ſtone; otherwiſe the maſs will be broken in the crucible into very ſmall parts, and would be unfit for greater works: neither muſt you pour out the melted maſs for fear of the attraction of aire, and puſtles to ariſe thence. But being willing to make out of the Maſs by Fuſion, not Engraving Money or Images; there is no need to leave the maſs in the crucible to cool, but preſently to pour it out hot in a copper morter, and nothing will ſtick to the crucible, but all the maſs will be poured out without any waſte: And this maſs, if thou wilt, thou maiſt powder or break into very ſmall bits for fuſion and impreſſion. But the maſs when cooled in the crucible, is to be taken by breaking the crucible, and to be reduced into greater or leſſer ſtones by cutting: but melting for money or images; you muſt place the money or image, which you will imitate, with the backſide or hinder-part downward in an iron Ring, a Fingers breadth broad of greater capacity than the money, upon a ſtone or plain wood, and ſprinkle on a little Tripoly, or fine Sand, through a cloth, namely, as much as ſufficeth to cover the mold, and upon this to put more, well moiſtened with water, like aſhes of cupels, and to preſs it, being moſt tenacious, firmly to the mold, but warily, leſt the mold be moved; which done, you muſt turn the ring, and with a knife lift up the mold, and to take it, being lifted up with ones hands or tongs, the image being left in the ſand, to be dryed by heat of the Sun or Fire. Afterward to caſt the image, place the ring with the image impreſſed in the ſand under a tile, and adminiſter a ſtrong fire, that the whole ring, with the ſand, and the image in the ſand may be very hot: then take off the ring, to ſee if the image have ſuffered any loſs; which, if it have not, you muſt put upon it ſo much of the aforeſaid glaſs, courſly beaten, as ſufficeth in the fuſion to fill the image impreſſed on the ſand; which done, put the ring again under the tile, and adminiſter a fire of fuſion, till the glaſs melt in the ring; to which, touch with a ſmooth iron and light, (with a handle) being hot the ring being taken firſt out of the furnace with tongs, preſſing the glaſs well to the mold; and then place it under a hot iron, or earthen veſſel to cool; and being cold, take the image from the mold, which anſwers to it in all things, if thou haſt aright proceeded, exactly repreſenting the Carvers art, or a ſeal impreſſed on a jewel, which excellent work is moſt fit to feign, and repreſent Antiquities and Rarities.

The colouring of the aforeſaid maſs follows, by which it is made moſt like to Gems.

IT behooveth that colours be taken from metals and minerals, namely from Copper, Iron, Gold, Silver, Wiſmuth, Magneſia and Granate; of other colours I know nothing of certainty, Copper commonly makes a colour green like the Sea, Copper with Iron, graſs-green; Granate a ſmaragdine colour, Iron yellow or jacynth; Gold the beſt skie colour; Wiſmuth common skie colour; Magneſia Amethyſtine, mixt, they give other colours; E. gr. Gold mixt with Silver gives an Amethyſt colour; Iron and Copper, a pale green; Wiſmuth and Magneſia, a purple; Silver and Magneſia, various colours like an Opal.

Images are alſo made of divers colours, if the maſſes of diverſe colours be broken into bits and mixt, be put upon the Mold, *&c.* And if thou deſireſt an opac maſs (green, red, skie colour, *&c.*) add a little calx of Tin darkning, on which as on a Baſis the colours inſiſt. For example; in making a Turcoiſe ſtone or a Lazulus, mingle with the Azure made of the ſilver Marcaſit or Zafora (to colour the maſs) the calx of Tin, that they may melt together, and before the impreſſion be made, put upon the Mold ſome prepared gold, then ſpread and put upon this the aforeſaid glaſs; and the fuſion and impreſſion being made, will be made thence a ſtone having golden veins like *lapis Lazulus* very delightful; But there muſt be a *calx* of Gold not loſing its ſplendor in the fire, ſuch as is made by Mercury, or that which is better, which is precipitated out of *Aqua Regia:* of which above.

Of the preparation of the colours for colouring the maſs of Flints and Cryſtals.

THe plates of copper often heated, are to be quenched in cold water of which more in the Fifth part, from three to ſix grains of it may be mixed with ℥ j. of the maſs for a Sea-green colour. Iron is reduced into crocus by reverberation; of which from four to ten grains are added to the maſs for a yellow or Jacynth colour; Silver is diſſolved in *Aqua fortis*, and precipitated with the liquor of Flints after it is edulcorated and dryed, whereof from one to ſix grains, added to ℥ j. of the maſs, they make mixt colours.

Gold is diſſolved in *Aqua Regia*, edulcorated and dryed, precipitated firſt with liquor of Flints, whereof from grain four to ℈ *ſs.* mixt with one ounce of the maſs, make a moſt elegant Saphire. And if from three to ſix of that ſoluble ruby made of the Gold, and the nitrous *Regulus Martis* be added to ℥j. of the maſs, they make a very polite ruby: Magneſia pulveriſed, whereof, from ſix to fourteen grains, to ℥ j. of the maſs, make an Amethyſt.

Marcaſit diſſolved in *Aqua Regia*, precipitated with the liquor of flints, edulcorated and dryed, whereof from one to five grains, to ℥j. of the maſs, give a Saphire, but not comparably ſo polite as one made with gold.

But being unwilling to calcine Marcaſite, let him take Zafora, and mingle to ℥ j. from five to ten grains; Granates of *Bohemia*, or Oriental pulveriſed, add from ſix grains to ℈ j. to ℥ j. of the maſs, for little green ſtones like to the natural ſmaragd or emrald: other things which remain of the mixture of the colours, are to be learned by experience.

To what uſes coloured flints and cryſtals are appointed, is not here to be treated of; one uſe excepted, which I ſet down for the eyes, which are weakened by too much watching, the heat of fire and ſmoak; ſee thou have a waxen mold circularly round, of the bigneſs of a diſh or trencher; (the Optiques are wont to call ſuch *lentes*) to which, put the beſt clay well mixed with hair: anoint the waxen type with oyl, and exactly apply the beſt prepared earth of crucibles (and durable in the fire) the thickneſs of a finger; which being

ing dryed, perforate in ſome part, that the wax being melted by the fire, may flow forth: afterward burn the mold in an earthen furnace; being burnt, fill it with prepared glaſs, and place it in a wind furnace till the glaſs melt; which at length being cooled, take off the type by attrition, and there ſhalt thou have the cryſtal reſembling the form of the type; which afterward thou muſt make and poliſh like ſpectacles in an iron diſh on both ſides; and take it out with a ſtrong iron wier, and thou ſhalt have a good cryſtalline *lent* for a ſmall price, which otherwiſe is ſcarce made of cryſtal of ſo great a bigneſs. Aud if thou wilt, thou maiſt colour the glaſs green, very pleaſant to the ſight, and fit a foot to it for greater benefit. And the glaſs doth not only ſerve for the Multiplication of light in the night time, that you may ſee a thing a far off in a chamber, but alſo for the fixing and calcining minerals by the Sun-beams, and melting of Metals, and multiplying of Pictures, like an hollow glaſs, and alſo for other uſes it may be compared with an hollow looking-glaſs, which doth the ſame of an equal bigneſs with the hollow glaſs; nor is there any other difference of them but reflexion. This glaſs-inſtrument is made likewiſe another way, and by leſs coſt and labor, if it be of a poliſht looking-glaſs, if two great orbes are cut out with a diamond, and if they are ſomewhat ſoftned with Fire, and are left there ſo long in the heat, until they ſhall ſtick like wax very cloſe to the ſtone, which done, let them be cooled again, which afterward taken out, will repreſent the form of an hollow glaſs; to which, it behoves to fix a leaf on the convex part. And the glaſſes do the ſame that an hollow metallick looking-glaſs doth, the reflexion excepted, which is not ſo ſtrong as of the hollow glaſs: And although the glaſſes are ſooner broke, yet they are very fit for the making of the following Inſtrument.

And they are bound together with a ſtrong wier, applyed acroſs on the concave part, and an hole is cut in the brim with a diamond on one ſide, of the bigneſs of a pea, then the creviſes are exactly cloſed in every place with the beſt lute; which done, a ſilver or copper ring is to be tyed about it, holding thoſe glaſſes ſtraightly, ſo that the Inſtrument may be fitted to the foot, all which well done, thoſe ſtrong wiers are ſeparated or cut off, with which the glaſſes were bound at firſt, namely, near the copper ring: afterward very pure *Aqua vitæ* is to be put in through a funnel, as much as is required for the filling it up; the Inſtrument being filled, the hole is ſhut up, which is to be kept for uſe; and this Inſtrument is better than the hollow glaſs; eſpecially, if it have in its diameter the breadth of one foot, and may be applyed to proſpective pictures, it doth excellently repreſent and multiply them.

Behind which, if you place a candle in the night, it gives ſo much light in the Chamber, that you would think it came from the Sun. It doth alſo many other things which are here omitted as ſuperfluous. And you may gather the diſperſed light in the aire in the night time with it, ſo that you may read the ſmalleſt writing. Such and others of the like things may be done by this furnace, all which to ſet down, would ſwell the Book too much. Other things of the metals examination and purification by fuſion, in another place.

Take this, Reader, which is given to thee, in good part, at another time thou ſhalt have better; and do not miſtake my writings, as if I did reprove the examinations of metals by the Ancients, fuſions and ſeparations, who only would communicate my opinion, and yield my aſſiſtance for further proceeding; for I know that dealers in metals giving too much credit to their ſmall proof when they find nothing, do, contemn oars as barren, often abounding with gold and ſilver; when nevertheleſs, *John Matheſ.* ſays expreſly in his *Sarepta*, that minerals oftentimes tryed in a ſmall quantity do yield no gold and ſilver, which in a great quantity, yield a great deal, wherefore credit it is not always to be given to ſuch tryals, often deceiving, as experience teſtifies.

And this not only in thoſe minerals which are digged out of the earth; but alſo in thoſe clayie and ſandy minerals, abounding with ſilver and golden flames; out of which neither by the leſs nor greater proofs, nor ablution nor Mercury is drawn with gain that thin and fiery diſperſed gold: which by ſome waters is done without fire eaſily; for I know ſuch mines are found neer many rivers of Germany, and many places in other Nations of Europe, out of which honeſt gain without much coſt and labor may eaſily be gotten. Neither are they dreams, which I have ſpoken parabolically of the perfection of metals, for it is poſſible by art to help nature in the perfecting things. There is therefore no more need of any thing than of knowledge; therefore the nature of metals being known, and their properties, they are eaſily ſeparated, purged and perfected.

But what I have written of the univerſal medicine, I have done for the aforeſaid cauſes, which have made me believe the thing, not as profeſſor of the Art. The other things of coloured red glaſſes and looking glaſſes I have added, becauſe they are eaſily prepared by this furnace, as ſometimes neceſſary in ſome works. Other things of the handling metals are not without cauſe now omitted, which happily may be ſometime delivered in another place, wherefore now we end.

THE

FIFTH PART

OF

Philosophical Furnaces:

In which is treated of the wonderful Nature of the Fifth Furnace: Also, of the easy Preparation of the Instruments and Materials belonging to the foresaid Four Furnaces. Most profitable for Chymical Physitians.

Of the Preparation of the Furnace.

AS concerning this, of which, though I made no mention in the Preface; for it was not my Resolution to mention it in the last Part, because I was purposed only to treat of the Instruments, as well earthen, as those of glass, and also of the other necessary things belonging to those four parts premised; yet I am willing now in this Part, (which I have judged to be the most convenient place for it, for which I did before design another) to discover the wonderful Nature thereof, as far as I may for the Studious Artist's sake. And although I know that more in this part, than in all my other writings, especially the ignorant and unskilful, will be offended; yet I will not therefore pass it by, perswading my self, that by this means I shall do a work, that will be most acceptable to the searchers of Art, and Nature. For I do devoutly affirm, That this is the choicest of all my secrets that I confide in, in which I have already seen wonderful things, hoping that the Divine Benediction will some time or other be obtained upon the practice thereof. And as for the structure of it, much cannot be said thereof, because it is not built as other Furnaces are, but it is every where found extructed by Nature, being ordained for no other works, than those of Nature, *viz.* for the making of any *menstruum* that shall dissolve gold, silver, and all other metals, and minerals without any noise, as also pretious, and common stones, and also glasses: the original of which, is the original of the *Menstruum*. Now what, and what manner of Furnace that is, that produceth this Royal *Menstruum*, (coming from the *Menstruum* it self) and that easily without any labour, you may easily conjecture, that it is not any common one, by the help whereof other things are distilled, that can yield such a *Menstruum* that is not corrosive: which certainly is not any common *Menstruum*, because there is but this one *Menstruum* that I know, which doth not partake of any corrosive quality, that doth more than any, or all other corrosive waters whatsoever. For all corrosives whatsoever they are, as *aqua fortis*, *aqua regia*, spirit of salt, vitrioll, allome, aud nitre cannot together, and at once dissolve the close union of gold, and silver, and other most hard subjects, that cannot be dissolved in waters, though never so caustick.

This indeed is wonderful, and stupendous, that a thing every where found most vile and base, should doe so great a miracle: I know not what moved me to write of it, knowing that I shall in this part offend not onely the wise by writing so openly, but also the ignorant detractors, and slanderers that will accuse me of falsity. And truly these considerations might justly have deterred me, but that I knew I might doe a good work, recalling many from their errors: For many are perswaded that there is no other dissolving *Menstruum*, besides the aforesaid corrosive spirits; but those are Chymists that are ignorant of Nature; yet the Philosophers with one consent say, that those corrosive destructive spirits make a fruitless solution of

metals; for experience teſtifies, that the ſolutions made by the help of *aqua fortis*, and *regia*, and other ſpirits, colour the hands, being that which a true Philoſophical ſolution doth not, and furthermore, teſtifies, that thoſe, *viz.* which colour the hands, are not to be reckon'd among the true Philoſophical ſolutions, but to be contemned as Malignant. Wherefore I was willing to write theſe things to inſtruct thoſe that erre. Let no man therefore perſwade himſelf, that a *Menſtruum* ſo vile and contemptible, is of leſs efficacy, than thoſe corroſive ſpirits. I my ſelf did once ſcarce believe, that ſo great Vertues could be in ſo moſt vile a *Menſtruum*, until I had experience of the truth in good earneſt.

I could here add more things concerning the original of the univerſal *Menſtruum*, which is ſo contemptible, which doth by its wonderful powers and vertues diſſolve all metals, minerals and ſtones radically without any noiſe, unites and fixeth them; the ſolution whereof doth not colour the hand; the conjunction is inſeparable, and the fixation incombuſtible; I ſay, I could add more things concerning it, but that divers inconveniences, which by this means I might incur, as alſo the envy and hatred of others do deter me. For although any one doth think to diſcover the poſſibility of Art, and Nature; yet few would be content therewith, being very deſirous of all manner of revelation; and if we ſhould not gratify them, we ſhould forthwith incur their hatred and envy, who would without doubt judge otherwiſe of the matter, if they had but any experience of our labours. Be thou therefore (courteous Reader) contented with this diſcourſe, that ſhews thee the poſſibility of Art and Nature; and diligently ſeek after it in the fear of God, and without doubt thy labour ſhall not be in vain.

Of the Building of the Furnaces.

HOw thoſe Furnaces of the firſt and ſecond part are to be built and made of Potters Clay, and Stones; I need not ſay much, becauſe there be many Books extant, treating of this matter ſufficiently; yet this caution is to be obſerved in building of the Furnaces, *viz.* that thoſe Furnaces, in which a very ſtrong fire is not kindled, need not ſo ſtrong walls, as thoſe in which we diſtil, ſublime, and melt, with a moſt ſtrong fire. And for what belongs to ſubliming and diſtilling Furnaces; you may erect them of thoſe common bricks which are made of the beſt clay, and well burnt, compaſſing them about with very ſtrong walls, that they may the lónger retain the heat: or elſe you will continually have ſomething to do in mending them, and cloſing their chinks, which hinder the regiment of fire. Wherefore they muſt be compaſſed about with iron hoops, that they may be durable and not gape. Now what concerns the melting Furnaces, the aforeſaid bricks are not of uſe in the building of them, becauſe they not being durable melt in the fire; wherefore you muſt make other bricks of a very good earth that is fixed in the Fire, ſuch as is that of crucibles, *&c.* of which, afterwards; which are to be made in a brazen or wooden mould, and to be burnt, and it matters not whether they be round or ſquare, a regard being had of the Furnace, that ſix or eight of them make one courſe, or row. But you need not build the whole Furnace of thoſe ſtones, for it is ſufficient, if the place only, where the coals ſtill lye, be made of them, and the other part of the Furnace be made of common bricks.

A Lute for the erecting of Furnaces.

LUte may be made divers wayes for this buſineſs; for men prepare their Lute ſeveral wayes as they pleaſe. Some mix with ſifted Potters earth, the beaten hairs of Cows, Oxen, Harts, or the chaffe of Barley, Tow, Flocks, Horſe dung, and the like, that hold together the clay, and prevent chops, to which they add ſometimes ſifted ſand, if the clay be too fat, beating the mixture together with water, and bringing it to a juſt conſiſtence. And this is the beſt mixture, that is not ſubject to cleaving, yet weak, becauſe in length of time the hair and chaffe are burnt, wherefore the Furnace becomes thin and weak. Many leave out combuſtible things, and mix Potters clay, and ſand together, and temper them with brine, for the making of their Furnaces. And this is the beſt mixture, becauſe it is not combuſtible as the other is, neither is it ſubject to cracking, by reaſon of the ſalt: and for this purpoſe, the brine of fiſh and ſalt fleſh doth ſerve, and is very good, becauſe the blood helps the joining of them together: but if the *Caput mortuum* of vitriol or *Aqua fortis*, being mollifyed, be mixed with Potters clay and ſand, you go a better way to work: for this Lute is not at all ſubject to cracking, but fixed in the fire and permanent. With this Lute are Retorts, and Gourds very well luted, and coated, alſo the joints of Retorts, and Receivers cloſed: this being mollifyed with a wet cloth applyed to it, may again be ſeparated, and taken off, as that alſo with which ſalt is mixed: but the other Lutes that want ſalt will not be ſeparated, by reaſon whereof glaſſes oftentimes are broken. Wherefore in defect of the *Caput mortuum* of Vitriol, temper the clay and ſand with brine: But many mix the filings of iron, powdered glaſs, flints, *&c.* but you need not them for the building of the Furnaces, but only for the coating of certain glaſſes uſed for ſeparation, and diſtillation, becauſe the filings of iron being helped with ſalt, binds, and joins together moſt ſtrongly.

Of the cloſing of the Joints, kindering the evaporation of ſubtle Spirits.

THe aforeſaid Lute is ſufficient for the cloſing of the Joints of the firſt Furnace, where air is not kept from the Spirits, but not of the Veſſels of the ſecond Furnace, where moſt ſubtle Spirits are diſtilled, which it cannot retain, penetrating the ſame with the loſs of the better part: wherefore you muſt make choice of another; unleſs upon the other being well dryed, a mixture made of quick Lime, moſt ſubtilly powdered, and Linſeed-oyl, beſmeared over with a pencil, which the porous clay attracting to it, is fortifyed, ſo as to to be able to retain thoſe moſt ſubtle Spirits: but this Lute can hardly be ſeparated again; becauſe refuſing water, it cannot be mollifyed; wherefore the clay is to be tempered only with the white of eggs, and to be applyed with linnen clouts: but you muſt prevent the burning of the linnen, by reaſon of the extream heat of the neck of the Receiver

ceiver, by putting between an iron or ſtrong glaſs, *viz.* betwixt the receiver and the retort. The joints alſo may be cloſed with oxe bladders wet in the white of eggs, alſo with ſtarch tempered with water, if it be ſometimes applyed, being ſmeared on paper. For by this means thoſe moſt ſubtile ſpirits are eaſily retained, but not corroſive, for which uſe the *caput mortum* of *aqua fortis* is more convenient which after it is dryed muſt be ſmeared over with a mixture made of linſeed oyl, and quick lime.

And divers kinds of theſe lutes are had being deſtined to divers uſes.

Another Lute for broken Glaſſes.

IT happens ſometimes that glaſs veſſels, as receivers, and retorts, have ſome cracks, but otherwiſe are whole and ſound; which are greater in thoſe glaſſes that do again ſuffer the heat of the Fire, wherefore at laſt the glaſſes are broken, which if you will prevent, make a liniment or thin lute of linſeed oyl, quick lime, and red lead; which being ſmeered over a linnen cloth apply to the crack, upon which being dryed apply another: but if the crack be very great, you may apply three or four linen cloths, for the greater ſafety ſake: as you may apply the whites of egges beaten together, upon the cracks with linnen, and caſt upon it quick lime ſifted very fine, and preſs it down hard with your hand: which being done, you may apply over them more linen clouts wet in the whites of eggs, and caſt upon them quick lime again: which when the lute is well dryed, retaines the ſpirits, but ſooner ſubject to the corroſion of corroſive ſpirits than the former.

Note well that quick lime is not to be mixed with the white of eggs, and ſo uſed upon linen clouts, as the manner of ſome is; becauſe the whites of eggs acquire a hardneſs from the lime before they be united, and therefore cannot ſtick, but linen clouts wet Firſt therewith before the quick lime be caſt upon them, ſo that the lime doth not immediately touch the glaſs, being applyed betwixt two linen cloths.

How thoſe ſubtile ſpirits when they are made, may be kept that they evaporate not.

THoſe glaſſes in which thoſe ſpirits are kept are for the moſt part ſtopt with cork, or wax, upon which afterward bladders are bound: which ſtopping is convenient for ſome ſpirits, that do not prey upon cork or wax: For all corroſive ſpirits, as of vitriol, Allome, common ſalt, nitre, *&c.* corrode cork; and lixivial ſpirits, as that of harts-horn, tartar, ſalt armoniack, urin, wine, *&c.* melt wax, and penetrate it.

And although other ſtopples might be made, which might retain both ſorts of ſpirits, yet it would be tedious and laborious to open thoſe ſo often, and to ſtop them again. Wherefore I have found out a fit kind of glaſſes, *viz.* of ſuch, whoſe mouths have diſtinctions, and are fit to receive their covers; as it appears by the delineation. [*See the firſt figure*]. *A.* ſignifies the cover: *B.* the glaſs containing the ſpirit. *C.* a drawer by the help whereof the ſpirits are taken out of the glaſs, when there is occaſion, into the diſtinction in the brim of the mouth; *viz.* of the glaſs that contains the ſpirit, is put quickſilver, and upon this is put a cover; this being done, the Mercury cloſeth the joynts of both glaſſes running in the brim, ſo that nothing at all can evaporate: for the ſpirits do not penetrate the Mercury, unleſs they be very corroſive (a thing to be noted) which then in proceſs of time turn the Mercury into water, but very ſeldom; and then the Mercury is to be renewed. But we need not give ſo much honour to corroſive ſpirits, being not to be compared to thoſe volatile ones, which being abſtracted from corroſives not prey upon Mercury; and muchleſs than theſe, do lixivial ſpirits corrode Mercury; and for the ſake of theſe were theſe glaſſes invented, by the help whereof moſt ſubtile ſpirits are without any loſs of their vertues, if you pleaſe, a very long time preſerved and kept. And becauſe when there is occaſion the ſpirits cannot be poured forth by reaſon of the Mercury in the brim, you muſt get a drawer like to that, by the help whereof wine is taken out of the veſſel, but leſſer, having a belly with a little mouth made very accurately. This being let down you may take up as much as you pleaſe, as is needful; the upper orifice whereof being ſtopped with the finger nothing drops out; being put into a leſſer glaſs is thence poured forth for your uſe. Then you muſt again cover the remainder of the ſpirit that is in the glaſs, and as oft as is needful take out with that drawer as much as is uſeful. And this is the beſt way by which the moſt ſubtile ſpirits are retained; which alſo are very well retained in thoſe glaſſes, whoſe ſtoples are of glaſs ſmoothed with grinding. But this is a more coſtly way of keeping in ſpirits, and it is done after this manner.

How glaſs ſtopples are to be ſmoothed by grinding for the retaining of ſpirits in their glaſs veſſels.

FIrſt of all order the matter ſo that you have glaſs bottles of ſeveral ſorts, ſome greater, ſome leſſer, with ſtrong necks, and mouths, with their glaſs ſtopples, which being ſmoothed by grinding ſhut the orifice of the bottle very cloſe. Now they are ſmoothed thus. Put the ſtopples in the turn, being ſet or faſtned in ſome wood, bring it into a round ſhape, then being moiſtned with *Smiris*, and water mixed together, let it be put to the mouth of the bottle, ſo as to be turned round in the mouth of the bottle, which you muſt often take away from the ſtopples being faſtened to the turn, for the oftner moiſtening of it, which is with that mixture of prepared *Smiris* and water, with the help of a pencil, or feather; and that ſo often and ſo long, until the ſtopple ſtop the mouth of the bottle moſt cloſely: which being done, you wipe off the *Smiris* with a lint from the ſtopples and mouth of the bottle, then ſmeer over the ſtopple with a liniment made of ſome fine waſhed earth, and water, or oyl, and again turn it round in the mouth of the bottle, and often ſmear it over with this freſh mixture, until the ſtopple be moſt exactly ſmoothed, which afterward is to be tyed to its proper bottle; the ſame alſo is to be underſtood concerning the reſt, that one may not be taken for an other, *&c.* And that you may not need to take away ſo much from the ſtopples, and bottles, get ſome copper moulds made for the ſtopples, which ſtopples muſt be taken whileſt they be yet warm, ſoft, and new drawn from the furnace, that they may be made of a juſt roundneſs, as alſo other copper moulds. Which muſt be put into the mouths of the bottles, whileſt they be yet hot and ſoft, for the better making of them round, whereby afterwards the ſtopple may more eaſily, and quickly become fit to ſtop the

mouths of the bottles very close, (as for example: *A.* is the ſtopple, *B.* the glaſs or bottle) if thou knoweſt how to order them rightly, they will quickly and eaſily fit one the other.

In defect of a turn, proceed after the following manner, which is ſlow, yet ſafe, becauſe in a turn the glaſſes, oftentimes waxing hot are broken by reaſon of the over great haſt; and it is thus, make an iron or wooden receptacle fit to receive the glaſs bottle, which being covered about with linen, and put in, join both parts of the receptacle warily and ſoftly, with the help of a ſcrew, that the bottle be not broken, and that that inſtrument, or receptacle of the bottle being faſtened to a form with the help of the ſcrew, cannot be moved. Afterwards cauſe that another wooden inſtrument be made for the ſtopple (as for example, *A.* the ſtopple with its receptacle *B.* the bottle with its receptable) that may be ſeparated in the middle, and be again reunited with a ſcrew after the putting in of the ſtopple, which being ſmeered over with the aforeſaid mixture of *ſmiris* and water, take the inſtrument with both hands, and put the ſtopple round about the neck of the bottle, and grind it round upon the other, as Wine Coopers are uſed to do in ſmoothing the taps; and that ſo long until the ſtopple be fit for the bottle; then reitereate the ſame labour with the earth *tripolis*, until it be compleated; and it will ſtop as well as a ſtopple made by the help of a turn [*See the ſecond and third Figures before the fourth part.*]

After this manner alſo you muſt work thoſe greater glaſs receivers of the firſt furnace, that without luting they may be cloſed. Stopples alſo of vials or Boltheads for fixation may be wrought after this manner, which in ſtead of luting may be put into the mouths of the vials, upon which are put caps of lead; by which means in caſe of neceſſity they may be lifted up, *viz.* in caſe the ſpirits by too ſtrong a fire be ſtirred up and rarified, by reaſon of the danger the glaſſes are in to be broken, and may again fall down into the mouths of the bottles being preſſed down with the leaden caps, and ſo ſtop cloſe again. And this way of ſtopping is better then that which is done with cork, wax, ſulphur, and other things: becauſe in caſe the fire be not well governed, and by conſequence an errour is committed, you may preſerve your glaſſes by lifting up of the ſtopples, *viz.* when the ſpirits are too much ſtirred up. And although this be a better way of ſtopping than the other common way; yet that which follows is better then this, whereby the ſpirits are eaſily retained, the glaſſes being preſerved, and without all danger of being broken. And it is thus, *viz.* get a glaſs pipe to be made crooked according to the figure ſet down, into the belly whereof is quickſilver to be put from half an ounce to an ounce, or thereabouts, and let this pipe which hath a belly be put into the vial containing the matter to be fixed (as for example. *A.* the pipe with a belly, *B.* is the vial, and again *C.* ſignifies the aforeſaid leaden cap with the neck of the vial *D.*) the joints whereof afterwards are to be covered over with lute, and the vial will never be in danger of being broken. *See the fourth Figure.*

Theſe foreſaid ways of ſtopping are the beſt, by which the breakings of glaſſes are prevented, *viz.* whileſt men are in an errour about the fixing of ſpirits of ſalts, minerals and metals, which although they are fixed with great coſts and labours, yet do not ſatisfie what is promiſed and expected, becauſe thoſe kinds of fixations are violent and forced, and by conſequence contrary to nature: but in the profitable fixation of ſpirits, not ſo, where we muſt follow Nature, and not commit our ſelves to fortune in our labours. For only fools are wont to break their glaſſes in their ſuppoſed tincture; but Philoſophers not ſo; for *every violent thing is an enemy to Nature*; and all the operations of Nature are ſpontaneous. They erre therefore, and never ſhall come unto their deſired end, who attempt violent fixations. I cannot be perſwaded that bodies dead, or half dead can be ſo mixed together as to multiply: but I could eaſily believe that the conjunction of male and female of one and the ſame ſpecies, ſound and nouriſhed with ſound and wholeſome meats to be natural, and to make a ſpontaneous propagation, and multiplication of their ſpecies; *viz.* of thoſe that endure in a good, and adverſe fortune, in life, and death; but the conjunction of dead things, to be dead, and barren. Do but conſider how many and various inſtruments both gold, ſilver, copper, iron, tin, and lead; as alſo earthen, glaſs, ſtone, and other veſſels of other materials have been already invented, and found out for the fixing of Mercury alone with gold and ſilver, but in vain, becauſe they have no mutual affinity. For although Mercury adheres to metals, or metals to it, yet that is not by reaſon of any affinity for multiplication, or perfection ſake: for it appears by experience that Mercury flies away in the fire, and leaves the gold, ſilver and other metals. Where it is clear that they have no mutual affinity requiſite for the multiplication of metals, nor is it ever poſſible: For they that have a mutual affinity embrace one the other and abide together for ever, although volatile, yet never leave one the other, like gold and Mercury, when they are united together with the ſtrongeſt bond, ſo that they can never be ſeparated although with the ſtrongeſt Fire. Wherefore a great care is to be had in the fixation of things joined together; which if they have a mutual affinity, will embrace and retain one the other, without the help of any curious glaſſes with long necks. Of which things if thou art ignorant, abſtain from medling with them, as being more hurtful then profitable, as dayly experience both mine own, and others do witneſs. But that thou mayſt the better underſtand what things have a mutual affinity one with the other: attend a little to what I ſhall ſay.

Is not he to be laughed at for his folly who will pour rain, or common water on gold, ſilver, and other metals to fix them? See therefore the unwiſe actions of many covetous Alchymiſts in ſo hard a matter, that ſpend their time in trifles, reaping according to what they have ſowed, and at laſt leave off their work which they have undertaken, after they have expended much coſt, and ſpent their labour in ſtenches, watchings, and cares. For I have oftentimes ſeen thoſe, that although they have not choſen common water for their *menſtruum*, yet have made choice of *May*-dew, ſnow or rain gathered in *March*, and water diſtilled out of Noſtock, or excrement of Stars; vegetables and animals for their ſolvent, in which they have loſt their labour.

For as the radical union of the aforeſaid things with metals is impoſſible: ſo never is any good to be produced from thence, by reaſon of their difference. And ſuch may deſervedly be compared to thoſe, who aſcending a very high ladder that hath many ſteps, doe preſently endeavour to fly from the lowermoſt to the uppermoſt; which is a thing impoſſible: ſo neither can there be any conjunction of things that do ſo much differ. But as any one may

may eaſily aſcend the higheſt ſtep by degrees, ſo alſo any one may (which yet he need not do) join together extreams, by adding firſt a thing that is moſt near to one of the extreams, and then to this another next to it, and ſo by conſequence, until you come to the other extream, which is a thing that requires a very long time, and is a work without profit. And if things be joined together that have the next affinity, the one will be delighted in the other, and the one will embrace the other, will overcome, and retain it. As for example, there is a certain ſalt, and that only, that can coagulate, and turn into a body like to it ſelf, even common water, which can be fixed in a very little time, with, and by one only certain mineral, which is very volatile. Minerals alſo may be fixed by metals, and metals, (a thing which I never yet tryed) by a certain thing more excellent than metals, without all doubt. But therefore it is needful in the fixation of minerals to begin with the coagulation of water, whereby it is turned into ſalt; and this afterward into a mineral; which would be too tedious; but it is ſufficient to begin in things moſt near, in which nature hath begun to operate, but hath left imperfect; for then there is hope of gain, if contrary things are not joined together, elſe not. Behold how ready Nature is at hand to help any thing that is adminiſtred to it, which it can help: as for example, make ſalt of calcined Tartar by the help of ſolution and coagulation (but do not take that for it, of which a little before mention hath been made, which is far better than ſalt of Tartar) of which after it is calcined, obſerve the weight; upon which afterwards pour half the weight of moſt pure rain water; diſtilled to avoid the ſuſpition of impurity; then draw off the water gently in *Balneo*, or Sand, which again pour upon the remaining ſalt of Tartar, and again draw it off; this do ſo often as is needful, until all the water be conſumed. Which being done, take out the ſalt, and weigh it, being firſt made red hot in the Fire, and thou ſhalt find it to be increaſed in weight, which increaſe came from the water, and not elſewhere.

Note well that the cohobation of the water is to be reiterated often upon the ſalt of Tartar. Obſerve, that by this means, the water is convertible into ſalt by Art, *&c.* And if thou doſt not believe the converſion of things material and corporeal, how wilt thou believe the converſion of things immaterial, as of the Sun, and Fire into a material fixed ſubſtance; of which thing, ſomething ſhall be treated in our Treatiſe of *Aurum potabile*, and more at large afterwards in a Treatiſe *De Generatione Metallorum*, if God permit: For you muſt know that the circulation of the Elements, and things elementated, *viz.* how one is converted into another; and how they nouriſh and cheriſh one the other: as for example, the Earth yields Water, the Water Air, the Air Fire, and the Fire again Earth; which if it be pure, yields pure Earth. But that thou maiſt underſtand aright how any thing to be fixed, may be retained by another, by reaſon of affinity, obſerve the following example. The Husbandman caſting ſeed into the Earth for to multiply, doth not chooſe any Earth, but that which is convenient for multiplication, *viz.* an Earth that is neither too dry, nor too moiſt; for the Seed caſt in ſand cannot grow, but is loſt: For whatſoever is to be preſerved, is to be preſerved by an equal temper; which, by how much it is more equal or like, ſo much the more perfect ſubſtance it doth produce. Humidity therefore being neceſſarily requiſite for the growth of vegetables, without which, they can neither grow, nor multiply, but the ſeed being caſt into moiſt ſand, and the Rayes of the Sun acting upon the ſand, and ſuddenly conſuming the humidity thereof, whence follows the burning up of the ſeed in the dry ſand, becauſe there was no affinity betwixt the water, and ſand; without which, the water could not be retained by the ſand, and conſequently, the ſeed deprived of its nutriment; it follows neceſſarily, that ſome *medium* be required, or bond joining and binding the rain, and ſand; *viz.* ſalt, by the help whereof, the rain water is retained by the ſand, that it be not ſo eaſily conſumed by the heat of the ſun.

The ſand therefore retains the ſalt, and the ſalt, the rain water for the nutrition of the bud: but every ſalt is not convenient for this buſineſs; for although Chriſt ſaith, *Luk. Chap.* 14, Verſe the laſt, that earth without ſalt is barren; yet any common ſalt is not to be underſtood thereby: [*See more de Natura Salium.*] for ſome ſalts, as common ſalt, ſalt of Vitriol, Allome, *&c.* do not only not do good, but do hurt to Vegetables, hindering by reaſon of their dryneſs their growth and increaſe. Now lixivial ſalts promote them, that which Country-men do better underſtand, than our ſuppoſed Philoſophers: for they know how to help their barren ground with the excrements of Animals; which are nothing elſe but a lixivial ſalt mixed with ſulphur, making the earth fat and fertile. And by this means a *vehiculum* (rather a bond) is adminiſtred to the rain water, that it may the leſs be conſumed by the heat of the Sun. Moreover, all ſeed (conſiſting in a lixivial ſalt and ſulphur) loves its like, from whence it borrows its Nutriment, which is obſerved but by a few Learned or Unlearned. Husband-Men may well be excuſed of their ignorance, becauſe they work only out of Uſe and Cuſtome. But others that bear the Title of Learning not ſo; whoſe Duty it is to Render a reaſon of Germination, who may deſervedly be Aſhamed of their Ignorance, being leſs knowing than Husband-Men. It is manifeſt, that Dung makes the Earth Fruitful; but how, and for what reaſon, not ſo; but if it did want nitrous ſalt, it would neither make it Fertile, nor promote Germination: for it is not unknown, that Nitre is made out of the excrements of Animals. The goodneſs therefore of the dung conſiſts only in the lixivial ſalt contained in it, and not in the ſtraw.

But you will ask perhaps, why doth not any other ſalt help Germination? Why is the ſalt of dung required to Germination, and no other? We have already anſwered that, like are helped with like; and contraries are deſtroyed by contraries: For experience doth teſtify, that every ſeed conſiſts in a lixivial ſalt and ſulphur, and not in any acid ſalt; wherefore alſo it doth deſire and embrace its like. Let him therefore, that will not believe it, make tryal of the diſtillation of the ſeed of any vegetable; of which, let him force over a pound by a retort; and he ſhall ſee by experience, that not an acid ſpirit, but a flegm together with plenty of oyl, and volatile ſalt whitening the whole Receiver, comes over; being that which no root

or ſtalk can do: for the chiefeſt vertue, odour, and taſt of vegetables, animals, and minerals is found in the ſeed, in which thing provident Nature hath done very well, whileſt ſhe attributes the chiefeſt faculties to the ſeed, being more obnoxious to injuries then the reſt, which is alſo preſerved, nouriſhed; and cheriſhed by its like.

Now this diſcourſe which might otherwiſe have been omitted, was therefore appointed, that the cauſe of the germination of vegetables might be made the more manifeſt; and that what things have been ſpoken of the attraction, and fixation of all things might the better be underſtood. The germination therefore, and multiplication of both minerals, vegetables and animals muſt be ſpontaneous, and not forced, as is that barren and fruſtraneous of the falſe Chymiſts, becauſe preternatural. Wherefore when you fix any thing be cautious in the adding of any thing that ſhould retain it, with which nothing can be fixed. Fire indeed doth always do its office; but it knows not how to help any preternatural thing; which it doth wholly deſtroy, againſt which nothing can be prevalent, unleſs it be rightly ordained according to Nature.

And thus much is ſpoken for inſtruction ſake, to thee that intendeſt to fix any thing, leſt otherwiſe thou loſeſt thy labour.

Of the making of the beſt crucibles.

THe beſt crucibles that are requiſite for the fourth furnace, not being found in every place, I thought it worth while to ſet down the manner of making them: for I am not ignorant how oftentimes many for want of theſe are conſtrained to be content with thoſe that are uſeleſs, and truly with great loſs of metals, whileſt the crucibles are broken in the fire, and conſequently with a tedioufneſs in drawing them out of the aſhes.

Chymiſts have been in a great errour a long time, and not only they but alſo goldſmiths, and they that ſeparate metals, as alſo others that need the help of crucibles, who perſwade themſelves that the beſt earth that is fit to make the beſt crucibles is to be found no where but in *Haſſia*; and therefore with great charges have cauſed that Gibſenſian crucibles be brought over; not conſidering that almoſt in every place in Germany ſuch earth is to be found, which indeed is a very great folly of men, proceeding from the not knowing of good earth which is to be found almoſt every where. I do not deny but that the earth of *Haſſia* is very good for crucibles, tyles, retorts, and other veſſels which are to be ſet in a very great Fire, for which cauſe alſo is commended Gibſenſian, and Waldburgenſian crucibles.

A few years ſince ſome have made their crucibles, and other veſſels that will endure the fire well, of earth brought out of *England*, and *France* into *Holland*, which have retained metals very well in the fire, but not ſalts, becauſe they are too porous and not ſo compact as thoſe of *Haſſia*, wherefore thoſe of *Haſſia* are ſtill preferred before others, retaining better, metals, and ſalts. But although this earth be brought from thence to other places, yet ſuch ſtrong crucibles could not be made thereof, the cauſe whereof being not the conſtitution of the air, and place to which ſome have falſely imputed it, but an error in the making and burning of them. For in *Haſſia* there is a great abundance of wood, of which there is no ſparing in the burning the crucibles even to a ſtony hardneſs, which could not be done by a ſmal Fire of turffes.

The like errour is committed about ſtone pots, and other veſſels which are made at *Frechemium* and *Siburgus*, and other places near *Colen*, which are carryed almoſt through all Europe, the goodneſs whereof is aſcribed only to the earth, and not to the making. But now experience hath taught us that any good earth doth become ſtony in a violent fire, without reſpect of the place where it is taken. Wherefore it is very probable, being a thing poſſible, that ſuch veſſels are made elſewhere: for every earth being burnt retaining a white colour, *viz.* with an indifferent Fire, makes pots, and crucibles porous, but with a ſtronger, and with a longer delay, compact like glaſs, eſpecially if common ſalt be caſt in a plentiful manner upon them, being burnt with a very ſtrong fire, becauſe it addes to them being very well burnt within an external glaſy ſmoothneſs, by which means they will be the better able to retain ſpirits in the Fire. Wherefore let no man doubt concerning the making the foreſaid veſſels of any other earth that is white in burning, with the help of a very ſtrong Fire: which by how much the greater whiteneſs it gets in burning, by ſo much the better and excellent pots it makes; and ſeeing there is a great difference of making crucibles to be ſet in the Fire, and of ſtone pots retaining liquid things, I ſhall ſhew the manner of making both, *viz.* of ſtone pots belonging to the firſt and ſecond furnace, and of crucibles to the fourth, and thus it is.

He that will try the goodneſs of white and pure earth, *viz.* whether it grows ſtony in the fire, let him caſt a peice of crude earth of the bigneſs of a hens egge into a very ſtrong Fire, obſerving whether it doth quickly or ſlowly cleave and break in pieces; which if it doth not cleave and become powder, although it may have ſome cracks, is good earth, and fit for burning, if ſo be the mixture be well made, in which lys the art.

The earth that is to be burnt, for pots, receivers, and bottles, needs no other preparation then that for bricks, which becauſe for the moſt part it is too fat, you muſt mix with it clean ſifted fuſible ſand, tread it with your feet, and knead it with your hands before veſſels be made thereof; which being made are to be dryed in the heat of the Sun, or in ſome other warm place; and being dryed are to be burnt in a very ſtrong Fire for the ſpace of twenty four or thirty hours, on which in the mean time you may caſt ſalt if you pleaſe, which being thus burnt do like glaſs retain eaſily all liquid things. But let him that makes crucibles, tyles, bricks and other veſſels appointed for a very ſtrong Fire, uſe more diligence in the making of them. And truly firſt he muſt beat very ſmall with a wooden hammer, the earth being dryed well in the Sun, or elſewhere, and being beaten ſearſe it through a great ſearſe, and to one part of the ſifted earth mix two, three, or four parts (the fatneſs of the earth being conſidered) of the earth burnt in a potters furnace, and powdered, which being mixed with a ſufficient quantity of water he muſt tread with his feet, and afterwards knead with his hands, and the earth will be prepared for the making of veſſels, and when he makes crucibles and teſts, let him provide for wooden moulds both greater and ſmaller, made in a turn, hy the help whereof they may be made, for the aforeſaid veſſels cannot be formed by the uſual art of the potters; becauſe the matter of them muſt be very lean, appointed

pointed for a moſt ſtrong fire; wherefore commonly they are made by the help of moulds after the following manner.

Let a piece of the prepared earth be applyed with your hands to the mould. which you muſt hold in one hand, applying and fitting the earth thereto with the other, or hold it with your legs, that the earth may be applyed with both your hands. Alſo you muſt firſt rub the mould very well with clean ſifted ſand, for elſe the earth will ſo ſtick to the wooden mould, that a crucible can ſcarce be taken off without danger, which being done, it is further fitted by ſtriking it with a wooden inſtrument ſmoothed for the purpoſe, by which means the crucible lyes very exactly upon the mould, for by this means crucibles are made very ſtrong; which being done alſo let the crucible be taken off, and ſet upon a board, and be dryed, firſt in the air, then by the heat of the fire, or ſun, and then be burned in the firſt chamber of our fourth furnace, or in a potters furnace. And if you intend only to melt metals and not ſalts, you need not burn the crucibles if they be well, and exactly made.

Now this caution is to be obſerved in melting by the help of crucibles not burnt, that you muſt give fire above by little and little, for fear of breaking the crucibles feeling a ſuddain heat.

Now that they may be made equal in ſtrength, weight, and thickneſs, you muſt weigh one crucible rightly made by the help of the mould in one ſcale, and a piece of the prepared earth, which is to be put into the other ſcale, and if they be equal in weight, take out that piece, and put in another; and this do ſo often, till you be come to the number of the crucibles which you would have made: By this means they are made equal, and you need not cut off any overplus of the earth when it is fitted to the mould, becauſe all are made equal, by reaſon of the equal weight of the matter of each of them, and the work is ſooner done then otherwiſe.

This indeed is the beſt way but tedious and laborious, wherefore conſidering the matter a little more ſeriouſly, I found at laſt that the following way is far better than the former; whereby not only ſtronger crucibles are made, but alſo more in one hour, then in that former common way in three or four. Where firſt, the mould is made of latten (on which I adviſe you to apply the earth) ſignified by the letter *A*. *viz.* that being the beſt, which is made by the help of fuſion. Then the counter-mould anſwering this, ſignified by the letter *B*. yet ſo that that do not enter too deep into this, not touching the bottom by the diſtance at leaſt of one fingers breadth; but in greater crucibles a greater thickneſs of the bottom is required, as the practiſe will teach thee.

Let him therefore that is making crucibles apply the earth to the mould, as hath been above ſaid in the Firſt manner, which being done, let him again take off the crucible that is formed or caſt, and ſet it in the air to be dryed. Then having Firſt made a ſufficient number of crucibles, let him make the mould clean from the earth or ſand, and annoynt it with greaſe, or oyl Olive taken up with a ſponge, as alſo the counter-mould, into which let him put the crucible being half made and dryed, and into this the mould, which he muſt ſtrike above twice or twice or thrice with a heavy wooden mallet, that the earth may be rightly, and exactly applyed to the mould; which being done let him take off the mould, and turn the countermould together with the crucible, which let him knock a little againſt the form (where the crucibles are made) and let him take in his hand the crucible falling from thence; which he muſt afterwards dry and burn, as hath been above ſaid in the Firſt manner. And by this way are made the beſt, and the beſt proportioned crucibles, Fixed and ſmooth, not only for melting of metals, but alſo for minerals and ſalts; the like to which I never yet ſaw, as being without all danger, if ſo be rightly made of the beſt earth. And that they may be made eqnal in weight and ſtrength, they muſt be weighed as before hath been ſaid, And this labour is eaſie and pleaſant, when they are made with ones own hand, and that greater or leſſer at pleaſure.

After the ſame manner alſo are made teſts *viz.* by the help of the like kind of moulds, which muſt not be long but plain like ſhells as appears by the annexed Figure, *A*. and *B*. Not only teſts but alſo cuples are made by the help of theſe moulds. [*See the fifth and ſixth Figures.*]

Now teſts are made more eaſily this way then crucibles, becauſe the earth only is weighed, and being handled with the hands is put into the counter-mould, which then you muſt with the upper-part preſs hard; that it may be made conformable to the mould, *viz.* plain, not long, that which may eaſily therefore be made; and for this cauſe thoſe crucibles are eaſily again taken out, *viz.* if the mould be turned, or the counter-mould be a little knocked againſt the ſides of the form. And if the earth be beaten in too faſt that it goes out at the ſides, you muſt cut it off with a knife, or elſe the crucible, or teſt is hardly taken out, ſticking to the brims, which practiſe will teach thee. For all things cannot be ſo accurately demonſtrated by a pen.

And take this for a caution, that thou do not make thy teſts and crucibles of earth that is too ſoft, but of that which is half dry, otherwiſe they are hardly taken out of the moulds; for that is more eaſily and rightly applyed to the mould. And if thou proceed rightly according to the preſcript, ſcarce one crucible of a hundred will be loſt.

This alſo is to be obſerved, that the ſuperfluous earth which is cut off muſt not be mixed again with the maſs for crucibles, becauſe it is ſpoyled with the fat, or oyl that is ſmeared over the moulds, and therefore cannot be ſo well mixed again, and being burnt cleaves, for which cauſe bad crucibles are made. Wherefore it is to be kept apart for mending of furnaces that are ſpoiled with an extraordinary heat of the Fire; or for covers of crucibles that are to be made by the help of the hands only, or of moulds, which we cannot want, if we would work all things exactly.

Now for tyles, and other veſſels that ſerve for diſtillation, and melting, they are made by the help of wooden moulds after this manner. Let the mould be made exactly like to the tyles, and other veſſels, then cut off leaves from the earth being very well prepared, with a copper wier upon two equal tables of wood, and then a piece of the earth is to be laid with a knife upon the mould, that it may there get ſome hardneſs; which afterward is to be taken away, dryed well, and burnt. And if any thing further is to be done, *viz.* by cutting off, or adding, it muſt be done by earth half dryed, or a little hardened. For by this means any one may get for himſelf earthen veſſels that are neceſſary,

without much coſt or pains for certainty ſake. For thoſe that are ſold, are negligently made, in which oftentimes in the drying, the cracks which are made, are filled up with ſome earthen liniment, before they are burnt, which therefore are not dura- in the fire, but are broken, and that oftentimes not without great loſs of the metal, which is again to be gathered out of the aſhes by the help of a tedious waſhing. It is better therefore to work thoſe veſſels with ones own hand for certainty ſake. For not all and every crucible can alwaies and every where be made equal, and be of a like durableneſs in the Fire, though they are made moſt diligently: and therefore a conſideration being had of their goodneſs, they may be uſed for divers uſes, and the better may be uſed in the melting of the better metals. But let no man perſwade himſelf that all theſe can indifferently hold in the Fire, although they be the beſt of all, how many ſoever you make; for I never yet ſaw any earth which could hold litharge in the Fire and ſalt of Tartar, becauſe the beſt that ever I ſaw is not free from penetration of them, which is the greateſt impediment of ſome profitable operations, which therefore are omitted.

And let this which hath been ſpoken, ſuffice concerning the making of crucibles: let every one therefore that hath a care of his buſineſs, uſe better diligence for the time to come in the making crucibles for more certainty ſake, and he will not repent of his labonr. Now how Teſts and Cuples may be exactly applyed to the aforeſaid Molds, is not my work at this time to ſhew, becauſe many years ſince it hath been done by others; eſpecially, by that moſt ingenious Man, *Lazarus Ercker*, whoſe Writings concerning the manner of making of Teſts and Cuples I cannot mend, to which Authors I refer the Reader, where he ſhall find ſufficient Inſtruction and Information concerning this matter. But there are alſo other Teſts, of which I ſhall ſay nothing in this place, but elſewhere happily I may, by the help whereof, lead is bettered in tryal if it be ſometimes melted again.

Of the vitrification of Earthen Veſſels belonging to the firſt and ſecond Furnace.

IN the defect of glaſs Inſtruments belonging to our firſt Furnace, you may make ſuch as are very uſeful, of the beſt Earth, which being well glazed, or double glazed, are ſometimes better than old Glaſs; eſpecially, thoſe that are made of Earth that do not drink up the ſpirit, ſuch as is found almoſt every where, which becomes ſtony being burnt: Now the Art of burning hath not hitherto been ſo well known, of which ſomething hath been ſaid already, where the Earth being burnt with a very ſtrong fire, is made ſo compact, as that it becomes hard and ſolid as a ſtone. The Potters Furnaces being too weak for this ſtrong burning, there is required a peculiar Furnace for this Work; in which, the ſtrongeſt fire for the burning of them may be made: But becauſe no body thinks to build ſuch an one, only for ſome few Veſſels not worth the ſpending of coſts and labours: there is yet another way of vitrifying of any ſort of Earth (red Clay only excepted) not to be ſlighted if well done; eſpecially, if the matter vitrifying when it is cold after the burning is ended, doth not cleave and chop, and it is not hurt by corroſive ſpirits as the glaſs made of lead, retaining ſpirits, as well ſubtle as corroſive, as that white vitrification of the *Italians* and *Hollanders*: you muſt therefore in defect of a fitting Furnace, wherein Veſſels being burnt become ſtony, make them of the beſt Earth, and glaze them with the beſt Glaſs of Tin, but not of Lead; and by how much the more the calx of Tiu goes into the vitrifying mixture, ſo much the better is it made; for Tin being reduced into a calx with Lead, hath no more affinity with corroſive ſpirts; wherefore it is more fit for vitrification. But he that will not be at ſo much coſts, let him vitrify with Venice Glaſs powdered, which vitrification alſo is not to be ſlighted, requiring a very great heat for the burning, and therefore flowing with great difficulty in theſe common Potters Furnaces; wherefore you muſt mix ſome Borax with the Glaſs, that it may flow ſo much the more eaſily in the Potters Furnace; elſe you muſt pour upon the earthen Veſſels being burnt, Water mixt with Glaſs, ſo that it the Glaſs may ſtick to them every where exactly, which afterwards being well dryed, ſhall be gathered together into one heap artificially, leſt they take up too great a ſpace, like earthen Diſhes that are to be burnt, and afterwards compaſs them round about every where with burnt Bricks, an hole being left open above for the caſting in of coals, yet ſo, that the Bricks be diſtant from the Veſſels the breadth of an hand, whereby the coals being caſt in above, may the more freely go round about down to the bottom; which ſpace being filled with dry coals, you muſt put upon them other living coals, that the fire being kindled above, may by little and little burn downward and perform its work; which being ſo done, the Veſſels will be out of all danger, if ſo be they are all well dryed.

The fire being kindled and burning, you muſt cover the hole with ſtones, until the fire of its own accord be extinguiſht; the coals being ſpent and the veſſels become cold.

N. B. Now if there be a great heap of veſſels, you muſt firſt, the coals being burnt, add freſh coals once more; for elſe the veſſels being placed in the middle, cannot be ſufficiently burnt, nor the glaſs ſufficiently flow; wherefore caution is required in the governing of the fire in this manner, where, if all things are rightly done, the veſſels are better and more truly burnt and vitrifyed than in any common Potters Furnace whatſoever; yet with greater danger to the veſſels than in a Potters Furnace compaſſed about with walls. But let him that burns crucibles and other ſmaller veſſels, burn them in our melting or diſtilling Furnace, being covered wirh coals, giving Fire firſt above, for ſo I my ſelf was wont hitherto to burn all my crucibles, and burn and glaze all other diſtilling veſſels; and this in defect of fitting Furnaces is the beſt way of burning and vitrifying, where in three or four hours ſpace, the veſſels are exactly burnt and vitrifyed. Now the earth that is to be burnt quickly, muſt be the beſt, and durable in the Fire, for fear of breaking of ſome of the veſſels. Let him therefore in this caſe for ſecurity ſake, uſe our fourth Furnace, who hath built it with his chambers, in the firſt whereof he may burn and vitrify without any danger. But that foreſaid way of burning and vitrifying, is not to be ſlighted; wherefore I would have thee be admoniſhed to be cautious in giving of Fire, that you give no more

or

or leſs than you ſhould, leſt afterwards you impute the cauſe of your errour committed, to me, whilſt the veſſels are broke as if I had not wrote the Truth, but to thy ſelf that erreſt, and muſt for the future be more diligent, and cautious in this work.

I know other vitrifications of divers colours hitherto unknown, and indeed moſt ſecret, not to be communicated to every one indifferently: but he that knows how to reduce metals into a true glaſs, retaining the colour of its metal, is indeed the inventor of a very great ſecret; to whom, if he conſider the matter more profoundly, and exerciſe himſelf therein, a Gate is open, with the bleſſing of God, to a greater light.

There are alſo other vitrifications, with which the earth being covered doth appear, as if it were adorned with Gems; but becauſe it is not our purpoſe now to treat of ſuch kinds, I ſhall make an end of vitrifications, one only excepted, which I ſhall communicate for the ſake of the Sick, and Phyſitians; and it is this:

Make little earthen Cups very ſmooth and white of the beſt earth being burnt: then make the following glaſſe to flow in a very ſtrong crucible, in which dip one cup after another, being held with tongs, and firſt made red hot in ſome little Furnace, letting them lye covered therein for a while, that the earth may the better attract the glaſs; which being done, let them be taken out, and be ſet again into the foreſaid collateral Furnace, where they were before made red hot, when one is taken out, dip another in the molten glaſs in its place, which alſo is again to be ſet as the firſt into the aforeſaid Furnace; and this is to be reiterated ſo often, until all the pots be covered over with glaſs: all which being done, the Furnace is to be ſhut cloſe every where, that the wind enter not into it, and ſo it is to be left until it become cold of it ſelf, and the glaſs covering over the cups remain intire, which otherwiſe cannot be if the cups be ſet in a cold place; now the glaſs is made after this manner.

Take of crude Antimony two parts, of pure Nitre one part; grind them well being mixt together, kindle the mixture being put into a crucible with a red hot iron, and the Sulphur of Antimony will be burnt together with the Nitre, a maſs of a brown colour being left behind, which you muſt take out while it is hot with a ſpatle that it may cool, which afterwards being melted in another ſtrong crucible for the ſpace of half an hour, or an hour, makes that glaſs with which the aforeſaid cups with their covers are covered over.

Of the uſe of the aforeſaid Cups.

THere is no one that can deny that Antimony is the moſt excellent of all vomitives, wherefore, ſo many and ſo various preparations have been invented by Phyſitians for the taking away of the malignity thereof; whereof I have ſhewed ſome, together with the uſe thereof in the Firſt and Second Part of this Book, where alwaies one is better than another; yet notwithſtanding 'tis confeſt, that Antimony reduced into Glaſs, is ſufficient to purge the Stomack and Bowels from all corrupt Humors, and that without all danger, (being rightly adminiſtred) as well by vomit as by ſtool, by which means many grievous immineut Diſeaſes are not only prevented, but alſo preſently are cured.

But you infer, that this is yet a crude and imperfect preparation, and therefore not ſo ſafe. To which I anſwer, that Antimony that purgeth, needeth no preparation, for if all the crudity thereof were wholly taken away by fixation, it would no more cauſe vomiting or ſtools; wherefore the aforeſaid glaſs of Antimony is not to be feared, becauſe it is not dangerous, but may ſafely be given to Children that are one or two years old, but not in form of a powder, but in infuſion or extraction of its chiefeſt vertue made with honey, ſugar and wine, ſweet or ſowre. After which manner being given, it attracts from all the bowels all vitious humours, and evacuates them as well upward as downward, without danger; of which thing elſewhere more at large. Let him that uſeth the aforeſaid Cups, infuſe one or two ounces of wine, and ſet them a whole night in ſome warm place, and the wine will attract from the glaſs ſo much as doth ſuffice it, which afterwards being drank in a morning, doth perform the ſame as an infuſion made with the powder of Stibium; and this is a more delicate way than the other, becauſe a Cup is ſent to the Patient that he may infuſe in it the ſpace of a night, two or three ſpoonfuls of proper wine, placeing it in ſome warm place, which he may drink up blood warm in the morning, with a due ordering of himſelf afterwards: Which, in my judgment is a more delicate way, being made with ones one wine, and ones one hand, than that tedious way of potions, both large, bitter, and nauſeous. And this Cup may oftentimes be uſed, and if at length the wine ſhould not attract ſufficiently, the Cup with the wine is to be ſet in ſeething hot water for a little time, that the wine might the better attract, and work, when need ſhall require. Now he that gives ſuch kind of Cups to others, muſt inſtruct them concerning the ordering, and adminiſtring of the ſame. One Cup is ſufficient for the Maſter of a Family, with his whole Family for all the daies of their life. It is not to be uſed by all, and every one, and in all Diſeaſes indifferently, but only by thoſe that are ſtrong and young; and where the principal parts are not hurt. Cups may alſo after another way be covered over with Glaſs without Antimony, as follows.

Sublime *Auripigmentum* in a Glaſs or Earthen Gourd; and take the gallant golden coloured Flowers thereof, which being after a peculiar manner melted, yield a red and moſt beautiful Glaſs almoſt like an Oriental Ruby, which being broken in pieces, may be uſed in ſtead of an Ornament; but this is more ſoft, and brittle, than Glaſs of Antimony. This Glaſs, or thoſe Flowers of *Auripigmentum*, which are not yet reduced into Glaſs, do notably glaze the aforeſaid Cups with a red beautiful Colour.

He therefore that will vitrify the aforeſaid Cups, muſt firſt heat them red hot in a Fire made with Coals; and being thus hot, dip them in the aforeſaid melted Flowers, and being taken out thence, put them under an earthen, or iron red hot veſſel, and there let them cool; which do perform the ſame things as thoſe which are ſaid of the Antimonial Cups.

Theſe Cups are not dangerous, as to be feared, becauſe as Antimony is corrected by calcination, ſo *Auripigmentum* is by ſublimation: from which, if all the malignity be taken away either by Fire,

or by nitre, the vomitive vertue is taken away, as afterward ſhall be demonſtrated more at large in theſe five parts, when they ſhall come forth again with enlargements, *viz.* what purging things are, and how they put forth their vertues, a conſideration being had of their malignity.

There are alſo other ways of vitrification, and indeed very fine, and moſt deſireable by all, if they ſhould be communicated; but becauſe it is not now my purpoſe to treat here of mechanical things, but only of ſome particular vitrifications of veſſels belonging to our furnaces, I am reſolved to omit them at this time, and make an end of theſe things. I am reſolved, God willing, to ſet forth theſe parts more corrected, and in a larger manner, where many excellent things now omitted for ſome reaſons, ſhall be publiſhed, and communicated.

Wherefore I will now put an end to this fifth part, where although I might have added ſomething that is ſingular concerning artificial furnaces, yet becauſe time will not now permit, it ſhall be deferred to another time and place, where we ſhall treat further of the examining, trying and ſeparation of metals: For the beſt way of melting of metals in a greater quantity hath not yet been known: And although they that deal in minerals perſwade themſelves of the perfection of their art, yet I can demonſtrate an eaſier, and more compendious way of melting of metals in a ſhorter, time, in a greater quantity, and with leſs coſts and pains. Of which more at large elſewhere, wherefore (Courteous Reader) be contented with theſe things, and if I ſhall ſee that theſe few things ſhall be acceptable to thee, I will ſometime hereafter for thy ſake and to thy profit communicate *wonderful ſecrets* which the world will not believe, and which hitherto are hid, either out of envy or ignorace.

FINIS.

AN APPENDIX.

TWo years ſince I began to publiſh my new invented furnaces where alſo there was mention made of ſome ſecrets, which though I thought never to divulge; yet nevertheleſs I underwent many troubles for the communicating of them. Wherefore I beſeech every body that they would no more create troubles to me or to themſelves by their petitions or writings, becauſe for certain cauſes I ſhall for the future communicate nothing but thoſe things which follow. Expect therefore patiently the time of another Edition, when theſe five parts ſhall come forth more corrected and enlarged, and many moſt choice ſecrets ſhall be communicated, which were for certain cauſes omitted in the firſt Edition.

I ſhall now God willing communicate thoſe things which follow, yet upon this condition (becauſe many are ſuch, that by means thereof thou maiſt with a good conſcience, without hurt to thy neighbour, through Gods bleſſing, get great riches) that thou be mindful of the poor, and a good ſteward of riches got honeſtly, and uſe them to the glory of God and the eternal ſalvation of thy ſoul.

The preparation of corn, as of Barley, Wheat, Oates, *&c.* of Apples, Pears, Cherries, *&c.* where fermentation being made they do yield by way of diſtillation a pure ſpirit very like to the ſpirit of wine without great coſts; of the remainders whereof if the matter were corn, may be made good beer, or vinegar; but if the matter were any kinde of fruit, as apples, pears, a very good drink like to wine, ſo that by this means thou maiſt find a double profit, by which thou maiſt not only have whereby to live honeſtly, but alſo to lay up for thy heirs.

An excellent and wholeſome drink of fruit, and corn, that is durable and like to Spaniſh, French, and Rheniſh wine.

A diſtillation of the *Aqua vitæ* of certain vulgar things not coſtly and like to the *Aqua vitæ* of French and Rheniſh wine.

A preparation of ſugar like to the Weſtern, and of tartar like to the natural Rheniſh, out of honey and not coſtly; where one pound of ſugar doth not exceed the price of eight or ten ſtivers, and a pound of tartar, that doth not exceed the price of two ſtivers.

A peculiar purification of crude tartar without loſs, and a reduction of it into great cryſtals not coſtly, ſo as the price of one pound doth not exceed ſix ſtivers.

The taking away of the ingrateful taſt and odour of honey ſo as afterwards there may be made from thence a certain good *Aqua vitæ* retaining no more the ſmell and taſte of honey: alſo a very good Mead or Methegline like unto very good wine, with which

which the ſame things may be done as with the beſt wine.

A preparation of Mead out of raiſins, great and ſmall, very like in all things to Spaniſh wine; out of which alſo is made a very good vinegar without great coſts.

A preparation of wine and good vinegar of wild grapes.

Durable and wholeſome drinks of gooſeberries, barberries, mulberries, ſtrawberries, and the like.

The mending of troubled acid muſty wines, *&c.*

The preparation of a very good vinegar out of certain vegetables which are to be found every where, which may be compared to that which comes out of France, and in a great abundance, whereof two rundlets of nine Gallons do not exceed the price of one Royal. [A Royal or Imperial is 4 *s.* 6 *d.*]

The promoting of the ripening of wines of the cold countries of Europe (a very few that are very cold being exempted) that they may yield very good ſweet and durable wines, whereas otherwiſe they could come to no maturity, being very like to thoſe which hotter countries yield.

A certain ſecret way of carrying wines from mountainous places, where carts, ſhips, and other commodities are wanting, where the carrying of ten pipes, doth not exceed the price of one pipe otherwiſe carryed, ſo that by this means, outlandiſh wines may be brought to any place with great profit.

A very good and eaſie preparation of verdegreaſe out of copper, whereof one pound doth not exceed the price of ſix ſtivers.

A new and compendious diſtillation of vinegar, of which a rundlet of eighteen gallons doth not exceed the price of half a ryal, with which many things may be done, eſpecially the cryſtallizing of verdegreaſe, of which one pound prepared after this manner, doth not alſo exceed the price of half a Royal.

A compendious and very eaſie way of diſtilling a very ſtrong ſpirit of urin, and that without any coſt and pains, ſo that twenty or thirty pints ſhall not exceed the price of one royal, being very excellent in medicine, Alchimy and Mechanique affairs, by the help whereof a moſt beautiful blew vitriol may be made out of copper, being very profitable in Alchimy and medicine, making ſilver ſo fuſible, that by the help thereof, glaſs veſſels, as baſons, diſhes, and candleſticks, *&c.* may be ſo guilded as to be taken for ſilver.

A way of diſtilling the ſpirit of ſalt in a great quantity, and that with ſmall coſts, ſo that one pound thereof will ſcarce exceed the price of ſix ſtivers being very excellent in Alchymy, Medicine, and other Arts; eſpecially for the doing of theſe following things, *viz.* the ſeparation of gold from ſilver without hurt to the Cups or other things, alſo the ſolution and ſeparation of gold mixt with copper and ſilver by the force of precipitation, where the *Menſtruum* that is preſerved, may again be uſed for the ſame uſes, which ſeparation is the eaſieſt of all other humid ſeparations, whereby gold is reduced to the higheſt degree.

The ſeparation of volatile ſparkling gold out of ſand, *&c.* very profitable, without which otherwiſe it could never be ſeparated, neither by the help of Waſhing, nor by Mercury, nor by the force of Melting.

An artificial ſecret, and hitherto unheard of, trying of ſtubborn Metals, finding out their Contents, which otherwiſe could not be found out: for oftentimes there are found golden mines, which are ſtubborn, in which nothing is found out by the common way, and therefore they are left unlaboured in, and ſometimes elſewhere, where there are not found Mines of Metals, there are found other things, as white and red talc, that yield nothing, being tryed the common way, or very little, all which yet abound with gold and ſilver, which may be ſeparated this way.

A new, and unheard of compendious way of melting Mines in great plenty, where, in the ſpace of one day, by the heat of a certain ſeparating Furnace, more may be melted than by the common way in the ſpace of eight daies, where not onely coſts are ſaved, but alſo is hope of greater gain.

Another way for the better proving of things melted, and a new way of ſeparating ſilver from lead.

A very ſpeedy way of melting Minerals, whereby they are melted in great plenty, by the help of Pit-coals in defect of other coals.

The fixation of Minerals, Sulphureous, Arſenical, Antimonial; and others that are volatile, which cannot be retained and melted by the force of fire, by the help of a certain peculiar furnace with a grate, ſo that afterwards they may by infuſion yield gold and ſilver.

The getting of gold and ſilver, that ſparkles, and is rarified, out of ſand, pure clay, flints, *&c.* by the help of melting.

The ſeparation of gold lying hid in baſer minerals and metals moſt profitable, which cannot be done the common way.

A very quick Artificial and eaſie ſeparation of melted gold and ſilver by the help of fuſion, ſo that in the ſpace of one day, by the help of one furnace, ſome hundreds of Marks may be ſeparated with far leſs coſts and labour, than by the common way by cement and *Aqua fortis.*

The reduction of elaborated gold, of chains and other ornaments unto the higheſt degree; alſo the ſeparation of gold from guilded ſilver, by the help of fuſion, by which means a hundred marks are more eaſily ſeparated than twenty of the common way.

A certain way whereby more ſilver is ſeparated from lead then by the Copper.

A ſeparation of good gold from any old iron, which although it be not a labour of great gain, yet it is ſufficient for thoſe who are contented with a few things.

A ſeparation of gold and ſilver, from tin or copper, according to more or leſs. The maturation of mines, ſo that they may afterwards be able to yield more gold and ſilver, then by the common way, alſo the ſeparation of gold and ſilver out of Antimony, Arſenick, and *Auripigmentum.*

The ſeparation of the external ſulphur of *Venus*, that the Son *Cupid* may be born.

The ſeparation of ſilver from the cuples, into which it enters in the tryal without melting or any other labour or coſt.

The preparation of divers earthen things to be done in any part of the world, like to the Porcellan, that hold fire and retain ſpirits.

A certain Allome exalting and fixing any colour, eſpecially requiſit for ſcarlet and other pretious colours, with a certain perpetual cauldron, that doth not alter colours, and is not coſtly.

A making of colours for painters, as of purple

gum, ultra-marine, not coſtly, and eſpecially of that rich white, never before ſeen, like to Pearl and Margarites; alſo a peculiar colouring of gold and ſilver.

To conclude, I refer the Reader unto the Reſidue of my Books, that Treat of thoſe Secrets more plainly; which I am reſolved ſhortly to put forth.

Thoſe Secrets are all openly taught in the following Treatiſes, as in the Explication of Miraculum Mundi, Apology againſt Farner, Proſperity of Germany, &c.

FINIS.

Of the Tincture of Gold,

Or, the True

AURUM POTABILE:

What it is, and how it differs from the falſe and ſophiſticated Aurum Potabile: How it is to be Spagirically prepared; And how to be uſed in Medicine.

Of Aurum Potabile.

THere is no man that can deny, that the true and ancient Philoſophers did ſtudy long life, and the conſervation of their health. Whence it came to paſs that they did diligently ſeek out the ſubject of preſerving health, and prolonging life: wherefore by the help of fire they did practiſe the ſeparations, and proofs of all vegetables, animals, and minerals, ſeeking out their powers and vertues: Who found out the greateſt harmony of all things as well in the heavens, as on earth, betwixt the Sun, Gold, Man and wine. For it cannot be denyed, that the life of all things proceeds from the heat of the Sun; wherefore they ſought to unite gold the terreſtrial ſun or body fixed and perfect, cauſed by the rays of the ſun, with man by the help of ſpirit of wine.

But haply there will be ſome, whom this my narration may offend denying that gold is the Son of the ſun, or a metallick body fixed and perfect, proceeding from the rayes of the ſun; asking how the ſolary immaterial rayes can be made material and corporeal? But they are very ignorant of the generation of metals, and minerals. And although I am not now reſolved to write of the generation, and original of metals, yet endeavouring to demonſtrate that that there is a vivifying power of the ſun to be found in gold (deſtroyed and volatilized) and to be prepared into a moſt wholeſome medicine for man, I will not omit for the ſake of the ignorant and incredulous, to demonſtrate the truth by one or two examples, which although I could demonſtrate by moſt certain and firm reaſons, yet for brevities ſake I am now reſolved to omit them, recommending to the ſearcher of the Nature, and propriety of metals, my treatiſe *De Generatione Metallorum*, which without doubt will take away all ſcruple from him; objecting only againſt him that oppoſeth the truth, two queſtions and reaſons which are to be confuted: and the firſt is, whence comes that increaſe of both the quantity and quality of any viſcous, mineral liquor, that hath been expoſed long to the ſun

Sun in an open glaſs veſſel? Whether from the Sun, or elſewhere? But thou ſayeſt, that that encreaſe comes from the air, the vehicle of all things. I anſwer, if from the air, whether was not that air impregnated by the Sun? and whether there be any thing in the air, which it received not from the ſtars? But place this liquor in a cold Cellar, in a moiſt air, and thou ſhalt by experience know that no weight is added thereto, even as in the Sun, or (in his ſtead) fire: that Liquor will draw ſome phlegmatick moiſture which will be eaſily ſeparated by heat, the weight of the former liquor being left. This may be ſhewed by this Example: diſſolve ſome ſulphurous metal, as Iron, Copper, or Zinck, with any acid ſpirit, and at length take away the ſpirit, make the remainder red hot; yet not too much, but as much as ſufficeth to take away the ſpirits, which afterward (its weight being obſerved) put in a crucible on the fire, but take heed leſt the metal run over, but at length let it darkly glow with the crucible, for the ſpace of three or four weeks, which done, take it away again, and weigh again the metal, and thou ſhalt find the evident encreaſe of the metal, which thou ſhalt perceive more evidently by this way, as follows: Put copper, or ſome ſulphurous metal, with 16 or 18 parts of lead in a well-burnt cupel; made of the aſhes of wood or bones, in a tryed furnace, (the weight of the cupel, copper, and lead firſt exactly obſerved) and cauſe the copper to evaporate by fire with the lead, which done, take the cupel when it ſhall be cold, and again weigh it, and thou ſhalt find it far more weighty, ſo that its weight (though much of the lead goes into air in the cupellating) not only exceeds its former weight, but alſo of the copper and lead by the ſaid cupellation; therefore it is juſtly demanded whence this Encreaſe proceeds, whether the heat of the fire was not coagulated into a metallick body by means of that melted metal? Therefore it is probable, that if you knew the metallick matrixes in the ſurface of the earth, in which the beams of the Sun and heat of fire being received, may be coagulated, metals may as well be generated in them, as in the bowels of the earth.

But thou replieſt it is probable the heat of vulgar fire to have ſomething metallick in it, which comes by attraction of the melted metal in the Cupel, but not in the Sun-beams.

He that will thus try the truth, let him put a cupel very well burnt in the beams of the Sun, together with copper and lead, to which let him apply a hollow Looking-glaſs, ſo that it may be operated upon by the Sun-beams gathered into a center, and may thence be made hot: But thou muſt continually hold the Looking-glaſs in thy hand, that thou maiſt turn or direct it to the Sun, according to the courſe thereof, leſt the cupel wax cold, the beams of the Sun being turned away, but if it be rightly obſerved, the work ſhall be done no leſs than in a furnace of fire with glowing heat.

You muſt have a Looking-glaſs at leaſt in diameter two feet, nor muſt it be too deep; but be in depth the 18 or 20 part of the globe, that ſo it may the further caſt the beams: it muſt be very artificially ſmoothed, that it may more exactly gather the beams to the center. Now the preparation of theſe burning-glaſſes is not of this place, but in the fourth part of our Furnaces, where we have taught not only how they are to be made of metals, but alſo of glaſs, and how poliſht and uſed.

This demonſtration, which might be otherwiſe omitted, is therefore ſet down, that it may be known how Gold proceeds from the Sun, and is ſecretly endued with its proper ſtrength and proprieties, by Chymiſtry, reducible into that which it was before its coagulation, namely, into a heating and living ſpirit, communicating its ſtrength and faculties to man's body. Therefore the Ancients uſed great diligence in the reduction of gold, in which nothing is found more excellent than the pureſt and fineſt ſpirit of wine made by diſtillation, and they did not uſe commou gold melted out of ſtones, or waſht out of ſand, but purged by benefit of fire, and Philoſophically quickened and unlocked, not by help of corroſive ſpirits, the uſual way of vulgar Chymiſts, but by ſome water which Nature freely gives without help of violent diſtillation; by which they manifeſt that which is hid in gold, and they have hid what is manifeſt, and therefore they have made it fit for the ſeparation of its tincture from a groſs and black ſuperfluous body. For they knew that the compact body of gold hath no affinity with the vital Spirits, therefore they have choſen only the fineſt part of gold to their Elixir, *viz.* Its tincture, which they have radically joyned with the ſpirit of Wine, and being joyned, have made them ſpiritual or volatile, ſo that neither can be ſeparated from each other in the fire, and being in the fire, are ſublimed, or fixed by a longer digeſtion, and coagulated into a fixt ſtone, which they count for the greateſt treaſure in this World. Therefore the ancient Philoſophers affirming, that there is not a better medicine under the Sun than it, which is made from the Philoſophical union of wine and gold, both by an inſeparable recoagulation and fixation; nor without gold can ſpirit of wine, nor this without it be made a medicine, becauſe gold without ſpirit of wine cannot be made volatile, nor this be coagulated and fixt without it. We therefore, their Poſterity juſtly, follow the opinions of the moſt famous men, not for their authorities ſake, but for ocular demonſtration, which is the trueſt tryal.

Therefore the knowledge of the preparation of this medicine being beſtowed on me from the higheſt, I have intended, becauſe a man is not born for himſelf, briefly to deliver its preparation and uſe: but I will not caſt pearls before ſwine; but I'le only ſhew the way to the ſtudious ſearchers of the work of God and Nature, who doubtleſs will underſtand my writing, but not the ignorant and unskilful; let therefore the brevity of the preparation offend no man, becauſe I mean not to proſtitute this Art (divinely obtained, not with idleneſs, but with much watching, labours and pains) nor give to the unworthy a bit before chawed, but only to communicate it to the pious, who ſhall ſee with open eyes, that the thing is ſo. I deſire therefore, the ſimplicity of my ſtile may offend no man, being not adorned with rhetorical figures, after the wonted manner, for truth wants not many and elegant words, being contented with ſimplicity and brevity, with which it is eaſier and better demonſtrated, than with thoſe intricate and ſophiſtick diſcourſes.

℞ of living gold one part, and three parts of quick Mercury, not of the vulgar, but the Philoſophical every where to be found without charge;

and labour, (thou maiſt alſo add living ſilver of equal weight with the gold, and indeed better than only gold, for the greater variety of colours proceeding from the mixture of male and female: but one perſwaded that a better Tiucture proceeds from gold alone may mix gold only, not ſo, one skilful of metals, who knoweth the power of the cordial union of gold and ſilver, diſſolved in one and the ſame *Menſtruum)* put them mixt in a Philoſophical veſſel to diſſolve, and in the ſpace of one quarter of an hour, thoſe mixt metals will be radically diſſolved by the Mercury, and will give a purple colour; after encreaſe the fire by degrees, and it will be changed into a very fine green, to which taken out, pour the water of dew to diſſolve, which may be done in half an hour, filtre the ſolution, and abſtract the water through a glaſs alembeck in B. which pour out again afreſh, and abſtract, which do three times, in the mean time that greeneſs will be turned into a black colour, like Ink, ſtinking like a carcaſs, and therefore odious: and it behoves ſometimes to take away the water reaffuſed and digeſted, and that blackneſs and ſtink will depart in the ſpace of forty hours, and will produce a pure milky whiteneſs, which appearing, take away all the moiſture till it be dry, which will be a white maſs, and in few hours of a pleaſant colour, divers colours firſt appearing, it is turned into a fine greeneſs better than the former, to which you muſt affuſe the ſpirit of wine well rectified, to the depth of two or three fingers, and that green gold diſſolved will draw that ſpirit of wine, for the great amity, like a dry ſpunge drawing waters, and will communicate to it a quinteſſence as red as blood, by which means the greeneſs is deprived of its quickening tincture, the ſuperfluous aſhy body being left.

You muſt decant and filtrate the tinged ſpirit, and in a B. by a glaſs alembeck, abſtract it from the red tincture, attracting the fiery eſſence of the ſpirit of wine, ſo that they may be very cloſe and inſeparably conjoyned, from which an unſavoury water only diſtils, the vertue of the ſpirit of wine being left with the tincture of gold like a red fiery ſalt, fuſile and volatile; of which grain 1. can tinge ℥ i. of ſpirit of wine, or any other liquor, with a blood-red colour, for it is ſoluble in any moiſture; and therefore may be kept in a liquid form for the Panacea of moſt deſperate Diſeaſes. Now I will communicate the proprieties of the true tincture, by which true potable gold is known. This tincture next the ſtone is the beſt of all medicines, between which and that, there is but this difference, the ſoul of gold is volatile, nor hath entrance into imperfect metals, and therefore cannot tranſmute into pure fine gold, which vertue is attributed to the Philoſophers ſtone. The ſoul of gold, though it be the beſt part, yet it is not fixt in fire, but volatile; but the Philoſopher's Stone is fixt in fire, and remains, by reaſon of a longer digeſtion. But whether that ſoul or volatile tincture and red Lyon may be fixt by help of fire, and turned into the Univerſal medicine, and tinging ſtone, that I know not, becauſe hitherto I have not tryed, *&c.* therefore he may who extracts the ſoul of gold, make further tryal, whether he can find any thing better. For this Work treateth of nothing but the beſt medicine of gold, but other things I know not.

Therefore the deceit of the Diſtillers of Wine, and other vegetable waters, ſelling potable gold, is not unknown, being not aſhamed to ſell any water coloured yellow or red to the ignorant for a great price. And the errour of others diſſolving the body of gold in *Aqua Regia*, or ſpirit of ſalt, which again they abſtract to a dry remainder, to which for extraction they affuſe the ſpirit of wine: Which is not an extraction, but ſome particular ſolution of gold, made by help of the corroſive ſpirits left in the gold, tinging the ſpirit of wine with a yellow colour, which ſo coloured, they call their potable gold; which notwithſtanding is reduced into gold, the ſpirit of wine being abſtracted, which can do no more than any other Calx of gold, which the *Archeus* cannot digeſt, but ſeparates, being indigeſted, with the Excrements. And alſo it is the errour of others, ignorantly deceiving themſelves and others, extracting the Calx of gold with peculiar *menſtruums* and ſpirits, knowing not that the *menſtruum* affuſed to gold to be red of it ſelf by a long digeſtion, which decanted, they adminiſter inſtead of potable gold, who if they weighed the remaining Calx, would by experience ſee that nothing departed from the gold; which you may try by the ſetting the ſpirit or *menſtruum* in a remiſs heat, or longer in cold, which of it ſelf doth wax red, as if it had been affuſed to the Calx of *Sol.* But the cauſe of this redneſs is (unknown to them) nothing but a certain nitrous ſalt and volatile, as of Antimony, Urine, Tartar, Hartshorn, Hair, *&c.* exalting the colour of any Sulphur.

Wherefore it neceſſarily follows, if *Artiſts* mingle with the ſpirit of wine in which is a ſulphur, ſuch exalting ſalts, that it will thence be exalted in colour, and wax red; which alſo happens to them, who uſe to extract a tincture with diſtilled Oyls, having a volatile ſalt, as are oyl of Lemmons, Cloves, Soot, *&c.*

For ſuch-like tincture or potable gold is ineffacious, as experience witneſſeth. But I would not ſay there is no other tincture to be prepared out of gold, beſide this tincture: for being diſſolved in ſweet *menſtruums*, that it cannot be ſeparated by precipitation, it can do wonderful things in many grievous Diſeaſes; but alwaies the living metal is to be choſen inſtead of the dead.

But true potable gold is not ſo only in name and ſhew (as are divers waters tinged with a yellow or red colour) but alſo endued with golden faculties and vertues, ſo that it may actually appear to be made of gold, but irreducible by Fire into Gold, ſpiritual and penetrative, ſtrengthning the vital ſpirits, that they may overcome their enemies. But it muſt alſo be endued with this Vertue, that it may change imperfect metals, chiefly Mercury, Lead, and ſilver into pure gold; not truly like a fixt tincture, tinging with profit the baſer metals in flux; but only perfecting particularly in a moiſt way by digeſtion, where ſome part of the metal alone is turned into better. For this tincture of ſalt or gold is very volatile, ſo that it cannot reſiſt the fire; but with a gentle heat it melteth like wax, and is ſublimed like red ſalt, ſoluble in ſpirit of Wine, that it may be fit for Phyſical uſes.

Alſo true potable gold being taſted, is neither corroſive, nor aſtringent like other ſolutions of gold: neither doth it pollute the hands, the nails and hair with a black or yellow colour, but rather makes them

them more fine; neither doth it infect copper, tin, lead, with ruſt or a black colour, but rather makes them more clear; neither is it a body of gold reducible by extraction, nor into white gold, which may recover its former colour by Antimony, and *Aqua Regia*, but it is like an aſhy earth, and ſublimable in a gentle heat like Arſenick, not enduring the tryal of the cuple, which vertues if it have, it may be called the true Tincture of Gold: but if not, not ſo, but rather a ſophiſticated potable gold, not to be medled withal.

Of the medicinal uſe of this golden Medicine.

WE have before demonſtrated the ſun to be the original of gold, or endued with the incredible vertues of the terreſtrial ſun. For the ſtrength and vertues of all vegetables, animals and minerals lie hid in it; which cannot be manifeſted but by a Philoſopher, and that by ſeparation, to wit, of the intrinſical and pure parts, from the impure.

This ſpeech will happily ſeem to thee incredible, or not very likely to ſay that gold is reducible into a ſpiritual eſſence, agreeable to humane nature, endued with the ſtrength of all animals, vegetables and minerals. Surely thou ſhalt hardly perſwade him whom *Vulcan* hath not made a Philoſopher to believe it. But who will trouble himſelf ſo much as with ſure reaſons to decide all Controverſies, which if poſſible, yet for many reaſons is here omitted; but for ſureties ſake I will ſend back the Reader to the ſecond part of our Furnaces, where he ſhall find how out of Antimony and Sulphur, by a good Chymiſt, with the help of fire, may be drawn not only the force and faculty of divers vegetables, but alſo their natural odour; which yet did not appear in them before they were radically diſſolved, which if it may be done by any imperfect and fetid mineral, why not alſo by a perfect and mature mineral?

If we were good naturaliſts, and very diligent Chymiſts, then we need not to fill Elaboratories with ſo many pots and boxes, nor ſpend ſo much coſt in fetching in ſo many forreign medicinal ſpecies, becauſe without queſtion the ſtrength and properties of all vegetables, animals, and minerals, by an eaſier way may be found in ſome few ſubjects. And as the true tincture of *Sol* well fixed, is endued with all the vertues of all vegetables, animals and minerals; ſo alſo deſervedly is aſcribed to it the force of curing all diſeaſes; but with a difference. For there are divers kinds of the Gout in hands and feet, as alſo of the Stone and Leproſie; which ſometimes are inveterate and uncurable Diſeaſes, ſometimes new and curable. Who therefore, not mad, would promiſe to cure all and every diſeaſe indifferently, by any certain medicine? Certainly no man, although he had the very ſtone of the Philoſophers.

For oft-times the Stone of the Bladder is expelled or cut out, moſt hard and inſoluble by *Aqua-fortis*, which not any medicine not corroſive could diſſolve; which ſtrength, although they aſcribe to their medicine, yet they cannot perform it. Promiſes therefore do not ſuffice, which none can perform: for *Promiſes become Debts*, which is obſerved by few; wherefore by the haters of the Art the truth ſuffers, and the hope of good ſucceſs of Chymical medicines dyeth. *It is beſt* therefore *to perform more than promiſe*, and the work ſhall praiſe the workman. How can a Medicine penetrate to the extream parts of the body; to wit, the hands and feet, and diſſolve the coagulated matter waxing hard, which out of the Body no corroſive Medicine can diſſolve? It is ſufficient if a medicine finding a viſcous tartareous and ſalt matter, not yet coagulated, do diſſolve and expel it. The like is to be underſtood of the ſtone in the reins and bladder. In this manner I will aſcribe the curing of the Gout in the hands and feet, the ſtone in the kidneys and bladder, to my tincture of *Sol*, as well in old as young; but ſo that, if need be, ſpecifical Catharticks may be adminiſtred, and extrinſecally Bathes for promoting the cure, whereby Nature may the ſooner do its office. But above all things, we muſt not ſlight Divine Providence: For oft-times God ſmites us with a Diſeaſe incurable by Art, unleſs Divine wrath be firſt appeaſed *by humble Repentance*, which is the beſt medicine of all. As alſo the cure of all Diſeaſes coming of the corruption of the Blood, as the Leproſie, the French Diſeaſe, and other impurities; which are taken away by this tincture, if withal Catharticks and Diaphoreticks are adminiſtred, cleanſing and renewing the blood above all other medicines. This Tincture alſo takes away all the obſtructions of the Liver, Spleen, Kidneys, and other parts, becauſe it warms, attenuates, incides, and evacuates the original of divers Diſeaſes. It alſo cures all violent and acute diſeaſes, as the Epilepſie, Plague, Feavers, *&c.*

It provoketh the Menſtrues of old and young, chiefly, if alſo extrinſically it be rightly adminiſtred: which way many are well cured, who otherwiſe are like to periſh miſerably; it warms and cleanſeth the Matrix above all other Medicines, and renders it fit to perform its office: It preſerves it alſo from all accidents of *Sterility*, and other very grievous Diſeaſes, cauſing death. It expels the water of the Dropſie by urine, it rarifieth and dryeth up the ſuperfluous moiſtures of the internal and external parts, like the Sun drying and conſuming waters, by which means the body recovers its priſtine ſanity: of other diſeaſes to write in particular there is no need, becauſe in all and every one, without difference, it may be uſed as a general Medicine, in old as well as young. This medicine doth not only reſtore, but alſo conſerve health till the predeſtinated time.

The Doſe is from three grains or drops to twelve or more, but to Children 1, 2, or 3. with its appropriated vehicle, or in wine or beer to be adminiſtred daily, which Doſe may be taken oftener in a day, reſpect being had to the ſick party.

And ſo I make an end, hoping to have pleaſed my Neighbour: for without doubt, who uſeth this golden Medicine well, ſhall do well, chiefly lifting up his heart (acknowledging his ſins) to God the Giver and Creator of all good, in filial humility, imploring his help and bleſſing; which the omnipotent God and merciful Father, that he would beſtow on us his temporal bleſſing in this life with ſound health, and hereafter life eternal, of His free grace, *Let us pray, Amen.*

FINIS.

THE MINERAL WORK:

THE FIRST PART.

Wherein is Taught the Separation of

GOLD

Out of Flints, Sand, Clay, and other Foſſiles by the Spirit of Salt, which otherwiſe cannot be purged. Alſo a *Panacea* or Univerſal Antimonial Medicine, and the uſe thereof. Invented and publiſhed in favour of the Studious in the *CHYMICAL ART.*

By **John Rudolph Glauber.**

A Preface to the Reader.

THere will be ſome without doubt, becauſe the Edition of other Pieces (of which I made mention in ſome former Tractates a few years paſt) hath been hitherto by reaſon of diverſe journeys, and other various impediments, neglected, who will think (having no knowledge of me) that I am unable to perform my promiſe; and there are others, who knowing my Condition, and the Contumelies of my Enemies, will fear that I being diverted from my purpoſe by theſe Reproaches, will make void my ſecret promiſes. But I have reſolved to ſtand to my promiſe, that theſe men may ſee that I am neither moved nor altered with the Taunts of the Envious; but that they may be convinced by real demonſtration of my ſecrets; ſome of which, I ſhall now for the publick good endeavour to communicate. And although the ingratitude of the World be cauſe enough for my ſilence, yet the uprightneſs of my Heart would not permit me to conceal thoſe things, notwithſtanding the malevolent and ungrateful. Beſide alſo the following Reaſon moved me, becauſe there are ſome ambitious men, who falſly boaſt of the knowledge of diverſe of my ſecrets; wherefore, ſome have been moved to think that mine are not my own, but the Works and Writings of others; by which means I have been deprived of my due Praiſe, being attributed to another. And this I have often found, that one or other having by entreaties obtained a ſecret from me, have afterward through Oſtentation aſcribed it to themſelves.

There are others alſo who fear not to reproach me, and my Writings, as though they were trifles, not attaining their deſired end, who (rather than I who have written plain enough) are themſelves to be blamed, for being ignorant how to work. Such and other things might deter me, but I would not omit the publiſhing of theſe Writings for thoſe mens ſake who are pious and honeſt. Wherefore I openly affirm, that theſe things publiſhed by me are not only no trifles, but moſt true, and alſo my own, and not the Invention of another. And I call him a lyer, who ſhall boaſt himſelf the Author without any of my help. But of theſe enough! yet I would have the Reader know, that for the meaneſs of the ſtile, I am not like many Writers, who more look after the flouriſh of words than the thing it ſelf; I rather ſeek that my Neighbour may profit by me. Wherefore, for his better underſtanding, I had rather be prolixe in words, tedious to delicate ears, than write in obſcure brevity adorned with Rhetorical figures. For I know that the ſtudious in the Art do affect a prolixe, plain, and diſtinct information or inſtruction, rather than a Ciceronian *or obſcure. And now, in the Name of God, I will begin my Work which is moſt profitable to all, and will faithfully communicate and publiſh the ſame in that manner as it was written by me in my travel, under the title of* The Mineral Work, *divided into three parts. In the firſt of which ſhall be taught how out of ſand and golden flints, corporeal gold may be drawn by the help of Spirit of Salt. Which ſecret, although it may ſeem ſmall, yet it is that whereby (a knowledge of the true ſtones and true ſand being obtained) life may be ſuſtained, and alſo the coſt laid out may be recompenſed, as ſhall be proved in the following parts.*

In the ſecond part ſhall be treated of the original and generation of metals, and alſo of the deſtruction of Minerals and Metals.

In the third part ſhall be demonſtrated the poſſibility of metallicol tranſmutation by Nature and Art, and that with divers reaſons: which demonſtration is not (unleſs I am deceived) performed yet by any, being the foundation of all metallick Philoſophy, and the Golden Crown *of all my Writings. Which God grant I may perfect, to the glory of his Divine Name, and the good of my Neighbour.* Amen.

THE

The First Part of the

Mineral Work.

A most profitable process of the separation of Gold out of Flints, Sand, Clay, red and black Talk, and other Fossiles, containing very subtle Gold, thin and spongeous, which otherwise cannot be separated, either for its scarcity, or the obstinacy of the Mineral, by reason of the great Cost to be bestowed; viz. *very easily with the spirit of Salt.*

KNow first, (good Reader) that not all Sand, Clay, nor all Flints, and other Fossiles do contain Gold, but only some, without the knowledge of which, this secret availeth nothing. And because the knowledge of these are very necessary for the Artist, I will shew how they are to be proved, whether they contain Gold or not, that he labour not in vain, but that it may prove to his commodity or profit.

The madness of Men, searching after uncertain things is wonderful, but neglecting certain, although exposed to every ones view, for many seeking the perfection of Metals to gain Riches, are busied about an uncertain thing, because of a thousand scarce one obtaines his end: altho' they may be perfected and purified, I mean imperfect and impure metals, so that good Gold and Silver may thence be extracted, but this Art is given to few, neither is every one fit to perform the business; because it requires an ingenious and experienced ARTIST: But the thing which is certain, may be performed with small cost and labour by any vulgar Chymist, having any knowledge of the Art of fusion and separation, being an ingenious man, and not seeking things too high or too gainful at the first tryal. Be cautious therefore in the extraction of the aforesaid stones, for if thou shouldst with the spirit of Salt extract many of them, having no Gold without doubt thou shalt find no Gold there: And if thou shouldst extract some contained in them, and if thou be ignorant of the separation of it by Antimony, thou canst thence hope for no profit.

First then, the knowledge, *viz.* of those stones is necessary afterward of that separation by Antimony. Impute therefore the fault, if thou erreſt, not to me, but to thine own ignorance, if thou knowest not to extract the Gold; for I have written clearly, though thou shouldst not know any thing that were omitted. And I before admonish thee to be cautious in thy work, lest thou labour for nought: For it is certain, and no fiction, that in many places there are found golden flints, and golden clay, and sand, oft-times abounding with gold. And if they do not abound with it, yet may they be extracted with profit: but the flints abounding with it are extracted with greater gain. There are also found whole Rocks and Mountains of Gold, and great Mountains filled with golden Sand and Clay, not returning the charge of washing, either for its too great rarefaction or spungiosity and levity, by reason of which, its washed away with the sand; all which, how poor soever, may be extracted by the spirit of Salt with gain, and by Antimony fixed and purifyed. In brief, this is such a secret, by which, no man can be an impediment to another, as in other mechanical operations, whereof no man may be ashamed; for God did therefore create Gold in the earth and stones, that we may therefore extract it to the glory of His Name, and the benefit of our Neighbour; neither hath he forbidden the true and genuine use of it. I say therefore in truth, that I have here described this Art, how ever despised by the ignorant, yet of greatest moment, and almost incomprehensible. Now consider the thing a little farther, thou shalt find every where in the earth great Treasures to be hidden, which only through ignorance are not discovered. Truly it is known to all, that there is found golden sand and clay in diverse places, which for the aforesaid Reasons are left unlaboured, but by this our Art may easily be worked upon.

There are found also silver Mountains, out of which, silver cannot be extracted for the little weight it yields: there is also found in many places a certain yellow or reddish earth, or such like clay, which though it contain store of silver, yet it cannot be extracted with profit by this way, yet separable, with gain, but not by the spirit of salt,

which leaves it untoucht, but by ſome other thing, every where to be found in plenty, of which, for ſome reaſons we ſhall ſpeak nothing here.

And this way of ſeparation makes much for the poor mineral of copper, which with profit cannot be worked upon by the vulgar way, to be ſeparated from the Copper, afterward by ripening it into a better metal, or turning it into verdy-greaſe for want of a better art, which buſineſs alſo may well and honeſtly more than maintain a family. This way alſo may the rejected droſs of the gold, ſilver, and copper be with profit ſeparated. But becauſe I have decreed to handle here only the extraction of gold out of ſtones, therefore theſe menſtrues which are uſed in the extraction of copper and ſilver, are deſervedly omitted, and reſerved for another place, where ſometime they ſhall be delivered, to wit, if I ſhall ſee that this demonſtration ſhall be accepted in mens eyes, which more very excellent ſhall follow. As now I have undertaken a more excellent matter in love to my countrey, by which it may appear, that *Germany* however reduced to want, is yet rich enough, if it would but at laſt look upon its hidden treaſures. There is no need to offer a fore-chewed bit, for demonſtration is ſufficient, neither will we obtrude a good upon the negligent; for to the ungrateful the beſt things are unacceptable. Theſe therefore being waved, in ſhort we will give the demonſtration and extraction of thoſe flints, not doubting but the expert and experienced, though the ſluggiſh may not, will thence reap profit, and give God the praiſe.

What belongs then to the aforeſaid ſtones, out of which gold may be extracted, thus the matter ſtands. All kind of flints for the moſt part have inviſible gold, ſometimes viſible and inviſible, volatile and corporeal together: but many commonly contain impure iron-like volatile gold, and alſo mature, and a few, ſulphureous and copper-like.

Stones which the *Germans* call *Quartzens* and *Hornſtein*, containing pure and corporeal gold, although mixt with ſilver and copper, may be burnt and ground, and extracted with Mercury, and if they abound with gold, be purged by flux; which labours are uſual with diggers and dealers in metals, of which I do not intend to write, becauſe others have heretofore writ of them. But thoſe flints *Quartzen* and *Hornſtein* every where almoſt to be found, containing but a mean quantity of diſperſed iron-like Gold, Marcaſite-like, and that either fixt or volatile, cannot be ſeparated with gain, to wit, neither by Mercury nor by Flux, wherefore they are neglected by the Miners, either out of ignorance or for the intolerable coſts. But I having tryed thoſe baſe ſtones, that how little gold ſoever they poſſeſs; yet may it be ſeparated with great gain, I would not intermit to publiſh this knowledge for my Chriſtian neighbours ſake, not doubting but this publication will be profitable to very many. For I am not ignorant that there are as well learned, as unlearned, noble as ignoble, ſecular as ſpiritual, either by war or otherwiſe expoſed to poverty, ſo that they are hardly able to maintain their family, *&c.* and for their ſakes and others in want. I have publiſhed this ſecret, which rightly handled may bring no ſmall gain yearly, but eſpecially where thoſe ſtones are plentiful, and alſo that ſpirit of ſalt, whereof the deſcription is given in the firſt part of the Philoſophical Furnaces, and hereafter there ſhall be given a better, if nothing hinder; in the mean while uſe and enjoy theſe. And if it happen ſo that thou canſt not rightly perform all things of the aforeſaid tractate, bluſh not to learn the manual Operations [which cannot be ſo exactly deſcribed] from thoſe that are experienced, leſt you hereafter unprofitably ſpend your labour and coſts. As for thoſe ſtones know that very many of them are found in ſeveral places, chiefly in thoſe that are ſandy and mountainous, but in ſome more and better than in others: for there is ſeldom ſeen ſand without flints, and oft-times the ſand it ſelf, though very little doth not want Gold. But they are very likely to be found on the ſhoars of Rivers, where the waters waſhing away the ſand from the flints they are found in great abundance, though they are not ſo eaſily known by their outſide, as thoſe which were found clean in the ſand, becauſe they are covered with ſlime. Wherefore they muſt be broken with a hammer, that that may be ſeen which is in them, which may better appear if they be burnt, and quencht in cold water. For the ſtone retaining its whiteneſs when it is burnt and quencht doth contain nothing; but acquiring a redneſs it ſhews there is ſomething in it, and the more red it is the better token it is.

N. B. But this is not to be underſtood of ſandy ſtones, waxing red in ſome part, in the fire, containing no gold, but of flints out of which by a mutual percuſſion fire is brought forth, which the more pure they are the purer gold do they yield, There are alſo flints out of which fire is forced by percuſſion being red in the fire, which contain no gold but Iron; which you may know by that clear redneſs before the burning, which being burnt is changed into an obſcure redneſs, not ſhining and crude: but the flints containing Gold, being burnt do acquire a fair golden yellowneſs, or reddiſh colour, as if they were covered with gold, and that through the whole ſubſtance if they be broken in pieces. And theſe give a pure gold, but thoſe other yield a red extraction like blood, yielding not gold, but the pureſt and malleable iron, good in Chymick uſes, (but chiefly for ſilver to be cemented and exalted) for gold is ſeldome to be found in them; the which is well to be obſerved leſt thou draw out iron in ſtead of gold, and ſo loſe thy labour.

Alſo the beſt ſtones containing gold, are thoſe which are white and ſhining, here and there throughout having in the whole ſubſtance green ſpots and lines, red, yellow, skie-coloured and brown. There are alſo black flints out of which fire is forced by percuſſion, having gold and iron, which may be ſeparated with profit, yielding ſometimes plenty of ironiſh Gold, which may in like manner, be ſeparated of which afterward.

They are very good flints alſo which being burnt retain a whiteneſs, with veins green, skie-coloured, and ſuch like, neither are they diſeſteemed which burnt, have black ſpots, and not veins.

But the ſtones (*Quartzen* and *Hornſtein*) although they in burning are not altered, yet if there be ſeen before gold volatile and ſpiritual, they by ſeparation of themſelves yield gold.

Groſs and ſubtle ſand having light and yellow gold, yields in the burning a skie-coloured ſmoak, and is exalted in colour, *viz.* browniſh: but that hath nothing which is not altered.

Subtle earth, yellow or red, paſſing through ſand or a mountain like a vein contains alſo gold, which is for the moſt part volatile, and not mature, flying away in reduction, having ingreſs into ſilver and

other

other metals, and therefore for this reaſon conſervable,

For thy better knowledge thou mayſt prove the ſtones, with white fuſile glaſs, which thing is treated of in the fourth part of the Philoſophical Furnaces, that thou mayſt not have cauſe to impute the fault of thy errour to me; therefore I would have thee underſtand, *viz.* that all ſtones contain not gold, neither in all is it ſeparable by the ſpirit of ſalt: they are therefore to be known before they be applyed to the work.

Now follows the preparation of flints, and the extraction of the gold contained in them, by the ſpirit of ſalt.

Firſt the flints being made red hot in the fire, they muſt be quencht in cold water, after taken out and cooled, and finely powdered.

N. B. When they are broken in a Mortar the better parts may eaſily be ſeparated from the baſer: for while they are finely powdered, always the beſt part goes into red powder firſt, the worſer part thicker and harder, containing little or nothing, being left; And if they be courſly powdered and ſifted through a fine ſieve the more ſubtle part like red powder goes through the ſieve, the unuſeful part being left in the ſieve like white duſt, which may be caſt away: and if yet ſome redneſs appears, it muſt again be powdered in a Mortar, and the better part ſhall go into a red powder, the baſer part being left in the ſieve hard and white which is to be caſt away, but you muſt obſerve that not all and every of theſe flints are thus ſeparable by powdering; for ſome being beaten do every where retain the ſame colour, without any ſeparation of the better parts, which you muſt finely powder and extract in the whole ſubſtance, But they (*viz.* thoſe ſeparable) are more eaſily extracted, becauſe all the gold contained in one pound for the moſt part may be gathered out of three or four ounces finely powdered and ſeparated in the aforeſaid manner; ſo that it is not needful to extract the whole ſtone, nor to ſpend ſo much ſpirit of ſalt. But ſand and clay need not ſuch a preparation, but without a preparation being made before, are extracted by the affuſion of the ſpirit of ſalt.

R then of the flints as aforeſaid prepared and ſeparated two, three, four, ſix pound, to which being put into a cucurbit of glaſs whole (undivided) pour of the ſpirit of Salt to the depth of three or four fingers breadth, and place it in hot ſand or *Balneo*, that there the ſpirit of ſalt may be hot, and may extract the Gold, and ſo let it continue for five, ſix or more hours ſpace, until the ſpirit tinged with a deep redneſs, can extract no more. And perchance at the firſt time (though ſeldom) it may not be tinged with ſo great a redneſs, then muſt you decant that ſame imperfectly tinged ſpirit, and pour to other flints after the manner expreſſed, prepared in another cucurbit, and place it with the flints in a moderate heat for to extract the gold; which done pour it off again, and pour it to freſh flints, and do ſo often until it hath drawn to it a ſufficient quantity of gold; which afterward thou muſt keep, until thou haſt gotten a greater quantity, and all the Gold may be ſeparated at one time from it, as afterward ſhall be ſaid.

Which done pour to the reſerved flints in the firſt cucurbit, a freſh ſpirit of ſalt, and leave that ſo long in heat, until it be coloured, and extract the gold that is left in the flints, and was not at the firſt time extracted; which ſpirit being afterward decanted, pour it to the flints reſerved in the ſecond and third cucurbit, to extract the reſidue of the gold which was left at the firſt time; and ſo conſequently to the others reſerved, until the ſpirit be ſufficiently coloured, and can attract no more; which afterward pour off and put it to the firſt, which was reſerved. You muſt alſo pour a freſh ſpirit to the remainder of the extraction for the extracting of all the gold. At length pour to it alſo common water to waſh away the tinged ſpirit of gold remaining in the flints, that none of the Gold may be loſt.

And this labour is ſo long and often to be repeated till there remain neither flints nor ſpirits; in the mean while you ſhould caſt away the flints extracted and waſhed, that the cucurbits may be filled with freſh flints, and ſo continue the work; and if there be no more ſpirit left to continue the extraction, you may then ſeparate the extracted gold from the ſpirit, which is done as followeth: but firſt you muſt have plenty of glaſs veſſels, or retorts of the beſt earth, which may retain the ſpirits; which you may ſo far fill with the impregnated ſpirit, that the ſpirit in the abſtraction run not over, which done, it is to be extracted in a dry *Balneo* by little and little from the Gold, which ſpirit ye may uſe again in the aforeſaid work. And the Gold which is left in the bottom of the veſſels, is to be ſeparated from the veſſels with a crooked iron wier and (kept being very like to red earth) for its uſe, until thou haſt gotten a good quantity, *viz.* ſo much as ſufficeth for ſeparation and purgation (of which afterward) to be made by Antimony.

N. B. But when thou ſhalt extract red talc with ſpirit of ſalt, red or black granates, *Smiris*, or *Lapis Calaminaris*, and other Foſſiles, which beſide fixt Gold contain much immature and volatile Gold; you muſt in the abſtraction caſt in a little iron, *viz.* to the ſolution, which retains and fixes the gold which otherwiſe flyes away in fuſion. Wherefore thoſe ſolutions and extractions of Talc and other things containing volatile gold are better extracted out of iron Cucurbits by earthen alembicks than out of glaſs and earthen retorts, becauſe then that volatile gold doth attract only ſo much thence as is ſufficient for its fixation; which iron is after eaſily ſeparated by the Antimony from the gold, as ſhall after be taught. And this is to be noted, that not the whole granate is ſoluble in the ſpirit of ſalt, although it be long left in digeſtion, always retaining its former colour; wherefore there is a difference to be made, or a preparation to be learned, requiſit for the ſolution of the gold contained in them.

And you muſt extract Talc not with too much or exceſſive heat, leſt its ſubſtance be totally diſſolved in the ſpirit and be a hinderance to the work; becauſe there is little profit then, for it is therefore appointed, that a little gold diſperſed in a great quantity of Talc may be reduced into a little compaſs that it need not that all the quantity of Talc be made fuſile, becauſe it will thereby procure loſs. But there is no danger in flints, becauſe the ſpirit of ſalt doth not diſſolve them as it doth Talc, but only extracts gold from thence, the ſtony body being left. The *lapis calaminaris* may alſo otherwiſe be handled in the extraction and fixation than gra-

nates, flints and Talc, becauſe it is almoſt wholly ſoluble in the ſpirit of ſalt; which work is not here to be handled, becauſe the extraction and fixation is taught in a peculiar way in another place, neither do I mean to treat of it here, but only of the extraction of gold out of flints every where to be found. And this is the way of extraction of Gold out of flints and ſand in heat by the ſpirit of ſalt, to be done in glaſs veſſels. But there is another way too, which is done in cold without glaſs veſſels, which I thought worth the ſetting down, that in the aforeſaid work you may chooſe which you pleaſe, this or that, and it is done as followeth. We muſt have in this way ſtore of earthen funnels well burnt, and not ſucking up the ſpirits; for want of which we muſt have ſuch as be of ſtrong glaſs: there muſt alſo be a form with many holes in it to receive the aforeſaid funnels, under which muſt be placed glaſs diſhes or baſons to receive the ſtrained ſpirit.

Here follows the work to be performed by Funnels.

THe Funnels being put in the holes of the form, you muſt firſt put a big piece of *flint* in the ſtraighter part of the Funnel, to which after put leſſer pieces, and on theſe again leſs, *viz.* as much as ſerveth to fill the ſtraight part of the Funnel, of which the larger part is after to be filled with powdered flints, but ſo that there be left a depth of three or four fingers breadth for the ſpirit of ſalt. By this means thoſe greater pieces in the lower part will hinder the paſſage of the fine powder in the Affuſion of the Spirit of Salt.

Which being done as it ought, pour to the flints contained in the Funnels the ſpirit of ſalt, two or three fingers breadth in deepneſs, which forthwith ſhall work on the flints, and attract their gold, and then run into the diſh or baſon ſet underneath: and becauſe for the moſt part at the firſt time, ſome of the powder paſſeth through with the ſpirit, you muſt ſo often pour the ſame ſpirits on the flints until there be a ſtoppage, and the ſpirit come clear; afterward pour this ſpirit into the ſecond Funnel with flints; and then into the third, and ſo conſequently, until it be ſtrained through the flints of every Funnel; or till the ſpirit be ſufficiently coloured, which you muſt keep until you have gotten a ſufficient quantity to be diſtilled by retort for the ſeparating the ſpirit from the gold. Then that firſt ſpirit being ſtrained through the flints of each Funnel according to order and coloured, pour a freſh ſpirit to the flints of all the Funnels according to order, beginning at the firſt, till you come to the laſt, until that be ſufficiently coloured; which being done, pour a freſh ſpirit of ſalt to the flints (according to their order) contained in every Funnel. And when you ſee the ſtrained ſpirit not to receive a tincture, it's a ſign that all the gold is extracted; and then pour on no more ſpirit but common water, that it may be ſtrained, and the water will attract the ſpirit of ſalt left in the flints, that none ſhall be loſt, which acidiſh water ſave by its ſelf to the ſame, and the like uſes: which being done, take out the extracted flints, and fill the Funnels with freſh as before, *viz.* to be extracted; and do this ſo long as you have flints and ſpirit. But you muſt not pour a ſpirit not ſufficiently tinged into the ſpirits that are well coloured and impregnated with gold, but keep it a part, and pour it ſtill to freſh prepared flints, according to order, contained in divers Funnels, *viz.* until it be ſufficiently coloured; and being coloured, ſeparate it by the glaſs retorts with the reſt, extracting it from the gold by abſtraction; and being abſtracted again, uſe it to a new work like the former. And by this means with 100 pound of ſpirit of ſalt may be extracted ſome thouſand pounds of flints prepared, and ſeparate the gold contained in them, which otherwiſe by fuſion cannot be done. But the chief point conſiſteth in the extraction (the ſpirit of ſalt being well and rightly firſt adminiſtred) *viz.* that the ſpirit may not be waſted, whereby many ſtones may be abſtracted with a little ſpirit. But this caution is to be obſerved in this extraction, which is done in cold, that it requireth a ſtronger ſpirit of ſalt than that, which is done in heat by cucurbits, or elſe the buſines goes on ſlower: but with a ſtronger ſpirit by this (the cold) way they are extracted ſooner and eaſier than by that which is done in heat; and neither ſo dangerous, laborious or coſtly: this extraction then, *viz.* the cold, requires a ſtronger ſpirit of ſalt (which is worth noting) than the hot.

And this is that way, by which thoſe golden flints, and other golden foſſiles are prepared, and with the ſpirit of ſalt are extracted, and by which it is again ſeparated from them: Now ſhall follow the manner of purification, *viz.* of the Gold left in the Retort.

N. B. The pure gold being extracted out of the flints, not the iron-like, there needs no great buſineſs of purification; for thou mayſt purify it by fuſion with borax, or with the fluxing powder made with the equal weight of nitre and tartar: but if the gold extracted out of Flints be mixt with iron, as for the moſt part it is, then you muſt not fuſe it with Fluxing Powder, becauſe it is not thereby purified or rendered malleable Gold, but ſeparate it by lead, by which way it is purged and made malleable. And if ſuch Gold have any ſulphureous impurity mixt beſides, it is not to be ſeparated with lead, becauſe it is then partly turned to droſs and other impurities by the iron with loſs; wherefore it is to be purged with three parts of Antimony and ſeparated; by which means nothing is loſt; which is the beſt way of ſeparation and purification of Gold, *viz.* the ferreous, without which it cannot otherwiſe be ſeparated without loſs.

How impure Gold may be ſeparated and purged by Antimony.

THis work is neceſſary to be known, if you think to have any benefit by the aforeſaid extraction of Flints by the ſpirit of Salt, which without this ſeparation and reduction is of no moment: and what profit I pray is there by the extraction of immature Gold, which by the common way cannot be purg'd, requiring the induſtry of the Artiſt in fuſion, whereby it may be ſeparated from its ſulphureous fæces and fixed? For it is eaſie to conjecture, that ſuch ſpiritual and volatile gold mixed with Iron, by that common flux is not reducible into a body, but rather into droſs: for experience teſtifies that gold diſſolved with the ſpirit of ſalt, end alſo iron, or any other ſulphureous thing, the ſpirit of ſalt being abſtracted cannot be reduced whole by the vulgar flux made of Nitre and Tartar,

going

going into droſs: which if it happen to corporeal, pure and fixt gold, how ſhall it be otherwiſe with that which is incorporeal, unclean and volatile? for the Gold being ironiſh commonly, which is extracted out of ſtones, and iron having great affinity with gold (by reaſon of which being nearly united, it is difficultly ſeparated, ſo that it eaſier goes with iron into droſs than parted from it) you muſt of neceſſi ty make a flux not only attracting that impure gold, but alſo purifying and cleanſing it, that which Antimony alone doth, which with its combuſtible fuſible Sulphur eaſily enters that ironiſh Gold: But by its Mercury it attracteth the pure corporeal gold, and cleanſeth it, and ſeparates it from all droſs without any loſs: wherefore there cannot be a better flux, but requiring induſtry, or an ingenious ſeparation of the Antimony from the gold, without waſting the gold; which is done as follows.

And firſt your ferreous gold, that is left in the abſtraction of the ſpirit of ſalt, muſt be finely powdered in iron retorts or pots, and mingled with it two or three parts of Antimony powdered, and mixt in a very ſtrong crucible filled and covered, and then fuſed in our fourth furnace, until that flow like water; which ſoon appearing, pour them together into a heated Cone, ſmeared within with wax, and when they be cold, ſeparate from the droſs the *Regulus* (having moſt of the gold) with a hammer, and keep it by it ſelf. Which done, you muſt again melt the droſſy Antimony (as yet containing much gold) that was left, in the crucible, and add to it a little filing of Iron, mixing them with a crooked wier, and that Antimonial combuſtible ſulphur will be mortified by adding iron, and will yield a *Regulus* containing the reſt of the gold, which, as a regard is had to the quantity of iron added, will be more or leſs, and for the moſt part will anſwer in weight to the weight of the iron; then caſt the maſs (well flowing) into a Cone heated and ſmeared on the inſide with wax, which being cold, ſeparate again the *Regulus* from the droſs with a hammer, which alſo is to be kept by it ſelf; melt the droſs again, as before, and precipitate it with iron, and extract the *Regulus* thence, which keep by its ſelf, for it contains gold and ſilver mixt. For the beſt gold is precipitated the firſt time, but afterward the baſer ſort, and at laſt only Silver. Wherefore every *Regulus* is to be kept by it ſelf, that the pureſt gold may be a part, and the ſilvered gold by it ſelf.

N. B. And if the Antimony, by the addition of Iron, do loſe its fuſibility, and therefore can yield no *Regulus*, it's required, that you at every time when precipitation is made, by adding iron, that you do alſo caſt in ſome *Miſy*, to make the maſs to melt in the crucible and precipitate the *Regulus*. All the gold and ſilver being reduced into three or four *Regulus*'s, you muſt keep the droſſy parts by themſelves that were left, of which we ſhall ſpeak hereafter.

Now follows the way of ſeparating the Gold and Silver from the Antimony.

THE aforeſaid antimonial *Regulus*'s may many waies be purged, and firſt by help of Bellows on a plain earthen teſt, as the cuſtom is with Goldſmiths when they make Gold fuſile by Antimony, which labour is tedious and dangerous; which cannot be done often without the loſs of health, nor in great quantity: wherefore when a better way is known, 'tis a folly to do it ſo. The *Regulus*'s alſo may be purified by lead on a teſte, which work may be done in a great quantity, but it requires abundance of coals and lead, where the Antimony cannot be preſerved: but it may be done with gain, and is to be preferred before the former waies: Thou maiſt if thou pleaſeſt calcine the aforeſaid *Regulus*'s to aſhes, and then fuſe them; which way the gold and ſilver may eaſily be drawn out. Thou maiſt alſo fuſe them in a crucible, and by the addition of ſome ſalts, ſeparate the antimony from the gold and ſilver, turning the antimony into droſs, which being ſeparated, thoſe are found purified and malleable, which though it be the eaſieſt way, it is yet alſo very dangerous, for the ſalts often, if you do not warily proceed, do ſpoyl much gold and ſilver, and ſometimes leave gold immalleable, and ſo double the pains.

But he who knows how to do this by Nitre only, he may with great gain, and in a ſhort time, purifie a great quantity of the aforeſaid *Regulus*'s without loſs of the gold, ſilver, or antimony. There are alſo other means for the doing of it which to relate were tedious and indeed impoſſible. Wherefore I will ſet down the beſt of all, moſt profitable in the ſeparations of great quantities of *Regulus*'s. Where firſt is required ſome peculiar little Furnace with a Fire almoſt like to that in our firſt part of Philoſophical Furnaces, built for the ſubliming of Flowers; it wants indeed a grate, but it hath little vents for to make the coals burn, that thy antimony ſeparated from the gold, may be ſublimated or elevated into ſublimatory veſſels. Which being rightly built and heated, let ſo much of the *Regulus* be caſt in with a ſpoon as the Fire can bear, which will quickly melt and be elevated, the air being attracted by the vents, without any trouble: which being ſublimed, you may caſt in more, if you have more, until all the *Regulus* be ſeparated and ſublimated from the gold and ſilver, which are left in the Fire pure and malleable; the furnace being cold, you may take out the Flowers and keep them (of which afterwards) for uſes, which way you may not only ſeparate a great number of *Regulus*'s from gold and ſilver in a ſmall time, but alſo keep all the antimony, which may many waies be uſed in Alchymy and Medicine with great profit. Which ſure is an excellent knowledge, for not only hereby may any one get abundantly, without wronging his neighbour, but alſo help many ſick People, *viz.* by that excellent Medicine made of the Flowers: which is a ſpecial gift of God, for which we owe immortal Thanks. And this is, of all others that I know, the beſt way of ſeparation of gold from antimony, which is not only done in great quantity, in a ſhort time, and with ſmall charge, but alſo without loſs of the Antimony.

Here follows the Uſe of the Antimonial Flowers.

FIrſt, you may take the whiteſt of the Flowers out of the lower hole, and keep them for a Univerſal Medicine; but reduce the reſt (being leſs pure) into *Regulus* by the ſalt of Tartar, for divers uſes, as ſhall be ſaid afterward; or you may mingle them with an equal weight of common ſulphur, or antimony, which being mixt in a covered crucible, melt them, and they will yield an antimony like to a natural,

tural, good to purifie gold: or thou maiſt mingle them with other metals or minerals, that by this means they may be made better. Or thou maiſt uſe them in Chyrurgery, for they of all ſtiptick plaiſters make the beſt. In brief, the aforeſaid Flowers may many waies be uſed with good gain and ſucceſs.

The aforeſaid antimonial droſs may alſo be reduced into Flowers, and uſed in the ſame manner; which indeed are endowed with as excellent Properties, as they which are made out of *Regulus*'s; becauſe in that fuſion and ſeparation of gold extracted out of Flints and Talc, the gold only that was fixt and mature, was ſeparated from the *Regulus*'s, (the immature and volatile being left in the droſs) and elevated with the Flowers: It follows thence, that theſe are better, as well in medicine as in the tranſmutation of metals.

Or, if thou wilt, add to the antimony (as aforeſaid uſed) old iron, to reduce it in a furnace, and take the *Regulus*, having gold and ſilver, which may therefore be uſed in other operations of Chymiſtry, where there is need of *Regulus*, as we may ſhew hereafter. But the droſs doth yield a *Regulus*, *viz.* in a very ſtrong Fire, and a Furnace with a peculiar ſeparatory by abſtraction, which although it contain not gold, yet it may be uſed not without gain, as if it be mingled with Tin in fuſion, it procures to it a hardneſs and ſound, uſeful for faſhioning divers ſort of Houſhold-ſtuff, which is not ſo eaſily darkened as the common Tin, or if thou wilt not, thou maiſt make weights of it.

Hitherto we have treated of the extraction of gold out of Flints, and of its putrification by antimony; now we will teach you how to uſe the reſt of the antimony, as well in the perfection of baſe metals as in medicine, as well for the preſerving of Health, as the curing of Diſeaſes.

But ſeeing we have made mention of an Univerſal Medicine, to be made out of antimony aforeſaid, I would not have thee think that that is ſuch as can take away all diſtempers in general, without diſtinction, which vertue is only aſcribed to the Philoſophers Stone, but not by me to this medicine; to which I attribute no more than I have tryed: But this in truth I dare affirm, that there is, beſides the ſtone, ſcarce any comparable to it; for it doth not only preſerve the body from divers Diſeaſes, but alſo happily frees it from the preſent, ſo that it may deſervedly be termed a *Univerſal Medicine.*

The Preparation followeth.

℞ of the flowers purified from the droſs a pound, *viz.* of Antimony, by which the extracted gold was purified, which for the moſt part are of a yellow colour, having gold volatile and immature: in defect of which, take the flowers made out of the golden *Regulus*'s, being for the moſt part white, to which pour in a Glaſs Vial, ſtrong and long-necked, of ſpirit of wine tartariſed, three or four pound, mingle and ſtir them well together, and put on it another crooked pipe (within which let there be ſome ounces of Quickſilver, as is deſcribed in the Fifth Part of our Philoſophical Furnaces) and make ſtrong the joynts with a bullocks bladder thrice folded, made wet; which dryed, place the glaſs in *Balneum*, and give fire by degrees, that the ſpirit of wine with the antimony may digeſt, in which leave it for 24 hours ſpace, and ſo ſoon as the fire is out, take out the glaſs, when it is cold, pour off the ſpirit tinged red from the Flowers, and pour on freſh; and place it, as before, in *Balneum*, to digeſt 24 hours ſpace, till it be red, and do this the third time, or ſo often till the Spirit be no more coloured, for then no more is to be poured on, and that which is coloured, is to be filtred with Cap paper. The reſt of the Flowers, after the extraction, as not requiſite to this buſineſs, are to be either kept by themſelves, or thrown away. But the tinged Spirit is to be abſtracted out of a glaſs cucurbit by an alembick, to the half, from the tincture, which diſtilled ſpirit may again be uſed in the ſame work: but the tincture left in the cucurbit is the medicine, of which mention has been made.

Now mention being made alſo of tartariſed ſpirit of wine, that I may ſatisfie the doubtful concerning that I will here alſo give its deſcription, which is as followeth.

R. of Tartar 20 or 30 pound, put it in a large coated retort, and place it in ſand, and diſtil the ſpirit off with a ſoft heat.

N. B. This work may better and ſooner be performed by that inſtrument of our ſecond Furnace; and becauſe it requires great and large receivers, as being very penetrative, thou maiſt firſt apply a tin or copper Serpent to the neck of the retort, inſtead of a receiver, which is placed in a tub filled with cold water, that the ſpirits being thereby cooled, may be retained, which afterward you muſt abſtract to the half, out of a glaſs cucurbit by an alembick: for the other half with the black oyl is unprofitable in this work, and therefore to be taken away. After that, mingle the more ſubtile part, diſtilled with half of the *Caput Mortuum*, of the aforeſaid Spirit, calcined to a whiteneſs, and abſtract it half again in a gentle *Balneum*, out of a glaſs cucurbit by an alembick, the joynts whereof are every where to be well cloſed, and the calcined Tartar ſhall receive with it ſelf the ſtench, together with the Phlegm, only the purer part of the Spirit, and more ſubtile diſtilling forth, which is again to be mingled with the other half of the Tartar calcined to a whiteneſs, and to be rectified by another alembick; the *Caput Mortuum* may again be calcined to take away the fetidneſs, that it may be uſed again. And this is that tartariſed ſpirit of wine, with which the aforeſaid tincture and eſſence is extracted, and truly not only this, but of all other metals, which no other can do. And if it were lawful, I would write ſomething more of its wonderful force and vertue which it hath in purifying baſer metals, with which it hath a great affinity; for it can ſeparate the pure from the impure, of which more in another place. But when it is to be uſed in mending of metals, it needs not ſo much rectification as is required in the extracting of metallick medicines; where you may draw it in plenty out of the dry lees of wine. But there is alſo another tartariſed ſpirit of wine, which may alſo be uſed in this ſame work, which is made after the followiug way: Diſſolve in a pound of the ſpirit of wine ſix ounces of Cryſtal of Tartar; which ſolution uſe in the aforeſaid extraction, in the ſame manner.

Of

Of the Vertues of this Medicine.

THis Antimonial Tincture doth, above all other Medicines evacuate vitious humours, and insensibly purgeth impure blood; opens any obstructions of the Liver, Spleen, Reins, and the other vessels, attracting to it all malignities, and leaving no impurities behind it. And becauſe it cleanseth the blood, it cures the Leprosy, French-pox, and itch, and other Diseases proceeding from the impurity of the blood. By its penetrative and attenuative vertue, it resolves all tartareous humours, and evacuateth them, *viz.* which ingender the Gout, the stone of the Bladder and Reins; but not the Stone perfectly coagulated, only it mitigateth its pain, and hinders its encreaſe; but being not hardened or coagulated, it attracteth and evacuateth it totally and fundamentally out of all parts; it takes away also all Feavers, and other diseases coming from the superfluity of humours. It gently evacuateth the water between the skin, by siege and urine. In brief, it strengthens and purges the principal parts, and preserves them from all preternatural accidents. It is a most excellent preservative in the time of pestilence, and other contagious diseases; and of them being caught, it is a most absolute remedy, expelling the disease suddenly from the heart, and evacuating it. In few words, 'tis of all others a most excellent Universal Medicine, very profitable to both old and young, and also very safe; but warily to be ministred, by reason of its strength with which it is endued, which is most powerful, for it is as a great fire, which extinguisheth the lesser. Truly a better medicine cannot be desired than this, which is extracted of a very mean thing, in a short space of time, and with very small cost and pains. I ingenuously confess, I never saw its like, which I doubt not to be the best in the World. Wherefore then do we seek any other but this, *viz.* which excels in those things which are desired from the real medicine? But as it is most excellent, yet I am certain, that many deluded people will be offended at it, being prepared out of Antimony, a mean and despised thing, and after a plain way. But 'tis no matter, *For the world will be deceived*, looking after gay things, disrespecting and despising mean things, when all good things, yea, even when God himself doth rejoice in simplicity, for which, by wicked and proud men he is not sought unto. But this is the effect of sin, by which man is so blinded, that though he know not good, when set before his eyes, yet he is studious of evil.

Of the Use and Dose of this Medicine.

SEeing of all medicines it is the most powerful, it had need be warily used, for a smaller dose is alwaies safer than a greater; which therefore may after be given; the which is to be observed in all diseases of young and old. To children of 2, 3, 4, or 6 months old, against the Worms, Scabs, Feavers, and Epilepsie, you need not give above half a drop with a proper vehicle, which you may repeat three or four times a day: it killeth the Worms; it emptyeth the stomach of evil humours: it refresheth them, and preserves them from scabbiness; and because it evacuateth evil and corrupt humours, it preserveth them from the small pox and measles, *viz.* if it be used every month; but to children of 1, 2, or 3 years old, you may give a drop, and to children of 4 or 5 years old a drop and a half: to young people between 15 and 24 years, may be given 2, 3, or 4 drops. To stronger bodies from 25 to 50 years, 4, 5, 6, or 7 drops. But the dose must be greater or less, with a regard had to the sickness of the patient. And in the Stone and Gout, may be daily administred in wine or beer, *viz.* in the morning fasting, unless the patient be very weak; for then you may give it twice or thrice in a day, and continue this till the cure be perfected; where is to be observed that he must keep a temperate dyet.

In the Leprosy, French-Pox and Scurvy, every morning may a dose be given, and the disease shall totally be rooted out. Otherwise, *viz.* the strength being too much wasted and weakned, you may give only every other day, *viz.* so long as shall be need.

In the Epilepsie it may be given daily; and also in the Dropsy. In all Feavers, two or three hours before the fit. In the Plague it is to be given presently, and every day to be repeated: but for a preservative to be drunk every week once. In all other internal affects it must be given daily, until the declining of the disease; but afterward by little and little, the medicine is to be used till the disease be fully cured.

In external, as in fresh wounds by a blow, thrust or shot, broken bones, *&c.* every day once; with a necessary extrinsical application of a Plaister. In old Fistulaes and Cancers, it may be used once every day intrinsically and extrinsically, the place affected may be cleansed with Mineral Oyntments. For by this means every inveterate evil, how desperate soever, is throughly cured, and pleasantly, without all pain.

But although this be most precious of all medicines, yet there is a *menstruum* not corrosive, with which not only more easily than with the spirit of wine tartarised, a Universal Medicine may be extracted out of Antimony, and endued with better than the aforesaid vertues; so that for the charge of one royal, in three days time, so much may be gotten as may serve to cure some thousands of men, but also all vegetables, animals, and minerals and metals, are radically dissolved and reduced into their first matter: by which means not only very great Poysons are changed into most wholesome medicines, but also bitter things are deprived of their bitterness: for by it things are so corrected, that they do no more provoke stool and vomit, *viz.* which are very vehement Cathartick (by nature) being changed into most excellent restoratives. Also fetid things being corrected by it, do acquire a sweet odour. And it doth not only (which seems a wonder) dissolve vegetables, animals and minerals with those things which come of them, but also the very Glasses; wherefore you must alwaies chuse the strongest glasses for digestion and solution, or in the defect of such, the weaker are to be changed every 6 houres. And yet it is not at all altered by those things that it doth reduce and turn into their first matter medicinal, neither in vertue nor colour; for it alwaies keeps the middle place between pure and impure, of which this falls to the bottom, but that swims on the top of the *menstruum*, which may again be used. In brief, it's vertues in preparing medicines cannot be enough praised. But it may be compared with the Mercurial water of *Basilius*

Valentinus; and the *Alcaheſt* of *Paracelſus* and *Helmont*, which I judge to be the *Fire* of the *Maccabees* turned into a thick water under-ground. It is a perpetual fire, but not alwaies burning viſibly; it is a water permanent, not wetting the hands, the Sope of the Wiſe, the Philoſophers *Azoth*, and the Royal-Bath.

Which Menſtrue though I have known ſome years, and have often uſed it with metallicks, and by it have found out many ſecrets, yet I never thought of its uſe in Phyſick, until being askt of one who was a great Student of *Helmont*, whether I knew the preparation of the liquor *Alcahaſt* of *Paracelſus*; and naming ſome of the vertues of this liquor in preparing Medicines, I began to bethink my ſelf, and I obſerved that it was my *ſecret Balneum*, that purifies minerals. Wherefore I preſently made tryal with vegetables and animals (for I knew the Vertues thereof in metallicks) and I found wonderful and aſtoniſhing things in it, which before were incredible to me. I affirm and confeſs therefore ſincerely, that all and every the invented medicines publiſhed by others and my ſelf, how rare and coſtly ſoever, are moſt mean things in my eſtimation. For this *Univerſal Key* was wanting to us. For our vegetables and minerals, however by art macerated, cannot be perfectly reſolved, and therefore we hitherto have had but part of their vertues. But now we need not much art, labour and coſt, to reduce a whole body without corroſives, into the firſt matter, like in ſhape to ſome clear and excellent water, of its own accord caſting forth its ſuperfluous terreſtreity, and becoming a moſt wholeſome medicine, conſiſting of the three pureſt principles; the which cannot be done without this *menſtruum*. For, What elſe could Phyſicians extract out of herbs than Syrups, Electuaries, Conſerves and Waters? With which Preparations they were not amended, but only qualified with the addition of Sugar or Honey, becauſe there is no ſeparation made of the pure from the impure, or good from bad. For all are left mixt together in the Electuaries and Conſerves, but in the Syrups and Waters diſtilled there is only ſome part. Extracts indeed by the ſpirit of Wine are not to be diſeſteemed, if rightly prepared, but they are no better than their ſimples; and beſides, want that which the ſpirit of wine cannot draw out, which remainder, though being calcined for the drawing out the ſalt, which is mingled with the extract, yet that is not of much moment, for fire deſtroyeth the vertue of herbs, ſo that fixed ſalts, as cryſtalliſed, do perform nothing in medicine, thoſe excepted which without combuſtion are made out of the juice of herbs, of which in the third part of our Furnaces Philoſophical. But none dares extract the moſt ſtrong or efficacious ſort of herbs for medicine, becauſe they in preparation are not corrected or amended.

But by this means the moſt ſtrong Herbs, which without this Preparation are poyſons, are matured and purified by the liquor *Alcaheſt*, ſo that they may ſafely be taken againſt moſt grievous Diſeaſes. For God did not create theſe herbs in vain, as ſome think, which he purpoſely created that his wonderful works might appear, and that it is poſſible to take away the Curſe from them by a man, being freed from the malediction by the regeneration through Chriſt. See *Opium*, Mandrake, Henbane, Hemlock, and other ſtupifying things, how deadly they are, being cautiouſly uſed; which corrected by this Menſtrue, become moſt ſafe and excellent medicines. How dangerous is ſpurge, ſcamony, hellebor, gambugium, and other ſtrong purgers (being adminiſtred unwarily) no man is ignorant: all which are by this way corrected, and changed into moſt wholeſome medicaments. Who, I pray, dares eat Wolfsbane, and poyſonous Toad-ſtools, and other venomous vegetables? which are all ſo corrected by the liquor *Alcaheſt*, as that not only they are not poyſonous, but are alſo turned into moſt ſafe and wholſome medicines of many diſeaſes, *Nux vomica*, Levant-berries, and other things that diſturb the Brain, are by this means made wholſome; alſo poyſonous Animals, as Spiders, Toads, Serpents, Vipers, *&c.* are by it corrected, as that not only they are not poyſonous, but do reſiſt and expel poyſon.

N. B. Conſider the Spiders ſigned with the croſs, who change their skin every month, and renew themſelves, which the ſerpents and halcion do but once a year. How great the vertue of worms, earthy and crude, *&c.* is in reſolving tartarous humours, and the French Diſeaſe, many know; What then will they do, being corrected with this Menſtrue? The *Cantharides* and *Millipedes* are alſo ſo corrected, that they may more ſafely be uſed in provoking Urine. And if that moſt venomous Baſilisk, of which there are ſo many fables, whoſe ſight only kills men (which according to the letter is falſe) could be had, he might be changed into medicine by the liquor *Alcaheſt*; as that mineral Baſilisk, Gun-powder may be, which in a moment kills innumerable men; alſo Arſenick, Orpiment, Kobolt, and the like; ſo that they be deprived of their malignity, and be reduced into very excellent medicines. In brief, its excellent vertues which it manifeſts in correcting of venomous ſimples cannot be ſufficiently deſcribed. Wherefore it's worth our pains to ſearch it with all our power, that we may prepare admirable medicines, that the ſick may not for the future be ſo vexed with thoſe tedious and bitter cups. Truly I cannot enough admire its great vertues, which have been hid ſo long. It is not a corroſive thing, and yet diſſolves every thing, but ſome things ſooner than others. It changeth and amendeth their natural vertues; wherefore it may be the comfort of Spagyriſts, having a long time ſought for rare medicines, *viz.* being that by which vegetables are ſeparated and corrected, and alſo animals and minerals. Wherefore all conſcientious Phyſicians may have commended to them the Preparation of this univerſal Menſtrue, by the help whereof to prepare their medicines; of which the original and preparation is vile, but its vertues moſt efficacious, the finding out and uſes abſtruſe. Wherefore it is not obtained, but from God, *from whom proceeds every good gift*. Do not think then that gluttony and drunkenneſs, idleneſs, pride, and lying, the contempt of thy neighbour, malice, avarice, with an impious life, to be the means by which it is to to be obtained, for it is only *the gift of the merciful God*, *viz.* this Menſtrue, the gate and key of which is only Divine mercy. But that thou maiſt know what is to be determined concerning medicines prepared out of poyſonous ſimples, I will in brief expound that by example; for all vegetables, animals, and minerals, called poyſons, making war with humane nature being intrinſically uſed, and therefore not undeſervedly ſhunn'd of all, are like ſome powerful unvanquiſhable enemy, with all his power ſeeking the oppreſſion and deſtruction of his contrary, who being checked by a mediator of no leſs ſtrength, and recon-

reconciled with his contrary, does no more (being unable before the reconciliation to reſiſt his powerful enemies) fear the contrariety of his enemy, which now is made his friend, bringing aid for the exſtirpating and vanquiſhing of all ſuch-like (otherwiſe) invincible enemies. Even ſo is it with venomous vegetables, animals, and minerals, deſtructive to humane nature: which by the liquor *Alkaheſt* (a checker and reconciler) are ſo corrected and reduced, that they hurt not, being deprived of their malignity and made friends with men: whereby they are not longer poyſonous enemies, but very ſafe and wholſome remedies, agreeing to humane nature, overcoming and expelling other the like enemies otherwiſe poyſonous and invincible, for by how much the more enemy before reconciliation it was, by ſo much the more help is brought by it, the reconciliation being made. There is not the like found in nature, which can ſo ſuddenly correct Poyſons, and reduce them into their firſt matter, and bring them into very wholſome eſſences. Let religious Phyſicians then that can, get this. And ſo I end this declaration (not without cauſe ſet down) which will move thoſe hearts which are not as yet hardened. This certainly is a true Philoſophical correction, with which that which is malign is turned into a wholſome ſubſtance. What profits that correction, I pray, which is made by the admixtion of other things, as in the mixture of Catharticks and Cordials? Truly nothing, neither can the Cordials do any thing but debilitate the Catharticks; for nature is not at once able to expel a purging poyſon, and attract a thing confortative and corroborative: For a Purge being given, forthwith that ſhews its ſtrength in the body, whoſe malignity nature reſiſting, deſireth to expel it, before that it can attract the confortative; wherefore that friend is expelled, together with the diſeaſe. The ſame happens in the mixture of ſugar, honey, and other ſweet things with bitter, ſharp, and tart, *&c.* whoſe unpleaſantneſs is not corrected by ſweet things, but only dulled, thereby acquiring another ſmell and taſte, without any other eſſential alteration. Which correction is like to that which is made in Taverns, amending the air with ſweet fumes, which before was infected with the ſpittings, ſpewings, and ſtinks of ruſtick drunkards, which is to ruſticks an excellent correction, attracting the ill as well as the good aromatick odour, being by drunkenneſs deprived of their judgment, but not ſo to ſober men enjoying the uſe of Underſtanding, to whom that ſeems a ruſtick correction. In this manner (not to be commended) are at this day ſimples corrected. But a true and Philoſophical correction is done by it ſelf, without the addition of other things, by benefit of the fire only, as well actual as potentially moiſt, by ripening, mending, and ſeparating the malignity; which is done by the liquor *Alcaheſt*, as it is called by *Paracelſus* and *Helmont*.

But whether this my liquor be the ſame *Alcaheſt* of *Paracelſus* and *Helmont*, it matters not if it perform the ſame things.

Fire, and a fiery vertue may do much, but not by burning and deſtroying, but by maturation and nutrition; and feeding and moiſtening. Of which moiſt Fire, ſee *Artephius*, *Bernhardus*, *Baſilius*, *Paracelſus*, &c. for maturation is not done with cold things, but hot, promoting germination. And what ever Nature hath left imperfect in the vegetable, mineral, and animal kingdom, *viz.* accidentally; that may be amended by Art with the liquor *Alkaheſt*, which is the beſt way of correction, until by benefit of art, and the help of nature, ſome better thing be found out, *&c.*

And theſe are the vertues of that wonderful liquor *Alkaheſt*, which is made uſe of in the preparation of medicines: And, becauſe it is ſaid before that it ſhews its vertues on metallicks alſo, I could not conceal them from the ſtudious. But all its vertues ſhall not here be related, for it is endued with ſo many, that no mortal is able to number them. As for me, although by divine favour and the inſtruction of that excellent man *Paracelſus* (excellently in a certain place, but obſerved but by few; deſcribing it, ſpeaking of it briefly, but very plainly and clearly naming it) I did obtain the knowledge thereof, which afterward daily I did more and more encreaſe, ſo that I could hardly believe that any ever had ſpent ſo much money and pains in the ſearching of its vertues, for the trying of metals: yet I muſt needs confeſs, although happily I have made more tryal therein than any other; that many of its vertues are as yet unknown to me. Seeing then that its vertues and ſtrength cannot all be tryed by any man, by reaſon of his ſhort life, although ſearching an hundred years; and that by our merciful Father only to a few, and but part of the knowledge of its wonderful and incredible force, is granted, to the glory of His Divine Name, in favour of the poor ſick, which none, how learned ſoever, with his ambitious learning and craft could ever obtain. Therefore ſome excellent gifts being given from the Father of lights, the Omnipotent GOD, to ſome of His Children, *gratis*, and out of meer mercy, *viz.* for ſome cauſes, I eaſily believe, that it is not His Will that it ſhall long be kept cloſe, but be revealed to the world, to the glory of His Name, and the benefit of our poor neighbour. Wherefore I could not longer hold my peace, hiding my talent which I received *gratis*, though ſmall, but communicate it *gratis* to my neighbour; but ſo that the Divine myſtery may not be gotten by thoſe ungodly abuſers, but only by the worthy through divine favour. I affirm therefore expreſly, that in whole nature ſuch a thing may not be found; for not only by its help all animals, vegetables and minerals may be reduced into very excellent and ſafe medicines, but alſo be brought into the firſt matter; minerals and metals may be purified, waſhed and fixed, and ſo changed into better bodies. That which is worthy admiration, that in ſo vile and mean a ſubject ſhould lye hid ſo great vertues, by which alone without any other art, may be acquired riches and honours, and loſt health. Than which thing, what doth mortal man more need in his miſery, beſides the Divine Word, the comfort of the ſoul, than for neceſſary ſuſtentation of life, ſoundneſs of body, and honeſt report before God and men? All theſe things may be had with this ſubject, ſo that one need not to involve himſelf into any other troubleſome art or vanity of this world, having this ſecret, whereby all neceſſaries may in abundance be procured: of which gift that this unclean world is unworthy, I do affirm ſincerely, becauſe it ſwells with ambition and avarice; for which we are not able to give God the Donor ſufficient thanks in our whole life, wherefore I would have all what ſtate or order ſoever earneſtly admoniſhed, that they do not uſe this gift from Heaven to the deſtruction of their ſouls, but in thankfulneſs to Him that gave it, and every way to the good of their Chriſtian Neighbour.

Now follow the Vertues which it manifeſteth in Metallicks.

FIrſt, it (*viz.*) the Philoſophical Menſtrue, doth radically diſſolve all minerals and metals without noiſe, and reduces them into very ſafe and wholſome medicines. Out of gold it makes potable gold; out of ſilver potable ſilver, and ſo conſequently of other potable metals; ſo that it may well be called *The Univerſal Mercury.*

Secondly, This ſecret Menſtrue purgeth, waſheth, and tranſmuteth minerals and metals to a more noble ſpecies; wherefore it may well be called *Sapo Sapientum*, by which the ſaying of the Philoſophers is confirmed; *Ignis & Azoth abluunt Latonem.*

Thirdly, By it all minerals and metals are matured and fixed, ſo as that afterward the immature gold or ſilver incorporated with them, may by cupellation be drawn out with gain; wherefore 'tis deſervedly compared to *Hermes* ſeal.

Fourthly, It makes metals volatile, and radically conjoyns them that they abide together, and one act on the other in the fire; it deſtroys and revives, kills and renews; wherefore it is compared to the Phenix.

Fifthly, It ſeparates metals without any loſs, and that ſpeedily; but after another manner than corroſives, ſo that each of them may be had by themſelves. For Example: Being about to ſeparate gold, ſilver, copper, iron, tin, lead mixt; one, or two, three, or four of them mixt, that they may appear each by themſelves, without the loſs of any, you need not cupellate the mixture with lead, which way only gold and ſilver are gotten out, with the loſs of all the reſt: but by this way they are all preſerved, where by turns, one after another, they are extracted wonderfully and ſwiftly, in half an hours time, by this ſharp *Vinegar of the Philoſophers*, &c.

Sixthly, By it metals may ſuddenly be mortified and reduced into tranſparent glaſs, irreducible, and like *Amauſa*, but reſerving the propriety and nature of every metal: which in the reduction of Gold do give perfect ſilver; whereby is confirmed that ſaying of the Philoſophers, *The corruption of one thing is the generation of another*; and that of *Paracelſus*, *Ex aliquo fiat nihilum, & ex nihilo aliquid.* But this incombuſtible water, or permanent water, ſhews the truth of the Philoſophers writings, generally mentioning it. In it the ſolution, putrefaction, diſtillation, ſublimation, circulation, aſcenſion, deſcenſion, cohobation, inceration, calcination, coagulation, fixation and fermentation; *&c.* in their work to be done at one time and one way: In which only operation all the colours appear of which the Philoſophers make mention; as the head of the crow, virgins milk, dragons blood, peacocks tayls, green and red lyon, *&c.* There is alſo by it demonſtrated the truth (by the liquor *Alkaheſt*) of that Hermetical ſaying, *That which is above, is as that which is beneath*, &c. and many other things are performed by its help, as making that ſecret Sandivogian *Chalybs*; alſo that long ſought-for oyl of Talc.

So far (courteous Reader) hath come my Experience; neither doubt I, but by it to obtain that univerſal *Salamander* which lives in the fire.

Theſe things which I write are true, and no fallacies. And though this ſecret be incredible to the ignorant, for the wonderful vertues it ſheweth in the preparation of medicines, I would willingly publiſh it to the World for publick good, but on conſideration I held it not meet to communicate it for certain cauſes. But only leſt the knowledge of it ſhould periſh, and that the true (and almoſt extinct) medicine for the curing of diſeaſes vulgarly incurable, might flouriſh, I have revealed this ſecret *menſtruum* to two friends, *viz.* its preparation and uſe. [See the preparation in *Mirac. Mundi*, and *Apology againſt Farner.*]

But do thou not think, becauſe I write of theſe high things, that I do intend to make common the Secret to all in general; not ſo, but I endeavour to confirm him that ſeeketh, and give him occaſion to ſearch this ſecret deeper; which being found, he ſhall not only find the truth of my words, but he ſhall daily by exerciſe obtain far greater things than theſe.

And becauſe I have never aſpired after vain riches and honours, nor never deſire them; I might well be perſwaded to leave to others, as yet not hating the wicked World, my troubleſome labours, becauſe in this my painful age ſuch tedious labours are very burdenſome; beſides Philoſophy hath pointed me another way, ſo that what I am able I have determined to abſtain from theſe vanities, and to ſeek a perpetual good, the life of reſt; but my counſel ſhall not be wanting to thoſe that ſeek it: for beſides moved with the former reaſons, alſo ſeeing innumerable many vain Philoſophers, as well learned as unlearned, unceſſantly working, and loſing their time and labour, and at laſt deſpairing, are perſwaded that there is no truth in the Philoſophers writings, but to be all filled with lyes and deceits; whence royal Chymiſtry is diſgraced.

But this *menſtruum* ſufficeth to defend the writings of the Philoſophers, without the metallick tranſmutations; ſo that I verily believe the time to be near, when the Omnipotent G O D, before He judge the World by fire, will ſhew His omnipotency to the Nations, by the revelation of the wonderful and incredible things of nature; of which, tranſmutation of metals is not the leaſt, which in the third part of this Mineral Work I ſhall deliver to the laſt age, (being acceptable to God) to the profit of my neighbor, and for demonſtration ſake. Wherefore I now paſs over ſuch things, with a firm hope, that this faithful Admonition ſhall be received as an undoubted and infallible truth.

How the aforeſaid Regulus *of the flowers and droſs of Antimony, is to be uſed in the bettering of courſe Metals, ſhall be ſhewn, that ART may not be abuſed.*

THE Antimonial *Regulus*, a radical metallick humour, may help to perform wonderful things, for being reduced to a water without a corroſive, it reſolveth all metals, cleanſeth, waſheth, and purifieth them, and turns them into a better ſpecies, ſo that particularly not a ſmall gain may be from thence received. But how it may be reduced into water, and how by its help metals may be reſolved, volatilized, and again fixed, hath been demonſtrated by *Artephius*, *Baſilius* and *Paracelſus*; wherefore we need not here repeat their writings, but refer the Reader to their works.

But not only the *Regulus*, but alſo all Antimony may many waies be uſed in the ſeparation of metals, *viz.* For the extraction of hidden Gold, which can-

not be done without Antimony; as ſhall appear by the following example. When you find a marcaſit or other ironiſh foſſile, that will not yield to the tryal by lead, add to it three parts of Antimony, and being well mixt, melt them in a covered crucible, and being melted, pour it into a cone; and when all is cold, ſeparate the *Regulus*, which purge again by fire as before, and thou ſhalt find gold contained in the aforeſaid foſſile: And if it be indued with more plenty of gold, for it is not all drawn out at one time, *viz.* with the firſt *Regulus*, another *Regulus* is to be melted, by adding more iron and ſalt-petre, which is alſo of a nature near to *Sol*. And if theſe marcaſit foſſiles are not ferreous, you muſt in the firſt fuſion, add iron and nitre to them, or elſe they yield no *Regulus*. By the adding more ſcales of iron, more *Regulus* is made, and for the ſame uſe as that is, of which above in the fuſion and ſeparation of extracted gold; weights alſo may be made out of the droſs. And thus are *lapis calaminaris*, marcaſit, kobolt, zink, talc, and other foſſiles ſeparated, *viz.* containing gold.

But all gold containing iron (as that of Stiria, Carinthia, the Granacia, and of Tranſylvania, *&c.*) may this way be eaſily ſeparated with profit, by the help of iron. And if the iron have no gold, yet if the Antimony have it, it may thence be ſeparated by fuſion with iron, *viz.* if it be brought to a *Regulus*. The reſt of the Antimony may again be fuſed with new iron and new glaſs of more weight than it, but leſs than this, and be reduced into a *Regulus* fit for the following uſes. Out of the droſs let weights (that nothing may be loſt) be made, that thou maiſt have the more gain; as may appear from the following example.

When you have the Antimony, a hundred of which contains two duckats, if you will ſeparate the gold; take a hundred [weight] divided into three or four parts, fuſe it according to art, adding a little iron and ſalt of aſhes, and reduce them into ſmall *Regulus*'s, weighing a pound or two. Then melt the droſs with half the weights of the iron in a large and ſtrong crucible, and thou ſhalt have more *Regulus*'s about fifty pound or more, droſs 40 *lib.* which make weights of, or elſe guns, *&c.* the reſt, about eight or nine pounds, will vaniſh into ſmoak. And ſo thou haſt reduced the gold contained in a hundred weight, into one or two pounds, which thou maiſt ſublime by fire into flowers (leaving the gold in the fire) for its uſes, but thoſe 50 or 60 pounds of the *Regulus*'s prepared by adding much iron, they having little or no gold, you may mingle with tin for its beauty, hardneſs and ſounding, to make divers ſorts of houſhold-ſtuff, as platters, diſhes, *&c.* for tin mixt with the *Regulus* looks like ſilver for whiteneſs and hardneſs, and ſounds like it, nor is it ſo eaſily dulled as unmixt.

Now let us weigh what gain may come from the ſeparation of the meaneſt Antimony. Put caſe that a hundred weight of Antimony be ſold for three Royals (for ſo for the moſt part the Polonian is ſold, than which, although that of *Hungaria* and *Tranſilvania* be dearer, yet this hath more gold) to which add 60 pound of iron, which is ſold for half a royal, and the charge of coals and crucibles requiſite be half a royal more: the total of the expences is four royals, for which take two duckats in gold, ſixty pound of *Regulus*, eighty pound of droſs, and one or two pound of flowers. Thoſe 60 *lib.* of *Regulus* may be ſold at the price of tin, whereof a pound is ſold for a quarter of a royal, and then their whole price is fifteen royals. Then the eighty pound of refuſe made into weights, may be ſold at forty ſhillings, or at leaſt twenty four ſhillings, or half a royal; and all things being conſidered and reckoned, as they ought, there may remain the value of ſixteen royals.

And though the Antimony ſhould yield but one duckat, and a pound of *Regulus* ſhould be ſold at the eighth part of a royal, yet the remainder would be above ſix royals: And in a day there may eaſily be two hundred weight ſeparated by two men. And then ſuppoſe it ſhould contain no gold (as ſome Antimony doth not) yet may four or five royals be gotten daily.

But when you have Antimony, one hundred whereof contains three, four, or five duckats, and iron requiſite to the ſeparation containing one or two ducats, then there is ſo much more gained. Then let him that undertakes this buſineſs ſeek for the beſt Antimony and iron, and he may well gain in a day twenty, thirty, and ſometimes ſixty royals.

N. B. And if you ſhould have ſo much *Regulus* that you could not mix all of it with tin, for want thereof, then it may be ſold in parcels, ſo that one ℔ may go at a fourth part of a royal; by which means the daily gain may not be diminiſhed, but may be rather encreaſed; as may be ſeen by what follows. The *Regulus* of Antimony is the maſculine ſpecies of Lead; whoſe firſt being is gold impure and immature: but the firſt being of common Lead is impure and immature Silver; as experience witneſſes; for Antimony being purged and fixt, yields gold, but the common lead only ſilver. And becauſe Antimony, which is better than common Lead, is called the *Philoſophers lead*, or their *ſecret lead*; of many ſo named, but known of few; not that the thing is unknown, or of an unknown original, but by reaſon of its hidden proprieties; therefore I ſay that its vertues are not all to be known by any mortal, though he ſhould have a hundred years to ſearch into wonderful nature, for it is unſearchable, and the creator of all wonders, let him injoyn himſelf ſilence, neither let him glory in the knowledge of it, who hath not made tryal of it; for in it, through it, and by it, Nature and Art do ſtrive for perfection. Of which more elſewhere.

Now follows the Uſe.

HAving mentioned *Antimonial Regulus*, which is Lead and better than the common. It muſt alſo purify impure metals, waſh them, ſeparate the occult Gold and Silver in them; that which the common Lead can do, to which, if thoſe be added, it attracteth the more impure part in the Cupel, which it converteth into droſs, and draweth down with it into the porous aſhes, leaving the purer Gold and Silver in the Cupel: but from ſome Tin and Copper not yielding to the Lead, nor willing to be waſhed by it, it cannot extract their Gold and Silver; neither hath any one written the way of ſeparation by it. *Lazarus Erker* indeed hath deſcribed (and others alſo) the way of ſeparating Silver from Tin and Iron, which is not to be diſeſteemed if it be accidentally mixed with Silver, which is ſeparable that way, but not ſo, being generated in, and radically mixt with them,

requiring other Lead, willingly embracing Tin and Iron, which nothing but *Regulus* can perform.

But seeing Tin and Iron do for the most part, contain much Gold (but chiefly Tin) *viz.* inseparable by the common way, it will be worth our pains to seek another Lead and way of separation; as it is apparent to Refiners, proving Tin and Iron by the common way on a test; whilst Tin and Iron melted in the Lead, do forthwith shew their stubbornness by innate proprieties and forsake it, *viz.* as a contrary rising to the top like dross or ashes, without any separation, Gold and Silver being excepted, if accidentally mixt together, which are left with the Lead; but not so being hid in their middle or center. But that the truth hereof may appear, I will demonstrate it by example: Place on a test under a tyle 16. parts of Lead, and one of Tin, after the manner of proofs, give a fusing fire for to separate the dross; and all the Tin almost flying away, will at the bottom be burnt, and separated like ashes, being sublimated on the top of the Lead; not deprived of its Gold and Silver incorporated together, which afterward I shall demonstrate, when all the Tin is sublimated from the Lead, and calcined, and the test taken from under the tyle, and the rest of the Lead poured off, and you shall find after cupellation no more Silver than the sixteen parts of Lead did contain before, if they had been cupelled without Tin; sometimes less, some part being taken away by the Tin in the examination: the same is done with Iron, altho' thou shouldst add Copper with glass of Lead, to retain the Tin and Iron, thereby to separate their Gold and Silver, you would effect nothing: for although some more Silver may hereby be extracted, yet that would not come from the Tin or Iron, but from the Copper: it may therefore be extracted another way, of which, hereafter.

In the mean while I will prove clearly, that the separation of tin and iron by common lead, thereby to get their gold and silver, is of no value, which being left in them, are turned into ashes and dross.

Take any tin, and reduce it into ashes by lead, or agitation, on a smooth earthen vessel (tryed before, by the common way, for distinction sake, which calcine well, that the corporeal tin powdered, may be calcined, or being melted, may be separated from the ashes. Then take of these ashes one part, and of the following flux, or of that a little after six parts or more; being mixt, fuse them in a strong crucible with a strong fire, until the Flux have Consumed or drunk up all the calx of the Tin, and of them both shall be made one, *viz.* yellow or red Glass, which may be tryed with a crooked wier put in: which if it seem not clear, the crucible must be covered again, and a greater Fire be given, until the Fire be perfect; which labour in one half hour is finished: which done, pour it into a brass mortar, afterward to be covered, until it be a cold, that it leap not out and be lost.

Afterward powder it, which with calx of Tin, mix the equal weight of filings of Iron; being mixt, put them into a strong Crucible (becausse the Flux is very penetrative) covered, and give a strong Fire for fusion half an hour: which done, pour it out, for the Tin hath made separation, and reduced some part of the Lead out of the Flux, sinking to the bottom to be separated when it is cold, to be reduced into dross on a test, and then to be cupelled, and you shall find grain Gold drawn from Tin without Silver. And if before you weigh the calx of Tin by the lesser Hundred weight, and after that the grains of Gold, you may easily conjecture how much Gold is contained in the whole hundred weight of Tin ashes, *viz.* at the least 3, 4, 5, or 6. *Lotones*, or *half Ounces*, if thou work aright.

See then the Fault is not to be imputed to the metals, but us, being ignorant of the separation of the Gold and Silver.

You should not perswade your self by this means to get much wealth out of Tin; for I have not written this for that end, but only to demonstrate the possibility. And if thou think that Gold will come out of Iron by the fluxing powder, mingle then filings of Iron with the Flux, before thou put in the calx of Tin, and thou shalt find in so doing, that Gold doth come neither from the Flux or Iron, but out of Tin; then being hereby assured, that 'tis the Tin which contains Gold, thou mayst consider, how most conveniently that may be extracted, *viz.* with other Lead, and another way, as shall be hereafter taught. Neither think that Tin contains no more Gold than you have heard; for more there is if you can wisely extract it: neither do I deny, that more Gold may be extracted out of the Tin, but more care than this is to be given, if you desire more plenty. But Gold may thence be extracted, not only by Flux, but diverse other wayes, in diverse weights; for what is written, is only for demonstration of the possibility, that the Gold contained in the imperfect metals, may be extracted by a secret separation.

The Fluxing Powder requisite to this Work.

℞ one part of very pure and white Sand, or Flints, having no Gold fusible; to which, add three parts of Litharge of Lead; being mixt, fuse in a very strong Fire, that thereof a transparent Glass may be made of it, which pour out, that it may be cold, and reduce it to powder; which use in the aforesaid manner. But you may ask, why Sand and Flints are mingled, seeing they are not of a metallick nature: to which I say, the calx of Tin, cannot, as also other Fossiles be Examined by Lead alone, for the following Reasons, *viz.* becausse in the Calcination of Tin, its metallick nature is hidden, but the impure and earthy parts are manifest, wherefore it hath no longer affinity with Lead and other metals; unless the hidden parts of the lead be manifest, and also other metals and the manifest be hidden, for then they easily embrace one the other, and are again mingled well, and not altered.

What belongs to the alteration of other metals doth not belong hither; for to this place only pertain Lead and Tin, the alteration of which is demonstrated by this tryal; whereby it appears to be thus.

Lead reduced into ashes, by it self, or into Litharge, and deprived of its metallick form, cannot so in this work be used without the flints or sand, for the following reason. The lead and glass thereof made by it self is very fusible and volatile; but the calx of tin is very difficultly fused: which two calxes, although they should be mingled to fuse in a crucible, yet would not be mingled, nor being

being fuſed, embrace one the other, by reaſon of the difference of their fuſibility; becauſe the calx of lead alone being fuſed by a ſmall fire, will perforate and penetrate the crucible, the calx of Tin being left in the crucible: wherefore you muſt add ſand or flints to the lead, *viz.* to hinder its fuſibility, that it may endure the ſame degree of heat with thoſe that are difficultly fuſed, and further their flux. For like things do mutually affect and embrace each other; as water doth water, oyl oyl, and glaſs glaſs; and metals other metals; but water is not mingled with oyl; neither are glaſſes mingled with metals, but metals with metals, and glaſs with glaſs, whether it be made of metals or out of ſand. Wherefore they greatly err who mingle the calx of metals difficultly miſcible, or other hard things with lead to prove or examin, not conſidering that corporeal lead hath no affinity with them: who remaining in their errour, and not weighing the thing further, conſequently can find nothing of any moment.

But when the calx of metals united with lead by a *medium*, as flints or ſand, are brought together into tranſparent glaſs; then the lead being precipitated and ſeparated from the mixture, it cannot be, but that the gold and ſilver contained in them muſt be carried away with it. This is a true and philoſophical tryal, and not to be contemned, for many things may be by it performed.

N. B. But this is not to be paſſed by, that in the mutual mixture and fuſion of the glaſs of lead and the calx of tin, and other hard metals, one may eaſily err, *viz.* in the precipitation (which is done with the mixture of iron) of the gold with the lead into *Regulus*, by either the exceſs or defect, ſo that nothing may be gotten, which is committed in precipitation. For if the mixture ſtand long in the fire not fuſed, it is burnt, ſo that it cannot well be ſeparated, and if it ſtand too long fuſed in the fire, the gold is attracted by the droſs, by reaſon of the mixture of the iron, having great affinity with the gold, ſo that by this means nothing can be gotten: wherefore the Work is to be done warily, and with wiſdom and induſtry. You muſt have a care you burn not the *Regulus* of lead with too much fire, when you reduce it into droſs; for fear of attracting the gold from the iron, and turning it into droſs. And although this may by Art be prevented, yet we muſt not preſently create every one *Maſter of Arts*, it requiring diligence and daily exerciſe, beſides the reading of Books. But this Secret ſhall other where be communicated.

This admonition then I give, that thou do not impute thy errour (if thou doſt err) to me, but to thy ſelf, for what I have written is true: and do not thence infer an impoſſibility of attracting gold by iron, out of lead, and of turning it into droſs, which is no wonder to me, though it may ſo ſeem to thee. Which he who hath the knowledge of metals will himſelf eaſily perceive. But that thou maiſt be certain, try the certainty after the following manner: Take two hundred *lib.* of lead, of the leſſer weight of the Refiners, put it on a teſt under a tyle; add eight or ten *lotons* of pure gold, of tin two or three *l.* ſix or eight of iron, *viz.* of the leſſer weight: make them flow together an hour to make droſs; as Examiners uſe to do; then pour it out, and ſeparate the lead from the droſs, *viz.* to cupel that which is ſeparated, then weigh the grains of gold left, and thou ſhalt find half of it conſumed by the droſs. If this happen to corporeal gold and fixt, How will it be with that which is newly extracted out of an imperfect metal? Therefore you muſt diligently ſearch out the natures of metals, and then ſuch caſes will not ſeem incredible.

From hence then, and other Examples mentioned it appears, that that ſeparation which is done by teſts and cupels, is not true and legitimate; and conſequently, that another profitable ſeparation of metals is to be ſought; becauſe by this the greater part of gold and ſilver burns into droſs, witneſs Experience, for which cauſe the former example was alleadged; whither belongs the proof, *viz.* how much gold the droſs hath attracted, which is done as followeth: *R.* the remaining black droſs, to which add a double weight of ſalt of tartar, put it in a crucible filled but to the half (for fear of boyling out) and covered, that nothing fall in, under a tile or among live coals, one or two hours ſpace to digeſt; and a new *Regulus* of lead ſhall be precipitated, which ſeparated from the droſs, you may cupel, and you ſhall find new grains of gold attracted by the iron in the droſs, and now ſeparated by the ſalt of tartar, overcoming the force of the iron. And ſo you have heard from two examples, how in the coction of the ſeparation gold may be drawn out of the lead by tin and iron, and that therefore there is need, that gold be ſeparated by the *Antimonial Regulus* out of the aforeſaid metals, and not by lead, if you would extract the true ſubſtance with gain.

N. B. Gold may likewiſe be ſeparated out of the glaſs of lead (being firſt diſſolved with the aſhes of tin) with coal duſt, adding it in the flux and ſtirring it with an iron wier; and alſo with common ſulphur, by burning it on it: but the aforeſaid way with iron, is to be preferred before thoſe two which ſpoyl the gold, *&c.* wherefore the remaining droſs is to be gathered, which by ſome abſtracting furnace by other means may be tryed, for to recover the ſpoyled or loſt gold and ſilver.

And all theſe are alleadged to demonſtrate that the gold in tin and iron is to be ſeparated by the *Antimonial Regulus*, and not by Lead. But how this ſeparation may be perfected, you ſhall hear in the third part, where we will treat of lead, explained by *Paracelſus*, in his book called *Cœlum Philoſophorum*, and other artificial Chymical labours: wherefore here we omit it, being ſuperfluous to handle one thing in divers places. In the mean while exerciſe thy ſelf in leſſer things, that thou maiſt be more fit for greater when they ſhall be ſet forth. But wonder not at my liberality in publiſhing ſo great ſecrets, for I have reaſons for it. Such a burden is too much for me alone, neither doth it profit the Covetous to ſell his goods to them which keep not their words, nor pay the money, after they have obtained their art, which hath hapned to me. Wherefore I have determined to communicate ſome ſecrets to all the world indifferently, that the poor may receive ſome profit by them; knowing that though I write plainly, yet that all will not at the firſt view obtain their deſires. For ſome are ſo dull, that they cannot imitate a work though often ſeen. For ſome have often viſited me, to ſee my new manner of diſtilling, which though it was ſufficiently demonſtrated to the eye, yet they could not imitate it, till with often peruſals at length they have found the

right path. Others have left it as too hard a work, when it would not presently succeed, which if it happened to those who had an ocular demonstration, how much more difficult will it be and hard to them who have nothing but what they have heard or read. Wherefore I am certain, that though I should publish every one of my secrets, yet could they not be performed by all men, my coals and materials being left sufficing for my necessity. Wherefore I fear not to publish, the next opportunity offered, divers profitable and excellent secrets, *viz.* in favour of all and every one.

As for that spirit of salt necessary to this work, you may find it in the first part of my Philosophical Furnaces corrected and amended; but the way of separation in the fourth part.

And so I finish this work, being published in favour of those who by war (though honest men) are reduced to poverty. But what things are deficient in this little tract shall (God willing) be delivered in the next (which shall follow in a short time) largely and clearly without fraud.

FINIS.

THE

SECOND PART

OF THE

Mineral Work.

Of the Birth and Original of Metals and Minerals, viz. *How they are produced by the Starrs, and take to themselves a body out of the Water and Earth, and are found in a sundry shape. Written and brought to light for the sake of the Diligent Searchers of Nature.*

A Preface to the Reader.

Courteous Reader,

WHereas in a former little Book, lately by me published, I mentioned this little Tract of the Generation of Metals, and through want of time, could not hitherto make it publick, although earnestly desired by men of the meanest and highest condition: I have now determined to spare so much time from my other Imployments, as to do this Work for the publick good, no ways doubting, but that (although this my opinion of the Generation of Metals, doth not agree with all the Philosophers) *yet will it get credit from, and the assent of not a few quick-sighted men.*

That which I here declare, I do not exhibit with flattering words, or many circumstances, or the testimonies of other Writings, but with a naked and genuin simplicity; for which very cause I would not make this little Tract too prolix, but have unfolded my mind with the most Compendious stile that I could. But let none think that I endeavour to weaken and nullifie the Opinions of other men concerning the Generations of Metals, and obtrude mine in the World, no, not in the least: I leave to every man his free will, and the Liberty of viewing others, who have written Monuments of this thing, and of comparing of them with my writings, that he may evidently perceive which of the two Corresponds most with Nature and Truth: I aim not at any Honour hereby, as if I were wiser than the common sort: Nor do I reap any benefit by making this little Book, but 'tis done only for this end and prrpose, That (because I have formerly written of Metalline things, and have also made mention of this little Tract of the Birth and Nativity of them) I may give light unto my Writings, and render them more easie to be understood; for I should most bitterly suffer, if but one only should be lead into errour by my Writings, but I trust that the light is springing up unto many, by the guidance whereof they will more cautiously handle than hitherto they have done. Let the Benign and Merciful God, our Father of all things, of whose Wonders the Heaven and Earth are full, give unto His poor needy Children that which may tend to the Glory of His most holy Name, and to our health.

OF

OF THE

Birth and Nativity

OF

METALS.

THere have alwaies been many, and various Opinions concerning the Original of Metals and Minerals, *to wit*, of what matter they are first of all generated in the Bowels of the Earth; and how come to such a fixity, insomuch, that a young Beginner in this hard Science, hath been in suspence; which of them he should assent unto, and by what Phylosophy he should direct his course.

And whereas, throughout the whole Universe in so many Nations, there are so many men, both of high and low degree, as well Learned as unlearned, who busily seek at this day, to get their Felicity from the Metals; and whereas, without the true Knowledge of them, nothing at all of profit can be had (for by what means I pray can any one convert any imperfect Metal into a better, if he be ignorant of what Parts it is composed; into what Parts it is to be resolved before that it can obtain a more Noble Form) and that the Knowledge of their Generation is worthily necessary for their Melioration; we will in a few words clearly evidence, What is to be considered as to their Nativity. Although the whole Company of Phylosophers do almost unanimously testify, (but yet in succinct, obscure, and ænigmatical Terms) That Metals receive their Generation from above, by the force of the Stars, and are produced in the bowels of the Earth; yet some there are, who contend very ignorantly. and affirm, that Metals have not any seed at all, as other Animal, and Vegetable things have; and that (upon this account they have no propogating faculty, but were produced such in the belly of the Earth, by GOD in the first Creation of things. But this Deceit is too grosse, and palpable, and may be met withal most easily, by daily experience, declaring the contrary. For when being found in the Earth, they are by the Miners brought to light, we abundantly, and ocularly perceive, that even now they daily grow, and will not cease from this motion, unless rob'd of their Vegetable Vertue and Life, by external Accidents, which very thing convinceth the Opinion of Errour. Some there are, who teach that God, when he made the World, did instil into the Matrix of the Earth, not the Metals themselves, but their Seed only for its own propagation; which, if so, then long ago, would this Seed have afforded a new harvest of it self (of which, no footsteps are any where extant) by its own absolute Vegetation. Know therefore, that the manner of the Metallick Seed is far different from that of the vegetable and animal Seeds, which are perceptible to the sence of sight and feeling.

For the Metals are not all together created in the beginning of things, but begotten in length of time, out of the bosome of the Elements; and on them, being created by the Omnipotent GOD, is this Command injoyned, and this Power implanted, that they should give growth to all things, by their Vertue and Efficacy; for accomplishing of which thing, the one cannot in the least want the Company of the other.

For the Stars or Elements of Fire, delivers out the metalline Seed out of its own bowels; which the air carries down into the Water, that it may adapt to it self, a palpable form or body, which the Earth (embraceing it) doth cherish, nourish, and augment from form to form, until it comes to be a perfect Metal, which it (at length) brings forth into the light, as a Mother doth her mature young one; which Conception and Generation of the Metals, taking its Original at the very beginning of the World, will alwaies continue even unto its Dissolution.

For by the efficacy of the Elements, new things are from thence generated, and contrarily, old things are destroyed; which thing is not only done in Metals, but most apparently in Vegetables and Animals: for none can deny, but that various Hearbs, and little Animals are produced upon this Stage, by the alone vertue of the Elements, with-

out planting of the Herbs; and without the Seed of the Animals, which to purſue, I could lay down many Documents, were it needful, but 'tis altogether needleſs, to ſay any thing of that, of which none are ignorant. And now, who will not believe, but that the ſame may be done in Metallicks. God Omnipotent hath implanted in the Starrs, or Element of Fire, the vivifying prolifick and ſeminal vertue of all things, which power it doth not keep ſhut up within it ſelf, but ſends and lets it down by Divine appointment into the earths center, by mediation of the air and the water; which fiery beams ceaſe not, by reaſon of their implanted impulſe and vertue, to go forward, until they do at laſt meet with a place, beyond which it is impoſſible for them to go, nor can they ſtay there any longer, but leaping back from the center unto the circumference, are diſperſed throughout the whole earth, cheriſhing and impregnating it: which thing, unleſs it were done, and thoſe ſidereal vertues ſhould remain in the center of the earth, and never flow upwards, nothing at all would grow upon the Earth. But becauſe heat, and whatſoever is of the fire, is endowed with this nature, to go forward as far as it can, and where it can go no farther, 'tis ſtruck back, and leaps from the center to the Superfices; which thing is evident in a burning-glaſs, whereinto when the Solar beams fall, and cannot penetrate the compact and poliſht metal, they are diſperſedly forced backwards, and in thoſe fiery beams, whilſt (every where) they leap back, do in the poroſity of the earth ſnatch up, as it were, a fat humidity, adheres thereto, and by mutual mixtion are coagulated into a certain palpable Eſſence, out of which, according to the purity or impurity of the place, a pure, or an impure metal is with length of time produced; becauſe a metal doth not preſently become ripe in the ſame moment of time, but the Seed of the Metal is by little and little nouriſhed and increaſed in the matrix of the earth, with the heat of the central fire, until it attains its perfection.

Like as in the generation of Vegetables and Animals, it comes in uſe, whoſe ſeed being received into the ſuitable matrix, takes encreaſe from thence by little and little, until (if no obſtacles prevent) it obtains a predeſtinated and appointed form, whence 'tis, that according to the purity of the place the metals are alſo varied: For it is but one only ſeed out of which Metals and Minerals do proceed: but the place and other accidents are the cauſe of their Unlikeneſs, as we ſhall prove in the ſubſequent writing.

But to ſome men it will ſeem monſtrous, that I ſay there's a place in the middle of the Earth, the which nothing can paſs through or penetrate, but is ſtopt; that which is heavy remains there, but the more light is carried backwards: which opinion it will be worth while briefly to explain.

In the Creation of the World, the Elements being as yet not ſeparated each from the other, but being a *Chaos*, God inſtituted their ſeparation, and ordained a place where the more ponderous part of the maſs ſhould be ſeparated, (which is the Earth) which thing is even continually done, becauſe every heavy thing or earth knits it ſelf to its aſſigned point, as a Bee doth to his hive, from whence at length this Globe is made or born, upon which we inhabit: Preſently after, that which was next in weight, the water, made its ſeparation from the other Elements, and encompaſs'd the Superfices of the earth, having the ſame center with the earth, inſomuch that if the earth were not, the water it ſelf would have chiefly or primarily encompaſſed the ſtable and founded point of Gravity or the Magnet; but becauſe the earth exceeding the water in ponderoſity, doth intercede, it worthily aſſumes its appointed place, and takes the waters upon its back.

Now, as the other two Elements, the lighteſt of them, the Fire, God likewiſe ſent to its proper aboad, a place moſt remotely diſtant from the inferiour Globe of the heavy Elements; the other light Element, the Air, being the *medium* between the fire and the water, God hath ſet it between them two, that conſtantly touching each the other, they might mutually circulate, cheriſh, and uphold each the other, until being at length diſſolved, they are reduced into their own nothing, from whence they were produced.

For the Fire cannot burn without the Air, nor the Air be conſerved without the Water, nor the Water be nouriſhed without the Earth, nor the Earth (being as it were dead) bring any thing to light, except the Element of Fire doth firſt ſpiritually inſtill thereinto its own ſeed, whence it is afterwards made corporeally and ſenſibility, ſuch as is neceſſary for all growing things.

And now, leſt what I have ſpoken (*viz.* that the Earth hath its own center unpaſſable by any thing, whereinto the ſidereal rays ſtriking, are contracted into a ſtreight room, and (driven back) from thence are ſublimed and diſtilled throughout the whole Orb, from which all kind of Metals and Minerals (by the help of the Earth and Water corporifying them) are produced) may ſeem a fable

Know, that this Philoſophy is demonſtrable by many uncontroulable reaſons; which Philoſophy I do not my ſelf only embrace, but alſo many more have done, 'mongſt whom the moſt famous *Sandivow* is not the leaſt, who writ, That in the Earths center is a vacuity, in which nothing can reſt, the which thing even the reaſon or order of Nature ſeems to evidence, in whoſe middle point a void place is neceſſarily requiſit, into which all the vertues of the Stars may pour out themſelves, may mutually operate upon each other, and excite a marvellous heat, permitting neither delay or quietude for any thing in that place: but from thence, even the unbroken vertues of the Stars are by little and little enforced to go back unto the circumference, where joyning themſelves to the moſt pure earth, they exclude a metallick child; ſo that you need not wonder, becauſe of that moſt intenſe heat that ſways there, when as all the Aſteriſms, the Sun, the Moon, the other Planets, with Starrs innumerable, do into that place inject their powers with all their might. If you conſider but the ſolar magnitude only, being by Aſtronomical Calculation 64 times the bigneſs of the earthly globe (omitting to ſpeak of the other innumerable huge bodies, that jointly caſt their influences into the belly of the earth) what an unſpeakable furious heat thinkeſt thou that all theſe will give, which in the center of the earth muſter up their vertues, and make them manifeſt and efficacious: Conſider a little how much one pugil of the Sun-beams can do, being taken in a concave glaſs, or a metalline ring well poliſhed, or any other inſtrument, and ſtraightened into the center for a concave-glaſs rightly made, having but the Diameter of a ſpan, doth eaſily burn wood, or any combuſtible body; but if the Diameter be two

ſpans,

ſpans, it melts with the Sun, Lead, Tin, Biſmuthum, and other metals eaſily fluxible; if 4 or 5 ſpans, then it melteth Copper and Silver, and ſo mollifies Iron, that it may be wrought upon the Anvil. If now experience evinceth this thing, that a little handful of the beams collected and ſtrengthened into a point, be of ſo great force as to melt even metals, and to fume away ☿, ♂, and Arſnick, Auripigment, Koboltum, and other volatile and immature metals of like kind; what thinkeſt thou would be, if the beams were congregated the compaſs of 10 or 20 fathoms, doubtleſs they would burn up all other metals, except Gold, like a flame, and elevate them into fume? And what are 10 or 20 fathoms, if compared to ſo many thouſands of thouſands which are attributed to the Sun, whoſe heat (paſſing by to ſpeak of the other great Starrs) if it were congregated into one place, (which is ſo done in the earths center) what an incomprehenſible burning heat, thinkſt thou, would be there? verily nothing would be fixt enough to reſiſt the burning; and indeed there is nothing in reality that doth reſiſt it, whence neceſſarily that point is vacuous wherein nought can reſt or remain.

Thou wilt object, that I ſpeak of many things, but prove a very few; for who was ever there, and beheld ſuch a Cavity? I Anſwer thus, that albeit, there be no ocular Teſtimony of this thing, yet naturally Phyloſophy affords Teſtimony ſufficient, whereby 'tis in very deed demonſtrated, that ſuch a place there is: now none denies, that the Sun and Stars by their motion do inviron the terreſtrial Globe, and imprint their beams thereon, which being granted (for no ſober man will contradict this) it alſo follows, that thoſe hot and inviſible beams do by an innate force and vigor go forwards, until they are ſomewhere ſtop'd, and a further progreſs prohibited them; which thing is done in the middle moſt point of the Earth, or all the Phyloſophers are altogether Lyers, who unanimouſly believe, that the heat is carryed directly forwards, and not backwards: but behold an apparent Example of this thing: Put a Coal upon ſome thick braſs, or iron plate, and thou ſhalt ſee that the ſide under the Coal will firſt wax hot by the penetrating heat; take off the Coal and try with thy hand, and thou ſhalt find it hurtful by the overmuch heat; try alſo the under ſide of the Plate, and thou ſhalt find it to be but gentle warm, and after a little delay, try yet once again, and thou ſhalt find that the heat is gone directly forward, and that the underſide of the Plate is hotter than the upper part, whereupon the Coal lay.

Hence thou maiſt clearly perceive, that the heat never goes backwards, but is carried directly forwards; which being ſo, thou ſhalt be enforced to confeſs *nolens volens*, that in like manner the Aſtral heat ſticks not in the Superfices of the earth, but pierceth even to the very bottom center.

Well, but thou wilt again object, If the Sunbeams deſcend through the earths thickneſs, even to the very center, Whence is it, that the whole earth grows not hot thereby, or at leaſt ſo warm as it is on the ſurface? for 'tis found by experience, that the digg'd-up earth is not warm, but cold, and no heating beams are therein perceptible. Take this for an anſwer, That the diſperſed beams of the Sun do not diſplay their efficacy, but only in thoſe places where they are collected and become ſenſible; a hint of which you may obſerve in the earths ſurface it ſelf; where a ſpeedier paſſage being not permitted, but through the hardneſs of the ſtones, and its own denſity, there being a ſtop and obſtruction, the heat becomes duplicated, and manifeſtly augmented, inſomuch, that in all very hard rocks and clifts there is ſometimes created ſo great a heat by the continual Conflux and Condenſation of the Sunbeams, that if accidentally, wood or fuel be laid thereto, it burns and flames up, which never happens in a thin and porous Aire (how near ſoever to the Sun) it being uncapable of ſtoping thoſe beams; for by how much the higher you aſcend into the Aire, by ſo much the more intenſe ſhall you find the Cold to be; inſomuch that the moſt Touring Mountains, altho' poſited in warm Countries, are alwaies covered with Froſt, Ice, and Snow, when as in the bottom of thoſe Hills, the Ground is very warm, and brings forth varieties of Fruit, although it be more remote from the Sun: The cauſe of which Cold in the Tops, and of Heat in the Bottom, only conſiſts in the reflection of the ſolar Beams, which are ſtayed and multiplied below; which thing cannot at any rate be done in the Fire that is above.

Theſe beams having firſt paſſed the ſuperfices of the Earth, where they were a while joined and multiplyed, are by little and little debilitated, and return to their ſimplicity; whence it comes to paſs, that that part of the Terrene Globe, which is furtheſt diſtant from the Centre, hath as little heat, as the Aire on high: but if it were poſſible to aſcend higher, and nearer to the Sun, the heat would by little and little be encreaſed, and be found greateſt at the Sun it ſelf: In like manner may a Compariſon be made about the Earths heat, which near the Surface is very faint, but nearer the Centre, more and more encreaſing; (there being its Seat and Collection) ſo that the middle Earth, between the Sun (from whom the heat flow) and the Centre, where the whole being gathered together, is repercuſſed, may deſervedly be eſteemed the coldeſt part; of which truth, a certain demonſtration is readily produceable.

For when in the hotteſt day of Summer, watry Clouds are elevated by the Winds, higher than ordinary, they are made pure Ice by the force of a moſt intenſe Cold, which fall down in little bits of that form or ſhape, which they were imprinted with by the Aire, to the great detriment of Vegetables; and is by us call'd Hail, and ſo cold, that we are not able long to hold it in our hands, and uſually lies ſome daies in the Suns heat ere it melts by the warm Aire, and returns into Water.

Now then if there were not a great Cold in the middle Region of the aire; whence is it, that thoſe Clouds are ſo frozen; and who knows how great the Cold is, where the Aire, in its own middle point, is moſt of all cold; doubtleſs it is ſo great, that no living thing is able to live therein the twinkling of an eye, but would incontinently be tranſmuted into a ſtone, even as we have frequently perceived the earthy Exhalations born up on high into the middle Region of the Aire, to have been there coagulated, and compacted into the moſt hard ſtones, and ſo to have fallen down; and not only ſtones weighing ſome pounds, but alſo metals too, and chiefly iron of a great weight, repreſenting the ſhape of many conglomerated drops, have been in that part of the Aire condenſed out of dry Exhalations, and thrown down thus concreted;

the which thing others have handled more at large; whence 'tis ſufficiently evident, that the Sun-beams, in ſuch places as they can freely paſs through, without any impediment, give not any heat from themſelves: but only where they are detained and fixt, and by how much harder the detaining matter is, by ſo much it cauſeth a better heat. Thou alſo ſeeſt that Wood, or any porous Body never contracts from the Sun, ſo great a heat, as a ſtone doth; nor doth a ſtone, ſo much as a metal, although all placed the one by the other, to the Suns heat; the cauſe of which diverſity, doth alone conſiſt in the pores, of which ſome bodies have more, ſome leſs; thereby granting a more ſpeedy paſſage to the heat; for 'tis (as I have often ſaid) the property of the heat, to haſten directly forwards, as long as 'tis not impeaded, and extreamly unwilling to go back. A Teſtimony whereof, as well the Kitchen Fire, as the Solar, or Fulminous Fire affords unto us; for if any body ſitting near the Fire, hath caſually in his pocket, any metal, be it a key, knife or money, the heat (eaſily penetrates the thin Garments) lights upon the metal, whereto it adheres and augments; and gets ſo much heat, that ſometimes it cannot be held in the hand; but the cloathing, although nigher the Fire, is ſcarce gently warm; the ſame thing uſually falls out in Thunder, whoſe Fire, becauſe it flyes very furiouſly, if it hath not room to paſs the pores of ſolid withſtanding bodies, it diſſipates and diſſolves them in a moment, and leaves porous bodies whole, which Lightning, often melts the ſword in the ſcabbard, or money in the purſe, the Receptacle of them being whole: It alſo breaks the hollow and marrowy bones of Animals, the fleſh remaining whole and ſound; the Cauſe thus, for that this fulminous heat moſt ſwiftly penetrating, is deprived of time to penetrate, and warm a metal by degrees, and will not return backwards, contrary to its own nature, and therefore ſubdues and conquers the weaker Element by force and power; for Fire only is the moſt potent of the Elements, and knows not how to yield to the other three, but they are compelled to ſtoop to it, with which priviledge the ſaid Fire is from God endued, even from its very infancy.

In the ſame and like manner is it with the Sun's, Moon's, and other Stars heat, and occult Vertves, which by their efficacy, haſten on forwards ſo long, until they meet with that which they cannot penetrate, where making a ſtand, and heated as it were together, are compelled to go back, ſearching after a place to reſt, and become corporeal; for the chiefeſt heat being in the Earths Centre, gives not any delay to any thing, but continually drives back, what flows thither, into the porous and moiſt Earth, where the Beams being ſublimed and hidden, may cloath themſelves with a ſenſible Corporeity, and proceed from one degree to another, until they are well concocted into perfect Metals, no impediment intervening.

But let me not be miſtaken by any one, as if it 'twere my Opinion, that in the Centre of the Earth, the fiery place is conſtitute, of which the Scriptures make mention; for I have nothing to ſay as to that place; nor deſire to know ought concerning it. This place which I deſcribe, is diſcovered to us by natural Phyloſophy, but that place the Scripture makes mention of, I leave to Theologiſts, by which they may terrify the wicked Multitude, that they precipitate not themſelves raſhly, and by Troops thereinto.

And now becauſe the Helliſh Fire is here mentioned, I cannot omit to blaſt the moſt unſound Opinions of ſome putatitious Doctrines thereabouts: There are in many places found Mountains, belching forth, with huge force, flames, fumes, aſhes, and ſtones: In *Europe*, is the Hill *Ætna* of *Scicilia*; in Iſland, is *Hoctu*, behind *Norway*; there's alſo *Veſuvius*, adjoining to *Naples*, and many more other places in other Parts of the Earth; ſome part of which continually burn and fume; others at certain times and intervals; which places, many acconnt for the fumings of Hell. Heela

But verily this cannot be rational, becauſe thoſe burning Mountains have a natural Original, and Cauſe of Fireing, kuown but to very few; for in in ſome places are found Mountains wholly Sulphure which being kindled, either by the Central or Elemental Fire of Thunder, or any other accident cannot but burn, and when ſuch a Mountain hath but once taken Fire, and begins to burn, who can reſtrain the burning; no body, becauſe of the greatneſs of the Fire, and danger of what may happen, being therefore left to it ſelf, it feeds downwards, being never deſtitute of matter fit for the Fire.

And now if any one underſtanding by the Monuments of the Antients, that theſe Mountains have burned for ſome Ages, yea, and for Thouſands of Years, ſhould wonder, whence Fuel ſufficient for that Fire ſhould be had, let him know, that this may eaſily be done; that a Mountain ſhould burn without intermiſſion, not only for the magnitude of the Terrene Globe, in which a mountainous Wax, or Bitumen, Brimſtone, and ſuch like Combuſtible Things abound: But alſo, becauſe of the never-interrupted Motion of the Stars, whereby they never ceaſe repleniſhing the Earth with their out-flowings, and generating (beſides Minerals) ſuch Combuſtible matters as theſe, augmenting and cheriſhing the Fire.

But they endeavour to confirm their Opinion by the lamentable Howlings, which at ſome times are heard nigh thoſe Mountains; which Cryes, the credulous Vulgar People report to be of the Souls, which are loſt: But theſe are but Trifles; for thoſe Out-cryes are then only uttered, when the Mountains endeavour to throw out much Fire, otherwiſe they burn and fume very gently, which as ſoon as the Adjacent Inhabitants perceive, they well know, that they ſhall ſhortly have an Harveſt of aſhes, fire, & ſtones, out of the Mountains: and that they may avoid the hazard and danger threatned by the Fire, they carefully keep far enough off. And for the moſt part, a great Quantity of the Sulphure is prepared in the neighbouring parts, whereby the needy get their food, by digging it up, purging it from its Impurities, and preparing it for humane uſes; but as to the Cryes, it ſeems to be nothing elſe in my opinion, but only the Fire breaking forceable through the ſtreight Channels, the hard Stones and Caverns, and produceing thereby a dreadful ſound, which they commonly call Ejulation, or Howling. They alſo add, that about thoſe fiery Mountains, Ghoſts, Viſions, and Spirits uſually appear viſibly. This alſo is true, and Grounded upon Nature, but yet thou canſt not prove that they are Devils and infernal Spirits; there being even otherwhere ſeen, and found diverſe Spirits in the Bowels of the Earth, being Monſters not unwonted, or ſtrange to ſuch as dig, or are Miners, by which they are frequently injured; yea, and ſometimes

times deſtroyed, lamed or infected; ſometimes theſe ſpirits are hurtleſs and idle ſpectators, or playing with the workmens implements; or even labour themſelves not in the leaſt filling their Pockets, how ſtrongly ſoever they ſhew themſelves bent upon their work. But ſuch ſpirits appear in various forms, oftentimes reſembling an Horſe, a Dog, or other Beaſt, ſometimes a Dwarf-like crooked man; frequently they appear cloathed with an aſhy Cowle of a *Monk*; they uſually are Teſtimonies of great Felicity and rich Mines; ſometimes they do great miſchief, by choaking the Miners with a wicked habit, or throwing them headlong into the Pits, by reaſon of whoſe malice many of the rich Mines are unavoidable left undigged, they boldly defending their hidden Treaſures.

Let theſe things concerning the ſpirits, about the burning Mountains, or thoſe remaining in the profundity of the Earth, and appearing in the ſeveral ſhapes, be ſpoken by way of Parentheſis. And now I return to the thing in hand, and will demonſtrate, that there is nothing of Community betwixt theſe burning Mountains and the central or infernal fire, but that theſe blowout a thick and material fire; which I thus prove.

Firſt of all, Theſe Mountains do at ſometimes ceaſe to burn, breathing out ſmoak only between whiles more copiouſly: ſometimes they dye and expire through want of fuel to ſupply them.

But the central fire can never be either diminiſhed or vaniſh as long as the ſun ſhines and ſtarrs gliſter, and ſend down their vertues into the earths centre. Even as the infernal Fire ſhall never expire, the Scripture thus teſtifying, wherefore that fire, though a moſt furious Mountainous fire, cannot be either of theſe two, but is meerly material, ſubject to encreaſe and decreaſe, and its food deſiſting, plainly extinguiſheth: Beſides, the fire of thoſe Mountains heats not fervently, but for the greateſt part ſmoke obſcurely; but the adjoyning Earth is very hot, for the ſpace of ſome miles, ſo that you cannot long ſtand there without injuring your feet. The Waters alſo which flow down from them, are boyling hot, and manifeſtly ſmell of ſulphur a good Portion whereof they have within themſelves.

Beſides theſe flaming and ſmoaking Mountains, there are ſometimes found other Denns or Caverns, breathing forth neither Flame nor Fume, and yet a great heat, which is another kind of fire, which is largely treated of in the Chronicles of Metals, where amongſt other things, this is alſo added; That on a time a Wind gaping, aroſe in a certain Mountain, and ſent forth a huge heat, and in the night only was ſome ſplendor perceptible, aſcending towards Heaven, and ſometimes a breathing heat was only obſerved.

On this a curious *Monk* was in himſelf perſwaded to let down into the cranny, a pot, bound on an Iron Chain, with intent to draw up ſome molten Gold, which he believed to be thereunder, which when it came to touch the fire, it preſently melted and fell down, the which in like ſort burnt away like Chaff, with a good part of the Chain alſo, and was ejected and thrown up again in the form of a fume, with a great noiſe and crack, but the Monk hardly ſcap'd with his life, the gold being left behind in the Hell; but thou maiſt readily divine what ſort of fire this was, which reduced the Pot and Chain into fume in the twinkling of an eye, that it was not a material fire, becauſe void of ſmoak, but the aſtral fire.

It is well known to the Miners, that the central and gehennal fire doth oftentimes aſcend the high parts of the Mountains, and warm them, and there cheriſh and maturate the metals: which Caverns, when in their ſearching for Metals, they come nigh unto, they feel too much heat, that they are even againſt their wills compelled to deſiſt. But this heat, although indeed in the action of the growing, Minerals doth uſually excite and make great enough; yet for the greateſt part it derives its Original from the central fire, and this central from the Starrs. But after what manner and reaſon the ſtarrs beget the central fire, and this generates the Minerals and Metals, I will demonſtrate to the unknowing as briefly as I can.

Thus therefore ſtands the caſe: We read in *Moſes*, in the firſt of *Geneſis*, that God, when he made the World out of the confuſed *Chaos*, did give the Elements their original firſt, and aſſigned to Earth its proper place, and injoyned on earth its Office to be done; but by what means they are preſerved by the interceding perpetual Circulation, natural Philoſophy doth demonſtrate. It will not therefore be to our purpoſe to treat prolixly of them, but only of the riſe and nativity of metals, will I compendiouſly ſpeak as far as I know of them, *viz.* in what manner the metallick kind draws its original from them, together with its encreaſe and augmentation, and how having arrived to the top of their perfection, they come to their end.

I have a little before demonſtrated, that the ſuperiour element of fire, as the Sun, Moon, and the other Starrs, ſend down their inviſible vertues and fiery beams into the earths center, where they are congregated, and cauſe huge heat, and being not permitted there to reſt, leap back again, and are ſcattered throughout the univerſal Globe, and impregnate it with various and wonderful Creſcentials, which are called Minerals by the Philoſophers, cheriſhing and perfecting them in various forms. The reaſon and manner of which thing I will here in a few words unfold.

Every ſpiritual thing, come it from whatſoever body it will, is inviſible and impalpable, nor can any thing be made of it alone, but it's forced to remain a ſpirit, until it meets with a ſubject whereto it may adhere, be united, and by the benefit thereof be turned into a Corporeal Nature, and pure, anſwerable to the purity of the ſubject and ſpirit, the ſpirit is in the room of ſeed; but the ſubject anſwers to the earth or matrix in which the ſpirit is concocted, into a ſenſible body ſuitable to its own nature. But 'tis to be known, that the manner of Metallick conception and generation, is far different from that of the Vegetable and Animals: For in moſt Vegetables that have arrived to their perfection, nature works out a ſeed for a farther propagation and encreaſe, being the moſt excellent part of the herb, which at the Springs Entrance being committed to convenient earth, produceth a new plant in all points like unto the former, from whence it ſprang, by which doing new ſeeds of the ſame plant, are always conſerved. Although indeed ſome plants are not propagated by the ſeed, but by the root. Yet they are very few, and in ſuch, the root it ſelf ſerves inſtead of ſeed. And that in ſome places Plants grow out of the earth, without the aſſiſtance of either ſeed or root, its done by the help of the Elements, in whom the ſame force of impregnating the void earth and production of Plants, is at this Inſtant, as was at firſt, when they generated and brought them forth in the beginning of the World. In like manner is there a twofold production of Animals,

the one done by a proper ſperm, by which they are propagated, the other is a production of ſome little Animals, upon the world's ſtage, even without Sperm, by putrefaction only, and the mutual action and paſſion of the Elements.

Theſe two waies have footing alſo in Minerals, the one is the Univerſal impregnation made by the Starrs in the beginning of the world, the other is Daily. And even as the firſt generation of Vegetables and Animals is to be accounted far more excellent than that which is accidental and quotidian, ſo is it with Minerals likewiſe. As ſome Vegetables arrive to their perfection, and periſh ſooner than other ſome, ſo do metals and minerals alſo; and by how much the ſooner and quicker growth they have, by ſo much the ſooner do they periſh; and ſo on the contrary. And as a rational and movable Animal is a thouſand times in his nobility and fixity beyond a Vegetable, ſo alſo doth a Mineral, by reaſon of his fixity, far tranſcend any Animal; which wants an immortal ſoul.

Now when the Vegetables, Animals and Minerals, fatally terminating their period, are corrupted, and return into a nothing, each Element takes to it ſelf what is its own. The Starrs, the Spirit, the Earth, keeps the body which it formerly gave, and the Principles of the thing do each return unto their Fountains from whence they at firſt did flow.

And in this manner is there perpetual Death and Regeneration of things, by the teſtimony of Experience.

There are many ways by which Metals are brought to light, *viz.* by huge Fires: if by Accident and Careleſneſs of Shepherds, a Wood catcheth fire, the Earth by reaſon of the intollerable heat Gapes, and the molten Metal flows forth and is detected: ſometimes alſo vehement Earthquakes diſcover them.

Beſides, the Veins of Metals are found out when deep Wells and Pits are digged, or by the Plowing in the Fields, they are ſometimes dig'd up, and their Veins diſcovered: ſtrong Rivers waſhing away the Earth and Sand, do ſometimes open their Veins; the Fruits of which being found in the Banks, give cauſe of ſearching after them.

They are alſo diſcovered by means of an Animal, even an Horſe, by pawing with his foot, beating away the Earth uncovers the Vein, which happen'd at *Goſlaria* in *Ramelsbug*; even Hogs ſearching after Acorns, have diged up Mine-pits; or a pure Metal lifts up it ſelf into the Aire in the likeneſs of a Reed, by which means the exceeding rich Mines of Silver at *Kuttenberg* in *Bohemia*, was by a Monk manifeſted to the World, who walking in the Wood gathered a Silver Reed growing out of the Earth, and put it in his Cowle, and declared the thing in the Convent.

Sometimes alſo moſt vehement ſtorms pulling up very great Trees by the roots do open veins. Moſt frequently a Corruſcation gives undoubted teſtimony of Veins, which being enkindled by the warm air, runs a long ſome ſpace, in the likeneſs of a blew flame; nor is the finding out of the proceſs of Veins (not lying over-deep buried) very difficult if you rightly conſider, for they continually breath forth a warm Sulphureous vapour, upon which, not only the Graſs growing is thiner than is elſwhere wont to be, but even the Trees that grow upon them are dwarf-like, have paler and thiner Leaves than other Trees elſewhere planted have.

Likewiſe where the Dew, Hoar-Froſt, ſooner melts and vaniſheth, 'tis a teſtimony that a Metal is thereunder; the cauſe of which melting, is the warm vapours aſcending from the Veins.

But that teſtimony which the moſt imploy themſelves in, in ſeeking by an Hazel rod (which my ſelf have many times experienced) is fallacious and uncertain.

This is the Work of the Art, if any one conjoyning Metals in the Fire under a certain conſtellation, melt them into an electrum and make of them a little Ball, perfortated in the middle, wherein a wand of hazel of one years growth wanting little boughs, is to be implanted, which carry ſtreight out before thee where thou conjectureſt Metals to be, when the little Ball, bows the Rod & bends towards the ground it is without doubt that thereunder are metals, & that the labour undertaken about them will not be in vain.

This teſtimony proceeding from the Natural and infallible foundation of Philoſophie, is deſervedly to be preferred before all other Arts concerning the finding out of Metals.

Nor mayeſt thou wonder thereat, for we are unacquainted with moſt things; who is it that can certainly unfold why the Magnet atracts Iron, and heated Amber attracts Straw, Graſs, Thread and other Vegetables? the whole Earth is full of unſearchable Wonders and Secrets of GOD which are to be diligently obſerved by us.

Now as to the cauſes, why ſo many kinds of Metals are generated ſo unlike amongſt themſelves; ſome think one thing, and ſome another; many will that the Seven Metals onely have their product from the Seven Planets, *viz.* Lead from *Saturn*, Tin from *Jupitur*, Iron from ♂. Gold from the *Sun*, Copper from ♀. Quick-ſilver from ☿. and Silver from the *Moon*; but I am not of that Opinion; for how can the Sun, ☉, or any other Planet ſeek out to it ſelf in the profundity of the Earth, a peculiar place where to ſow its Seed, and procreate a Metal conformable to it ſelf; whereas we ſee that no Metal is digg'd out of the earth, alone, but alwayes mixt with others; for thou ſhalt never find Lead but there is ſilver in it, more or leſs; no Tin is dig'd or waſhed out but it hath Gold and Silver; all Copper and ♂ contains Silver, and ſometimes much ☉ which is neither conceived of, or believed by the Metallurgiſts, nor is ever Gold found without Silver or Copper, and ☽ is very ſeldom void of ☉ or other Metals; but if each Planet ſhould generate its own Metal, how comes it that another is adjoyned to it? I ſpeak of thoſe Metals only, which are either ſolely contained in their own Veins, or elſe are found and waſht out in grains in the Earth or Sand, either pure or mixt with ſtones.

I exclude thoſe which are (two or three mixt with each other) each in his own proper Vein, and are a burden or impediment, to one another, as Metalliſts ſpeak, and are often carried along a great while together, and not ſeldome do come together making one Vein, and are by and by ſeparated and diſperſed into various little Veins; and now, if each Planet ſhould create his own proper Metals verily he would alſo chuſe his own place, and would not ſuffer anotherto poſſeſs his proper neſt, and diſturb his operation.

But let us allow to each his proper Metal, and then what Starr ſhould we aſſigne to Biſmuth Cobolt, ♉ and Zink for their Generator, they being undeſervedly excluded from the Metalline Company, wherewith they are nearer affined then ☿, being fuſible with other Metals, and brought to uſe by the Artificers hand, which with ☿ Cannot be done; indeed

deed ſome are to be found alone, in Veins, as Lead and Silver, but ☉ being any where found and cleanſed from every Mineral, and waſhed out of the Sand, yet never wants Silver and Copper; Tin and iron are alſo gotten out of the Sand, and Earth in ſmall pieces, never ſimple, but mixt with ſtone; theſe grains or pieces yield the moſt Excellent Tin, (Called by the *Germans* Seiffenzin) and for the moſt part contains more Gold than that which is digged out of the pit, Becauſe while thoſe litle granulated ſtones are waſhed out (Switter or Sintranpen) many granulated ones containing much Gold, commix themſelves therewith, and are excocted and melted together with the Tin; in like manner the little grains of Iron yield the moſt Excellent Iron. The Miners find ☿ either runing or incloſed in a Red ſtone but to be excocted and vivified by Art; ſometimes alſo Copper is found in very little ſtones (Retauplein) like the Angulated Piris Stones; otherwiſe all Metals grow in their own Mines or Veins of the Mountains, out from whence being gotten with greateſt labour and coſt, together with hazzard of life, are purged from the Mine, by beating, waſhing, and melting; but how each are to be known, exploded, digged, beaten, waſhed, melted, and ſeparated from heterogeneous things, is copiouſly demonſtrated by the moſt Famous and Antient Metalliſts, *George Agricola* and *Lazarus Erker*.

I do therefore conclude that Metals, and Semimetals or Minerals, have their birth from one common Seed, but are by accident ſevered into various forms and ſhapes.

For the Vertues of the Stars being jointly carried into the Centre of the Earth, do not remain alone, but being mixt each with the other, goe back into the Caverns of the Mountains, ſeeking a place of Reſt, where they may make themſelves a Body; which if it be pure, makes alſo a pure Metal, if impure, an unpure Metal; and ſuch place is moſt like unto a Matrix, conceiving Seed from the Male, which if it forms into a body, cheriſheth, and being excocted to maturity, perfects it. Now the Aſtral Spirits ſupply the room of man-like ſperm, which being received into the moiſt Earth, in Caverns, as in a Matrix, is nouriſhed, and faſhioned into diverſe metallick Forms, and palpable Bodies, according to the purity of the place.

Hence alſo 'tis evident, That various kinds of Metals are generated out of one Seed accidentally, becauſe the Metals, whilſt in being, do grow riper by little and little, and are more and more meliorated, and daily experience doth demonſtrate, that they are nobilitated, not only under the Earth, but even above it. Hence 'tis, that the Miners digging out an immature Mineral, as *Biſmuth*, *Cobaltum*, or *Zinck* examining it, as they do ſilver, and finding nothing, ſay, that they came ſooner there than they ought, which Minerals being expoſed to the Aire, and then exploded, and tryed after ſome years, are found to contain much ſilver.

On this account I affirm, That if the common Seed of Metals, had alwaies a clean, and fitting Matrix, and no accidental impediments intervened, nothing elſe but Gold (the higheſt perfection of metals) would be generated; and that this is Natures intention, alwaies to bring to perfection, what ſhe hath begun: but Gold only attains this ſtate, all the reſt remaining imperfect; but it ſhall be clearly demonſtrated in the Third Part enſuing, that by genuine Alchumy, even they may be advanced to the ſame degree, which if it could not be demonſtrated, that imperfect Metals might by Art, be brought unto perfection, and by Induſtry, and the Fire; it might be very probable and credible, that each Metal had his own appropriated Seed and Planet.

But now, if common lead poſſeſſing but little ſilver, by the uſual trying of the Cupel, may, by the benefit of maturating Salts, be ſo far perfected by a ſhort digeſtion, as to yield much ſilver; and by a longer digeſtion or fixation, to yield, even Gold it ſelf, which it had not in it before [*Conſ. Part* 3*d.*] 'tis evidently perceptible, that 'twas not Nature's intent, that Saturn ſhould ſo remain in his Saturnine Eſtate, but that he ſhould be made Silver and Gold.

The other imperfect bodies may alſo be maturated by digeſtion, that they ſhall yield forth fixt Gold and Silver.

In like manner the ſpurious Metals or Minerals, as ♉ *Cobolt*, *Zinck*, *Biſmuth*, and others of that kind may be ſo fixed, as to be behind them, in the Cupel, good Gold and Silver, which is moſt plainly done in the Third Part.

Thus thou ſeeſt, That 'tis not Natures Fault, that there is ſo many imperfect Metals; but 'tis to be imputed to external Impediments; for if that Gold lay not hid in the Potentia in the imperfect Metals, by what Art could it be reduced into action?

Art cannot create either Gold or Silver, but Nature can, and yet doth not alwaies accompliſh it upon the Earth without the induſtry of Art: When a Gardner ſuffers the ſeed and root of the Plant to wither, nor commits it to the Earth, that it might be perfected; 'tis not the fault of the ſeed, but the Gardner, who ſuffers it, that it comes thus to periſh. Nature doth very often want help, as appears in the fruits of Animals, and Vegetables; and why may not help be neceſſary and profitable in metalline products, where, by the Artificers ingenuity, they may be holpen. 'Tis evident then, that Nature aims, as well to make Gold out of Minerals, and baſer Metals, as to make a Man of an Infant; or a Tree of a Nut: and if it be otherwiſe, it is not to be imputed unto her, but to external Accidents.

Now I ſuppoſe that I have ſufficiently proved by theſe things, that all Metals proceed out of one ſeed and root; and may be reduced thereinto, and alſo, that Minerals may be compared unto the firſt buding of Vegetables, imperfect Metals to Semiadult, or half ripe Plants; but Gold to perfect ſeed or fruit, brought by Nature unto its end or bound.

But this is to be underſtood of the Univerſal Birth, and Generation of Metals; which for the greater part, drawing their Original in the profundity of the Earth out of the Central ſeed, do grow in Caverns and Veins, and increaſe together into various forms, and are from theſe digged out with great coſts, hazards, and labour.

Now there's another Generation actuated in a plainly-diverſe manner, without the Central common, and propagated ſeed, done upon the Earths ſuperficies, by the Operation of the Stars above; yet 'tis the leaſt part of Metals, that are thus generated. It hath been ſaid, that there is a twofold manner of Generation, nature makes uſe

of in Animals and Vegetables, and ſo its in Metals.

The Firſt is moſt frequent and notable, the other is rare and inſenſible: The one is done in Plants, by the preparation of the ſeed or root; the other ſtrongly perfected by the influence of the Stars, and the Elements efficacy and power: for Example, If Rain-water, being received into ſome Veſſel, exhales in the heat of the Sun, or of the Aire, an Earth remains, which by an innate power, produceth various little Plants, little Animals, ſmall Worms and Flies, without the acceſs of ſeed.

The ſame happens in Metals, when the Sun, or any other Star operates upon the moiſt Earth; the aſtral Vertues are congregated, and being made corporeal, do exhibit diverſe Minerals and Metals, according to the purity of the Matrix, or moiſt Earth; where the Water is inſtead of the Matrix, and the Stars inſtead of the Father, or Seed: likewiſe, it is not poſſible for Metals to be generated in the Centre, where all things are dry, but far off from that place, where the Waters moiſten the Earth, and with which the Central Spirits can join themſelves, and paſs into Bodies and Metals.

For a dry ſpirit cannot coagulate himſelf into a body, by reaſon of his dryneſs, but wants a fit ſubject, from whence to take its body, which is Water: as ſoon as ever the ſulphureous ſpirit is mixt with the water, it is no more common water, but the rudiment and beginning of a metallick generation called ☿ by the Philoſophers, not the vulgar being already made metalline, but a viſcous water, which the metallurgiſts call Gur or a fermenting ſpume, which if contained in a convenient place, and Cheriſhed with the due Central heat, and an humidity, is in length of time maturated into a metal.

The Conception therefore, and generation of metals is not only in the profundity of the earth by the mediation of the central ſpirits carryed upwards, but alſo in the ſuperfices by the ſtars caſting their inviſible beams into a ſubtle, and fat earth where they are held, and become Corporeal.

For the ſidereal fire never ceaſeth to infuſe its virtues into the earth, and to Impregnate it with various products of vegetables, animals, and minerals, according as it meets with a matrix, nor is this done only in the earth as being moſt fit for metallick generation, but even in the air in thick Clouds, do they act the ſame thing.

Truly we frequently ſee that not only little Animals, as Palmer-worms, Caterpillars, Frogs & other inſects are there conceived and thence excluded, and deſcend mixt with the rain, but tis alſo evident by Credible Teſtimonys, that ſtones of an hundred weight, alſo Maſſes of Iron in the form of ſmall Conglomerated drops, exceedingly malleable have fallen down from the air, and alſo various Comets and other Igneous ſubſtances being gathered together in the air: are kindled; their matter being taken away they dy, and falling down upon the earth like a fume of Arſnick they infect it with their brats, whence an harveſt of many deadly diſeaſes doth moſt plentifully bud forth. Nay even thunder and lightning it ſelf is nothing elſe, but a ſubtle nitre enkindled, and with the Crack falling ſtones are procreated in the air; thence it appears, that not only the central fire doth ingravidate the Intrals of the earth: but alſo the Aſtral fire ſeeks a place of creating metals in the ſuperficies or in the air it ſelf, but no where more apt then in the veins and dens of the earth.

I well know, that there are many Opinions of thoſe metals, which are not in the bowels of the earth; but are found above either in the earth, or ſand in little grains, but they are for the moſt part Erroneous. Moſt men do think that gold which is found on the banks of Rivers and there waſhed out, was not generated in that place, but were broken off from ſome veins of gold by the ſtrength of waters, falls, or floods, and brought thither out of the mountains, which indeed may be true, for ſomtimes torrents do hurry alongſt them little ſhining golden grains which are afterwards taken up on the hairy backs of the beaſts, but that all gold found in Rivers, and ſtreams, is by the help of currents waſht out of the mountains, ſeems unlikely, but was rather generated there; for ſometimes gold is gathered by a river from whence the fountains are exceedingly remote and diſtant, which ſhould bring it thither.

Likewiſe in open Mountains, never ſeen by any fountains, is gold gathered out of the earth or ſand, of which kind is almoſt all the gold, which the Hollanders buy of the Indians of the value of an hundred or thouſand markes, which is not gotten out of the fountains or rivers, but for the greateſt part out of the ſand in open places, Elevated from the waters.

Such ſublime and dry places have been in Germany, alſo where the auriferous earth was carryed down to the rivers, and ſeparated from the gold, and even to this day where little grains of Zwitter or Tin are waſhed out, are grains of gold alſo found, not in low deep places, but ſcattered about the mountains and are uſually melted with the Tin, whence tis that ſuch Tin is generally wont to abound with gold, which thing I have frequently found experimentally.

The cauſe why gold is oftner found near rivers and ſtreams is this, becauſe that being carryed on with force they waſh away the ſand, being lighter and leave behind them, the more heavy grains of gold, from which the remaining ſand is waſhed away with leſs ado; but now the Rheniſh gold, ſuch as here is in Germany, and the like, is not pure, but mingled with ſilver and copper; nor is it always alone, or fine, like a metal, but in the form of an heavy and ſulphureous powder, whoſe combuſtible ſulphur being burnt and removed by fuſion, it acquires a golden colour tenderneſs, ductibility and purity.

But that which is brought from India, is, as to appearance gold, and is ſome greater, ſome ſmaller graines, and not as that with us is, yet not fine, but ſome is found better than other ſome.

I ſometime ſaw a dutch Merchant having a lump of this kind of gold well nigh fine or of Twenty four Carracts weighing ſome Lotons, but generally they are of the bigneſs of a midling ſand. But that which is waſht out in Hungaria, and Tranſilvania is eſteemed the fineſt of all, which I have found equivalent to duckets.

Now I ſuppoſe that I have ſufficiently demonſtrated, that all gold is not generated by the central fire in the belly of the earth, but alſo in the ſuperfices thereof, by the vertue of the ſuperiour ſtars, and not only gold, but other metals and minerals, eſpecially ♂ and ♀ are in like manner generated, and ♂ moſt frequently, which is plentifully found every where in round or angulated little ſtones, for the moſt part of a golden Nature, and though commonly neglected yet deſerve well to be obſerved.

Such

Such alſo are thoſe flints which are within of a reddiſh colour conteining a golden iron, for there is a great familiarity and friendſhip between ♂ and ☉, where under lys hid, a great ſecret and in the third part ſhall be explained more at large.

Now for a further conviction of ſuch as are incredulous, the metals are generated upwards or here above in a moiſt earth without the central ſeed, this example is conducible in marſhy parts, and places that are always moiſt, the Superiour Stars have a fit Subject to generate Metals in, witneſs Holland, where they yearly dig a peculiar turf or earth, which they burn inſtead of wood, which contains, beſides ſulphur, Arſnick, ♂ and ☿ yet, all, is not thus, but only that which is dig'd out of the moſt deep places, and is called baccrt, the reſt called been ſeldom contains any thing other thing than, ſulphur & a little Arſnick, whereas the other hath very much, ſulphur and Arſnick being an unwholeſome fire to ſuch as are not there unto accuſtomed, which although it be in depth Twenty Thirty or Forty feet, yet do they ſcarce extract or dig out five or ſix, or at the utmoſt ten foot, becauſe in ſome depth it wants ſulphur altogether, and is unfit for the fire.

Now then ſuch as try for bituminous Turf, or ſuch as ſearch for the depth of a Marſh, or ſeek after a ſandy bottom, drawing forth the earth with long borryers or Caugers) do find that by how much the deeper they go, ſo much the leſs, ſulphur they find, and at the bottom none at all.

Whence tis evident that ſulphur Arſnick, or that Mineral that lys hid in the earth received his Original from above, and not from beneath. But the moſt Metals are produced in the earths bowels, and the feweſt nigh the Circumference, whoſe ſeed is found more powerful in the deep, than in the Circumference; for the ſidereal virtues do conſtantly haſten to the centre, and not finding further paſſage ſight together, and ſtrive each againſt the other, and cauſe a huge heat, by the repercuſſion whereof the whole globe grows warm, and is gravidated with all kinds of Minerals.

Thus then are all Minerals, and Metals procreated, as well in the deep as in the Circumference, out of a moſt ſubtle Aſtral ſeed, with a ſutable moiſture wherein it frameth a body to it ſelf, nor let any wonder that Metals are generated of an inſenſible, and moſt ſubtle warm vapour, if joyned with humidity, they fall not down from heaven as a ſtone from an houſe, but deſcend ſpiritual, and getting a fitting place in the earth do (by the waters mediation) put on a body, and get their weightineſs from the earth, even as the ſeeds of vegetables and Animals, which (as is moſt evident) give only the form, increaſe and life, but ſupplys not the place of the body it ſelf.

But moſt falſe is the foundation of ſuch as imagine, that Metals have there Original from common running, ☿ and burning ſulphur (each being a ſemi-mettal) tis indeed certain that metals are born of ☿ & ſulphur but not the common, but ſuch aforementioned, *viz.* Aſtral, a ſulphureous warm, dry, and ſpiritual ſoul, and terreſtrial viſcous water, from whoſe mutual conjunction (as of Male and Female Seed) all Metals are born.

That Erroneous Opinion hath been the cauſe of many labours on, ☿ and they are not a few, who have waſted all they had by this, their Philoſophy. And how many have attempted to fix common, ☿ either with or without Gold or Silver, and do at this day attempt the like, with hopes of turning it into Gold or Silver, but all in vain, my ſelf have to my loſs tryed it, and how far I have come, the third part ſhall declare.

In like ſort as great a number have attempted to extract runing, ☿ out of Metals, intending to fix it (as the firſt of Metals) into Gold or Silver, but all in vain, for as the beginning was fooliſh, ſo the end terminates in loſs; and ſuch have chiefly with much trouble ſought after the ☿ of ♄ or Antimony being perhaps ſeduced by the ſayings of the Philoſophers, who affirm that ♄ the father of all Metals reduced into ☿ may be eaſily Changed into Gold, but this is not that running ☿ but a viſcous water, that may be handled like the firſt being of Metals, according as the Artificer willeth, and may be changed into any form. I cannot tell what madneſs poſſeſſeth men that aim to reduce ♄ or ♁ into running ☿ in hopes of a more eaſy fixing it, whereas neither of both ever was running ☿ and in my opinion will never be, but grant it may be made ☿ to what will it be more profitable then ♄ it ſelf, it being hereby made more volatile, and not more fixt, but ſay they ☿ is a purer ſubſtance then ♄ and will therefore the more freely be amalgamated and fixed with the Sun and ☽ no, by no means. Well! I will grant that ☿ may be made of ♄ or ♁ which yet I can hardly believe, what will it profit thee? Nothing at all; but now I readily believe, and have experienced that ♄ and ♁ being after a Philoſophical manner reduced into ☿ that is, into a viſcous water, is moſt eaſily joyned with the ☉ and ☽ and is to be fixed even without them, but twas never ſeen that, the putatitious ☿ of ♄ did ever accompliſh any praiſe worthy thing in the Meliorations of Metals. I grant that running ☿ may eaſily be made out of any Metal by the addition of vulgar ☿ and I have tryed it, but what profit comes therefrom; enquire of thoſe that have to their loſs practiſed thereabouts.

If running ☿ were the principle of metals, ſome ſmal portion thereof would verily be found in all mines of metals, or in moſt of them, but becauſe it is not there found it neceſſarily follows, that ſuch opinion is to be accounted a vain fiction.

Now all Philoſophers do unanimouſly teſtify that nature forms the firſt rudiments of metals, out of the Aſtrall Spirit, and terreſtrial water, by affirming that every thing may by art be reduced into that, out of which it was at firſt made.

And whereas metals may be reduced into a viſcous water without any corroſive, and this by a due heat and digeſtion tranſmuted into more pure, and better metallick forms, tis undoubtedly credible that they proceed from hence, and not only metals, but alſo many ſtones, and mineral things, either conteining metals, or void of them, found upon the earth, and under it, have their firſt beginnings after the like manner, my ſelf having ſeen ſome mine-diggers, in ſandy mountains diging for other things, who have accidentally chanced upon this *Gur* or Kur, thinking it to be a Lump of Fat, one of them carryed it home, and anointed his ſhooes therewith, but the next morning he found them over laid with a ſtony cruſt, and the lump or maſs it ſelf converted into an hard ſtone, but I am not ignorant that ſtones are otherwiſe generated, the reaſon how, pertains not hereunto.

A metal being reduced into its firſt matter like to Kur, is in the Artificers hand to induce into it, what form he liſts, nor can it indeed be ever meliorated

unleſs it be firſt reduced to its *prima materia*. In a ſolid metal, it cannot be perceived of what parts it is compounded, but being reſolved, it's parts are diſcovered, and it being by extraction deprived of its proper Soul, wherein its life and whole dignity lodgeth it is no more a metal, but reſembles an unſhapen brittle earth, without metallick Liquability, and its whole goodneſs conſiſts in a very little quantity of ſoul, and ſtarry maſculine ſeed, the remaining body being a dead and vile earth.

Finally, even this (which I have mentioned in my treatiſe of Potable Gold) ſufficiently confirms that metals are alſo created upon the earth, becauſe, that not only the ſolar beams being collected in various ſubjects become corporeal, but even the heat of our uſual fires doth likewiſe do the ſame thing which the tryals of the Cupels abundantly teſtifies, let the Reader ſearch and view the place. Nitre and other ſalts are evidently produced by the ſun, in a moiſt earth, which thing will never be effected in a dry. And the Philoſophers making mention of the melioration of metals, have always minded inceration, as exceeding neceſſary to their intention.

In this work, moiſture is the patient, and heat ſupplys the place of an Agent; this is diſcernable in Vegetables, Animals and Minerals, there being nothing that can attain perfection, without due moiſtening or endure the action of a maturating heat.

And by how much the thicker and fatter the water is, by ſo much the fitter for a matrix, and therein ſeed will more greedily and ſpeedily ſtick and germinate.

But by how much the thinner, it is by ſo much the more fit it is to be accounted for the ſeeds vegetation.

Water of it ſelf cannot be made a metal, unleſs it be firſt impregnated with ſeed by the ſtars, and gifted with a Vegetating life; which ſeed is the original, the ſoul, and life of all metals; and how much the more of ſuch ſeed they have, ſo much the better and more fixt they neceſſarily are.

On this account I firmly adhere to this Opinion, That metals receive their Soul, Spirit, and Life from the Starrs, as from an univerſal ſeed, and their Body from the Water as an univerſal mother, and derive the diverſity of Bodys, and degrees of Goodneſs according to the Scituation, purity or impediments thereof, and are digged out by men (for whoſe ſake (as the nobleſt Creature) all things are made) with great greedineſs, coſts, and hazards from the Bowels of the great Animal, and are prepared and elaborated for their many-fold Uſes.

Let thus much ſuffice as to the generation of Metals; but now by what means they arrive to the utmoſt end of perfection and Dye, and are hindred in their growth, we will not paſs over in ſilence.

Thus therefore the Caſe Stands, There is a certain time prefixt to all Creatures, how far they may come or protract their life, which predeſtinated time if it be cut off, and attaines not unto its ſcope or end, it comes by accident and may not be imputed unto Nature, and this is done ſundry wayes according to the various tempers of ſuch enemies as they meet withal, ſome are hurt by the cold Air, prohibiting their growth, as is evident in Metals digged from their mines or trunks and expoſed to the air, then ceaſing to grow, and were they ripe or unripe Metals, ſo remaining, but if they get a new matrix, then as the ſeed of a plant on the Earth, they begin again to grow and haſten towards perfection. To ſome, as to Vegetables and Animals; the aire is the life, of which being robbed, they expire and Dye. The air deſtroys Fiſh, the water is their life, but the death and deſtruction of two-footed and four-footed Animals.

Even as all the elements have their proper offſpring which they cheriſh, ſo are they the deſtroyers of other things, which the riſe and death of Metals clearly teacheth.

For as ſoon as ever (being conceived in the earth) they begin to grow, they become partakers of a certain ſaltiſh Nature, as their matrix, in which, and by which, they are afterwards perfected, wherein as long as they remain uninterrupted, they go forward, and are bettered in quality and quantity, but as ſoon as ever their contrary, as Aire or common Water meets with them, they are ſtopt from proceeding further in the matrix and Dye.

They being (becauſe of this moſt ſubtle ſalt) while in being, moſt impatient of both *viz.* Water and Aire.

Now if the aire invades them, their life, conſiſting in a Volatile ſalt, is elevated and drawn back by the Stars: If water breaks in, they diſſolve and are waſhed away, the matrix being deſtroyed by its contrary Element, whence 'tis that ſuch Metals in their *primum Ens*, lying Embryon like, and obnoxious even to the ſmalleſt corruption, do periſh, and never attain to the appointed perfection by reaſon of ſuch deſtructive accidents and injuries, whoſe tender ſalt is gon into ſulphur, and is no more ſubject to the corruption of either Water or Aire. As for thoſe that are Mature and perfect, if they are not cut off from their ſtock being extracted out of the Earth, from which they have no more nutriment, their ſulphurious covering being laid aſide, the defence and ſafegard of their Nature being baniſhed, they rightly reſemble a decrepid Old man, whoſe Radical moiſture is dryed up and are diſſolved and eaten up by the ſame Aſtral Salt, or Vehement Corruſcation, from whence they did ſpring, and thus are reduced unto Nothing; amongſt which, *viz.* metals, as well as amongſt Vegetables and Animals, Nature obſerves a perpetual Circulation of Life and Death.

It ſometimes happens that the diggers finding a metal excavated by the Aſtral ſalt, like to the Hony Comb by the Bees, are accuſtomed to ſay, that they came thither too late, whence it is concluded that the ſame corruſcation is the begining and end of metals.

Tis of ſmall moment to know who firſt digged up metals applying them to uſe; *Adam* was the firſt to whom GOD revealed the Art, becauſe he could not want it,

It ſeemeth certain, that that whichwas by his ſucceſſors diſcovered to *Noah*, and from him propagated unto us will undoubtedly be conſerved unto the Worlds end, becauſe of its great neceſſity and benefit.

But as this Art is profitable and uſeful, and noble, ſo it is chargable, coſtly, and dangerous, and alſo uncertain of getting gain, but yet not to be neglected on that account, it being an honeſt thing, and pleaſing to GOD, and managed heretofore by many Prophets and Kings, and now at length, diſervedly had in great eſtimation by us Chriſtians, becauſe of its neceſſity.

He

He may well boaſt of earthly felicity, to whom GOD ſhall vouchſafe to give ſuch a Light, of ſeeing by what Artifice Nature is to be holpen, and that which is ſuperfluous and adhering to vile and abject metals every where, may be removed, and the defect ſupplied; ſuch an one hath in very deed a rich and durable Mine; neither are Ghoſts, Inundations of Waters, evil Tempeſts, unwholſome Vapours, and other inconveniences, that hinder from a purpoſed intention, to be feared. But verily man, by reaſon of the continued wickedneſs of his Life, being made uncapable of this high Art and Science, is compelled to get out Metals from the Earths bowels, in the ſweat of his brows, and to paſs over his life in cares and labours.

And thus I conclude this Tract concerning the generation of Metals, and refer the Reader, deſiring things more at large, to the Third Part, wherein is accurately taught of what property Metals are, how to be diſtinguiſhed each from the other, opened without corroſives, reduced into their firſt matter, and how by the benefit of art and fire, new and better Metals are to be generated out of that firſt matter.

Likewiſe, how they are to be examined by a far better way and manner than uſual; how to be purged and ſeparated each from the other, and alſo unfolding (as far as is permitted) a little Book of the moſt expert Philoſopher *Paracelſus*, or his Book of *The Vexation of Alchymiſts*, whereby the honour due unto him (though much obſcured by evil ſlanderers) may be again reſtored unto him, and the whole world may know that he was moſt expert in natural things, and wrote very faithfully, and left unto us a large light, though obſerved by a very few, for the encreaſing and propagating whereof, and defending it againſt the haters of the Light, I will enter upon the Third Part, for my Neighbour's good, for the accompliſhment whereof I pray GOD, the Creator of all things, and the Patron of Truth, mercifully to vouchſafe his aſſiſtance. *Amen.*

FINIS.

THE

THIRD PART

OF THE

Mineral Work.

Wherein under the Title of a Commentary on a little Book of Paracelſus, *called,* The Heaven of Philoſophers, or a Book of Vexations, *the Tranſmutation of Metals are Taught in general; with an Appendix demonſtrating their particular Proceſs, Melting, Exploration, Separation, and other neceſſary Operations.*

A Preface to the Reader.

Courteous Reader,

I Will not conceal from thee the reaſon why I have taken upon me in this Third Part to explain a Book of Paracelſus, *called* The heaven of Philoſophers, *leſt thou ſhould'ſt believe I wanted matter to write, did I not encreaſe my Book by the Writings of other men. That Good which I have here decreed to write, I could have done even without the admixtion of* Paracelſus's *Books, but this properly is the cauſe, becauſe* Paracelſus *in our precedent Age, publiſhed very many moſt elegant Books for the Publick Good, but obſcure enough, and for this reaſon are by the unskilful accounted falſe, and are contemned; but yet becauſe they are ſtored with* Arcana's *or Secrets, they are moſt highly to be eſteemed. Now, after that I had perceived the ſaid Books to be true, I did very impatiently bear ſuch ſiniſter reports of this man, as blazed him abroad for one Ignorant of all things, and a Vagabond; who in very deed had but a few Equals in true Genuine* Philoſophy, Medicine, *and* Alchymy.

He did many good turns to all, eſpecially to the Poor, of which many Teſtimonies are extant; and amongſt others, that Epitaph is to be ſeen, which is in the Hoſpital of St. Sebaſtian *at* Saltsburg, *where he was buried, and to which he bequeathed his Goods, and is graven in Capital Letters in a Marble, and erected in the Wall, the Tenour whereof I my ſelf have read, and is thus:* Here lies buried *Philippus Aureolus Paracelſus,* a famous Doctor of Medicine, who by a wonderful Art cured thoſe direful Diſeaſes, the Leproſy, Gout, Dropſy, and other incurable Contagions of the Body, and to his honour gave and bequeathed his Goods unto the Poor. He died in the year of our Lord, 1541. the 24th. of *September.*

And what haſt thou now to ſay? Had he not been ſuch a one as is mentioned in the Epitaph, the Magiſtrate would not have honoured him with ſo eminent an Encomium. Moreover, all prudent Lovers of Truth do to this day believe, that he never had his equal: And although through the Envy of ſome unlearned men he is deſpiſed, yet it derogates nothing from him, for he will ſtill remain Paracelſus.

And now, ſeeing that our Paracelſus *hath hitherto undergone ſuch bitter things, and that none have dared to open their mouths againſt thoſe ſlanderers, I will attempt the explication and illuſtration of his chiefeſt Books, and prove that he was not either a Lyer or Impoſtor, but moſt experienced in the light of Nature; and to this end will I begin with his* Heaven of Philoſophers: *I will not avow, that he could make heaps of Gold and Silver, (himſelf mentioning not any ſuch thing, but he only diſcovers the poſſibility of the thing, which even I alſo will endeavour to declare, although I am ignorant of doing it in great quantities, which thing I am not greedy after) yet 'tis my contentation to be capable of diſcovering truth from falſhood, and convince ſuch as are incredulous, having ſome hopes, that by this my faithful writing, an occaſion will be adminiſtred unto others of ſearching after and obtaining their deſired end.* Amen.

The Heaven of the Philoſophers:

OR,

A Book of Vexations.

By **Philippus Theophraſtus Paracelſus.**

The Art and Nature of Alchymy, *and what is to be thought concerning it; being comprehended in Seven undoubted Rules, reſpecting the Seven vulgar Metals.*

The PREFACE. *Theophraſtus Paracelſus* to all Alchymiſts and Readers of this little Book.

BEloved and Expert of the Art of Alchymy, *and all ye who promiſe to your ſelves much Riches and Gains of much Gold and Silver, which thing* Alchymy *doth plentifully teach, and ye (who being occupied about theſe things) would be vexed, and cannot ceaſe until you have experienced what it gives, and what promiſes it performs; verily, daily Experience teacheth, that there is not one of a thouſand that becomes Maſter of his Deſire; which I will not call the fault of the Art or Nature, but the unskilfulneſs of the Artificer.*

Wherefore I will not ſtuff this little Book of Alchymy *with difficult Art and tedious Labours, as the common Alchymiſts are wont to do.*

℞ ☽ melt it with Nitre and Tartar, of this take one Lot, of Gold one Lot, of Tin three drams, of Schlich one dram, of Sulphur two Lots, of Vitriol two lots; let them flow with ☽ in a Crucible with Arſenick. *Becauſe alſo all the ſigns of Heaven, and the characters of the Stars and Planets, together with their changed and inverted terms and names, as alſo the Receptacles of the matter, and the Inſtruments of Artificers are uſually very well known; It will not be needful to treat of theſe things anew in this Book, although herein are uſed theſe ſigns, names, and characters, when it ſeems convenient and profitable.*

Now here is delivered another Reaſon of Alchymy, *in ſeven Rules, accommodated to the ſeven Metals, after an infallible manner, although in Expreſſions not adorned, but undreſſed and ſimple: Yet, as to the ſence, the expreſſions are abſtruſe and profound as can be; which may deſervedly be called the Miſtriſs and Summ of all* Alchymy; *from which even the myſteries of other things may be produced, divined, and known, with many new Speculations, from whence new Cogitations and wonderous Operations, do (by examining and trying) come forth to the Light, that in many places they are even, in the Examen or tryal it ſelf, found to contradict the Pleaſures of the Philoſophers.*

Likewiſe in this Art nothing is more certain, than that which is leaſt apprehended and believed; and this is the only fault and cauſe of all various Operations in Alchymy; *whence 'tis that many ſuffer loſs by their own unskilfulneſs, and ſo labour in vain, either becauſe there's more of the matter, or leſs, or equal weight, whence the thing is more corrupted in operation and deſtroyed; or if the thing is truly lighted on, it is become more exalted, and tends unto Perfection.*

For the way is moſt eaſie, but is found by but very few. It's alſo expedient, that an ingenious man conſider the Art and certain Rule of Alchymy, *whether he would make ſomething or nothing: he ought to make a nothing, that he may bring ſomething unto nothing, and that ſomething may be again generated out of nothing; which Saying is incredible, but yet moſt true;* Corruption makes a good thing perfect: *Yea, good cannot appear, becauſe of his covering and hider; good alſo is begun whilſt 'tis hidden; the hider ought to be removed and deſtroyed, then the good being freed, will manifeſtly appear in his luſtre, the* Gloſs: *the hider or covering is the Mountain, Sand, Earth, or Stone wherein the Metal was generated. Now every viſible metal is the obſcurer or hider of the other ſix metals.*

Becauſe therefore that by the Element of Fire Imperfect things are corrupted, burnt up, and ſublimed ſuch as the five metals, ♂, ♀, ♃, ☿, & ♄ *are; but the Perfect not at all,* viz. *the two moſt Noble, the* ☉ *and the* ☽, *therefore they ought to abide even in the fire, and to aſſume their body out of the other Imperfect metals, in which they are deſtroyed, and to appear viſibly; which thing,*

how

how it may be done, and what helps are thereto neceſſary, ſhall be taught in the ſeven Rules, viz. *What the nature and property of every metal is; what operation he hath, being mixt with others; and what he can do.*

'Tis alſo to be obſerved, that theſe ſeven Rules cannot forthwith be underſtood by one that is ſomewhat dull, at the firſt reading and view, a weak underſtanding cannot compaſs hard things. Hence every of theſe Rules wants much ſearch and travel. Some are pufft up and proud, ſuppoſing themſelves well to underſtand; and theſe things are childiſh, which are here delivered, and they know far better, and do plainly contemn theſe things of mine.

Glaub.] This Preface is of it ſelf perſpicuous, and needs not any ſingular Interpretation or Explication, but indeed the Proceſs which he mentions requires a more accurate Obſervation.

Take Antimony, melt it with Tartar and Nitre, of this take one lot; of Gold one Lot; of Tin three drams; of Schlich one dram; of Sulphur two lots; of Vitriol two lots: let them flow with Silver in a Crucible with Arſenick.

This is the Proceſs of making Gold and Silver, which *Paracelſus* will not have to be accounted like unto other Proceſſes, of much labour and long time, but is confident, that by the help hereof he can get Gold and Silver with little labour, time, and coſts.

'Tis not to be doubted, but that this hath been tryed by thouſands, and fruſtrated the hope of ſuch as laboured thereabouts; and that not without cauſe, they imagining that theſe are fooliſh ingredients to be taken for ſuch work; my ſelf have heard many of thoſe that have made trial, to be very much diſpleaſed: By what means can gold and ſilver be made by volatile and preying ravenous things, ſuch as ♁, Vitriol, Sulphur, & Arſenick are, which do not only yield from themſelves no Gold or Silver, but even corrupt them, and bring them to fume, or at the leaſt turn them to *Scoria*; my ſelf trying this when I had blown them altogether, I found that theſe metalline ſpecies, as Schlich, Vitriol, Sulphur, and Arſenick did, corrupt the Sun and Moon, ſpoiling of its metalline form, and tranſmuted it into *Scoria* or droſs. But now this is the thing which *Paracelſus* requires and aims at, and therefore ſhould not by any means hinder or deterr us; he preſently, for the better explication of his meaning, adds, Something ought to be made a Nothing; and again, the Nothing to be made Something; which thing the unskilful doth not heed or believe, that Metals being corrupted and made *Scoria*, when by the benefit of Art they are reduced, are by this means meliorated; which albeit it be moſt true, yet are they but a very few (as he ſaith) who believe it to be true: and he confirms the whole proceſs throughout the Chapter, even to the Chapter of ☿, and explains it, ſaying, *Corruption makes a good thing perfect.*

The Good cannot appear by reaſon of its covering. The hider or veil muſt be taken away, that the Good may be freed and become conſpicuous; that alſo the firſt covering, under which metals are hidden, and wherein they are generated, is a Mountain, Sand, Stone, or Earth, all which are to be ſeparated by fuſion, that the metals may become pure.

Here the Metallurgiſt deſiſts, and is clearly ignorant of any other covering. But *Paracelſus* addeth, That each metal is a hider of the other metals, which thing the ſeven Rules do largely demonſtrate, and adviſeth the Chymiſt not to reſt ſatisfied, when he hath gotten from the Mines a vendible metal, as ♂, ♀, ♃, ♄, melted from the droſs, but to conſult further with natural Philoſophy, and to examin whether or no theſe are pure enough, without any adhering and deteriorating veil.

How great the difference is betwixt a rude and a vile Mineral (where the metal is largely diſpers'd and commixt with much ſtony matter and other impurities) and a tractable metal faithfully ſeparated, is well known. So much, and more, is the difference betwixt a vulgar and imperfect metal, and the Gold and Silver which it contains ſhut up in its bowels. But becauſe the melting of metals out of their mines is, by reaſon of its long uſe, grown vile, and not eſteemed an Art, but a Trade, and every where exerciſed, without any ones admiration; yet in its beginning, before it became ſo commonly known, it was worthily accompted a deep Secret, although now diſreſpected. We may not doubt, but that even yet another veil adheres to metals, and may with as much facility be removed; and its inward, pure, and fixt center, Gold and Silver be melted out and ſeparated, if the way were but known. But becauſe men do not beſtow any further Labour and Induſtry in ſearching, and the uſe of vulgar metals is highly neceſſary, we reſt contented, in that metals once melted from their mines become malleable, and fitted for the uſe of man: Nor is this unadviſedly done, for the life of man can as little want Iron, ♃, ♀, and Lead, as it can gold and ſilver.

Paracelſus teacheth, That imperfect metals are corrupted and brought into a nothing, by the force of fire; which they cannot ſuſtain or bear; but their good parts, Gold and Silver, cannot be deſtroyed, but in the great ſtrait and force of fire do come together out of the imperfect metals, and mutually defend each other, the impure portion being burnt up and removed.

Now then, that the ſpecies and ingredients of this proceſs may be underſtood, ſomething muſt be mentioned by us thereabouts.

Thus then 'tis written; R. ♁ melt it with Nitre and Tartar, of this take one lot; 'tis to be noted that you are not to take the lot of the whole molten maſs, but of one of the two, either the upper part being the *Scoria*, or inferiour or lower being the *Regulus*, which this flowing mixture ſends downward.

But which it is, it cannot be perceived by the words; yet becauſe *Paracelſus*'s intention here is to deſtroy gold and ſilver by the admixtion of the aforeſaid ingredients, and to bring them to nothing, out of which nothing the deſtroyed augmentation of the ſun may be afterwards by ſome additament, obtained, in reducing it, it ſeems probable to think that the *Scoria* of the mixture is not to be taken, but the *Regulus*, which hath Ingreſs into Tin, Arſenick, and Schlich, and unites them with gold and ſilver, for it is the Property of the *Regulus*, to unite & conjoin contrary Metals and Minerals.

Tin is joined with malleable metals, and melted and ſuffers the fire with them, brings them into *Scoria*, the which thing Sulphur, Vitriol, and Schlich, alſo perform, and are here uſed by *Paracelſus* for no other end than to corrupt the ſun and moon, and bring them into *Scoria*. But what ſchlich (Schlich) this is, becauſe no proper name of Gold, ☽, ♂, ♀, ♄, or ♃, is added, no body can eaſily tell, for this is called ſchlecht by Chymiſts and Metallurgiſts when they take a Mineral excellently well ground, and waſhed with water, thereby ſeparating the mineral or the rubiſh and ſtone, the heavyer, and more noble part of the

metal remaining in the bottom of the veſſel, which examining they thereby Conjecture the value of the metal or mineral: this labour they call a bringing into *Schlich*, or alſo *Secher*, and becauſe all metals may be reduced into ſchlichs or calx, this word Schlich or Calx may ſuit with all metals, or elſe it may be that moſt ſmall duſt or powder in poliſhing mills, (Schleiff-muhlen) where various Iron Inſtruments, Swords, Breſt-plates, and other Arms are Poliſhed, and which is wont to be under the grinding ſtone in deep guttars deſtinated to that purpoſe, or gathered in wooden veſſels, and ſold to ſuch as dy black cloaths, and is called calx or Schlich. But now whether or no, he means this or the calx of any other metal, it is uncertain, nor doth it much concern; for the Sun and ☽ may be reduced into a nothing without any of theſe Calces, and may be again augmented, and brought into ſomething, as you ſhall ſee in the following Chapters of the Tranſmutation of metals.

Vain was their expectation who thought to turn all theſe ſpeices, thus blown together, into Gold and Silver, but yet could not get any other thing than a yellow, or ſpadiceous *Scoria* contrary to their hopes but the Corruſcation (Blick) is moſt bleſſed and gladſome, if any one can get by reduction from a deſtroyed metal brought into Scoria, a moſt noble one and better than heretofore it was. But this deſtruction and reduction is not uniform, but is perfected many ſeveral ways as the following Chapters teach.

The First Rule.

Of the Nature and Property of Mercury.

ALL things are abſconded and hidden in all things, but of all things there is one which is a coverer or hider of the reſt, and is a Corporeal Body, External, Viſible, Moveable: all fluxes are manifeſt in this veſſel, for this veſſel is a Corporeal Spirit, and therefore all Coagulations, and Conſiſtences are captivated and ſhut up therein being overcome by its flux compaſſed about and ſtrengthened thereby, what this flux is, its cauſe and name what it is called, cannot be found, becauſe there is no heat which may be therewith compared. The burning of the Gehennal *Fire may be likened thereunto, on which account this Flux hath nothing at all of Community or Affinity with other fluxes, which are melted by the heat of common fire, and become hard and coagulated by natural cold. Theſe fluxings or meltings cannot thus operate with* ☿, *they are too weak, he values them not; hence 'tis to be obſerved, that the mortal Virtues of the four Elements have no ingreſſive Operations upon the Cœleſtial Virtues, which Virtues we alſo call Quinteſſence, becauſe Elements cannot either give unto, or take any thing from this Quinteſſence; the Cœleſtial or Infernal Virtue cares not for the four Elements.*

Hence note, That none of the Elements, nor any Elementary thing, be it dry or moiſt, hot or cold, none of theſe can do any thing againſt that Quinteſſential Virtue, but each hath its operation and efficacy for it ſelf apart.

Glaub.] In this Chapter or firſt Rule of ☿, *Paracelſus* uſeth ſuccinct but yet perſpicuous words, ſaying, that the fluidity of Mercury ariſeth not from the four corruptible Elements, but from the Quinteſſence, and therefore hath not any affinity with theſe Elementary fluxings and meltings. Now, what this Quinteſſence properly is, which *Paracelſus* here mentions, much might be ſpoken, but 'tis not ſo convenient at this time, my ſelf and other Philoſophers have largely treated thereof, and therefore ſpeak not of it now.

This only I add over and above, That *Paracelſus* will have the Quinteſſence to be a thing not ſubject to the four Elements, but permanent and incorruptible, whereby he gives to underſtand, That ſeeing 'tis ſo, that the fluidity of Mercury hath its originality from the Quinteſſence, and not elementary Fire, ſo its coagulation is in like manner to be made by the Quinteſſence and not by the elementary Fires, be they hot or cold.

But now, what that Quinteſſence is, that coagulates Mercury, and tranſmutes him into Gold or Silver, it may be eaſily conjectured, that it is not to be ſought for out of Vegetables and Animals, but to be extracted out of Metals, and ought to be much more pure, fixt, and meltable than they are.

Many are the things which *Paracelſus* hath written of this Quinteſſence, attributing great Virtues thereunto; he that deſires it, may read thereof in his Writings. Likewiſe many Philoſophers affirm it to be a thing reduced by the benefit of Art into the pureſt and higheſt ſubſtance. Which name of Quinteſſence, ſome there are that attribute unto that Tincture, wherewith perfections are wont to be made. By which it is evident, That by the name of Quinteſſence is alwaies underſtood the moſt pure, the beſt, and the moſt powerful part of a thing. But be it what it will be, 'tis clear, That Mercury is a wonderful ſubject, nor is to be coagulated and fixed ſo eaſily, as many have falſly believed, and tryed the contrary to their great loſs.

Many are the Coals which have been vainly conſumed about his fixation, and are conſumed, although alwaies in vain; my ſelf have alſo, though not often, handled him with a great deal of tediouſneſs, which although not permanently fixt, yet obſerving therein many ſingular things, of which I count it expedient to relate ſomething. In him is a moſt great power and virtue, moſt friendly to Metals; he is eaſily mixed with the pureſt Metals, and moſt difficultly with the impure; which denotes him to be of a moſt pure nature: And now, if he come to be fixed, I could demonſtrate, if need were, by indubitable reaſons, that a thing more pure than Gold would flow therefrom. It alwaies produceth ſomething as often as it is added to Metals, and conſtrained to undergo ſome fire, helping them evidently, even whilſt it is in its Volatility; what then would it do, if being therewith fixed, it were along while melted with them in the Fire?

This I add for the better Lights ſake.

When I was in my youthful days, and ſaw many attempting to fix Mercury with Gold and Silver, by Amalgamation, Sublimation, Coagulation, Precipitation, and other Labours of that kind, to tranſmute it into Gold and Silver; my ſelf alſo attempted ſomewhat about him, by the advice of *Paracelſus*'s Sayings, That in Saturn its Coagulation is to be found. On this account I melted in a little Crucible 6 or 7 parts of Lead, and added one part of Mercury; this I put into another Crucible where Nitre did flow, that it might be covered over thereby; in the mean while I melted the glaſs of ♄, (being made of 4 parts of *Minium*, and one part of Flints) in a greater Crucible, whereto I put the two former Crucibles heated to be covered by the glaſs.

Theſe three I again ſunk into a new Crucible flowing with the glaſs of ♄, thinking that I ſhould this way keep in the volatile Gueſt, having now ſhut up Mercury in ſo many walls, I put him to the fire, intending to fix him, and then indeed he ſuſtained it, not being able to break through; but increaſing my fire, and the Glaſs melting with Nitre, away he goes leaving an empty neſt, and left ♄'s weight whole and perfect, which having examined, it yielded a grain of Silver heavier than the common ☽ which I believed to be Mercury fixt and coagulated, but reiterating that labour, I found it to be otherways, *viz.* that the Mercury was not it ſelf fixed, but flown away, but yet by his occult power penetrated and meliorated the lead, that it afforded a little ſilver; alſo the whole maſs of lead was hereby made black, and hardened like tin, whereby I perceived, that Mercury being a pure, meer fiery ſpirit, is moſt impatient of the Fire, and cannot be fixed without a Quinteſſence.

But thus much indeed it can do, if being joined with other metals, it can be ſo long held, as to endure the Fire; although it preſently vaniſheth away, it doth in a manner change them, not by bettering them, but ſtirring them up by its penetration, that they may mutually act each upon the other, and receive a meliorating faculty, although without any great profit, as far as I know, but I only intend to diſcover its poſſibility, its miraculous and almoſt unſearchable power, for it may deſervedly be eſteemed a Miracle of Nature. It is a meer inviſible Fire; albeit ſuch as are ignorant account it cold, and by Art it may be made far more fiery and volatile; which I ſometimes have tryed, where being often injected into a vehement fire, again and again, and received in Glaſſes, it hath elevated it ſelf without any fire, and gone away into its own *Chaos*. In a word, many men have accompliſhed prodigious things with Mercury, but all of them without any fruit; of which more ſhall be ſpoken in its place.

The Second Rule.

Of Jupiter *and his Nature.*

WHatſoever thing is manifeſt, (as the Body of Jupiter *for example) the ſix other Corporeal Metals are therein hidden ſpiritually, and one more profound and remote than another.* Jupiter *partakes not of the quinteſſence, but of the nature of the four Elements, therefore his fluidity is manifeſted by a little heat of the Fire, and his coagulation in like ſort perfected by a little cold, and hath communion with the reſt of the metalline Fluxes.*

Wherefore by how much one thing is in nature like to another, by ſo much the readier is it united thereunto, if they mutually touch one another; that alſo which is nigh, is more efficacious and ſenſible; for that which is afar off, doth not enforce, nor is that which is remote, how great ſoever it be, much feared. Hence 'tis that heaven is not deſired, becauſe 'tis far diſtant, nor ſeen by any one; neither is hell feared, becauſe it is far off, whoſe form none hath known and ſeen, nor felt the Torment, and therefore 'tis valued as nothing. Thoſe things then that are abſent, are little regarded, or plainly rejected, being conſtituted in a thick place, for by the property of the place every thing is deteriorated or meliorated; which thing may be proved by many Examples.

By how much therefore Jupiter *is farther off from* ♂ *and* ♀, *and nigher to the Sun and Moon, by ſo much the more Golden or Silver-like is he in his own body, and ſeems more great, potent, pellucid, ſenſible, more fair, pleaſant, notable, palpable, more true and more certain than elongated, or at a diſtance. On the contrary, by how much the more he is elongated, by ſo much the more vile and abject he is in the matters aforeſaid: for things preſent are alwaies more notable than thoſe which are abſent: by how much any thing viſible is nearer, by ſo much a thing inviſible is more remote. Therefore it behoves the Alchymiſt to ſtudy how he may place* Jupiter *in a ſpiritual* Arcanum *and remote place, in which are* Sol *and* Luna; *and that he may take* Sol *and* Luna *from far, and bring them near, into a place where* Jupiter *exiſteth corporally, ſo that the* Sol *and* Luna *may alſo be corporal and truly preſent before his eyes in the* Examen. *For there are various labours and modes of tranſmuting metals from their imperfection, into a perfect ſtate.*

To mix one with another, and again to ſeparate the one from the other pure and ſincere, is nothing elſe but a genuine permutation made by the labour of Alchymy. Note, that Jupiter *hath much Gold, and not a little Silver. Put to him* Saturn *and* Luna, *and the* Luna *will be augmented by the reſt.*

Glaub.] Although I do not certainly know the reaſon why *Paracelſus* beginning with Mercury, paſſeth next to Jupiter; nevertheleſs it is very probable that he would thereby point at ſome ſingular Myſtery. Here he repeateth the former ſentence, ſaying, Every viſible metal hideth in it ſelf the reſt inviſibly, from which if we would reap any good, their inviſible and ſpiritual Gold is to be taken and brought near, or to be viſible; and on the contrary, the viſible to be removed afar off and made inviſible. But how this ought to be done he doth not teach, but leaves the Reader to ſearch it out in his ſeven Canons or Rules, which are very difficult to be underſtood not only by a rude Tyro, but even by one well exerciſed: And ſeeing that not one in a thouſand underſtands them, it is no wonder that his Writings have been had in Contempt.

Without doubt he aimed at our good, ſuppoſing he had written very clearly, and directed his ſpeech in ſuch a manner, as if he had to do with one that is skilful in the metalline nature, without having any reſpect to the common blindneſs and ignorance, whereby he received great thanks, and was highly eſteemed of by all.

But what ſhall we ſay or do? 'Tis bad meeting with wicked proud men, as thou moſt clearly writeſt; yet becauſe the unexerciſed, if they have even once erred, they wrack and abuſe the Writer with meer ſlanders: Hence it comes to paſs, that many deſire rather to be ſilent, and leave unto fools their own toys and vanities: But the Caſe being with more accurate examination conſidered, it ſeemeth evil to be revenged on the Innocent as well as the Guilty.

As for Tin, if thou ſearcheſt into its nature and property, it is a pure (compared with the other metals) unripe metal, abounding with very much combuſtible Sulphur, whereby it obtains its liquifaction and corruption in the fire: which being removed (and it may be done with a gentle fire) it loſeth its metalline fluidity, and very much reſembles unmelted aſhes, whereto if you add another ſulphur, whereby that aſhes may turn into a metal; and again

converteſt it into aſhes, repeating this labour until all its combuſtible ſulphur being burnt up, it refuſeth to go into aſhes, by Calcination, and then melt it, 'twill eaſily give forth its gold and ſilver in the trial (im abtreiben.) Now, in the being mixt with Lead, it cauſeth a ſtrife in a ſtrong Fire, and getting uppermoſt, turns into aſhes, that is to be imputed to the combuſtible ſulphur, whereby it ſo being melted with Gold, Silver, Copper and Iron, it makes them brittle like to Glaſs, but being diſpelled of that Sulphur, by roaſting or calcining by Incineration or Cementation, or any other way, it doth not any more make them brittle (which thing to do is full of difficulty) but is melted with them, and moſt eaſily ſeparated with, Venus (laſt ſich ſehgern) ſhe knowing how by her kind and flattering words to perſwade the two old men ♄ and ♃, mutually to abide each other in the fire; Gold and Silver will alſo do the ſame thing; but becauſe they are precious and eaſily flow out of the Crucible, and the Work may periſh, it is ſufficient to uſe ♀, which alſo will give from it ſelf its own hidden Gold and Silver, and not to take theſe metals which are purified with great labour, and drown them afreſh in impure metals, and deſtroy them.

There are alſo other waies of purging ♃, from his ſuperfluous ſulphur, *viz.* a Nitrous fire. If filed ♃, being mixt with Nitre, Sulphur, & Sawduſt, be kindled, part of the tin is elevated up into flores, and a part remains reducible in a ſtrong fire, which is to be ſo often handled the aforeſaid way, till all the ſubſtance be reduced into flores and aſhes, the metallick form and nature being moſt plainly deſtroyed; after this, let the flores be gathered out of the Receivers, and the aſhes elixiviated or waſhed, and by the help of a good Flux be reduced into a metal, which is to be again filed, ſublimed, and burnt, as before, until all the Tin remains like Sco ria, and will not ſublime; which being melted with Lead and ſeparated, (mit Blen amſtieden vnd abtreiben) thou ſhalt find gold and ſilver ſhut up in its bowels.

Likewiſe pour fixed Nitre (the liquor of it) on the filings of Tin, digeſt it its time, ſupply the evaporating moiſture with new Liquor, that it may be alwaies moiſt, but yet let it not be too wet, but like thick water. This Liquor diſſolves and takes away the combuſtible ſulphur of the Tin, and fixeth that which is incombuſtible, and makes it capable of enduring the fire; ſo that being melted with Lead, and purged (aenſieden vnd abtreiben) it yields its gold and ſilver.

Another ſeparation is thus inſtituted; Reduce Tin with common ♄ or *Regulus*, ℥j. into Glaſs or Amauſa, which keep a good while in Flux in a ſtrong fire, (forget not the inceration of Nitre or ſalt of Tartar) by which labour the purer parts of the ♃ being gathered together, do give a *Regulus*, the impurer parts ſeparating themſelves with the Lead and Salt into Scoria, the *Regulus* being purged (abgetrieben) thou ſhalt have the fixed gold and ſilver in the Cupel.

But 'tis to be known, that theſe Operations may be done without Copper, but yet will yield more ☉ and ☽ if Copper be added; not only for that the ♀ it ſelf gives forth its ☉ and ☽; but becauſe Tin of it ſelf, without the admixtion of ♀, doth not willingly let go its own ☉ and ☽. But in ſeeking of ſhelter amongſt its own ♀, and withdrawing it ſelf to the *Scoria*, is there hidden (the Labour being finiſhed) the *Scoria* can no more attract it into it ſelf.

♀ therefore is as it were a Receptacle, wherein the Sun and Moon collected and ſeparated out of the maſs, can defend and hide it ſelf, and is by Chymiſts called a Bath or *Balneum*.

In the 4th. Chapter, which treats of ♀, a more large account is given of this labour of metalline Glaſs. Moreover gold and ſilver may be ſeparated out of tin in this wiſe.

Melt common Lead in a Teſt (treib ſcherben) under a Muffle (een muffel) and being throughly hot, caſt in a little ♃, and it will incontinently have Ingreſs, but will forthwith aſcend and kindle like burning ſparks and go into aſhes; which muſt be taken off with a crooked Inſtrument, and more new Tin put in; which being burnt, let it be taken out. Repeat this labour ſo long, till all the Lead be devoured as it were by the Tin.

Put theſe aſhes on a Teſt, under a Muffle, and let them be yet well heated by the fire for an hour; ſo that if any grains of ♄ remain, they may be made aſhes, and the calcined aſhes of the tin may be the better fixed. Reduce theſe aſhes, and 'twill become a metal, which let be again made aſhes upon a Teſt; repeat this labour, until in reduction it refuſeth to go into a metal, but remains a *Scoria* and a metal deſtroyed; which put into an excellent Crucible, and by a Flux made of Tartar and Nitre, let it melt its due time, and the fixed Tin, together with part of the Lead, will go to the bottom into a *Regulus*; which being waſhed (abgetrieben) makes manifeſt the gold and ſilver hid in the Tin on the Teſt. This Labour is neat, eaſie, and but of ſmall charge, eſpecially where wood and coals are cheap, the *Scoria*, from which the *Regulus* is ſeparated, is not to be thrown away, but kept for other uſes, of which we ſhall preſently ſpeak.

Now he that promiſeth Gain unto himſelf from this ſmall work on a Teſt, is deceived, becauſe hereby is only found how much ☉ and ☽ is contained in an hundred weight of ♃, and what coſts are expended in its melting, whereby may be computed what gains may be expected every day, nor indeed is this work (thus done under a muffle) ſo profitably accompliſhed, as 'tis in greater Furnaces, where being a greater heat of fire, a more plentiful gain is promiſed. And although becauſe of many various Imployments my ſelf never tryed, yet I will briefly delineate and deſcribe how a large Return may be made, according to Calculation, computed by a ſmaller quantity.

An hundred of Tin requires 10 or 12 C. of ♄; (the work being wiſely handled) the price of the Lead, ♃, Coals and Labour, being ſummed up, and being ſubſtracted from the ☉, there ſeems to remain but a very little to defray the charges. But if you look thereinto a little more narrowly, you will find a recompence and benefit ariſing thence, not to be deſpiſed, eſpecially if you uſe Lead impregnated with ☽, which by reaſon of not conſidering the benefit and gain, remains unſeparated therefrom. Likewiſe you may uſe a golden ♃, ſuch being often found as contains as much ☉ as the ♃ coſts; and you may alſo meet with ♄, which contains as much ☽ as the Lead is worth, but not ſeparated by the Refiners, becauſe they are ignorant of this ſeparation, which by the uſual way cannot be ſeparated with profit: and that your Labour may be the more beneficial, you may add to your ♃ ſome golden or ſilver

ſtones

ſtones and minerals, as Marcaſites, ♁, Arſenick, Auripigment, Cobolt, and various Pyrites or Kiſij (which becauſe of the ſmall quantity of their included ☉, are never wont to be melted) & let them be *ſcorified*, which yielding alſo their gold and ſilver, do bring in a greater profit; but eſpecially if theſe Minerals having been firſt melted with Copper, are by the benefit of Iron (or melted with Iron) brought into *Regulus*, and their Gold reduced to a narrow compaſs, which *Regulus* being thrown into the Lead, together with the Tin, let be made into *Scoria*, and then their ☉ is gotten without much charge, and is depurated by the Tin. But now, if you would have this ſeparation profitable, it is not to be done in Crucibles, but in well compact Furnaces or Hearths, whereon the bright flames running, let your metals be throughly heated or calcined, and your Calcination, Incineration, or Annihilation being accompliſhed, let Reduction be made in an acute Furnace, (im Stichofen,) of which thing my time permits me not to give any larger account; its ſufficient to have experienced the truth thereof in a leſſer quantity; any one may try his fortune in Metallick Operations.

Now, although there are more waies of ſeparating ☉ and ☽ from ♄, yet what I have already declared ſeems ſufficient for this time; the following Chapters, wherein the nature of the other metals is treated of, will manifeſtly open what I have decreed to diſcover concerning them.

The Third Rule.

Of Mars *and his Property.*

THe ſix hid Metals have thruſt out, or expelled the ſeventh from them, and made him Corporeal, leaving unto him loweſt Dignity, and impoſing on him the moſt thick hardneſs and labour. In this body have they manifeſted their whole ſtrength, and hardneſs of Coagulation to be, ſhutting up, or keeping inward, their Colours and Nobility, with their Fluidity. 'Tis hard and full of Labour, to make a Prince or King of a Peaſant, or common Fellow: But ♂ by his Vertue, obtains Honour, and gets up into the high Throne of the King: But 'tis expedient, that care be uſed, leaſt haſtily poſting forward, he be taken. It is to be conſidered by what Art ♂ may be promoted to the Throne; but the ☉ and ☽ put in the place of ♂ with ♄.

Glaub.] We are come now to *Mars* in order, it being the 3*d*. according to the Compute alſo of the Aſtonomers, deſcending from above. Now *Paracelſus* doth not attribute the firſt place to ♄, as the Aſtronomers do, but to ☿; and haply, not without great Cauſe, hinting hereby ſome ſingular thing. He goes on, and ſays *Mars* is rude, ſharp, and thick, becauſe the other Metals have caſt out their moſt ignoble, and baſeſt part upon him, which thing experience teſtifies: He is compoſed of hard knotty Timber, and hath in him but little good; he is ſharp and churliſh, and not at all to be compared to gentle, tender, and noble ♃; but if he be once freed from his knottineſs, which is hard to do, and render'd tractable, he ſhews his Virtue, and diſcovers himſelf alſo to be a partaker of the Royal Blood. *Paracelſus* adds, that ♄ can take away his knots, and elevate him to an higher degree, although the Aſtronomers are very much diſpleas'd with the Conjunction of theſe two, as being the Author of all evil, and have therefore inſerted peace-making, and benign *Jupiter* in the middle. Now that Lame *Saturn* may poliſh and make crabbed ♂ ſmooth, *Paracelſus* tells you that there's need of Caution, leſt by over haſtineſs, he bring loſs upon himſelf. He ſtoutly reſiſts, nor doth he eaſily yield, but rather buſily contrives how to captivate and deſtroy others; yet *Paracelſus* mentions its poſſibility; whoſe Reaſons, Way, or Manner, we will briefly illuſtrate. ♄ indeed is by Birth, fitted to waſh the other imperfect Metals, and to purge them from their ſuperfluous Sulphur, if any good doth accidentally adhere unto them, but knows not how to remove their radical, and innate Impurity; and that it is not alone ſufficient for this thing, the trial of the Teſt witneſſeth; for although you add Iron to ♄, to be ſeparated upon the Cupel; (Abgehen Laſſen) yet hath it no ſincere ingreſs into ♄; but if it be ſo far brought by great labour, it doth not remain, but ſpeedily ſeparates to the Superficies, like *Scoria*, and leaves nothing with the Lead, but what was accidentally in it, himſelf withdrawing with his whole power, and native goodneſs; Tin alſo doth the ſame; but Copper albeit it ſwims not upon the Lead, nor goes away, yet it is not therewith radically joined, but being reduced with the Lead, into Liquable *Scoria*, deſcends into the porous Aſhes, of which we have accurately treated in the Fourth Part of our Furnaces, and in the Appendix.

Lead is not therefore the true waſhing of Metals, but that it may ſo become, 'tis clear that it muſt be aptly prepared; and if you do more exactly contemplate on the thing, you'll find it very rational; for by what means can ♄ the (moſt liquable of all the Metals, freely copulate with ♂, which is the hardeſt: Indeed 'tis true, that they enter each into the other by mutual fuſion; but 'tis forcedly and ſuperficially, not radically; as if one boils Water, mixt with Meal, into a Pulſe; the Water thickens, the Flour moiſtens; yet neither entring into the other, radically; but the Water getting into the Pores of the Meal, or Flour, makes it Pap: In the ſame manner is it with ♄ and ♂, they are indeed mixt; but cannot equally ſuſtain the violence of the Fire. ♂ doth not alter his breeding or wit; but in the melting together, remain an hard, and not eaſily melted Metal; nor is the humidity and liquability of the Lead hereby corrected; for although they are become one Maſs, yet each keeps his old Condition: but if they are ſo order'd, that both of them may undergoe the ſame Fire; then the Iron will yield, and deliver his Gold unto the Lead, and his warm Volatile Sulphur maturates the Silver, lying hid in the Lead; exalts it, and makes it corporeal, that each beſtows on the other, his Goodneſs and Virtue; each ſupplies the others defects, and both are perfected; for although hard crabbed ♂ be made flow with liquid and combuſtible Sulphur, or a Sulphureous Mineral, as ♁, *Arſenick*, or *Auripigment*; yet is not any tranſmutation made, each remaining in his own Nature, without alteration; like as ☿ being reduced into an *Amalgama*, with ☉ or ☽, makes no ſolution, only adheres unto the Gold, and eaſily ſeparates therefrom, leaving the Gold to himſelf: But if any one know how to conjoin, ☉ and ☽ with *Mercury* radically, they would not forſake one the other; but would perfect themſelves mutally in a ſtrong Fire; ſo would the other Metals too, were they but radically commixt. Some one may ask, what is this radical or ſpiritual Com-

mixtion of the Metals, and what I underſtand thereby? for Anſwer, They are to be ſo united with an implanted Love, that they freely join together, and ſo remain equally, enduring proſperity and adverſity; and neither of them diſcernible from the other, that they penetrate the ſhut Gates, and thick Walls, without any obſtacle; that the Volatile exhales not in the Fire: that which is liquable, ſeparates not from what is illiquable; thereby penetrating the Veſſel, leaving behind it, the more fixt, or rougher part, in the form of *Scoria*: But thou mayſt demand by what means I ſpiritualize the Metals, and radically conjoin them; what, muſt they firſt be diſſolved in *Aqua fortis*, or other corroſive Spirits, and be diſtilled by an *Alembick*, that they may become Volatile? No, I mean not any of this; this kind of ſpiritualization is a meer deceitful, and cheating Labour, hindering many thouſands, which otherwiſe would be nigher to the Truth: All the Philoſophers diſſwade you therefrom, that you do not torment the Metals with ſharp ſpirits, whereby inſtead of being perfected, they are corrupted and mortifyed radically. 'Tis madneſs to pour more Water into any one that is ſuffocated with Water, thereby to reſtore him to Life; this is to put the Bridle on the Horſe's Tail. Now 'tis evident, that the ſuperfluity in imperfect Metals, is their combuſtible and corroſive Sulphur; and by how much, the more imperfect and baſe they are, ſo much the more of a combuſtible Sulphur do they poſſeſs: an evident Teſtimony, of which we have in Iron, or ♂: 'Tis only his acid Sulphur that deprives him of every degree of dignity, which groſs, acid, and vitriolated Sulphur, did he not ſo much abound withal, he would not contract Ruſt ſo eaſily; and by the attractive Moiſture be ſo ſoon corrupted: and were he not ſo quickly ruſty, he would be put to better uſes, than now he is. But you may object, that you cannot conceive, how he can have ſuch a corroſive Sulphur, whence ſhould it happen to him, for the Mineral, and Stones, whence he is extracted, do not appear to be impregnated with ſuch a Sulphur; whence comes it therefore to be in him? Beſides, if the Mineral did partake of ſuch a Sulphur, ſurely it would never abide a Fire ſo violent, but it would be driven away.

My Friend, thou doſt not at all underſtand the Nature of Metals, and for what end it was, that Nature left ſuch a Sulphur in Iron, and the other imperfect Metals; for it is a Nutriment unto their better Parts, being like an *Embryo*, and as it were, a Covering or a Matrix, in which a noble Child is maturated, and is (after the ripeneſs of the pure Metal) thence excluded. For Natures intention was not, that Iron ſhould be but Iron, but rather Gold; but the digger not willing to wait ſo long, and knowing the manifold uſes of Iron, allows not time for it to become Gold, juſt like the Fiſher-man (who catching a very ſmall Fiſh, and the Fiſh deſiring to return into the Water, until being grown bigger, he might the better fill the Platter) ſaid, nay, but I will hold thee, as thou art, for 'tis uncertain, whether or no, being grown bigger, thou mayſt then be found. Juſt thus doth the Miner do, he waits not the Irons becoming Gold, but puts it to its preſent uſe.

'Tis commonly known, that there is abundance of corroſive Salt therein, which is not combuſtible in melting Fire, neither needs it any further demonſtration; it having been alſo treated of in the Annotations of my Appendix: and that thou mayſt ſee that a Metal can preſerve, and keep its volatile combuſtible Sulphur in a melting Furnace, I will expound it ſomewhat clearer: Gold having already obtained its perfection (it being a mature product) Nature hath ſeparated this combuſtible Sulphur, or acid volatile Salt therefrom; becauſe it needs it not for any further nutriment: neither would it hold it, if it ſhould be put unto it, but thruſts it from it in the Fire, and hath no affinity therewith, as the other imperfect Metals have.

Now *Luna* although it be not ſo compleatly perfect as *Sol*; yet, 'tis more perfect than the others, and hath notwithſtanding, a Commerce with this ſulphureous Salt; yea, ſo as to hold common Sulphur a very long while in a great heat, which we ſhall declare anon in the ſeparation of Metals; and if ☽ (which is almoſt a ripe Metal) doth thus, queſtionleſs the other more imperfect ones will do it more willingly; which thing, that you may be the more aſſured of, incorporate a ſulphureous Salt with any Metal, and continue it in a great heat; and after a few hours you ſhall ſee that your Metal will hold that Sulphur, and defend it againſt the force of Fire; but if a Metal be in ſome ſort freed from this ſulphureous Salt by a melting Fire, it doth again receive and hold it; Will it not therefore hold its own, wherein it was born and from whence it came forth. ♂ excells them all as to this, being not only a friend to ſulphureous and corroſive Salts, but alſo to Vrinous which (when it cannot have acid ſalts) it doth by a magnetick power attract and defend theſe in the fire. For example; mix the filings of ♂ with Nitre and ſalt of Tartar, and theſe ſalts, in a melting Fire, will be fixed with ♂, and reſiſts the Fire. Which thing is moſt worthy obſervation, and by no means to be neglected.

But to return to my former purpoſe of demonſtrating, that Imperfect Metals are not only, not bettered by corroſive ſalts and ſpirits, but are rather corrupted: Daily experience doth prove it before the eyes, that all ſuch as have uſed corroſive ſpirits in their bettering of metals, have done no good at all therewith, but have, to their hurt, loſt both their time and labour: whereas thoſe that have uſed other *menſtruums* that are not corroſive, have profited more therefrom, and have ſeen more than they have ſought; ſuch as thoſe are in a way tending to diſſolve metals without corroſives; to make them ſpiritual, and radically to unite them, that they may mutually act in, and ſuſtain or undergo the Fire alike, and may co-operate to purity and perfection, and may ennoble themſelves. Of which *Spiritualization* more ſhall be ſpoken in the Sixth Chapter, where *Paracelſus* alſo treats thereof. This therefore do I affirm of ♂, that he muſt be handled with ſuch *menſtruums* as are not only not corroſive, but contrary to Corroſives, and ſuch as mollify and ſeparate thoſe Corroſives which the Metals hold in fuſion, that ſo for the time to come they may attract no more any moiſture, and thereby contract Ruſt, and be corrupted; but may be rather able to preſerve and defend themſelves againſt Corroſives and combuſtible Sulphur. But let none think, that ♂ being by this Antidote freed from its thick, earthy, and combuſtible, and corroſive ſulphur, will be wholly turned into ☉, for 'tis the ſmalleſt part of ♂ that is good: by how much the ☉ is more noble than common ♂, by ſo much is the ♂, from whence

whence the Sol is ſeparated more vild than other Iron, and the remainder is nothing elſe but a moſt vild Earth or *Scoria*, void of all metallick fuſion. The milk of a Cow or another Animal, if unmixt with water, is good milk; but yet 'tis far inferiour in goodneſs to pure, good, well-wrought Butter; and by how much milk is more vild than butter, by ſo much is the whey and acid milk from whence the Cream is ſeparated, more vild than that which is ſweet and abounds with Cream. If generous wine be ſpoiled of its ſpirit moſt ſweet and moſt excellent, by the benefit of Deſtillation, one part of that is better than 12 parts of wine out of which it was extracted; the remainder cannot be wine any more, but is much inferiour to good wine, as wine is to the ſpirit.

The like is it with Metals, which being deprived of their ſoul, whereby they obtained a metallick form, they can no more be malleable Metals. Therefore 'tis good to conſider whether or no in the ſeparation of ☉ out of the Imperfect metals, it will be anſwerable (in value) to the metal, and other Expences neceſſary about extracting it; but now, if you know how to apply the reſidue of the Metal to other uſes, you may with the more confidence attempt the ſeparation. But to return to the words of *Paracelſus*, I will ſhew how ♂ may, through ♄'s help, arrive to a Kingly dignity. I have before ſaid, that there is no familiarity between the moſt fuſile and moſt hard metal, but the one will be gone away in fume before the other will melt, and that we cannot want ♄ in the ſeparation of ♂; but how it is to be handled, I will briefly explain.

Saturn of himſelf is liquable and volatile, but yet can be made illiquable and fixt without detriment of the Radical Moiſture or Metallick Nature; ſo as to undergo the ſame Fire with ♂, and being brought to this paſs, it is then fit for the ſeparation of ♂. 'Tis many waies made illiquable (Hartflüſſig) but the beſt way is by fixed Salts, of a contrary nature to the ſuperfluous Sulphur in ♂, and excellently well ſeparated from the *Reguli* made of ♂; for Nitre and Salt of Tartar do not only harden ♄, but unite other metals with him, making them ſpiritual, and moſt like to tranſparent, ſoluble Glaſs, the which having ſuſtained the Fire their proper time, the Agent being taken away, and the Patient ſufficiently purged, the pureſt part of the Metals, thus ſpiritually mixt together, doth by the force of ♄ ſeparate from the other unprofitable part. The *Regulus* is purged eaſily, ſo that there's no need of ſeparating the whole Maſs by precipitation and reducing it into *Reguli*; but ♄, by his innate force, doth in its due time finiſh the ſeparation or precipitation of the pure from the impure, of metals thus ſpiritually commixt and united. This is enough ſpoken concerning the way of ſeparating gold out of ♂, by ♄, *viz.* ♄ being firſt fixed by ſalts, and made hard to melt, ſo as to endure the ſame force of Fire with ♂, or otherwiſe 'twill be impoſſible to have any thing from ♂ by the uſual way of the Refiners, by the help of ſcorifying with ♄ (mit anſieden) and ſeparation (abtreiben) which even as ☿ alſo doth not ſtay with common Lead in a ſtrong fire, but ſeparate themſelves and go into *Scoria*; the which we have alſo hinted in the Firſt Part of this little Book, whereto we referr the Reader. This ſeparation of ☉ out of ♂, may be done with *Regulus* of ♁ and Nitre, and in ſome manner better than with common Lead, but that I do not deliver the whole Proceſs from top to bottom, let no body wonder thereat, for then the Book would grow to too great a bulk, and I ſhould not receive any reward the more from the Unthankful: Let it ſuffice, that I have declared the manner and the Species wherewith 'tis to be done; for 'tis for the ſake of ſuch Chymiſts as are moſt expert in the Fire and Metalline Works that I write, and not for the common Deſtillers of Waters. And as touching what may tend to illuſtrate what is ſaid, it ſhall be ſupplyed with ſome Proceſſes at the end of the ſeven Rules.

Whereas I have attributed to ♂ in the Firſt Part of this Treatiſe and elſewhere, that he doth not only unwillingly deliver his own gold, but alſo if any be either accidentally, or of ſet purpoſe, added thereto, he ſwallows it up and hides it, and will not reſtore it without detriment and loſs. Some body may admire how it's poſſible for to be done ſo eaſily by ♄ and Salts; let him know that this Extraction of ☉ out of ♂ is not any the common Examen or Trial, (abtreiben,) but a true and Philoſophical ſeparation (Scheidung) wherewith ♂ being well diſſolved, is moſt throughly ſeparated from his thick and hard body, concerning which, I never met with any full pregnant Proceſſes any where. And albeit that I am not ignorant that many, yea moſt that read, will not have any higher thought or conſideration, yet I ſay that there is ſomething elſe hereunder; and do believe, that it is to be eſteemed far more excellent than Sol it ſelf; which that thou maiſt not over-much trouble thy head about, I will not be ſhy in communicating it alſo unto thee. *viz.* Out of Iron is prepared a Salt without any corroſive, which is able to extract the ſoul from Gold, that it will remain half dead. But ♂ will be impregnated as it were divinely, ſo as to be able to give forth a golden Child: the debilitated Gold will recover its loſt Colour and Virtue by ♀ and ♁. Other Philoſophers have likewiſe made mention hereof, *viz.* that ♂ will not ſpare even the King, out of whoſe bowels he will ſteal Treaſures, and will not bluſh to adorn himſelf with the ſame. Concerning which Secret the moſt famous *Sandivow* wrote on this wiſe. "The "Chymiſts know how to change Iron into Copper or "♀, without the Sun: They likewiſe know how to "make ♀ out of ☿: Others there are that can make "☽ out of ♄; but if they knew how to adminiſter "the Solar Nature to theſe mutations, queſtionleſs "they would find a thing more precious than any "Treaſure. On which account I ſay, that we muſt "not be ignorant of what metals are to be conjoined "one with the other, and whoſe nature of them "correſponds to Nature. There is therefore given "one metal, which hath a power to conſume the "other metals, for it is as it were almoſt their wa"ter and their mother; one thing there is that on"ly reſiſts it, and is bettered thereby, *viz.* the *humi*"*dum Radicale* of the Sun and Moon; but that I "may diſcover it, 'tis called *Chalybs*.

Thus you ſee, that from ♂ alſo ſome good is to be gotten, although all ſpeak ill of him; and indeed he is wicked if he gets poſſeſſion: Nor will he ſpare the higheſt Powers, from whom he will forcibly wreſt their hidden Treaſures, but yet by Commerce with ♀ he will again repay it in time to be diſtributed amongſt the ſubjects; although the king being robb'd of his goods, looks pale upon it, yet he lays not down his Life, and he remaining alive, there is no cauſe of complaining, for as long as the Riches are not exported, but remain in the King-

dom, distributed amongst the subjects, he is able to receive his former majesty and splendor from his Revenues, and to gather new Riches, and preserve his kingly dignity whole and sound.

Here I foresee that our common Know-littles, in the light of Nature, will traduce me, as if I enterpret *Sandivow's Chalybs* to be common ♂, and say that 'tis not to be understood according to the Letter, but the Author would hint somewhat else thereby; but 'tis no matter, what I have written, I have written, and that not without cause. I am not ignorant, that he means not common Iron no more than I, but his inmost Magnetick force and power, or essence, prepared without corrosive, and known to few, which doth most greedily extract and transmute the soul of Gold above all other things. And herewith we will rest and cease.

The Fourth Rule.

Of the Nature of ♀.

THE other Six Metals have in ♀ *framed all their colours, and the* medium *of their Flux (with inconstancy) into an External body. It would be therefore profitable to hint to the understanding by some examples, by what means the visible may by the benefit of Fire be made invisible, and this again made visible and material. All combustible things may naturally be changed in the Fire, out of one form into another, as into a Coal, Soot, Ashes, Glass, Colours, Stones, Earth, but the Earth is reduced into sundry metallick bodies; and if a metal combust or corrupted with old age, is thereby become unmalleable, sharp, and brittle, let it well flow, and 'twill again become malleable.*

Glaub.] Although that ♀ being malleable more than all the metals, in and out of the Fire, is fit for all Operations, yet even this is not void of a combustible sulphur, but is radically polluted therewith, so that it will most easily, of it self, without addition of any other sulphur, be reduced into *Scoria*, and be corrupted, which corruption is occasioned by the muchness of its combustible sulphur; Gold and Silver being void of that Sulphur, are not subject to destruction. So that, although they undergo the Fire a most long season, yet go they not into *Scoria* like the other imperfect bodies; and for the reducing of them into ashes, combustible sulphur must be added; whereas the imperfect metals too much abounding with the same, are changed by a most light heat into Ashes, Powder, or *Scoria*, which *Scoria's* are melted into either transparent or darkish tincted Glass, according to the nature of the metal; which Glasses may be melted into malleable Metal, and again into Ashes and Glass, as you please, but alwaies with some loss, by reason of some combust parts irreducible into metal, the metal also remaining, as it was at first, without being any thing bettered.

He who knows how to melt Metals into pellucid Glass, by the addition not of metallick things, but of such things as have affinity with the metals, as Salts, Sand, or Stones, shall in reducing them, alwaies find his metal better than it was in the beginning: And that the Reader, for whose sake I have written these things, may the more throughly understand my mind, I will explain it somewhat more clearly. *Paracelsus* hath above affirmed, That every visible metal is an hider of the other metals lying hid invisibly therein, and that the hider is to be removed, if you would that those visible metals become visible and corporeal, which being most truly spoken, I know not what light it may be illustrated withal. The words also are succinct and easie to be understood, yet no body believes them; There's scarce one amongst an hundred that conceives what they tend unto. *Metals cannot be changed without putting off their metalline form*; for if you keep them along time in Flux, by themselves, or joined with others, if they remain in their Corporality, they cannot help each the other, but being destroyed either by themselves, or joined with other Metals, and nourished in the fire their due time, it cannot otherwise be, but that they should be bettered, for so long as it retains its metalline form, it cannot be holpen. 'Tis necessary that a hard body be broken and annihilated, before there can be made a separation of the pure from the impure.

But this is to be done by a genuine Chymical manner, and they are to be dissolved and throughly opened, with things of affinity with them, whereby the purer parts may be united, and the more gross may be separated. If a metal be forced with a most vehement Fire, its parts do firmly hold together; for if it be fixt, then the parts abide in the Fire; but if volatile, then the parts thereof fly away together, their natural bond holds them together, defending them against the Fires power, but dissolve their bond, and then they are compelled to submit to *Vulcan's* Force and Empire, and will let you make of them what you please. It may well shame the Chymists to work so disagreeably with Nature, and may well learn by the Husbandman's labours to send for Nature's help. The Husbandman therefore, when he sows his seed, to have a good Crop therefrom, he casts not his grain upon any sort of earth, without consideration, but chuseth such earth for each proper seed, as being well dung'd, may suit best therewith, and in a convenient season sows his grain, that it, being putrefied and annihilated, may be multiplied, he leaves it to the warmth of the Sun, and to the vivifying Rain to concoct and maturate it; well knowing, that without precedent putrefaction and loss of its form, it cannot be multiplied. He likewise knows, that when it hath arrived to its maturity it must not be left in the Field, but must be reaped, and then the better and more heavy part is to be fanned and separated from the lighter and worser part, *viz.* the Chaff; the which operation is, by Experience and long Use, known to be good and needful. This Process must a Chymist observe, for one Metal may be made the field of another, wherein putrefying, it may get it self a new body, which being done, he must likewise know how to separate the new body from the *fæces*, from which 'tis gathered and made; and how to fan *Vulcan* like the best and most ponderous, from the lightest, for both of them will be made better by the foregoing preparation, and the annihilation of the bodies. When a Country-woman intends to separate the better part of the Milk from the more gross and cheesy part, she puts it in a quiet warm place, that the best part may rise up, and the worst part go down; the which being as yet not sufficiently purified, she adds her art, and puts it into a Churn, and doth so long stir or agitate it until another separation be made of the pure from the impure, which we call *Butter*; which notwithstanding, had it lain never so long

by

by it ſelf, had never come to have been Butter, without the Hand and Art of the Country-woman. Who would believe that in Milk there lies Butter, if he did not daily ſee it? This ſeparation of the Butter from the wateriſhneſs, proceeds from the quick ſhaking and agitation, whereby the Milk heats; and if it doth not fadge, then do they put thereto ſome warm moiſture, which uniting it ſelf with the moiſture of the Milk promotes a ſeparation, for heat alone is the meer cauſe of haſtening the ſeparation. This now may ſeem a groſs Example to the Ignorant, but let none imagine that this ſeparation of the Butter from the Milk is alledged in vain, but rather to ſhow the way how out of imperfect Minerals the golden and ſilver milk or part, is to be ſeparated by the acceſs or addition of a warm Mineral water, and by the Fires agitation: Even as warm Water helps the moiſture of the Milk, that ſo it doth the eaſier ſeparate its own heterogeneous Butter (and yet the way of ſeparating the Butter from the Milk, without agitation, by the affuſion of a warm thing and coction, is not unknown;) ſo alſo the Metals are ſeparated, if they are along time boiled with their own Water.

Now, becauſe of themſelves they are compact bodies, if you keep them in Flux a long ſeaſon, they remain compact, and are not able by their own power to ſhew forth their Good or Evil, nor make it appear, whether or no they contain Gold or Silver: They are to be a long time boil'd with Water, that being diſperſed, they may be tranſlated out of their metalline nature, and the pure (by the agitation of the Fire) may be ſeparated from the impure; which purer part of the metal doth not ſwim at the top, like Butter, but ſettles to the bottom like a *Regulus*, after the metallick manner, and all being cool, it muſt be ſeparated from the *Scoria*, and in a Cupel be waſhed to the utmoſt purity (abgetrieben).

But now 'tis worth the while to know what Water this is which is fit for this Work, and makes a ſeparation of metals; for ſeeing that it muſt have power to diſſolve metals, it's expedient that it be a friend unto them, and of the ſame kin, or (that I may ſpeak clearer) 'tis fit that it be their diſſolver and examinator; and this old *Saturn* hath power to do, out of which it may with ſmall coſts and labour be prepared; but the common *Saturn*, although it be called the Water of Metals by all the Philoſophers (but in the uſual waſhing in the Cupels 'tis not found ſo to be) yet as long as it remains in a compact metalline form, 'tis unfit for this thing; let him firſt be made Water himſelf before he reduceth the metals into water; which work is eaſie, of ſmall coſt, and of a few hours labour, and it goes into Water, and the Metals are thereby waſht. Of which more ſhall be ſaid in the following Chapter of ♄, and elſewhere. This alſo is to be noted, That if Copper being diſſolved with the Water of Lead, be digeſted its proper time, the moiſture dries, and the metal is hardened, and returns into a metallick body; therefore the Solution is to be kept alwaies liquid by the affuſion or pouring on of new water, leſt the mutual action be hindered, which the Philoſophers call *Incineration*: Which being neglected, all the Work doth not preſently periſh, but there remains moſt elegant *Amauſa*, and tinged Glaſs, which ſhines among the Copper, giving out from it ſelf a Blood-red Colour, wherewith not only wooden Veſſels may be adorned, but alſo Glaſs-Painters may uſe it; of which red Glaſs there hath been ſome found in old Churches; but 'twas believed that the Art was throughly loſt; but this came not by chance without doubt, but was purpoſely concealed by thoſe whoſe practiſing hereabouts did perceive a better thing to lie under it; for the red *Amauſum* or Glaſs, being burnt its proper time with a ſtrong fire, gives a *Regulus* yielding in the Leaden waſhing (im abtreiben) good Silver. But if you ſeek for ☽ out of ♀, it's better not to make the red *Amauſum* or Glaſs at all, but to keep on with Inceration, that it may not come to be red, but may remain a pellucid and green Glaſs, even until ♀ be well waſht.

Moreover this is to be noted, That ♀ and the other metals are not only reducible into ſoluble and inſoluble Glaſs, by this *Saturnine* Water, but the ſame is to be done by the addition of clean Flints and Salts, by which they are made much fairer than thoſe done with ♄; but in the ſeparation (Scheidung) they are vilder, becauſe the Diſſolvent is not ſo metalline, and after purgation, they do not ſo eaſily give their *Regulus* as thoſe that are done with the Water of ♄. There's alſo another way, by which the ſuperfluous burning ſulphur of ♀ may be waſhed, and ſhe cleanſed without the water of ♄ or of the Flints, *viz.* with *Salt-Petre*. If ♀ or any other imperfect metal be often mixt therewith and burnt, the purer parts come together, and the combuſtible parts come together, and the combuſtible ſulphur ſeparates in the form of *Scoria*. To conclude, This ſeparation and waſhing may be done by the help of other fixed Salts, but none ſo good as the Water of ♄. Now let the Reader know, that thoſe things ſpoken in a rude ſtile, concerning ♀, want not their weight, even as the following Chapters will openly declare.

The Fifth Rule.

Of the Nature and Virtue of Saturn.

THUS *ſpeaks* Saturn *of himſelf: The other Six Planets have excluded and thruſt me out, who am their Examinator, from the ſpiritual City, aſſigning me an habitation with a corruptible body; for what they neither are, nor will be, I am conſtrained to be: My ſix Brethren are Spiritual, wherefore as often as I am in the fire, they paſs through my body, and both I and they periſh together in the Fire, the two beſt excepted,* ☉ *and* ☽, *who are moſt neatly and purely waſht in my waters, and wax proud. My Spirit is Water, ſoftning the hard bodies of my Brethren; but my body is addicted to the Earth, whatſoever I lay hold on, is alſo made like the Earth; and is converted into one body. It would not be good that the World ſhould know what is in me, or what I could do; it would be better did they but know how to get that thing which is mine, and is in my faculty, they would lay aſide all other Arts of* Alchymy, *and handle this thing only, which I am able to perfect. The Stone of Coldneſs is in me; this is the Water by which I cauſe the Spirits of the ſix other Metals to congeal into the Corporeity of the Seventh, that is to promote* ☉ *with* ☽. Antimony *is twofold, the one ſort is the common black* ♂, *wherewith* ☉ *being mixt and melted, is purged; this is of neareſt kin to Lead; the other is white* Magneſia, Biſmuth, *and neareſt to Tin; being mixt with the other* ♂, *it encreaſeth* ☽.

Glaub.] Here we have mention made of *Saturn*, from whence the Bath (ſpoken of afore) for ♀ and

the other metals is prepared, and that twofold, the common and ♁, both which I have mentioned in my former Tracts, as profitable for this washing; but one is fitter for some metals than the other. *Venus* willingly enters into ♄, and may most rightly be washed and separated (geſcheidet) with the common Saturnine water, ♂ and ♃ will not; but ♁ receives them most greedily, holds and washeth them, which is impossible for the common ♄ to do. Yet notwithstanding *Paracelsus* seems to hint at some other thing here, speaking of the transmutation of ♄ with other metals, aiming (as I conjecture) as well at an universal as a particular transmutation of Metals by Saturn. Now Saturn also, as he is the water and washing of other metals, so may he himself be washed with Salts, which, as I shall anon declare, are his water.

But let no body wonder that I speak no larger of the nature and virtue of Saturn, whom I set so high an esteem upon; for it hath been most frequently mentioned, and after this will be; so 'tis not fit so often to repeat the same thing, one Chapter illustrates another. See such other small Tracts as I have written of Saturn, and compare them well together, and without doubt you will perceive my meaning. That which *Paracelsus* adds concerning the difference of ♁ is plain enough, and wants no illustration; for common Lead and ♁ (although much differing in the diversity of Sulphurs) was by the Philosophers called Black Lead. Bismuth, ashy Lead, and Tin, among the ancient Metallurgists, is white Lead; which appellations we shall leave to the ancients, and say no more thereof.

The Sixth Rule.

Of the Moon, *and her Nature and Property.*

IF any one goes about to reduce ☽ into ♄ or ♂, it will be as difficult as to make ☽ (with great profit) out of ☿, ♃, ♂, ♀, or ♄. But 'tis not expedient to make vile things out of good, but to make precious things out of base and abject things.

'Tis also fit to know of what matter the Moon is, and whence 'tis risen; he that is ignorant of this, will find it impossible to make Luna.

Quest. *What therefore is* Luna?

Answ. *It is the seventh external, corporeal, material, of the Six metals therein hidden; for always (as it hath been very often said) the Seventh hath the other Six spiritually hidden within it self; neither also can these six be without an external, material metal; nor can any corporeal Metal be without the six spiritual ones and their Essence. If you melt the seven Corporeal Metals, it doth nothing as to making ☉: after mixtion, each as its nature is, remains fixt in the fire, or volatile. For example, mix as well as you can ☿, ♃, ♄, ♂, ♀, ☉ and ☽, it will not therefore follow, that the ☉ and ☽ will transmute the other five, that they become ☉ and ☽: Although they are blown together into one mass, yet each remains in its own state,* viz. *if you take of the corporeal mixtion; for transmutation consists in the spiritual mixtion and union of Metals, because Spirits admit of no separation and mortification.*

Although you kill the Body an hundred times, yet will they always have another Body more noble than the former. And this is the promotion of Metals from one mortification into another; that is, from a more ignoble degree to a higher, that is Luna, *and from a better to the best, that is* Sol; *a most illustrious and royal Metal; 'tis also true, and always will be, which hath been often spoken of before, that always the six metals generate the seventh, and deliver it from themselves into a palpable and visible substance.*

Quest. *Now, then if it be so, that the* Luna, *or any other metal, is always caused and produced from the other six, What therefore is its Property and Nature?* I answer, *Out of ☿, ♃, ♂, ♀, ♄, and ☉, no other metal can be made, but ☽; the reason is, because as to the other six metals, each are indued with two good virtues, which in all make Twelve: these virtues are the Silverish or Lunar Spirit, which in brief understand thus; Silver is compounded into a corporeal Metal, out of the six Spiritual Metals, and their Properties, in number twelve, and is likened to the seven Planets, and the twelve Cœlestial Signs; for the ☽ hath from ☿ the Planet, and ♒, and ♓, a bright white flux and splendor, ☿, ♒, ♓; also ☽ hath from ♃, ♂, and ♁, a white colour, a great constancy against the fire and fixation, ♃, ♂, ♁; from ♂, ♑, and ♈, it hath hardness, and a good clangour or sound, ♂, ♑, ♈; from ♀, ♊, ♎, it hath the means of Coagulation and Malleability, ♀, ♊, ♎; from ♄, ♍, ♏, it hath a fixt body with heaviness and gravity, ♄, ♍, ♏; from ☉, ♌, ♐, it hath a sincere purity, and a great constancy, against the violency of the fire, ☉, ♌, ♐.*

Thus is briefly explained what is the exaltation and cause of the spirit and body of Silver, with its own compound Nature and Essence.

It must also be known what matter the metallick spirits do take in their first Nativity, when they are carried down into the Earth from the Cœlestial Influences, viz. *a vile Dirt or Stone, which the Mine-digger by breaking the body of the metal, destroys and burns in the fire, in which mortification the metalline spirit assumes another body, not fryable, but pure and malleable. Then the Alchymist coming, destroys this metalline body, kills and prepares it by Art, but that metallick corporeal Spirit makes apparently conspicuous, another more noble and much more perfect body, whether it be the Sun or Moon; then both the metallick Spirit and Body being perfectly united, are free and safe from Corruption by the Element of Fire.*

Glaub.] *Paracelsus* in this Sixth Chapter repeats the words which have been oftentimes afore mentioned, *viz.* That every visible metal is an hider of the other metals which lie spiritually hid within it; withal teaching, that it is impossible for corporeal metals, although melted together never so long, to be meliorated, unless they are first made spiritual; which I have oftentimes demonstrated and shewed to be the very Truth, and the right way to Transmutation.

But he doth not in expres words teach the way by which they may be made and rendered Spiritual; nor is it convenient to chew a Morsel, and thrust it into the mouths of the Ignorant.

Now I say, that as touching the spiritualizing of Metals, *Paracelsus* doth not advise that Metals be dissolved in corrosive Spirits, & digested & destilled over the Helm with it, by often Cohobations. The Spiritualization which he mentions here, is not to be done with Corrosives, for they are rather corrupted by them than perfected, neither in Glasses, but in Crucibles, and that in a few hours, without Corrosives, whereby they are so depurated, and as it were poudered, that they are transparent in and out of the fire, and dissolvable in any water. This is a true

Spi-

ſpiritualization of metals, and gainful if it hath the ſaid Properties: 'Tis otherwiſe called by the Philoſophers, the firſt matter of Metals, and at this time known but to few.

Our Laborators now adays know not any metallick ſpirits, but ſuch, as by the help of peregrine and noxious things, they drive over by an Alembick or Retort; but Experience teſtifies, that theſe are wholly uſeleſs and unprofitable for Melioration. And although the ancient Philoſophers write, Make the fixt volatile, and the volatile fixt, yet they mean not that the metals ſhould be deſtilled. Which ſublimation or deſtillation they did not meddle with, but all their metallick labours, as *Solution*, *Putrefaction*, *Deſtillation*, *Sublimation*, *Calcination*, *Inceration*, *Cohobation*, and *Fixation*, were done in one earthen veſſel, without Corroſives; nor did they weary themſelves with thoſe ridiculous labours that are done by the means of Glaſſes. But of this more in another place.

Now read diligently over and over again what *Paracelſus* writes at the end of the Chapter, and it will appear, that he ſpeaks of fuſion, and not deſtillation in Glaſſes; where he ſhews, that a metallick ſpirit at its firſt deſcending from the ſtars into the earth, hath a moſt vile form, like a ſtone, or dirt, which the digger of it melts with a ſtrong fire, whereby it gets a better form, and becomes a malleable metal. And here he is at a ſtand, and cannot proceed any farther. Now, ſaith *Paracelſus*, the Alchymiſt comes and takes this metal, and by his Art deſtroies the metallick body, killing and preparing it; and by his labour it aſſumes a more noble and fixt body, called (becauſe of its maturity) Gold or Silver. The ☽, although it be more pure and excellent than ♀, ♂, ♃, and ♄, yet having not arrived to maturity, it is (in compariſon of the ☉) like a flower, which is more excellent than the herb, but inferiour to the ſeed, which is the moſt perfect part of the ſame. And, as in Vegetables the flowers are indued with a more elegant colour than either the ſeed or fruit: So alſo is the ☽ more abounding with Tincture than the ☉; which I have very often tried, and could demonſtrate by many Examples; contrariwiſe, altho' the flower be, as to the form, colour and odour, above the ſeed, yet in goodneſs and durability it is much inferiour; for the flower at an approaching cold falls away; but the ſeed endures, and if it be helped, it produceth a new herb, flowers, and ſeed, by which its ſpecies are conſerved and propagated. And as in Vegetables the herb is the greateſt part, the flowers leſs, and the ſeeds leaſt, ſo in Minerals is the like order moſt fitly obſerved: for ſhould Nature produce only Flowers and Seeds with the Herb, whence would there be Graſs for Beaſts, whereby they might fill their Bellies, and ſo yield dung for the Country-man to dung his ground withal, that it might produce a new Crop of Herbs. Without doubt there's more Tincture hidden in ☽ than in ☉, the inmoſt part of which is a meer redneſs; but the centre of ☉ is a moſt fixt and ſplendid Sky-colour, which is to be well obſerved. As for the other Properties of ☽, which are moſt frequently known, 'tis needleſs to mention them; as to purity and fixation, 'tis neareſt to ☉, and therefore in metallick things 'tis to be likened to a Flower: 'Tis plainly void of combuſtible and preying Sulphur; but being not as yet arrived and concocted to perfection, it is a moſt ſuitable Vehicle to extract ☉ out of volatile and unripe Marcaſites, and other auriferous Minerals, and to make it corporeal. Concerning which I have formerly written, and will write more hereafter.

The Seventh Rule.

Of the Sun, *its Nature and Property.*

COrporeal ☉ is the ſeventh Metal of the ſix ſpiritual ones; in it ſelf it is a meer Fire; but the Reaſon of its being outwardly of an elegant, yellow, viſible, ſenſible, ponderous, cold and malleable body, is, becauſe it hath in it the coagulation of the other ſix metals, whereby 'tis compell'd into a viſible body. And as to its being melted with Elemental fire, 'tis from hence, becauſe it hath a fluidity of Mercury, ☿, and ♒, ſpiritually hidden in it ſelf; the which is alſo outwardly evident, becauſe it is moſt eaſily mixt with the ☉, and detained by him.

And whereas after melting, it grows hard by the Cold, viz. *is coagulated, and grows ſtiff, that comes from the other five metals, ♅, ♄, ♂, ♀, and ☽; in theſe five metals the Cold dwells and bears ſway, and therefore ☉ cannot be fluid out of the fire, becauſe of Cold. Nor can ☿ with his heat, nature, and fluidity help him againſt the five cold metals, for its heat ſufficeth not to keep the ☉ in perpetual flux, ſo that it is enforced to obey the other metals rather than one only, ☿, who (as to coagulation of metals) hath nothing to do, its Property being to make liquid, and not hard: It is the work of heat and life to make liquid, but cold is the cauſe of hardneſs, ſtiffneſs, and unmovable, being therefore likened to Death.*

For Example. *If you would reduce the ſix cold metals to fluidity, whether it be ♅, ♀, ♄, ♂, ☽, ☉, it is to be done by the heat of the fire, for metals are not melted with cold Snow or Ice, but are hardened thereby. Now, aſſoon as they are melted by the fire, and that the heat ceaſeth, the cold ruſheth in, whereby the metal ſtands ſtill, grows ſtiff, dies, and remains immovable. And becauſe that ☿ is alwaies fluid and living, tell me, I pray, whether or no ſuch a thing proceeds from heat or cold? Some or other may ſay, it is becauſe of its cold and moiſt nature, and that it is living becauſe of Cold; but whoever ſaith thus, and believes thus, is ignorant of Nature, and deceived and ſeduced with the vulgar, whoſe belief of any thing is out of the right way, & amiſs, & are therefore to be avoided and ſhun'd by him that would truly know; for ☿ is not living, by reaſon of cold, but becauſe of its heat and fiery nature, as all things elſe live becauſe of heat, for heat is the cauſe of life, and cold the cauſe of death.*

But that ☉ is in it ſelf a meer Fire, not alive indeed, but hard, ſhewing its fiery heat only outwardly, as yellow mixt with red, and the other five metals, are cold, viz. *♅, ♂, ♄, ♀, and ☽, giving their virtues to the ☉,* viz. *according to their frigidity a body, by their fire colours, by their ſiccity hardneſs, by their moiſture weight or heavineſs, by their reſplendancy ſound; and that it is not combuſtible, and to be deſtroyed by the Element of Terreſtrial Fire, that is by reaſon of its fixedneſs. Fire doth not burn Fire, nor deſtroy it, but Fire joined to Fire becomes the greater and more powerful in ſtrength. The Cœleſtial fire deſcending from the ☉ upon Terreſtrials, is not ſuch a fire as is in Heaven, nor ſuch as our fire is on Earth; but with us the Cœleſtial fire is cold, a rigid and congealed fire; and this is the body of Gold, and therefore we cannot tame or maſter ☉ with our fire, we can only divide it and melt it, as the ſun diſſolves and melts ſnow, congealed ice and water. Wherefore it is not permitted for one fire to deſtroy another, becauſe ☉ it ſelf is fire, and in Heaven it is reſolved, but with us it is coagulated.*

Gold is in a threefold ſtate with its Eſſence.

1. *The Cœleſtial*	*is*	*Reſolved.*
2. *The Elemental*		*Liquid.*
3. *The Metallick*		*Corporeal.*

The End of the Seven Rules.

Glaub. WE are now come to ☉, a kingly and moſt excellent Metal, the which *Paracelſus* compares to a meer abſolute Fire, and ſo 'tis found to be, if it be ſeparated into parts; 'tis likewiſe endued with a ſeed-like nature, more hot than the Herb it ſelf or the Flower. But to what end ſhould we write of bettering it, when as it needs it not, being already conſtituted in the higheſt degree of perfection, and Nature not being able to promote it to an higher degree: Now then if it be to be made better, 'tis behoveful to make it Medicine, for never was a more excellent metal than it ſeen. An Herb planted in a fruitful ſoil, and brought to its perfection by the heat of the Sun, the ſeed being ripe, it remains not in the ſame form, but withers, and the ſeed falls away; but if it be ſeaſonably gathered, it laſts a long while, and may, at your pleaſure, be put into the Earth, for the production of new Herbs of its kind; or elſe it may be uſed for the health of Mankind, having no other notable Uſe beſides. In like manner, Gold having arrived to its perfection, if it be to be farther advanced, it muſt be made Medicine, or be put upon the Metallick Earth, as Seed is on the Common Earth; where putrefying or augmenting, or growing, it may exhibit and produce a metalline Off-ſpring. Every body knows that a good Medicine may be thence made, and that various waies, but few know the manner how; but that 'tis able (like the Vegetable ſeed) to make Encreaſe out of the imperfect metals (being its own Earth) *Paracelſus* teacheth in this place, and many Philoſophers witneſs the ſame, which is not only true in a particular melioration, where by attracting its like out of the imperfect metals, it is encreaſed; but 'tis alſo to be believed as true, that from it may be ſeparated, by the induſtry of a skilful metallick Philoſopher, its inmoſt Vegetative power and pureſt portion (all its husks, or outſide, wherewith 'tis cloathed, being laid aſide) and may thereby be exalted to a more than perfect eſtate, although 'tis incredible to many, yet 'tis not in the leaſt to be doubted of, except we would make all the Philoſophers to be Lyers.

As for my ſelf, although I never ſet my hand to ſo hard a Task, yet I believe and affirm it to be in the nature of things, as having evidently obſerved by my other metallick Labours, that this Medicine is in the poſſibility of Art; the which I will alſo in due time ſet upon, if God give Life and Leiſure. What the other properties of ☉ are, and by what means good Medicines may be prepared therefrom, I have ſpoken thereof in many places of my writings, and in its proper place more alſo ſhall be ſpoken. And here we reſt and conclude this little Book of the Rules of the Seven Metals.

GOD and Nature make nothing in vain.

THe Eternal City of all things (there's an Eternal place in all things) without time, without beginning, and without end, is every where eſſentially. It operates in that wherein is no hopes, and that which is accounted impoſſible, unexpected, incredible, and plainly deplorable, will be true even to admiration.

Glaub. *Paracelſus* having finiſhed his Seven Rules of the Properties of Metals, begins after a ſort, to repeat and illuſtrate his ſentiment or opinion, comforting the Operator, leſt happily he ſhould be diſcouraged, if his affairs do not preſently meet with good ſucceſs; but let him ingeniouſly proceed, becauſe *Nature makes nothing in vain*; that which is leaſt of all believed, comes moſt of all to paſs; his words are clear enough of themſelves.

Item. *Note now ſome things on* Argent Vive.

Whatſoever whitens is of the Nature of Life, and of the Property and Virtue of Light, which cauſeth and makes Life. The Fire with its heat gives birth to this motion. And whatſoever blackens, is of the Nature of Death, of the Property and Virtue of Darkneſs, (having the efficacy and force thereof) which cauſeth Death; to the which hardening or induration the Earth with its Cold is the coagulation and fixation. The Houſe is alwaies dead, but the Inhabitant is a living Fire: If thou haſt found out the true Uſe of Examples, thou haſt overcome.

Glaub. *Paracelſus* ſpeaking here of Mercury, mentions Fire, which by its heat is the cauſe of Light and Life, but that which blackens, is the cauſe of Death; where making as it were a pauſe or ſtand, he adds theſe pregnant words.

Sacrifice the fat Vervein (or Sulphur). ℞ *eight lots of Salt Nitre, four lots of Sulphur, two lots of Tartar, mix them, and let them flow.*

Glaub. Here begin the Complaints of the Alchymiſts, becauſe *Paracelſus* writing of ſo good a matter, doth ſo ſuddenly break off, adding ſuch a Receipt, as in their judgment hath no affinity with Mercury, but is to him as a thorn in a man's eye. This powder indeed is a good fuſile powder, for the reduction of ſuch metals as are otherwiſe hard to melt; but in this place 'tis meerly vain and needleſs, becauſe ☿ by his innate fiery power and heat, doth alwaies flow; wherefore we want not this Flux for him. Had he written in this place, how he (*viz.* ☿) is to be coagulated and fixed, we would moſt willingly have heard him, and as willingly have been content that he had kept his fluxing powder to himſelf.

Such as theſe ought to blame themſelves and not *Paracelſus*, that wiſh'd well unto them. The words which went juſt before, may excuſe him; for he ſaid, that *GOD and Nature made nothing in vain*; whereby he intimates, that this powder is not ſo ſtrangely to be look'd on, as if it did not pertain to ☿, who is more than enough fuſile already, and wants it not. Nor was this mentioned to vex the Alchymiſt; no, *Paracelſus* knew this nimble fuſile powder, and its operations upon the metals, better than he that complains thereof, ('tis of incredible benefit in the metals, did any one know how to uſe it) and he placed it here, that we might perfectly learn its higheſt force and efficacy upon the metals;

tals; the which thing his foregoing words do alſo admoniſh us of: It operates beyond hope, that which is judged impoſſible is unexpected, incredible, and deſperate, will prove true to admiration. Wherefore, think you, would he have added this fire had it not been needful in this place? doubtleſs he knew how to burn the wings of ☿, and thereby to ſtay his flight. And although I know not how to fix ☿ herewith, yet have I experienced wonderous things as well in the metals as ☿, for if the metals, eſpecially ☿, be Philoſophically joined herewith, ſublimed and deſtilled, they afford wonderful *Menſtruums.*

It's alſo here ſaid, *Sacrifice the fat Vervein* (or Sulphur). 'Tis full well known, that the ſuperfluous Sulphur in metals that are imperfect, is the cauſe of their baſeneſs, and this fire is able to burn it up, but 'tis impoſſible that all ſhould know it; there's need of uſe and diligence, if you deſire *Icarus*, flying with his Father *Dædalus*, and approaching too nigh the Sun (whereby his wings being burnt, he tumbled down into the Sea) ſhould be drowned in the waters. The which let ſuffice, for there's enough ſpoken unto a wiſe man; let us therefore proceed.

What is to be determined concerning the Coagulation of ☿.

'Tis not at all expedient to kill ☿, *to coagulate him, and then reduce him into* ☽, *and to weary him with many ſublimations and other things, for this is but the deſtruction of the Sun and Moon that is in him. There's another more compendious way, whereby* ☿ *is made* ☽, *of ſmall coſt and charge, without any labour of coagulation: Every man reads in the Writings of the Alchymiſts, ſuch Arts as are mean and vile, and eaſily preparable, whereby in a ſhort time he might make abundance of* ☉ *and* ☽, *and are tired and vexed with the Writings of ſuch as do not teach them clearly and plainly, and would willingly hear this,* viz. *Do ſo and ſo, and thou ſhalt have good* ☽ *and* ☉ *to inrich thee.*

But good Sir ſtay a while, and wait till the Secret be plainly opened to thee in poſitive words without any labour; ſo as to enable thee (in as 'twere a moment of time) to take ♄, ☿, and ♃, and make *Sol* and *Luna* thereof. The Art will never be ſo eaſily known, how ſhort and facile ſoever it be in it ſelf.

Glaub.] *Paracelſus* goes on, and ſaith, That 'tis not needful to coagulate ☿, that ☉ and ☽ may be thence made, and that it is to be done with a moſt eaſie labour, and therefore few words are beſt. And here *Paracelſus* is to be compared to that Rich man, who having heard that many periſhed with famine, 'tis ſaid that he ſhould anſwer, That before he would be tormented with hunger, he would rather feed on ruſty Bacon and Peaſe, believing that all abounded with this fare; the which they deſpiſing by reaſon of their daintineſs, deſervedly periſhed. In like manner the good *Paracelſus* believed, that all Chymiſts were his equals, as to the knowledge of Metals, not dreaming of the many poor Colliers that torment ☿ by their ſolutions, precipitations, ſublimations, reſuſcitations, fixations, and other labours; when as they are ignorant of what it is, what abounds or is wanting therein, and ſo for want of knowledge, toil and labour to no purpoſe: ☿ is a ſubject of wonder, and is frequently wont to deceive the Alchymiſts, whom (*viz.* ☿) if you would on the other ſide deceive, when you purſue him, give him a little breathing (becauſe by force he's not to be compell'd) that he may a little wander about, but truſt him not too much, leſt flying away, he leaves behind him an empty Neſt. For which Work the firſt Furnace, with its many Glaſſes, very well fitted and united, will ſerve excellently well. But in few words, 'Tis a ſubject of an inexhauſtible wonder, the which I alwaies found the moſt ſtubborn of all the metals, that I have beſtowed grievous pains about; but yet do believe, that he that knows rightly to deal with him, will reap a benefit from him not to be contemned. But who is there that diſcovers the Way? Wonders muſt alwaies remain unknown unto us, and albeit we know not all things, yet let us acknowledge the great Mercy of GOD, and give Thanks to Him for that which we do know.

The Receipts of Alchymy.

WHat ſhall we ſay of the many Receipts and the various Veſſels, ſuch as are the Furnaces, Glaſſes, Teſts, Waters, Oils, Salts, Sulphurs, Antimonia, Magneſia, Salt Nitre, Alume, Vitriol, Tartar, Borax, Atramentum or Copperas, Orpiment, Spume of Glaſs, Arſenick, Calaminaris, Bole-Armoniack, *Vermilion, Calx, Pitch, Wax, Lute of Wiſdom, Powder'd Glaſs, Verdigreaſe,* Salt Armoniack, *Soot, Roſin of the Pitch-tree, Chalk, Mans-fat, Hairs, Egg-ſhells,* Lac Virginis, Ceruſe, Minium, Cinnabar, Vinegar, Aqua-fortis, Crocus Martis, Elixir, Lazure, (ultro-Marine) *Soap, Tutia,* Havergold, *Cryſtals. What likewiſe ſhall we ſay to their preparations, putrefactions, digeſtions, probations, ſublimations, calcinations, ſolutions, cementations, fixations, reverberations, coagulations, graduations, rectifications, amalgamations, and purgations. Moſt Books are fully ſtufft with theſe Alchymical things, as alſo what things are to be done by the benefit of Herbs, Roots, Seeds, Woods, Stones, Animals, Worms, Bone-Aſhes, Cockle-ſhells, Muſcles,* &c.

All theſe things are the Labyrinths of Alchymy, *and are great and but vain Labours. Moreover, although* ☉ *and* ☽ *might be made by the means of theſe things, yet by reaſon of the multitudes of them, the Work is rather hindred than advanced; and therefore it cannot be truly learned from the aforeſaid things, how to make* ☉ *and* ☽. *But all ſuch things are to be omitted, as operate not with the five imperfect Metals, for the production of* ☉ *and* ☽.

What therefore is the true Way, and the ſhort Path void of all difficulties, that leads to the ſpeedy making of good Sol *and* Luna? *How long will it be ere thou revealeſt it? I believe that thou underſtandeſt nothing of this matter, may ſomebody ſay, but doſt only mock us with theſe Riddles.* For anſwer: *It hath been already ſpoken of, and is evidently enough diſcovered in the Seven Rules; He that underſtands not, let him blame himſelf. Beſides, let no body be ſo mad, as to perſwade himſelf, that the Art is moſt eaſie to be underſtood, and to be perfectly known by the vulgar; that is neither ſo, nor muſt it ſo be; but it will be better underſtood in an occult and hidden Sence.*

This is the Art, viz. *If you make the Heaven or Sphere of* ♄ *to flow with life in the Earth, put in all the Planets, or which you pleaſe of them, but let there be of* Luna *leaſt of all; let it flow ſo long, until the Heaven of* ♄ *doth wholly diſappear, and the Planets remain alone dead with their own corruptible Bodies, and have aſſumed a new, perfect, uncorruptible body, that*

body is the Spirit of Heaven, by which the Planets become again corporeal and alive; as afore, Take out that new Body from the Life, and out of the Earth, and keep it, for it is Sol *and* Luna. *And thus haſt thou the Art plainly uncovered and intire; if thou doſt not yet underſtand and apprehend it, 'tis well, for ſo it muſt be; nor muſt it be publickly divulged.*

Glaub.] In this Chapter *Paracelſus* teacheth, That there's no need of ſo many ridiculous ſpecies, for the tranſmutation of Metals, but that there's virtue enough in the metals to operate upon, and to better one another, if they are rightly conjoined amongſt themſelves; yet in ſome Labours we cannot be without Salts and Minerals, becauſe they are uſeful to mollifie hard Metals, and to diſpoſe them to aſſume a melioration. But 'tis to be obſerved, that Corroſives are to be omitted, and ſuch Salts only to be uſed as are friendly to Metals. Likewiſe other Minerals and Foſſiles may be fruitfully uſed in fuſion, (Seigerung) ſeparation, and other metalline Operations, as additaments (als Suſans). The which thing *Paracelſus* denies not, but only rejects, and that deſervedly, thoſe ridiculous Compoſitions of the unskilful Alchymiſts, which they making in their uſe Sol. He dehorts the ſtudious Artiſt, and endeavours to bring him into the right way.

Furthermore, he teacheth but in an occult ſence, how good *Sol* and *Luna*, ſuch as will endure all trials, is to be extracted out of imperfect Metals; but 'tis ſo obſcurely done, that no body can thereby underſtand the thing; and ſuch only as aforehand know ſomewhat, and have had the like Labours under their hands, are able to underſtand his meaning.

Doubtleſs this Proceſs hath found many an one work enough, who have at laſt attained to nothing; but yet ſome have by chance lighted thereon, and ſo perceived the Truth of his Words, moſt of which Inventions do caſually happen; and whilſt that one thing is ſought after, and by accident loſt, ſomething is oftentimes found more excellent than that which was intended.

In like manner, moſt things unſought after have happened to me; and alſo my Labours have manifeſted to me the greateſt part of *Paracelſus*'s Arts, and not his Writings. And who will certainly and plainly teach what lies under that Covering? Many Archers there are, but few hit the mark. Neither ſeems it ſo neceſſary to take nothing elſe but the aforeſaid Metals; the which thing *Paracelſus* alſo in his forementioned Proceſs doth hint at, ſaying, When thou makeſt the Heaven, or Sphere of ♄, to flow with Life in the Earth, ſow in all the Planets, or ſuch as you pleaſe of them; but let not the Moons part be biggeſt, but let it be the leaſt of all. By which words 'tis eaſily conjectured, that the greateſt part muſt be of Saturn, whereby the other metals are to be waſhed and purified, and the leaſt part of the Moon. But ſome body may ask, What reaſon is there for the Moon being here, ſhe being already pure, for the waſhing of whom there's no need? Why this hath been already elſewhere anſwered thus, *viz.* That ſhe may attract, defend, and make corporeal, the waſhed, purified, and tender Sun, which would otherwiſe remain in the *Scoria*: Notwithſtanding this ſeparation may be made without the *Luna*, but then 'tis not ſo gainful. Neither alſo is it neceſſary to conjoin the Metals, and ſo make but one work in waſhing them with Saturn; each of them may be taken apart, and ſo cleanſed, unleſs a man knew how to contrive the compoſition, then indeed the Work would be facilitated, and more Sol gotten; the which is to be well obſerved, if either none, or very little Luna be taken. But if you take not ☽, then ♀ is to be added, as being of neareſt affinity to ☉ and ☽, in its malleability, and ſo that will attract the volatile and immature ☉ out of the imperfect Metals, and defend it in the fire, but much weaker than ☽. Tin and Iron being moſt impure and ſharp metals, may be waſhed with Lead, but with much difficulty, and may be deprived of their ſpiritual and occult ☉, but with far greater charges and coſt, than if you took in ☽, or at leaſt wiſe ♀. Now knowing this, Why do we not give to every one its proper additament, for the expedition and enriching of the Operation? 'Tis worth the while to be able to make a good mixtion of Metals, and with profit to waſh them with ♄, in which mixture none believes how much there's placed, nor my ſelf neither, had I not with Loſs learned the ſame. For, when in former years I ſought after ſomewhat in this kind of operation, as waſhing and ſeparation, and had ſometimes found out a good *Proba*; I have gone to repeat the ſame labour again, and have egregiouſly erred. And although I have for many years wrought hard in this kind of labour, and ſpent much (which I repent not of) yet I dare not boaſt of catching the beſt prey, but am content with a piece of Bread, but yet I do not diſpair, *Good things come ſlowly on,* and the thorny prickly Budds ſpring forth before the Roſes come. Now, if thou learneſt the weights the Work will be ſafe, and thou needeſt not to doubt of doing the ſame in a great quantity. *Paracelſus* goes on, and bids you to let the Planets which you have put in, to flow ſo long with the Heaven of ♄, until the Heaven of ♄ vaniſh, the Planets will remain, having received a new body, which is to be taken out of the Life and the Earth, which will be ☉ and ☽. And theſe words are variouſly interpreted by ſundry men, eſpecially what the Heaven of ♄ is, and are perſwaded, that if that were known, the reſidue of the Proceſs they could ſtate well enough. Many underſtand hereby the common ſeparation made by a peculiar ♄, taking the *Regulus* Stellate of ♂, which is ſtampt with a Cœleſtial Star, the which they blow on and melt with the Life, (which they interpret to be the fire) in the Earth (a Cupel or Teſt treibſcherben) the bodies being left upon the Teſt, like mortified Metals, the which reducing by a fuſing addition, and melting with Lead, (angeſotten) and promiſing themſelves Gold and Silver, they find themſelves to be in an errour, and accuſe *Paracelſus* of Sophiſtry and Deceit, becauſe they can't make good quantities of ☉ and ☽, by means of his Writings.

And now, what this Sphere of Saturn is, may be variouſly explained: It may not unfitly be taken for common ♄, becauſe being fuſed, it ſhines, and is turned round: or it may be taken for its Glaſs, which being melted in the fire, ſhines like the Sun: or it may be the Stellar *Regulus* of ♂, becauſe its *Stria* repreſents Stars when 'tis broken. But what benefit is it to know the Heaven of ♄ and to be ignorant of the true requiſite Life, and the reduction of the dead and reducible bodies. Common Fire is not the Life that *Paracelſus* mentions, but it may be ſtirred up thereby; and ſo he ſaith; The fire with its heat, is the Nativity to this motion: If by the Elemental Fire he ſhould mean the Life, and by the ſeparation of ♄, or blowing of the *Regulus* of ♂, (the flow-

flowing which *Paracelſus* mentions) then it muſt neceſſarily follow, that the deſtroyed bodies which remain, ſhould be made more perfect, and the Spirit of Heaven ſhould yet remain with them; for thus he writes, *viz.* The Planets by it do become corporeal and living, as they were before; but in theſe kind of ſeparation, ſcorification, or blowing off, it is not found ſo to be; but in theſe Operations their Bodies remain like *Scoria*, in which is neither ſpirit or life, much leſs ☉ and ☽ to be found, though never ſo diligently ſought after. *Paracelſus* ſaith expreſly, *viz.* That Body (*viz*, of the ſlain or kill'd bodies) is the Spirit of Heaven, by which the Planets do again become corporeal and alive as before; from whence 'tis to be underſtood, that thoſe bodies are ſpiritual, & not only corporeal and reſuſcitated, but ſuch as may give life even to ſlain or deſtroyed bodies, the which can't be ſaid of them, for a ſpirit muſt be penetrative and vivifying, and they are not ſuch. For if (according to *Paracelſus*'s mind) the dead bodies ought to be reduced to Corporality and Life, 'tis neceſſary that they have ſome hidden power; (which every one knows not) whereby they may demonſtrate moſt ſpeedily their embodying and vivification in a ſpiritual manner, without the addition of any peregrine Flux, or elſe they are deſervedly to be rejected. But if any one ſhould now imagine, that metals being by the red fire deprived of life, made ſpiritual and again corporeal and living, ſhould forthwith be all ☉ and ☽; he promiſeth more to himſelf than is right, and is deceived (for *Paracelſus* ſaith, that That new body is to be taken out of the Life and Earth and kept, for 'tis ☉ and ☽) for 'tis impoſſible even for the Philoſophers Stone, to convert the whole bodies of Metals into ☉ and ☽, for out of nothing, nothing can be made, as the Philoſophers ſay; and Experience teſtifies, none but God only made any thing out of nothing; but that thing which is, may by Art be reduced into nothing, and that again reduced into ſomething. Seeing therefore that the greateſt part of metal is an unprofitable, combuſtible noxious Sulphur, which never was a metal, but adhering only outwardly unto them, and being combuſt, reduceth their *humidium Radicale* into *Scoria*; which *Humidum Radicale* only (after its deſtruction) and not the whole maſs of Metal or ſuperfluous Sulphur, is reduced by the ſpirit of the Saturnine Heaven, out of nothing unto ſomething, *viz.* a Body and Life; the Sulphur which before the corruption was nothing, remains ſtill a Nothing; and if thou throughly obſerve the thing, the Caſe ſtands clearly thus; *viz.* If in this operation there muſt be a ſeparation of the imperfect metals, and a gathering together of the more pure, and a diſperſing of the more impure parts; theſe ſeparated parts muſt therefore neceſſarily be much unlike one another; and by how much ☉ and ☽ is more pure, if compared with imperfect metals, from which 'tis ſeparated: And theſe ſeparated parts are not of the ſame Goodneſs and Nature; as if ten duckets were divided into two parts, each part would have 5 of the ſame goodneſs and weight. Now, if from one of theſe halfs you take two or three parts, and put them to the other half, it only makes the one bigger, and the other leſs: And if there be nine parts on the one ſide, and but one left on the other ſide, yet cannot the major part boaſt of its excelling the other in quality, but only in quantity: As to Goodneſs, they are both equal. But now, if you take a Mineral or Metal commixt with ſtones, and by meaſure divide it into two equal parts, and then pound them, and by pouring water thereon, ſeparate the lighter parts after the accuſtomed manner, and the heavy Metal will ſettle to the bottom: Now the droſs and metal will fill the former meaſure, but will very much differ in their goodneſs.

Or if any one take two meaſures of Wine, and by the heat of Fire, ſeparate the more excellent Spirit by deſtilling in a Glaſs Alembick, and leave the other meaſure in the Cucurbit: Theſe two parts, though equal in quantity, yet they do much differ in goodneſs; the one part will be more noble than Wine, and the other worſer; and as the other reſidence is no more Wine, being deprived of Spirit, Life, Soul, and Strength, and is thereby unable to defend it ſelf from death, but tends to putrefaction; ſo on the other hand, the Spirit is not ſubject to putrefaction, but preſerves other things therefrom.

The like is to be underſtood of this metalline ſeparation, for the remainder, from which ☉ is ſeparated, can no more be made Tin, Copper, or Iron, but is a groſs earthy Sulphur, by the reaſon of the ☉ taken thence; whereas before it was ♃, ♀, ♂, or ♄. And by how much the Spirit of Wine is more excellent than common Wine, and ☉ than an imperfect Metal, by ſo much alſo will the Spirit of Wine and ☉ excel, if they are again ſeparated, and new fæces ſegregated therefrom. But this is not ſo neceſſary in this place; 'tis ſufficient to have declared the way and reaſon of this metalline ſeparation, about which we have even now treated, *viz.* That the whole metal, nor the ½ or ¼ part thereof, will become *Sol*, and the reſt remain a metal; but the ſeparation of the pure is very ſmall in quantity, in compariſon of the much impurity whence 'tis ſeparated. Nor let any one think he hath not attained the Art, and ſo will not reſt here, if all things become not ☉; 'tis ſufficient if there be ſome gotten, and that all the Labour is not beſtowed in vain.

By what means Cryſtals are to be Conjured, and all things to be ſeen in them.

TO Conjure is no other thing, than well to obſerve a thing, to know and underſtand what it is: Cryſtal is a Figure of the Air, in which is to be ſeen whatſoever is moveable in the air or unmoveable. The like appears in a Looking-glaſs, in Cryſtal, and in the Waters, for the Air, Water, and Cryſtals, are all one to Sight; like a Glaſs wherein an Object is to be ſeen, as it were, reverted.

Glaub.] I do not fully know what *Paracelſus* intends by this Conjuration of Cryſtals, becauſe it appertains not to the metalline Arts; but yet it ſeems not to be here added without good reaſon, ſomewhat he would intimate hereby. We read of the Ancient *Pagan* Philoſophers, that they conjured Cryſtals, and beheld in them many wonderful things; the which, whether it be true or no, I leave as I find it, becauſe in my Judgment, ſuch an Art ſeems not natural, but belongs to Diabolical Magick, which I have nothing to do with.

Paracelſus alſo hath elſewhere written of wondrous Looking-glaſſes of the ſame, and hath taught how to compoſe them of Metals, melted together in a certain Time and Conſtellation; the which many have attempted to do, but not one (as far as I

know) hath attained the Myſtery. It ſeems very probable, that he intends by this Conjuration of Cryſtals, that the Metals are to be made like to pellucid Cryſtals, Air, or Water, wherein the ſoul of the Metal may ſhine, if you would ſpiritualize them, and make them yield their ☉ and ☽. And in this Sence it agrees with the aforeſaid Chapters.

It likewiſe ſeems, that the mentioning of this thing is neceſſary for the ſake of thoſe, who practiſing on a ſeparation with ♄, have experienced, the Metals are to be firſt reduced into Tranſparent Cryſtals, before they part with their occult *Sol*: Which I have elſewhere ſpoken more largely of, about *Amanſa*, and therefore will here end.

Of the Heat of Mercury.

THey that believe that Mercury *is of a moiſt and cold nature, muſt lay down the Bucklers, for 'tis not ſo, but it abounds with a great heat and moiſture, which being naturally planted therein, keeps it alwaies fluid: For, were it of a cold and moiſt Nature, it would alwaies remain rigid and hard, like to congealed Water, and were to be melted like other metals, by the heat of the fire, which it* (viz. ☿) *hath no need of, becauſe it hath already a fluidity from heat, whereby it flows, and is alwaies conſtrained to live, and not to die, grow ſtiff, congeal, or be fixed. But this is ſingularly to be noted, that the Spirits of the ſeven Metals, or of as many of them as are conjoyned in the Fire, are wonderfully provoked and ſtirred up, and* Mercury *chiefly, and they emit, and ſend out their forces amongſt each other, for a mutual Victory and Tranſmutation; the one takes away the Virtue, Life, and Form from the other, communicating a new Nature and Form; ſo the Spirits or Vapours of Metals are ſtirred up by heat and mutual action and paſſion, and are tranſmuted from one Virtue to another, and at laſt to Perfection and Purity. But what elſe is to be done with* ☿, *that ſo his heat and moiſture being taken away, he may catch a great Cold, and be congealed, ſtand ſtill, and die; do as you hear in the following Figment.*

℞ *a moſt pure Silver Veſſel, in which ſhut up* Mercury, *then fill a Pot with molten Lead, in the midſt of which put in the Veſſel with the* Mercury; *let it flow a whole day, and the hidden heat will be taken away from* Mercury, *and the external heat will communicate to it the internal cold of the Lead and* ☽, *being both of a cold nature, by which* Mercury *will grow ſtiff, rigid, and become hard.*

Note, *The Cold which* Mercury *hath need of for its hardening and death, is not outwardly perceptible, like Snow or Ice, but is rather hot. Nor is the heat by which* Mercury *flows, felt by the hands, but 'tis rather cold. Hence Sophiſters (that is men ſpeaking without knowledge) pronounce him cold and moiſt, and ſtudy how to coagulate him with hot things, and thereby rather liquifie than harden him. Which thing Experience it ſelf teſtifieth. True* Alchymy, *which by one only Art teacheth to make* ☉ *and* ☾ *out of the Five Imperfect Metals, uſeth no other Receipts, than only from Metals, out of Metals, by Metals, and with Metals, are Perfect Metals made; for with other things it is* Luna; *for in Metals it is* Sol.

Glaub.] Here *Paracelſus* demonſtrates their Judgment to be falſe, who ſay that Mercury (in it ſelf a meer Fire) is by nature Cold, and returns to ſpeaking of Spiritual Metals, the which being ſtirred up by great heat of Fire, do operate upon one another, meliorate, change, and advance to perfection, as hath been taught in the foregoing Chapters. Then he adds a Fable or Story, how to coagulate or fix Mercury; but it muſt not be taken in the literal ſence, but of the ſpiritual ☽, whereby Mercury is to be promoted to Coagulation, in a moiſt way, and not in a dry, as the other Metals are, which Proceſs I never yet attempted. Then he finiſheth with an univerſal Rule of Tranſmutation, ſaying, Perfect metals are made from metals, out of metals by metals, and with metals, and that out of ſome ☽, out of others ☉ is made. He adviſeth to take no ſtrange thing, and only metalline ſubjects are to be taken for this Work out of ſome *Luna* only; out of others *Sol* only, or ☉ and ☽, both are to be extracted, which I have often tried; as in ♄, which of it ſelf gives only ☽, Tin, ♀, and ♂, by themſelves give only *Luna*, and pure *Sol*; but commixt with other Metals in a due proportion, they give only ☉, and very little or no ☽: Which maturation is to be aſcribed only to the labour and mixtion, which is deſervedly to be admired.

What Matter and Inſtruments are needful in Alchymy.

THere is no ſpecial need of any thing, excepting a Fire-place, Coals, Bellows, Tongs, Hammer, Crucibles, Teſt, (treib ſcherben) *and Cupels made of good Beech-aſhes. Then put in* ♄, ☿, ♂, ☉, *Copper,* ♀, *and* Luna. *Proceed to the end of* ♄. *'Tis very difficult and uncertain to find out Metals and Minerals in the Earth and Stones; yet becauſe all Metals are to be firſt ſought after and digged out of the Earth, this Labour is not to be contemned, but is Praiſe-worthy. Nor will this luſt and deſire in digging in Mines ſooner ceaſe, than the love of young Men to Maids will fail; and as the Bees are greedy of extracting Honey and Wax out of the Roſe, ſo prone and forward ſhould a Man be, to find out the Minerals in the bowels of the Earth, but without Covetouſneſs; he that is overmuch greedy, receives leaſt, for God doth not fill all men with gold and ſilver, but with want, dung, dirt, miſery, and ſcarcity. Some men alſo God beſtows a peculiar Intellect upon, and a piercing knowledge of Minerals and Metals; ſo that they know a far more compendious way of making* Sol *and* Luna *without digging in the Mine-pits, and without the Examen or Trying, and Fuſion of Minerals. So that 'tis not ſo altogether neceſſary to dig in the Earth for native* Sol *and* Luna, *but by a certain knowledge it might be made of five Species, (but of Minerals become Metals, which are Imperfect Metals, and are ſo called)* viz. ♀, ☿, ♄, Mars, *and* Copper: *Of ſome more eaſily, of otherſome more difficultly is* Sol *and* Luna *to be had.*

Note alſo, *That out of* Argent-Vive, *Lead,* ☿, *Gold and Silver is eaſily made; out of* ♂ *and* ♀ *difficultly. Nevertheleſs 'tis poſſible, but in the beginning and acceſs of* Sol *and* Luna.

Out of Magneſia *and Lead comes* Luna.

Out of ♀ *and* Cinnabar *ariſeth pure* Sol.

Likewiſe an Ingenious man (as I well remember) is able

able by due attention and preparation ſo to handle a Metal, as to be able by his ingenuity to do more in the Tranſmutation of Metals to perfection, and to guide the ſame better than all the Signs and Planets of Heaven can do. 'Tis alſo needleſs to obſerve the Twelve Signs, and to calculate the motions and Regiment of the Planets, and to obſerve a time, a day, the hour of this or that luckey or unluckey Planet; ſuch things neither promote nor hinder any thing; they neither hurt nor profit ought in the natural Art of Alchymy: *But if thou rightly underſtandeſt the art and poſſibility thereof, then go to work and labour when thou ſeeſt it moſt convenient; but if thou want'ſt the knowledge and practice thereof, then all the Planets, Stars, and Signs will wholly fail thee. It alſo comes to paſs, that metals lying long in the Earth, are not only changed into Ruſt, but by a longer ſtaying in the Earth, they return into their Native Stone, of which ſort are many found, albeit they are not obſerved, for there are found ſtony pieces of Money, of the* Gentiles, *which were Metal heretofore, and by Corruption were transformed into Stone.*

Glaub.] Here we are, in the firſt place, taught, that for the making of ☉ and ☽ there needs not many Inſtruments nor Species, but the metals are only to be conjoined, but not by the common ſeparation or waſhing: For if you ſhould waſh all the metals with Lead, yet would there remain no more ☉ and ☽ than was taken at the beginning; the reſt will deſcend with the Lead into the Cupel, and will lie at the top thereof like *Scoria*; therefore he doth again direct to a ſpiritual Commixtion and Philoſophical Separation. Alſo he adds, That 'tis an honeſt, good, and neceſſary thing to dig up Metals, but that the other is the more excellent, and that deſervedly, for it ſeparates Gold and Silver by Art from the more vile metals; for all ſuch as apply their minds to metals, do well know with what dangers, coſts, labours, and Cares, they are to be gotten out; but yet 'tis not therefore to be abſtained from, eſpecially ſince we labour by this Rule, of having a fore-known and certain end of our pains and work; the which cannot indeed be done in metallick Mineings, for we are frequently drawn by vain hopes to beſtow all our Eſtates on the Mines; and having ſpent all in vain labour, we are at laſt compelled to deſiſt from the Work; but yet if it ſucceeds well, they yield the more plentiful Returns; and many Chronicles of Metals do teſtifie, That many Poor men have, by the Benefit of a rich Mine-pit, grown moſt Rich and Wealthy in a few years ſpace. The finding out of Mines therefore doth wholly conſiſt in Chance and Caſualty, where Profit and Loſs are equally and alike to be expected: The Work is likewiſe very chargeable, and can't be ſet upon by every body, and therefore 'tis not for ordinary People, who have but little to loſe, but for rich Men, who, though they loſe much, are notwithſtanding able to live, unleſs happily a Poor man lights upon ſome Earth or Sand that is very rich in ☉ and ☽, and other Metals, by the waſhing whereof he may get a livelihood; or elſe finding a rich Mine, and ſo betakes himſelf to a Rich man for his Copartner, ſuch a one as is able to bear the Charges of digging it forth; and this is often done. But yet be it as it will, the thing is full of uncertainty. Whereas this Metallurgy, or Work on Metals, which *Paracelſus* makes mention of, is to be preferred far before the other, if any one (by the Grace of GOD) attaineth the Art, whereby he may with profit extract the ☉ or ☽ out of the already-digged-up Imperfect metals, which are every where to be ſold.

But to return to the buſineſs in hand, *viz.* To illuſtrate the Writings of *Paracelſus*, who deſerved much of his Country. He names ſome metals, out of which Gold and Silver may eaſily be extracted, and others, out of which 'tis difficult to get it, but in both *Sol* and *Luna* is to be added; for 'tis profitable, yea, neceſſary (the which I have frequently exhorted to) in the extraction of Gold and Silver out of imperfect metals, and is volatile, and may the more commodiouſly make it corporeal and fixt. Then he adds, That Metals, by a longer ſtay in the Earth, do die, and return into ſtones and earth, from whence they had their original. The like happens to Man, and all Creatures; nor is there any thing in the World, how glorious ſoever it be, but is vain, empty, and periſhing, but the Knowledge, Love, and Fear of GOD alone.

What thing Alchymy *is.*

ALCHYMY *is an intention, imagination, and ſtudying, or conſidering how or whereby the Species of Metals are tranſmuted from one degree and nature into another. Let therefore every ingenious and underſtanding man throughly conſider the good Art of* Alchymy, *for he that ſpeculates and well ſtudies, will the ſooner attain the Art and find out the Truth.*

Note, *That very much is to be attributed to the Stars and Stones, for the Stars are the framers of all Stones. And all the Cœleſtial Conſtellations, the Sun and Moon, are in themſelves nothing but ſtones, from which the Terreſtrial do ariſe, being as it were their burnt part, Coal, Aſhes, Outcaſt, Excrement, Expurgation, from which the Cœleſtial Stones ſeparating themſelves, become clear and tranſparent by their proper brightneſs: And the whole Globe of the Earth is nothing elſe but a dejected, ſlidden down, commixt, broken, recocted Rubbiſh, and blown as 'twere into one Maſs, having obtained Reſt and Conſtancy in the middle Circle of the Firmament. 'Tis alſo to be noted, that* Gemms (*the names whereof I ſhall preſently mention*) *together with the other Stones, came down into the Earth from the Celeſtial Stones or Stars, to which they are neareſt in all perfection of Purity, Fairneſs, Brightneſs, Virtue, and Conſtancy, or Fixity, and Incorruptibility in the fire, and are in a manner like to the Celeſtial Stones and conſtellations, being parts of them, and of the Nature derived from them, and are found by men in an impure groſs veſſel, and are ſuppoſed by the vulgar (who judge raſhly of all things) to have been there born or generated; ſuch as are found are poliſhed, and are carried throughout the World to be ſold, and are accounted as great Riches, becauſe of their form, colour, and other Virtues, of which I am now going to Treat.*

Of Gemms.

THe Emerald *is a green Tranſparent ſtone; it helps the Eyes, ſuccours the Memory, defends Chaſtity; the which being violated, it ſelf,* viz. *the ſtone, is hurt.*

The Adamant *or* Diamond *is a black Cryſtal; 'tis called* Evax, *becauſe it produceth Joy: 'Tis obſcure, and*

of an Iron colour, moſt hard, is diſſolved with Goats blood, and exceeds not the bigneſs of a Filberd Nut.

The Magnet *is a ſtone of Iron, becauſe it attracts Iron.*

The Margarite *is a Pearl, and not a Stone; 'tis generated in ſhells, and is white; for whatſoever is generated in Animals, in a Man or Fiſh, is not properly a Stone, but only in the opinion of the vulgar: It is properly a depraved (or a tranſmuted) Nature on a Perfect Work.*

The Jacynth *is a yellow pellucid ſtone; 'tis alſo a Flower, the which the Poets fain to have been a Man.*

The Sapphire *is a Skie-colour ſtone, of a Celeſtial nature.*

The Ruby *is a ſtone deeply red.*

The Carbuncle *is a ſtone of the Sun, emits light and ſplendour, like to the Sun in his own nature.*

Coral *alſo is like to a ſtone, all red, it grows in the ſea, on wood or a ſhrub, of the nature of the Water and Air; 'tis preſently changed by the Air, and turns to a ſtone, grows red, is incombuſtible in the Fire, and therefore may be eſteemed a ſtone.*

The Chalcedony *is a ſtone with bright and obſcure colours, with mixt and cloudy fluidities and colours, ruddy, like to a Liver, the vileſt of all the* Gemms, *ſhining with every colour.*

The Topas *is a ſtone, ſhining alſo in the night; 'tis found in either rocks or ſtones.*

The Amethiſt *is a ſtone of a red and yellow; it ſhines.*

The Chryſopaſſus *is a ſtone fiery in the Night, and in the day it appears Golden coloured.*

The Cryſtal *is a white tranſparent ſtone, like to Water congealed by the Air, and cold, (or of the Air and Cold) it is ſublimated, extracted, or (as they ſay) waſhed out of other Rocks.*

And now, for a Concluſion, I will give you this moſt true farewel. If any one will uſe a right reaſon, ſence, and cogitation towards Metals, what they are, and whence they come, let him know, that our metals are nothing elſe but the beſt portion of common ſtones; they are the Spirit of the ſtones, that is, the Marrow, Oyl, Pitch, and Fat of the ſtones; but it is not ſincere, pure, and perfect, as long as 'tis mixt and hid in the ſtones; this therefore is to be ſought for and found in ſtones, and to be known in them and extracted from them; and then it is no more a ſtone, but a well-wrought and perfect Metal, aſſimilated to the Cœleſtial Stars, the which alſo are peculiar ſtones, diſtinct from theſe ſtones. Whoever therefore is willing to find out metals, let him firmly believe this, and thus account, That he muſt not be only intent on the common Metals, nor have his hope placed in the bowels of the Earth, that ſo he might get good Minerals from thence, for often times there is above or without the Earth in ſight, which is not in the profundity and depth thereof, and oftentimes is better, and more rich.

Therefore all ſuch ſtones as you meet with, whether great or ſmall, as great whole ſtones or flints are to be moſt accurately ſearch'd or look'd into, and to be conſidered of what Nature and Property they are; for oftentimes a moſt vile Flint is found to be more excellent than any Cow. For the Matrix or Rock, Abbruch, *whence they are gotten, from whence ſuch a ſtone did ariſe, is not alwaies to be earneſtly ſought after, that you may have more from thence, for theſe ſtones have no Rock, the Heaven is their Rock; oftentimes alſo the Abject Earth, Powder, and Sand, hath much gold and ſilver Duſt,* (Schlich) *which obſerve.*

Glaub.] Here *Paracelſus* declares what *Alchymy* is, whoſe words being perſpicuous enough, need no illuſtration: Then he leads us to the birth of metals, the which are generated in the Earth, out of the Stars above: He attributes to Gemms the neareſt place of Perfection, but does not intend that we ſhould earneſtly ſeek after them, to have gold and ſilver from thence, but that the metals ſhould be made like them, as to their outward Aſpect, and then afterwards the ☉ and ☽ is to be extracted, to which all the ſcope of the foregoing Chapters tend, which is to be obſerved and enquired into, what his meaning is: Nor are the bare Letters alwaies to be truſted to, here is nothing mentioned by him in vain. What affinity have Gems with the metals? None at all: And although ſometimes the hidden ☉ and ☽ may be extracted, yet he doth not at all intend here that we ſhould make that, but repeating the former Doctrine, he hints unto us, That the metals out of which the ☉ and ☽ is to be extracted with profit, are to be firſt reduced into ſoluble or inſoluble Glaſs, moſt like to Gemms; a good Company of them he here reckons up, and adds to what uſe they ſerve; not that we might learn their Nature, Colour, and Properties, (as I ſuppoſe) but to teach us, that as they are found different in Colours and Virtues, even ſo may the metals be prepared into Colours like unto them. He that neither underſtands nor will believe, let him ſeek better things, and get help and aſſiſtance elſewhere.

Then at length, by way of addition, he concludes what Metals are, and that they are not alwaies to be gotten out of the profundity of the Earth, but are ſometimes to be found moſt plentiful in moſt vile powder, ſand, and ſtones; neither is it neceſſary to be earneſt in ſeeking their rock or original, whereby more may be gotten, becauſe the Heaven by its operation generates them every where: he reproves men for their blindneſs, becauſe they alwaies gape after great Mines, lying deep, dangerous to be found, and chargeable to dig out. That which is laid before their feet, as it were, they diſdain to acknowledge, peeviſhly affecting the dark, and ſtubbornly contemning the light exhibited to them by honeſt men, and by an innate malice they ſtudy to extinguiſh it. And thus is this Book ended, the which *Paracelſus*, a moſt experienced man, hath left behind him, written of Metallick things, and is moſt full of abſtruſe wiſdom, although few believe it, to the Elucidation and explaining whereof, I have heretofore uttered my mind, nothing doubting, but that hereafter it will be in better eſteem with All.

Indeed I could have written more openly, and explained his words more largely, and more exactly have diſcovered his occult ſence, but time and want of leiſure permits it not at preſent. But if I ſeem to any body to have written more obſcurely, let him conſult with my other Writings, for they illuſtrate one another.

Now follows the Praxis of the aforeſaid Theory.

THE afore-written Explanation of the Book *(of Vexations)* of *Paracelſus*, hath taught a moſt certain and undoubted Tranſmutation of Metals, and

and hath ſufficiently adviſed by what means they are to be handled. But becauſe this action requires a great experience in metallick affairs, I am willing to add ſome ſpecial waies of Proceeding, and that in perſpicuous words; but 'tis impoſſible to write ſo plainly that none may erre; it would be too prolix, tedious, and unfit, and as if many Elements of the Phyſicks, and other ſubtile things, were read to a Child that is not capable of underſtanding them; the labour thus beſtowed, would be wholly in vain: Nor do I undertake to inſtruct the Tyroes or Novices in *Alchymy*, but ſuch as are skill'd in the metallick labour of fuſion, waſhing, ſeparation, and the like, of a ſubtile Intellect and experienced Judgment.

I would verily have written more clearly, did I not fear that the Art would become a Trade; ſome will think that I have written too openly, and will be angry that ſuch Secrets are made known to the World: Who can ſatisfie all People? But be it as it will, 'twill be alwaies good to have done a profitable Work for my Neighbour.

This is the ART.

WHen thou haſt put in the Heaven of ♄, and haſt made it to flow with its Life in the Earth, then add the Imperfect Metals in a due weight, *viz.* ♄, ♃, ♂, ♀, and a little ☽; let them flow ſo long with the Heaven, until with it they diſappear, and having loſt their nature and metalline form, are reduced into earth. This metallick earth being yet joined to the heaven of ♄, and compaſſed wholly round therewith, raiſe up by the ſpirit of Heaven, and make it corporeal, and it will receive its former metalline form; but although it be bettered, yet let it be killed three, or four, or five times, and raiſed up, that the melioration may be greater, and produce in the ſeparation more *Sol* and *Luna*. There needs no Tyle, (Muffel) Cupel, Teſt, (treibs-ſcherben) Cucurbit, *Aqua-fortis*, and ſuch like Veſſels and Inſtruments neceſſary in other Metalline Labours, but 'tis perfectly finiſhed in one only Crucible, in one Furnace, with one only Fire, and in the ſpace of a few hours, from the beginning to the end. And to ſpeak more plainly in this Proceſs, the Sphere of ♄ is the *Regulus* of ♁, the Life is a whitening Salt, having its operation and motion from the Fire; the Earth is the Crucible. And thus haſt thou the whole Proceſs of the Work laid open, the which I have tried above an hundred times in a ſmall quantity; but let the ſtudious Artiſt, above all things, obſerve the Fire, of what original, nature, and virtue it is, and the other things will be the more eaſily underſtood; for the Wood, the Coals, and ſuch-like burning things, are not the Fire properly, but only its habitation, in which the Fire being occultly diſperſed in the Air, is made manifeſt, viſible, and perceptible. Even as the Man is not the Life or Soul, but only the receptacle wherein the Life or Soul, being infuſed from above, doth lodge: Nor is the man any more a man, but a meer carcaſs when the ſoul expires. In like manner Gold ceaſeth to be Gold when deprived of its ſoul, but is volatile, and a Mineral without colour. Whence 'tis evident, that the Goodneſs of metals conſiſts not in their bodies, but in their ſouls: On this account ☽ is added to the Imperfect Metals, that it may receive that inviſible ſoul which lies largely diffuſed throughout their bodies, that it may collect it, make it viſible, perceptible, and corporeal, whereby the mixtion of both (*viz.* of the *Luna* and the Soul of the Imperfect Metals) being made, it gets the name of ☉. Some body may ask, *Whether or no Gold will be produced, if no* ☽ *be added to the metalline mixture?* For anſwer, There will be ☉ produced, but leſs in quantity than if *Luna* were added, becauſe the moſt tender (and as it were incorporeal) golden ſoul of the imperfect bodies is not able to quit it ſelf and get out by its own proper force, from ſo many impurities as 'tis invironed with, without ſome other help, nor make a new body; 'tis needful and good to adminiſter and lend to it a body wherein it may be contracted, and thereto betake it ſelf, for which the *Luna* is moſt fit; the which being by a vivifying Fire radically united with the unclean metals, and well ſubdued or exerciſed in the mutual aſcenſion and deſcenſion, the purer particles of the Imperfect bodies do come together in this Circulation of the *Luna*, adhere thereto, are mixed, and become corporeal, the impure corruptible body being left, and a ſeparation made of the good from the bad.

So then, I have now taught perſpicuouſly the Art of extracting *Sol* and *Luna* out of all the Imperfect Metals, either apart, or conjoined with or without the addition of the *Luna*. If therefore thou attaineſt to the Art, I am glad; if not, thou haſt no cauſe to complain of me, for I have candidly imparted unto thee the meer and naked Truth.

Another Separation of Sol *and* Luna *out of the Imperfect Metals, by* ♄.

FIrſt of all, melt ♄ well in a melting Veſſel, (Scherben) add ♀, ♂, and ☿, mixt in due weight, melt them together, and forthwith the ♀ and ♂ will corrupt the Lead, being reduced into *Scoria* like to yellow Earth, and being reduced, they will in part reſtore their own Lead and Copper, but the ♀ and ♂ remain like black *Scoria*, which are to be kept: Let the Coppery Lead flow well again, and again add ♀ and ♂, and there will be again made *Scoria*, which are preſently to be reduced. Let this Labour of Scorification and Reduction be repeated, until there remain ſcarce one or two pound of Lead out of an hundred to be waſhed, and you ſhall find ☉ and ☽ in part, which the Metals give out from themſelves in this operation: But the *Scoria* which can't be reduced, let lie well heated red hot, in a peculiar Furnace, for ſome daies, and be fixed, and they will give in the reduction a golden and ſilvery ♄ or Lead to be waſhed, that ſo the remaining ☉ and ☽ which the *Scoria* drank up, being extracted, may be of uſe unto us. This labour (which I never tried in great quantity, will doubtleſly (in my opinion) ſucceed in quantities; any one may try the thing, and exactly compute how much profit may be thence had every year.

Alſo the moſt Imperfect Metals may (by the benefit of Salts not corroſive) be truly and infallibly fixt and waſh'd by a particular way, that they may give much ☉ and ☽, concerning which none need to doubt; the which I having oftentimes mentioned in my Writings, will not repeat it again.

Metals alſo being firſt reduced into a Calx, may be purged and waſh'd by the glaſs of Lead, made by the addition of Flints, ſo as to yield much *Sol*, concerning which I have written heretofore: But there's required much ☿, whereby the metals may be largely diffuſed, otherwiſe it will not let fall the fæces; nor can its more pure parts be gathered together into a body, and concentrated; I take in the Flints, that they may receive into themſelves the fæces of the unclean Metals, and ſo make a ſeparation of the pure from the impure. And like as we are wont to mix the whites of Eggs to Honey, Sugar, and other Vegetable Juices, in the purification of them by Water, that thereby the viſcouſneſs of the Juices may be attracted, and ſo be clarified. In like manner, the Flints do in this operation occupy the place of the whites of Eggs, and ☿ of the Water wherein ♂, ♀, or ♃ is to be diſſolved; the Labour is moſt pleaſant and ſpeedy, exceeding gainful, if the Crucibles (perforated by the Litharge) would but hold the mixture, and not let it paſs through ſo ſoon.

But whoſoever ſhall be ſo happy as to find Veſſels which can keep in the Glaſs of Lead for ten or twelve hours, he need not be ſolicitous or careful of other Arts to inrich himſelf by. For my own part, I could never be ſo happy hitherto, albeit I have carefully ſought it for ſo many years. One only pound of Iron, ♀, or ♃, doth ſometimes yield half, yea a whole lot of *Sol*, if the Work be rightly managed. And if you add a fix'd Salt, as of Tartar or bare Pot-aſhes, it will then yield more, but the Crucibles will be the ſooner perforated to our grief. I do believe that one or other will be a curious Searcher after this, and may in due time find how to make this Work ſucceed very well, both in Crucibles and in great Fires, or melting places; and will be thankful to GOD the Giver, and to me the Writer hereof. Heretofore I did ſet by this Labour very highly; and although I would not then communicate it to any body for a great price, yet now (being not permitted to make any further Progreſs therein) I freely beſtow it, that others alſo may try their fortune.

Alſo imperfect metals are purged from their combuſtible and noxious ſulphur, by the ſuddain fire of Nitre, of which we have formerly ſpoken about Mercury, the which is to be lookt on as the moſt ſpeedy, and as it were a momentary Melioration of metals N. B. eſpecially if they are reduced into a ſoluble ſalt without a Corroſive, for which thing ♂ and ♀ are moſt fit, exhibiting a Philoſophical Vitriol, the which may be moſt commodiouſly purifyed to perfection. There's a great ſecret lies here under, and haply greater than a particular work may require; let the Poetical fable of *Venus* and her ſon *Cupid* be conſidered of; what is there meant by *Cupid*, whether or no it be not ☉. Verily I could diſcover more good ways of producing ☉ and ☽ out of the more vile metals, but becauſe there's enough already ſpoken in the explication of the ſeven Canons or Rules, it ſeems good to me to forbear. He that doth not underſtand that nor can apprehend its drift or ſcope, will not be profited by the addition of more things. If the fundamentals are laid open, any one will conveniently adminiſter his intent and labours: But yet I will add over and above, a moſt pleaſant work, Parabolically, being the foundation and Baſis of the whole Alchymical Art, under which is comprehended the radical ſolution of metals, *Conjunction*, *Deſtillation*, *Sublimation*, *Aſcention*, *Deſcenſion*, *Cohobation*, *Cementation*, *Calcination*, *Inceration*, and *Fixation*, and ſo I will end the work of *Tranſmutation*.

There was a man (♄) who had two ſons, (*Biſmuth* or *Tinglaſs*, and ♃) the younger (♃) ſaid to his Father (♄), give me my portion, (Note well, *Biſmuth* and ♃ were always accounted Lead, as well by the Philoſophers, as by the ancient workers on metals, the one *viz.* *Biſmuth*, they called an aſhy colour'd Lead, the other (♃) a white Lead, and this a black Lead,) and behaved himſelf ſtubbornly and unmannerly, that is, aſcending or getting up; his Father gives it him, and he goes a wandring therewith, (Note well, when ♃ and *Biſmuth* together with ♄ do feel the fire, the ♃ is ſeparated from the ♄ and *Biſmuth*, and aſcending, takes ſome-what from ♄ with it, and becomes a Contumacious *Scoria*, and this is to go a wandring) and he enters into an Inn, *where* ♂ *the Hoſt*, *and* ♀ *the Hoſteſs*, had the ſign of the World(♁) in a hanging Table, who having entertained him, diſpoiled him of all his Fathers goods, (Solution) Then there grew ſuch a great ſcarcity of Corn (with drought) that all men were even deformed by reaſon of the Famine (corruption), to prevent which he is enforced to keep hogs, (that is to dwell with fætid Nitre) and to feed on huskes, (that is *Tartar*) (inceration, imbibition) by which being humbled (Digeſtion, Circulation, Edulcoration, Putrefaction) he returns to his Father, (Incorporation) as a loſt Son, (ſome thing is made nothing, and nothing is made ſomething again) he brings forth a new Garment, (*Argenteous*) he puts a Gold Ring on his finger, (☽ impregnated with ☉) after which he remains conſtant with his Father, and becomes a good and thrifty Houſeholder, that is, a fixt metal. And now that I thus compare this Tranſmutation of imperfect bodies, eſpecially of ♃ to the parable of the loſt Son let no body be therewith diſpleaſed, for I did it for the eaſier knowledge thereof. There lies under it a great ſecret, I never obſerved the like-changes in my whole Labours; for firſt of all, in the Solution appears a blackneſs, which haveing remained his time, there follows the tail of the Peacock, greenneſs and then whiteneſs; but whether or no a redneſs would follow, if it be detained longer in digeſtion, I am not certain, for I never arrived beyond the whiteneſs. It is a moſt pleaſant Labour, greatly exhilerating the Artificers mind, of ſmall charges and little difficulty; if they, find the weight and good veſſels, it ſhews the way and opens the Door to higher Secrets, happy is he who attains the things, he'll never be ſatisfyed with the ſight thereof, nor admiration, how rich, generous, fair and glorious Nature is in her retirements. Note well, that every Metal may be waſht apart with ☿ and Salts, ſo that being exalted, it may yield ☉ and ☽ in ſeparation, and paſs through all colours; but it will not be ſo profitable, as if they were all joined together, for then one operates ſpiritually upon the other, changeth and perfects him. And now having abundantly diſcovered, how ☉ and ☽ is to be extracted out of the imperfect metals, and becauſe in that labour ☉ and ☽ is moſt an end jointly together, 'tis very neceſſary to know, by what Art they may be ſeparated each from the other, that ſo each may be had by it ſelf, which is

to

to be done thus; If this mixture hath more ☉ than ☽, 'tis moſt profitably to be melted by Antimony and precipitated into a Regulus with Iron waſhed with Nitre and purifyed. This work you may find deſcribed in my former Books. NB. If the Nitre in the ſeparation of purification of the Reguli, prey upon ſome of the ☉ and ☽ and attract it to it ſelf, let none grieve thereat and account his labour loſt, but let him remember the ſaying of *Paracelſus*, Deſtruction or Corruption makes the good perfect; The Nitrous Scoria, in which the cleanſed Reguli are, let be carefully kept and fixt, then by a ſtrong flux let them be reduc'd and you ſhall receive the loſt Son, much more elegant than he was before it's being loſt, ſo that hereby you loſe not, but rather become a gainer. Here would be a fit place to ſpeak of a certain profitable work if the drift of the thing would permit. Enough is ſpoken to a wiſe man, Fools will not profit by any thing: But if it contain more ☽ than ☉, let the mixture be at firſt of all granulated, and burnt with Sulphur, let it be precipitated, either with ♂ alone or without it, with lead and Salts; thus ſeparating the ☉ from the ☽ into Reguli; then waſh it with Nitre or with Lead, and let it be purifyed, the work being to be done in like manner. You are to note that if the precipitation be done with ♄, then the *Caput mortuum* (Halb Kopff) is to be added, whereby the work will be apparently haſtned and bettered. NB. If the Reguli of the maturated or fixt Metals be coppery or pale, they need not be waſht, but 'twill ſuffice if being granulated, they are precipitated with Salts, and the *Caput Mortuum* (Halb Kopff,) all the ☉ and ☽ will come forth in peculiar Reguli, the Copper and the Lead will be ſcorifyed, and may in acute Furnaces (Stich ofen) be reduced, and be aplyed to other uſes according to the rule of Art. I judge it inexpedient to heap up more things concerning Extraction (Seigeren) waſhing, and the ſeparation of metals, being every where mentioned in my other writings. Alſo it will be needleſs to explain, by what manner metals may be more commodiouſly melted ſo as to yield more and better metals, as alſo how the poor and rough Minerals that abound with a preying and devouring Sulphur, whereby the metal in its fuſion, is turned into *Scoria*, and affords ſo little profit, that being not able to quit coſt, they remain unmanaged, the which Sulphur eſpecially in the Minerals of Copper and Lead, may by a ſingular Cement or Gradatory fire, be inverted and changed, ſo that afterwards in their fuſion, It's ſo far from ſwallowing up the metal, and turning of it into *Scoria*, that it rather exalts it ſo as to give ☉ in the ſeparation, the which could never have been done without this burning or roaſting. No body doth throughly ſearch after any help for this or that metal, either before the melting or in the melting of it, if the groſs fire is not able to melt it down, but moſt frequently the beſt part remains in the *Scoria* without profit or uſe. 'Tis poſſible for an experienced Chymiſt, profitably to extract that ☉ and ☽ which the *Scoria* have ſwallowed up, what by fuſion and by adhibiting ſuitable *Menſtruums*. A work of this nature hath been hinted in my diſcourſe of the Extraction of Flints, and more ſhall be likewiſe mentioned when I come to write of the felicity and hidden Treaſures of *Germany*, which time let the Reader with patience expect. A nother benefit would ariſe to ſuch as work on metals, if they had the perfect way of ſeparating ☽ and ſeparating the ☉ by precipitation, that lies therein, (Meider Schlagh) that it may not be ſo unworthily waſted with the ☽ by the Artificers.

And thus I conclude this Appendix or addition to the Mineral work, the which I have brought forth to light with a good will for my Neighbours ſake, that ſo, being accepted with a ſerene mind, the Glory of God may be thereby advanced; for which end I wiſh with all my heart a divine benediction on the Labours of every honeſt and active ſearcher into the metalline affairs. *Amen.*

The APOLOGY of
John Rudolph Glauber,
Againſt the Lying Calumnies of
CHRISTOPHER FARNNER.

'Tis an ancient Proverb, *He that toucheth Dung is defiled, and will alwaies ſavour of a Dunghill.* Experience makes it evident.

I Ever hated Quarreling, as more agreeable to the Peviſhneſs of Women, than the more Generous Temper of Chriſtian Men; and have, as much as I might, alwaies declin'd it, being rather deſirous to ſuffer injuries, to bear loſſes, by ſilence to forgo thoſe things I might lawfully lay claim to, to undergo any thing, ſo that I might enjoy my beloved Peace (with which GOD has bleſt me hitherto). Neither have I ever, ſo long as I have liv'd in the World, (and I am pretty ancient) been taken, by the worſt of men, for a contentious Perſon; But perfidious *Farnner*, unpro-

voked, urges me to this vindication of my ſelf, by going about not only to hurt my Perſon, but alſo by a Pride no leſs than his Envy, to explode and defame all my Writings, and by infamous Letters diſperſed abroad, to render me odious to all good men. Which wicked Enterprize, though I heard of it by many, I durſt not believe, till a printed Epiſtle of his came to my hands, which having peruſed, I thought I could not enough admire his deteſtable Impiety, and the many ſcandalous names he had for me.

Art thou not aſhamed *Farnner*, to expoſe my Works to the contempt of others, when thou neither doſt, or ever canſt underſtand 'em, and before now haſt prais'd 'em, as may be proved from your own hand? I'm ſure I never merited that you ſhould cavil at me where-e'er you come, and proclaim my Writings unprofitable. You ought rather all your Life, in conſideration of the many benefits you have receiv'd at my hands, to have behaved your ſelf as a Man grateful to me; but inſtead of that, notwithſtanding the Obligation that lies upon you to the contrary, you have deſpightfully recompenſed all my kindneſs with the baſeſt Ingratitude, which is directly oppoſite to goodneſs.

To what end do you deny that you had your greateſt knowledge from me, and in the mean time expoſe it as your own, and upbraid me from whom you had it?

I never before believ'd you unfaithful, but alwaies thought you candid, and have communicated ſo great things to no man as to your ſelf. I believe you will not deny your coming twice from *Lochgovia* to me at *Kitzinga*, and entreating me to communicate ſome Secret to you, whereby you might get a livelihood. Have you not been forced twice, being repulſed, to return home with this Excuſe, That I wanted time to inſtruct you? And when you came the third time, I ſuffered my ſelf to be perſwaded, and did communicate ſome Secrets to you *gratis*, on this conſideration, That you ſhould impart thoſe things wherewith I truſted you, to no man without my leave; which you promiſed by an Obligation, (*viz.* That you wou'd keep all things ſecret) under the penalty of Diſgrace, and the forfeiture of all your Goods. Why haſt thou falſified thy Word, and contrary to thy Promiſes, ſo wickedly ridicul'd me among all men, when with thy whole Family thou didſt promiſe to be faithful to me? Not only Obligations, but alſo thine own Letters are Witneſſes: Neither do I queſtion, that if I had loſt or wanted them to convince thee, thou wouldſt have denied, and that with an Oath, that thou waſt ever beholden to me for any thing, as thou haſt already begun, and as thou in thy ſpightful Writings deſpiſeſt all my Secrets, and proclaimeſt thine (which yet are mine) with praiſe. You doubt whether or no the reading this will make me repent that I ever truſted you with ſo many things, which I had never done, had not you obliged your ſelf to labour diligently with me in my Laboratory, to produce thoſe things for the profit of us both. But what can I do with them? They are periſhed and gone which yet might ſufficiently have ſuſtain'd both you and me, had not you made 'em publick.

I pray, What gain can you hope for from them, now they are every where known? Wherefore when I ſee thoſe things taken from me, and by you imparted to all men, in ſpight of me, for your own advantage, I think fit (for I cannot hope for any farther profit from them privately) to make 'em known to the World; and by the Grace of GOD, I may live without them: But if I alſo ſhould buy all thy goods which thou unjuſtly poſſeſſeſt and ſelleſt to every man, of thee, and diſtribute them about the world, thou wilt ſee thou canſt not eaſily recover them, or others in their room. I indeed will give you nothing for the future, neither can my unfaithful Servant, whom you have made as good as your ſelf, give you any thing, for whatever he hath learn'd of me theſe two years, he has given you, which you alſo have laid up among your own wares and expoſed to ſale. Who will hereafter truſt you, you have ſo wickedly deceiv'd me? Every man will abominate you, and ſhun your Partnerſhip and Company, neither undeſervedly, for the Laws of your own Obligation make this your Fate: So the merit of the Crime ſhall return upon the Author, and you can be more ſure of nothing, than that Divine Vengeance will purſue you. I confeſs indeed ſome others, as well as you, have injur'd me, but none by ſo wicked an act; whom nevertheleſs GOD (to whom I refer'd my Cauſe) hath ſo ſeverely puniſhed, that each of them, by one cauſe or other, has brought upon himſelf his deſerved Reward of Puniſhment. But I had yet farther tolerated you to exerciſe your Trade at your pleaſure; neither had I followed you to *Lochgovia*, to urge your Obligation to you, but had committed Vengeance to GOD; only for that you were not content to ſell thoſe things publickly for your filthy lucre, which you had of me, and which you obliged your ſelf to keep ſecret, and to take that profit to your ſelf which was due to me, but alſo you have rendered me, and the things you had from me, odious; which has been ſo much to my diſadvantage, that I can no longer bear, but am now reſolved to the utmoſt to refute thoſe impious and lying Calumnies, which you by your Letters have ſent into the world concerning me, and to defend my ſelf and my Works, againſt which you have ſo wickedly inveighed, that all the world may ſee how great your perfidiouſneſs has been towards me, and that your Heart acted by Helliſh wickedneſs, has raged againſt me with horrid Lyes, Taunts and Reproaches, contrary to all manner of Equity: You muſt needs know, that nothing can be more troubleſome to me, than to ſpend that time in reproving your Lyes, which I could otherways employ to greater profit; wherefore I ſhall anſwer your trifling ſtories as briefly as is poſſible. Every wiſe man will eaſily ſee how frivolous your Excuſe is. Do you think that any honeſt man will believe you, if you ſay you don't owe the greateſt of your Knowledge to me? No ſurely, for no man is ignorant of it: About two years ſince, you did not know how to bring a Crucible to the Fire, much leſs to make a trial of Braſs; which you did not learn of me, but my unfaithful Servant taught it you, whom you for that cauſe eſteem; yet ſeeing you know ſo much, how lawfully may I complain of him, what a Raſcal he has been to me, and that you for that very reaſon have taken him to your ſelf, that you may fiſh from him whatever he had learned in thoſe two years he ſerved me; although he did not ſhun you, becauſe he was unwilling to communicate thoſe things he had learn'd of me to any man elſe.

And ſo you make your ſelf Maſter of my Secrets, and Covenant with him to undo me and mine: Is this the part of a good man? You do not only

only expose those things you had of me, but those also which my perfidious Servant has since given you, to be sold at a price, when you have no right to sell another mans goods, to which you have no title. We'll come to the point and expose all your wickedness, as well your impious speeches, as perfidious actions, to the view of the world: But first of all, I will lay before you the obligations you gave me, as most sure pledges of your truth, that by the review of them, you may judge your self how honest you have been, and how faithfully you have kept your promises; and every man shall thence see, (especially those among whom you have so wickedly ridicul'd me) with what base ingratitude you have recompensed all my Favours.

The first Obligation which FARNNER *gave me, runs thus;*

Forasmuch as the most excellent and learned Mr. John Rudolph Glauber, *moved by a singular affection towards me, has communicated, shewen and demonstrated to me undernamed, some of those secrets whereof he is Master, and hath enjoined me to silence; I therefore bind my self, and promise upon my Credit and Reputation, and call God and my christian profession to witness, that I will divulge none of those things to any man living: but if it be so (which God forbid) that I do at any time communicate any of those things to any man, then I shall most willingly renounce all my right in those Goods, movables or immovables, which I shall possess, and give him absolute power to take them to himself, and convert them to his own use and advantage: and not that only, but I give him farther power to proclaim me perfidious and wicked, to defame me and make me abominable to all men, for which reason, the laws of Silence shall be observed by me most strictly. Nay farther, in consideration of the many benefits he has bestowed on me, I give up my self, my beloved wife, and my children to serve him in all things lawful and honest, to go when and where he pleases, and to ease his labours; and if he dye first, (which God avert) to be alike serviceable to his whole Family, which care he also has promis'd to me and mine: I promise then, (if my Fates grant me life) that I will be to my utmost, serviceable to him so long as he lives: In witness whereof, I have hereto set my hand and seal. Given at* Kitzinga, *the* 15th *day of* June, 1652.

Testis, Spirensis Canonicatus Quæstor, *Lochgoviæ & Horrhemi.* Christopherus Farnnerus.

The second *Obligation.*

I Christopher Farnner, *for the time being Canonicate Quæstor of* Spire, Lochgovia and Horrheme, *in the Dukedom of* Wirtemberg, *to all by whom these presents shall be read, make known, that the most excellent and learned Mr.* John Rudolph Glauber *for little or no reward, has communicated some of his secrets to me, and with me made a covenant after this manner, That I must oblige my self for what he hath already done, or hereafter shall do for me, to be all my life thankful, not only to him, but to his Children also. But for as much as 'tis most certain, this life will have an end, but we know not the time when, the first Obligation is not full and clear enough, and for that cause I bind my self and promise, (so help me God) and swear by the King of Heaven who always bears witness to the Truth; and farther, upon my Credit and Reputation, for the preservation whereof every Christian man should be induc'd to keep his promise, if (which that God would in mercy avert, I shall not cease to put up my daily Prayers) the above named Mr.* Glauber *and his beloved wife shall die, and leave their Children unmarried, I do oblige my self by this most solemn Oath, to observe faithfully, and as a Christian man ought, these following things:* viz. *I will forthwith take his Children to an inheritance with mine, and to my utmost skill, instruct them in the secrets of their dead Father, and shew them all things requisite and necessary, as fully as to my own Children; and that after this manner, That what ever of their Parents heritage belongs to them, they shall wholly possess, and they shall lawfully demand it as their proper due; and if any thing goes from him, I will redeem it, so that my Children shall lay no claim to it: on the contrary, (for those secrets communicated to me, which hereafter may redound to my profit) I make the aforesaid Mr.* Glauber's *Children Heirs with mine, that they may be admitted equally to my Estate, and alike enjoy the Goods of me living: But if I* Farnner, *contrary to my expectation, shall depart this World before Mr.* Glauber, *he is bound to instruct my Children in his Art, according as they are qualifyed, only so far, as that thereby they may get their living, and that they may not be burdensome to him. He may at his pleasure instruct him that he shall esteem most fit in some secret, with which he shall afterwards teach his Brethren to get themselves maintenance. And for the same cause, I call my little Son* Alexander, *and surrender him to Mr.* Glauber *and his service, so that he may keep him as long as he shall be willing, and it shall not be in my power to take him from him according to the agreement we have both made with him: all which things are restrain'd to this on either side, That if the Parents of either part die before their Children are provided for, which God forbid, and our Children shall be free by the early death of their Parents, then each shall to his utmost, provide for his own Children.*

That all these things may be observed the more firmly, I affix my Seal and name, and by my own hand writing, oblige my self so, that if at any time I falsify my word, my Children may be call'd to witness my perjury. Given at Kitzinga *the* 10th *of* September, *in the year* 1652. Christopher Farnner.

NB. I did not require this obligation of *Farnner*, neither wou'd I have taken it, but admonish'd him to be true to the first, with which I was content; for he gave me this for no other reason, but to get more out of me: But, because I had found out his cheats, and he wou'd not be advis'd for his own profit, he at last makes mention of this new obligation, in a certain epistle of his, thinking thereby I was oblig'd to a farther communication of my Art to him, tho I have often told him, that I valu'd not this last obligation but wou'd give it him again: But when he refus'd to take it, I cancell'd it, and kept it by me, for this reason, that it might be seen how he had bound himself by this new Obligation, which certainly he wou'd never have done, without very good cause.

Expreſſions gathered out of certain of Farnner's *Epiſtles ſent to me; from which is evident how greatly he is beholden to me.*

THerefore I faithfully aſſure you, that I will ſhortly leave my Houſe, and take a Journey farther off, to provide for my Family; my Wife too is very willing to go with me, and to be intereſted in our agreements, but I can't ſee what ſhou'd oblige her to it, when it can't be effected very commodiouſly: Yet I reſolve, if nothing extraordinary hinder me, after eight daies, that is, on the $\frac{1}{4}\frac{2}{4}$*th. day of* April, *to depart hence, and then anſwer your moſt friendly Letters, together with my beloved Wife, and all my Family, to take part with you in all your Labours, and help you with the greateſt diligence. But becauſe I intend to be ſo ſuddenly with you, I ſhall write no more at this time.* March 26th. 1653.

Out of another Epiſtle, *July* 17th. 1653.

I Hope you will excuſe me, that I did not come to you, becauſe hindered by my Wife's faultineſs, who telling me ſhe wou'd come with me, privily laid Obſtacles in my way; this offence won'd not deſtroy a Knave: Wherefore I again intreat you not to caſt me off, but continue your wonted favour to me; and I ſhall endeavour in my place to give you ample ſatisfaction; neither ſhall any thing hinder my ſpeedy performance of what I have promiſed.

Out of another Epiſtle, *July* 29th. 1653.

FOraſmuch therefore as I have by the wicked deceit of my Wife, broken the many Promiſes I made of coming to you, unleſs I wou'd have taken her wicked Amaſius *or gallant, as Companion in the Journey; it has at length pleaſed God to take her away, and ſo put me in a capacity,* Worthy Sir, *of ſerving you without the leaſt impediment, wherefore I give my ſelf wholly to your Commands: And altho' I have been perſwaded by Perſons of principal Authority to marry again, I will not, but commit my ſelf to be manag'd by your Counſel, as you were my Father. Therefore, ſince we are parted, if my Fates grant me Life and Proſperity, I will come to you, and commit my ſelf to your guidance and protection, Worthy Patron; for which reaſon I ſhall forbear to write any thing at this time of your Laboratory, more than what I ſee in your Letters, that all things may proceed the more regularly. Wherefore, though I have been ſolicited by many, yet ſhall reject all as much as I may commodiouſly, in hopes of this, that when I have firſt gotten your conſent, I may communicate my labour to ſome, whereby I may get a good Sum of Money: But theſe things ſhall be deferred till our happy meeting.*

In another Epiſtle he ſaith;

THat he was confident he could find out all my Art by my Writings, except that the Veſſels do not alwaies abide the Fire, and that the Apothecaries refuſed to buy his Medicines, unleſs he would teach them the way to prepare 'em: Again, he would give me Fifty R. Dollers for each month, for my part, as may be ſhewn from himſelf; theſe are his words: And if he was not oblig'd to me, why would he give me Fifty R. Dollers each Month?

From all which (and much more I might add, which for brevities ſake I omit) it evidently appears, that *Farnner* was obliged to me, which he would never have been, had not he receiv'd ſome benefit from me, which render'd him bound to me: But if he is oblig'd to me, why was he ſo wicked, as in his lying Epiſtles ſo malapertly to deſpiſe, and diſparage me and my Secrets, which he had from me? Hence then every man may perceive what they ought to judge of him, that he has both behav'd himſelf moſt perfidiouſly wicked toward me, and alſo, that he has ſufficiently declar'd himſelf the moſt ungrateful in the World.

But that no man may ſuſpect that I wreſt any word of *Farnner's*, in his obligations given to me, to his diſadvantage, or my own ends, I have taken care to have his own hand-writing view'd by Notaries and Witneſſes, who will atteſt, that what I have printed is word for word the ſame with what I have in writing under his own hand.

A Specification of thoſe Chymical Secrets *which* Farnner *learn'd of* Glauber, *and in the trial found true, and of thoſe which yet are found and brought to trial; where it muſt be known, that thoſe, of which there is no mention made here, if* Glauber *ſhould relate them, they would not anſwer his expectation in Practice, according to his information: Alſo the Charge which he muſt be at who will make trial of thoſe Secrets after a right manner, is here added.*

1. *Glauber's* Panacea, for 30 R. Dollers.

ABout which theſe things are to be conſidered: It is made chiefly of Antimony; *to which, according to his common way, Sulphur is added; which done, another Separation is made, in which, from a whole pound of Sulphur and Antimony, no man ſhall receive more than three ounces of the pureſt Sulphur. There are indeed two other Subjects, which produce a golden Sulphur better than Antimony; but I have found a way to extract a thick and pure Sulphur from all ſorts of Metals (except* Luna *and* Sol*) and Minerals, and after* Glauber's *manner to make Tinctures. All theſe Secrets annexed will be taught for the price named.*

2. *To reduce Minerals and Metals into Droſs, after* Glauber's *way, to reduce them to nothing, and then without Charge to bring them to their own Species again, or to turn them into fluid Oil, or Powder, or Tinctures; which things bear an affinity to thoſe above: For Twenty R. Dollers.*

3. Glauber's Alkaheſt, *and a way to prepare it, perhaps unknown to* Glauber, *and built upon a more firm foundation; Fifty R. Dollers.*

4. *The Trial of all ſorts of Braſs, but not of every ſort at once, for every one muſt have a particular Practice.*

5. *To make ſtore of Flowers of Coral for a little Coſt; ten R. Dollers.*

6. *To make melted Tin hard, that it ſhall ſhine and ſound like* [*Silver*]; *Ten R. Dollers.*

7. *To make white Vitrifications upon Veſſels; for Ten R. Dollers.*

8. *Plenty of Spirit of Salt.*

This is not prepar'd after Glauber's *way, and though* Glauber *was ſo great a Lyer as to affirm, that in a clear Fire fifty pound of this Spirit might be prepared in one day, yet he cannot produce above one or two pound: Wherefore my invention is much better, and my Spirit is pure, but* Glauber's *has* Vitriol *mix'd in it.*

And though I gave Glauber *a great Sum of Money to communicate theſe Secrets to me, yet I have not found any*

any of them true, according to his Information, but was fain, with great induſtry, to ſeek other waies of working thoſe abovenamed.

And for thoſe that follow, though they may ſeem to be derived to me from Glauber, *yet they have not ſucceeded by his Information, but I was forced to go another way to work, which will hardly be found by* Glauber.

9. *To prepare good ſtore of the* Spirits of Vitriol, Nitre, Salt, Aqua fortis, Aqua Regis, *alſo* Sulphur, *after a manner not yet known, and which will ſcarce be known to* Glauber; *forty R. Dollers.*

10. *To produce plenty of volatile Mineral Spirits, which Spirits aſcend the Still before the Phlegm; but the abovenamed after the Phlegm.*

NB. *Theſe Spirits have the ſame taſte that Spirit of Wine hath, and evaporate like it, and are void of corroding: neither do I doubt, but I can produce ſuch Spirits from Metals alſo, though in metallicks I have made no trial yet.*

11. *Flowers of Minerals and Metals, almoſt without diminution, compendiouſly under a refrigeratory cover, which* Glauber *never ſaw; Ten R. Dollers.*

12. *The Quinteſſence of all Vegetables: Although* Glauber, *in his Tract, promiſed to bring that alſo to light, yet he never performed it from all Vegetables, but only from hot, which give Oil, which is of no moment; but that from cold, to wit, Herbs, is artificial. Thirty R. Dollers.*

13. *To give new ſtrength to dead and eager Wines, and make them as good as ever, or better; Two Hundred R. Dollers.*

NB. Note here, *That I very much run againſt* Glauber's *Tract of* Vinary Secrets; *and if my own Induſtry had not taught me more than that, I might indeed, according to his inſtruction, encreaſe the ſtrength of Wine, but with an ingrateful reliſh, ſo as I could never hope to try eager Wines according to Art. But now I cannot only bring to maturity all ſorts of Liquors from both ſweet and ſowre Grapes, and other ſorts of Fruits, and give them new ſtrength in the Hogſhead, but alſo render them pallatable to all men. Whoever hath taſted* Glauber's *Wines, and ſhall afterwards taſte mine, will eaſily diſcern a difference.*

14. *To give any Wines what reliſh I pleaſe.*

15. *To prepare a burning Spirit of all ſorts of Bread-Corn in abundance, with great eaſe and profit, very much like that which is made of the Dreggs of Wine, and ſuſtaining all Trials: There are already eight pounds of it in trial, whether they will bear a Voyage by Sea, or not; they are ſent beyond Sea, which if they will undergo; Two hundred R. Dollers.*

NB. *Further, I know how to reduce all burning Spirits into one form; as, the Spirit of* Juniper, *or Bread-Corn, like to Brandy, or to make ſpirit of Wine like ſpirit of Bread-Corn or* Juniper, *ſo that it ſhall not be diſcerned of what ſubject 'tis made.*

Neither do I doubt, but that I know alſo how it comes to paſs, that ſome Liquors carry'd beyond Sea, are corrupted: Which therefore, if by the benefit of this trial, the Certainty is made known to me, a good reaſon, and after what manner it may be help'd, may be learn'd of me for a trifle.

16. *To encreaſe the ſtrength of all ſorts of Beer, that they ſhall have equal Virtue with* Rheniſh-*Wine, and yet the Beer loſe nothing of its reliſh, but be both more pleaſant and durable; for when thus order'd, it will not ſo ſoon ſowre; but if it be decay'd, which will happen to Wine in time, the Vinegar which will ariſe from it, will be as good as Wine-Vinegar: fifty R. Dollers.*

17. *To give ſowre Beer its natural ſweetneſs, and in fourteen days to make it ſell for freſh; and ſo, though turn'd three or four times, to make it ſweet in fourteen daies time without fail.*

18. *To produce Vinegar of Bread-Corn, and ſuch other things, very like Wine-Vinegar in all things, without fail; fifty R. Dollers.*

19. *To prepare Vinegar of green woods, an Hundred meaſures daily, together with Oil of Wood, without Charge; but if any man will have this like other Vinegar, it requires rectifying, which will ask ſome time and coſt: Ten R. Dollers.*

20. *Although* Glauber *delivered in a little Tract, a way to make Tartar of the burnt Lees of Wine, yet I have alwaies committed many Errours, by following his very Oral inſtructions, till bethinking my ſelf, I at laſt made it with fruit, and plainly reduced it to Cryſtals.*

NB. *Whoever will follow the Directions of that Tract, may.*

21. *To ſeparate every Oar of Copper with profit, and from thence to produce Gain.*

22. *Of that ſort of Copper Oar, if by chance they have any ☽ from thence, to ſeparate it with fruit, without loſs of the Copper and Lead.*

23. *To ſeparate Lead from Teſts and Cupels, for ſmall Coſt, and as little Labour.*

24. *To ſeparate Gold and Silver by melting.*

25. *To build a Furnace, in which one may both torrifie, melt, and try Metals in the Probations of* Cineritium; *containing the ſmall Trials of an hundred Crucibles, or more, only heat with Wood.*

26. *Further, a Furnace, in which, without Bellows, one may try a good quantity by the Probations of* Cineritium.

And Laſtly, *Foraſmuch as the leſſer Trials have deceived me, if I went to work on a greater quantity, I will teach wherein my chief skill conſiſts.*

1. *In the leſſer trial I have found, that with the Spirit of Wine, as 'tis generally prepar'd, I can make an Anatomy of all Vegetable, Animal, Mineral, and Metallick Subjects, ſeparate their three Principles, make the volatile fix'd, and the fix'd volatile, and force 'em through a Limbeck.*

2. *To force the Anima and Salt of Gold through the Limbeck, and to reduce it, well mix'd with its Spirit and volatile Salt, into a potable body like Vegetable Eſſences.*

But becauſe Gold may be reduced into ſuch a ſort of Eſſence, it will not be very hard to render the imperfect Metals and Minerals, with their Three Principles, potable: and theſe Principles are inſeparable in their volatility; wherefore I doubt not but they may be fix'd.

3. *Furthermore, I have found by ſmall trials the way of taking all Corroſion from all Corroſive Spirits, by this general Spirit, and of reducing them (by the help of Divine Providence) into ſweet Oils or* Menſtruums; *which if it anſwer the deſire in large quantities, (and I don't doubt it)* Glauber *with his* Alkaheſt, *which indeed is not wholly to be deſpis'd, muſt be forc'd to hide: for I have hopes, that by the aſſiſtance of Divine Providence, whatſoever ſubject I ſhall propoſe to my ſelf, I can ſeparate and purge its three Principles; laſtly, join them, and ſo produce a better ſubject and more pure: But 'tis true, ſeeing* I *was ſo often deceived in the leſſer trial,* I *did not interpret it as Truth, but Speculation. However,* I *can effect very well whatever* I *have here ſaid, as well in the great as leſſer.*

4. *But foraſmuch as ſo many excellent, as well as new, Secrets, offer themſelves, that* I *can't chuſe but clearly know them, and therefore 'tis impoſſible that* I *ſhould make all thoſe Secrets abovenamed profitable to my ſelf: And although* I *am now about many things, that hereafter a*

great quantity of them may be expos'd by me to be ſold in pounds and hundreds; yet I ſhall not be ſo envious to refuſe a Communication of them to any man for the named Reward; nor keep from him any knowledge I can give him.

Yet he muſt know, that it is very troubleſome to inſtruct any man that is altogether ignorant and void of skill in Chymiſtry; Therefore whoever will learn any of theſe things of me, let him either come to me, or ſignifie his mind by his Letters, thus: To Chriſtopher Farnner, *Canonicate Quæſtor of* Spire, *&c.*

Theſe are the words of the perfidious *Farnner*, which he hath uſed in his moſt falſe and wicked Writing.

A Specification of thoſe Chymical things.

THis, good Reader, is the Beginning or Preface of that Lying Writing, in which he hath expoſed to Sale thoſe Secrets he had of me, and found good: Beſides, he adds, That thoſe Secrets which he had of me, which do not ſucceed according to his deſire, are not added; but thoſe only whoſe Truth he has found in the trial.

Now we'll open this *Pedler's-Stall*, and look through all its parts, to ſee what is in it.

Theſe words follow:

1. Glauber's *Panacea*;

About which theſe things come to be conſidered.

HEre *Farnner* ſaies my *Panacea*, for the greateſt part, is prepared of *Antimony*; beſides, there are yet two other ſubjects, from which a purer Sulphur may be extracted, than that which is drawn from Antimony: Which vain fancies he may vend, or what elſe he will, I can't hinder him, ſeeing I have taught him to extract nothing but a pure Medicinal Sulphur from Antimony, by the benefit of a ſingular Liquor, which I call *Alkaheſt*. He adds alſo, That he can extract the ſame Sulphur from all ſorts of Metals and Minerals (except ☉ and ☽) and after *Glauber*'s way convert them into Tinctures.

I declare againſt this his firſt Poſition: *Farnner* here ſaith, That *Panacea* may be prepared from Antimony for the moſt part, and promiſes to communicate it to any man that deſires it, for a certain price, to wit, thirty R. Dollers. But thou haſt ſeen, gentle Reader, how ſtrongly he bound himſelf, by his Obligation given to me, to keep ſecret thoſe things I had taught him, and communicate them to no man, under the Penalty of Diſgrace, and the forfeiture of all his Goods. I confeſs indeed, being cajol'd by his frequent ſolicitations, I taught him the way of preparing the *Panacea*, but from no ſubject but Antimony. This *Panacea* of Antimony *Farnner* expoſes to ſale, for thirty R. Dollers; and moreover has taught that Preparation to many, from whence great profit hath redounded to him; when yet this was not lawful for him to do: But he ſhall be forced e're long to give his Reaſons for ſo doing, and I will one day ſee if I can have a remedy for this evil. I will now only ſhew how wicked he has been to me: Wherefore I am compelled to expoſe thoſe ſecrets he had of me and every where makes common, to the view of the whole World, that no man ſhall need to give Money to *Farnner* for 'em, or any other reward, but may come to the knowledge of them for nothing: for if that knowledge is divulg'd by *Farnner*, who unjuſtly, by the publication of it, endeavours to heap up to himſelf Fame and Riches, I may well communicate them to all men faithfully, that every man may ſave his money: But becauſe this *Panacea* is prepared by the benefit of a hot and Saline Liquor, which I call *Alkaheſt*, therefore 'tis neceſſary that he who deſires this *Panacea* ſhould firſt know the Preparation of the Liquor it ſelf, without which he can effect nothing. Indeed it grieves me, and I am very hardly brought to diſcover and divulge to the World ſo excellent a *Menſtruum*, by which ſo many rare Medicaments may be prepared; and I had never done it, had not this perfidious *Farnner* chang'd and adulterated it and its uſe in the Preparation of the abovenamed *Panacea* of Antimony and others, from Minerals, Animals, and Vegetables, and by proſtituting and communicating it to all men. I think him, indeed, a Boar out of the Foreſt, broke into my Garden of Flowers, that has with his ſnout routed up all the many Fruits, which with much ſweat and labour I have planted; but the deed will once be rewarded.

Now follows a very ſhort Deſcription of the Preparation and uſe of that Liquor, needfully requiſite in Vegetable, Animal, and Mineral Medicaments: And though I might teach another and far better way of preparing it, yet there's no neceſſity for throwing all my Pearls before Swine: It is ſufficient, to my ſorrow, that I cannot recal thoſe which this unfaithful *Farnner* has ſent abroad, and am forc'd to behold their deſtruction with the greateſt trouble.

Of the Preparation and Uſe of a certain ſecret Univerſal Menſtruum, *with which one may inſtitute an Anatomy of all Vegetables, Animals, and Metals; correct them, and from thence prepare good Medicaments.*

OF this *Menſtruum* the Modern Philoſopher *Helmont* makes mention in ſome places of his Writings, and attributes wonderful Effects to it, which he exhibits in the Preparation of Medicaments, and gives it the name *Alkaheſt*; which name *Paracelſus* alſo remembers; but in few words, it is the ſame as if we ſhould ſay *Alkali eſt*; for when the Letters *l* and *i* are joyn'd with a daſh, it produces the word *Alkaheſt*. But what moved *Helmont* to call it *Alkaheſt*, we ſhall not here diſpute: I indeed believe he did it, thereby to demonſtrate its Nature and Eſſence; for in German *Alkaheſt* is as Al gar heiß, or Al zu heeß; but in the *Brabantick* Idiotiſm, which was the Mother Tongue of the Author, it ſounds Altho-heeß, that is, very hot; and ſo the name anſwers to the Eſſence; for this Liquor is nothing but a meer fiery Water, by whoſe immenſe and ſecret heat Vegetables, Animals, and Minerals, if they are put into it a certain time, are forthwith purged, ripened, and made better, ſo that they become excellent and wholeſome Medicaments, which without this fiery water cou'd not be done. This *Menſtruum* then, is nothing but an igneous Liquor, prepared of urinous Salts, which is endowed with thoſe Virtues which are attributed to it in my Treatiſe of Flints.

An

An Admonition.

Here it is to be noted, that this *Menſtruum* may be prepar'd of more than one ſubject; for Nature is Copious, and ſets before our eyes many various Ingredients, from which, by the help of Art, divers things may be effected; as may be evidenc'd in this admirable Liquor, which may be made not only of the common *Sal terræ*, or *Salt Peter*, but alſo of the fix'd Salt of all Vegetables, and eſpecially of Tartar; 'tis no matter of what ſubject it is prepared, for it has ſtill the ſame Virtues that are aſcribed to it, foraſmuch as, if a right Preparation be made, the common *Sal terræ* and the fix'd Salt of Vegetables are of one and the ſame Nature and Eſſence: For the genuine *Sal terræ*, or *Salt-Petre*, may be made of Salt of Tartar; and of *Sal terræ*, or Nitre, a fixed Salt, like Salt of Tartar; of Spirit of Wine, Salt of Tartar; and of Salt of Tartar ſpirit of Wine: of Wine-Vinegar, Nitre; and of Nitre, corroſive Vinegar. So thoſe Salts partake of either nature, and will be manag'd at pleaſure; neither are they undeſervedly by the ancient Philoſophers, called Hermaphroditick Salts. Wherefore it is not for any one to be offended at its baſe original, and accordingly undervalue it; 'tis no matter wherein the good conſiſts, 'tis ſufficient to ſay it is good, and may be converted to good uſes: Good things ought to be ſo much the more eſteem'd, by how much the more mean and baſe their original may have been, for Nature and true Art uſe both baſe and abject things in their Works, and nevertheleſs, their deſires are accompliſhed: But on the contrary, the vain reaſon of Man in his labour aims at nothing but Sublimity and ſpecious Notions, and therefore brings nothing to a good end, but deſtitute of a happy ſucceſs, finiſhes his fruitleſs labours with great damage.

To conclude then, take this advice; Be not offended at this wonderful Liquor, becauſe of its mean original, but let the Work praiſe the Work-man.

Now follows the Preparation.

IF any man will prepare this Menſtruum of Salt-Petre, he muſt extract and coagulate that Salt from the earth with common water, and adding coals or ſome other vegetable Sulphur, fix or calcine it ſo long, till it be reſolv'd in the Air into a fiery liquor, then the preparation is finiſhed. But becauſe that ſort of earth, from which this ſalt is extracted, cannot be found every where, in its ſtead, you may take Nitre well cleans'd, which muſt be melted in a Crucible, upon which you muſt caſt a ſmall quantity of coals and that ſo long, till the coals upon the flowing Nitre will take fire no more, but remain dead upon it, for then your Nitre is fix'd and prepar'd, ſo as from it, this ſo admirable water may be made, which is made after this manner; While the fix'd Nitre flows yet in the Crucibele, pour it into a braſs mortar that in that it may cool, then beat it to powder, and ſpread it on a Glaſs table plac'd in the Cellar, or ſome other moiſt place, that there it may flow; ſo you have that fiery water which is endowed with ſo many wonderful virtues in the preparation of medicaments of vegetables, Animals and Minerals, of which I made mention before. But if you wou'd make ſuch a liquor of *Tartar*, which will be beſt for preparation of Medicaments of vegetables and Animals, then you muſt bring common *Tartar* made pure by Calcination, Filtration, Solution and Coagulation, and by flints purg'd from all impurity, into a fair and bright Salt, mixing ſix or eight parts of the pureſt *Tartar* with one part of flints well pulverated, which mixture you muſt melt in a cover'd Crucible, and pour it into a braſs Mortar to cool: This bright and white fiery maſs you muſt reduce into powder and put it into a Glaſs body, and pouring rain water thereon, boil it upon hot Aſhes, for then the rain water will diſſolve the *Tartar* only, and leave the Flints at the bottom, like a Mucilaginous matter which draws to it ſelf all the impurity of the *Tartar*, which before, by the common ſolution and filtration cou'd not be taken away, and ſo keeps it, that the Salt of *Tartar*, is by this means freed and purg'd from all impurity: then you muſt filtrate this ſolution, and draw the water from it by a limbeck, that ſo that Chryſtalline fiery liquor may remain in the Glaſs: And this is that preparation by which vegetables and animals are reduced into the beſt medicaments; but to prepare metallick Medicaments, and eſpecially for the making them better, liquor of *Tartar* is not to be added, but only liquor of the Salt of fix'd Nitre, which is not prepared by coals, but by the Regulus of Antimony, and that after this manner;

Put three parts of clean and pulverated Nitre to one part of Regulus Martis, put this mixture into a Glaſs waſh'd clean, and by a prudent increaſe of fire, make it boil a little in a Fixatory Furnace, and in this degree of fire, leave it five on ſix hours, then take it out that it may cool, then very finely pulverize it, and pour upon it rain water, and the Nitre, which by the Regulus of Antimony comes out fix'd, waſh out; and laſtly abſtract the water, ſo you will produce a fiery liquor fit for uſe in metallick operations.

NB. This fixation may be as well made in cover'd Crucibles, as in Glaſſes, and is good enough, only the management of the fire muſt be obſerved, neither let the heat from the begining be too intenſe, leaſt your Nitre evaporate before it be brought to a fixation, but keep a gentle fire, and it will effect the fixation in conjunction with the Antimony.

The Praxis. How by the mediation of this liquor Vegetables, Animals, and Minerals may be converted into good Medicaments.

TAke an herb, root, or ſeed, beat it very ſmall in a ſtone Mortar, then put it into a glaſs, and pour upon it ſo much of this fiery Menſtruum, as that the herb may be ſufficiently imbrued in it, afterwards ſet it upon ſand ſome days, or boil it, that of the herb and Menſtruum may be made a thick liquor, which done put to it as much ſpirit of Wine, well dephlegmated, as there was of Alkaheſtick Liquor, and well mix them, in a ſmall heat, leſt the ſpirit of Wine evaporate; ſo long digeſt it, till the ſeparation ſhall be made, and your Alkaheſt, with the fæces, will go to the bottom, but the ſpirit of Wine, with the Eſſence and Virtue of the Herb, will ſtay at the top, which afterward, though never ſo much ſtirr'd, will not mix, but each remains ſtill in his own

place: pour all that whole matter into a wide-mouth'd Glaſs, and there let it ſettle; then ſeparate the Medicine which the ſpirit of Wine has extracted from the Herb, with a gentle inclination from the Alkaheſtick Liquor, which retains with it ſelf the fæces of the Herb, ſo you will have the Virtue and Eſſence well corrected and perfectly ripen'd in the ſpirit of Wine, which abſtract from the Eſſence of the herb in a Bath, and the Medicine which remains like a red juice, and endowed with great Virtues, keep and uſe it as it is ordain'd by God and Nature. But the Alkaheſtick Liquor, mixed with the fæces of the Herb, Calcine in an earthen Veſſel, that all the reliſh and ſcent of the Herb, which remains in it, may be exhal'd from it, and afterwards diſſolve it in Water, and filtrate it, and draw it to a fiery Liquor, ſo it will be as good as it was before, and you may put it to the ſame uſes as often as you pleaſe.

Animals are to be bruiſed after the ſame manner in a Stone Mortar, and with the Alkaheſtick Liquor digeſted, and by ſpirit of Wine ſeparated, and in Vegetables the labour is the ſame.

But Metals in their proper Corroſive Menſtruums muſt be diſſolv'd precipitated, waſh'd, edulcorat'd, exſiccated, and then laſtly with the Alkaheſtick liquor poured on, digeſted, diſſolved, and with ſpirit of wine ſeparated and reduc'd into a potability.

But Minerals which may be pulveriz'd need not be diſſolv'd and brought to a calx, but 'tis ſufficient, that after pulveriſation with the Alkaheſtick liquor poured on, they be digeſted, and by ſpirit of wine ſeparated.

Nevertheleſs, you may alſo at your pleaſure render metals brittle and frangible, *viz.* By the help of the Regulus of Antimony, ſo that they may be pulveriz'd, then pouring your Menſtruum upon them, diſſolve, digeſt and convert them into Medicine: Which method is certainly good; You may alſo proceed another way with metals prepar'd by Antimony, *viz.* Mix them with three parts of pure Nitre, and in a Glaſs or earthen veſſel, by the dry way diſſolve, digeſt, fix, and by ſpirit of wine prepare into Medicine, which alſo will be good, for it is more profitable to operate by the dry than by the moiſt way, as it is cuſtomary to be done in vegetables and Animals.

And this is the ſhorteſt method of reducing Animals, Vegetables and Minerals by the Alkaheſtick liquor to the beſt Medicaments.

But how imperfect metals or Minerals, which otherwiſe in a Cupel or Cineritium trial, leave no gold or ſilver behind them, are to be brought to maturity and fix'd, that afterwards in the Cineritious trial, they may give a perfect gold and ſilver is done another way, whoſe proceſs is this:

Mingle and melt ſo much (Regulus) of Antimony with the imperfect metals or minerals as may render them friable, that they may be pulveriz'd, with theſe mix three parts of the pureſt Nitre, and this mixture cloſe ſtopt up, put upon a fire in glaſs or earthen veſſels to fix for ſome hours, afterwards take it off, and as they are melted pour them out, that they may give the regulus which is to be taken away, and with lead put into a Cupel and reduc'd to droſs, then that gold and ſilver which the imperfect metal or Mineral got in the fixation, ſtays in the Cupel which may be examined by the leſſer weights of probation, whence it will appear how great a fixation ſo little time will produce.

This is the plenary and fundamental inſtruction of the uſe of *Tartar* purg'd by flints, to extract the eſſence of vegetables and animals and of Nitre fix'd by coals and Regulus of Antimony, which begets a penetrating, correcting, bettering or ripening and purifying fiery, but not corroſive, virtue, which goes beyond all things, penetrates and corrects as above written, I have attributed to it. But leaſt the ignorant of natural things ſhould eſteem and proclaim this a corroſive liquor, we will prevent them, and ſhall endeavour to demonſtrate, that this liquor is no way a corroſive, but an enemy to and deſtroyer of all corroſives.

Like loves its like, with it is mingl'd, and immutably ſtays with it, as may be ſeen in ſpirit of Salt, Vitriol, Alum, Nitre, Vinegar and other corroſive ſpirits when they are mixed. But unlike things if they are join'd, are contrary to themſelves, and fight againſt each other, and forcibly withſtand one another ſo long, till the ſtrong o'er comes the weak and kills and deſtroys it or produceth another ſubſtance from it: that may be ſeen if this fiery liquor of *Tartar* or Nitre be mix'd with a corroſive Spirit, for it can not conſiſt with it, becauſe contrary to it, then which of theſe is the ſtronger, deſtroys the weaker and takes its nature to it ſelf.

And this difference ariſes from the unlikeneſs of the nature of either liquor, for one corroſive does not deſtroy another, as alſo one fix'd urinous liquor does not deſtroy another urinous liquor; becauſe one contrary fights againſt another contrary, but not againſt his like; ſo 'tis true, as hence may be fully demonſtrated, that this fix'd liquor of *Tartar* or Nitre is not corroſive, but only a fiery water and a perpetual enemy to all corroſives, and both kills and takes away their corroſive faculty from them. But ſome will ſay that the corroſive ſpirits of Salt, Alum, Nitre, Vitriol and ſuch like are fiery waters: I confeſs it, but yet with this diſtinction, thoſe ſpirits are indeed hot waters, but not vivifying, but rather cold and killing fiery waters, which no way ripen, purge or correct Vegetables, Animals and Metals, but deſtroy and kill all things they are mix'd with. But the fix'd liquor of Nitre or *Tartar* is contrary, and ripens, purifies and brings to perfection all it is mix'd with, which is impoſſible to all corroſives, whence it is as clear as the Sun, that it is no deſtroying corroſive, but a correcting fire.

Now follows another Clauſe of *Farnner*'s Epiſtle.

2. *All Mineral's and Metals.*

I much wonder that *Farnner* was not afraid to offer this proceſs to others at a price, which is plainly and clearly deſcribed in many places of my Books: and is done only by Nitre, by which ſulphurous metals (but not all metals and minerals, as he vainly boaſteth) are reduc'd to droſs, from which by ſpirit of wine, a metallick tincture may be extracted, as we have ſhewn above in the tract of the Alkaheſt: that droſs is truly fiery, and therefore eaſily attracts air, and is turn'd into oil, of which I have largely treated in the ſecond and fourth parts of (*Furn.*) and in the *mineral work* eſpecially in the explication of the wonder of the world, as alſo in my Hermetic Colloquies.

3. Glauber's

3. Glauber's *Alkaheſt*.

IN this Paragraph *Farnner* openly betrays his vanity, bragging, and helliſh calumny, in reprehending the induſtry and labour of good men, and boaſteth of a more firm foundation than perhaps I know of; whence it will appear to any man of Underſtanding, what this moſt ungrateful of men would be at, namely, which is the only thing he can do, he would do what he could to bring thoſe Secrets I intruſted him with into contempt with all men, and introduce his own fooliſh trifles.

Firſt, he ſaies, *Glauber*'s *Alkaheſt*, and preſently ſubjoins another and better foundation or way of preparing it: which if he points at any thing but my Alkaheſt, why then does not he forbear mentioning and contemning my Alkaheſt? for he does contemn it, and endeavours to prove, that that way or fundamental is unknown to me. Now he expoſes it to ſale at fifty R. Dollers.

4. *The Trial of all ſorts of Coins.*

'TIs true, *Farnner* did not mention this as a vendible, for it is not worth purchaſing with Money of him: for the common way of trying money has been ſhewn not only by many provers of Metals, as *Lazarus Ercher*, *George Agricola*, and many others, but I my ſelf alſo in many places of my Writings, and eſpecially in my explication of the Wonder of the World, have fully and exactly taught it, which *Farnner* can never be able to mend nor imitate.

5. *Flowers of Coral.*

YOU muſt know what belongs to this Proceſs that *Farnner* did not learn this Preparation of me, but of another man, which pleaſes him extreamly, though 'tis of no moment. But he moſt unworthily calls them Coral Flowers, which he expoſes to ſale at ten R. Dollers, ſeeing they are not Flowers, but rather to be called a Cremor; for when in a very hot fire they are reduced into a white Calx, from this Calx, by the help of Water, is drawn a Cream after this manner: The calcin'd Corals are put into common Water, and left in the Water a whole night, then in the top will appear a little skin, as is uſual in *Calx viva*, which muſt be taken off to dry. Laſtly, while that is doing, another little skin appears, which is alſo to be taken off, and that ſo often, till the Water will give no more.

I know alſo, that this Powder is held up by ſome Apothecaries as a certain ſingular Secret, (but that indeed exceedeth it) which is prepar'd of *Calx viva*, which I have alſo ſhewn to ſome that have attributed great things to this Powder, who, the Experiment being made, ſeeing me produce true things, What need is there, ſaid they, to burn precious Corals, when common Chalk (or *Calx viva*) will give the ſame thing as Corals, and they prepar'd no more Powder of Corals, but of *Calx viva*.

Therefore this does not deſerve to be called a Secret.

NB. That Corals, Pearls, Pearl-ſhells, and Tortoiſe-ſhells, as well thoſe that are in the Sea, as thoſe that are in Running Rivers, if they are burnt together, are brought into a true and natural Lime, like that which is made of burnt Stones, needs no probation. He that will not believe me, let him go to *Holland*, and other Sea-Ports, and he ſhall ſee that the men of thoſe Countries do not uſe Lime made of Stones, which are wanting in thoſe places to build Walls, but that which is made of burnt Shells, which the Sea in great abundance caſts upon the ſhore; which yet, is not ſo good as that which is made of Stones, which ſome Lovers of Curioſity have alſo brought them from *Germany*.

6. *To make melted Tin hard.*

AND this Paragraph, by right, ought to have been omitted, for it is not worth Ten R. Dollers, requiring no Art in the making it; and I my ſelf taught it many years ſince, as well in the Firſt part of the Mineral Work, as in the Fourth part of my Furnaces; and it is made by *Regulus* of Antimony, of which one part is mix'd with 12 parts of melted Tin, and no more, for otherwiſe the Tin would be made brittle, and rendered unuſeful; rather if one part of *Regulus* is mingled with twenty parts of melted Tin, it will come out hard enough. And farther, it may as well and rightly be made of *Zink*, as by *Regulus* of Antimony, and needing no great matter of Labour, melts ſooner than *Regulus* of Antimony.

7. *White Vitrifications.*

THeſe Vitrifications alſo, which he expoſes to ſale at Ten R. Dollers, are of no moment, for they are prepar'd of Glaſs of Lead, Tin-Aſhes, and Flints, and Wood-aſhes.

In *Holland* this Preparation is very common: whether *Farnner* is excellent at it or no, I much doubt; How then ſhall he teach others? And if he does excel, who will be the better for it? For no man ſtudies theſe Curioſities, or ſo much as looks after them, or covets them.

But although Glauber, *&c.*

Here *Farnner* again vomits at me a mighty heap of his infernal Lyes, which are as noiſome as any dead Carcaſs, as if he intended to infect me with their venom; but theſe ſtories do not at all agree with his other; for here he ſaies, Although he had with a great Sum of Money purchaſed certain Secrets of Glauber, yet he had made no Examen of them, but he was forc'd to convert them to other uſes. In the beginning of his Calumnious Paper, he thus writes: A Specification of thoſe Chymical Secrets which the under-written Farnner learn'd of Glauber, and in the Trial found True.

Here any impartial man may ſee what to judge of this double-Tongu'd Monſter. Here he denies what before he confeſs'd; he both calls them *Glauber*'s Secrets, and here affirms, that they never ſucceeded to his purpoſe: which if true, Why does he prefix my Name to them, if he never made trial of them? But if they have ſucceeded, and in the trial he has found 'em true, as he above confeſſes, Why does he here deny it? Can the ſame thing be True in one place, and Falſe in another? Certainly I can refute ſuch horrid Lyes no way better than by his own words. For if I ſhould ſay, See here, there, or in that place thou lyeſt, he would not care, but anſwer, He did not lye at all, but ſpake the truth; and I might repreſent a Conteſt between two ſcolding Women, one whereof calling the other Whore, and the other throwing back upon her the ſame things; but this will do nothing; wherefore I ſhall take another method.

In the first Obligation he gave me, he expresly saies, That I had communicated, demonstrated, and shewn him some Secrets: But if they were not for his use, why did he give me a valid Obligation, to keep those secrets from the publick? Not bent to these things, Why did he in all his Letters (which he sent me, and which are kept safe to confirm what I say) confess, and profess, that he, his Wife and Children, were bound to me, and that he wou'd come to me, that with his he might serve me all my Life.

If none of my secrets have succeeded to him, Why did he give me long since a new Obligation to be grateful to me? as I have demonstrated from his obligations and extracts out of his Epistles.

NB. What! Cou'd he not make trial of those things he had of me, in eighteen Months time? But if the trial has prov'd the truth of those things, and he has bound himself to me by a new Obligation; Why then does he dare to say, That none of those things which I communicated to him, prov'd successful? Why two years after? Now he is alienated from me, and having broken his Promises of coming to me, and working with me in my Laboratory, (being married again) is an Excuse for his absenting himself, yet he asks me to communicate to him more secrets, and then he'll come. *NB.* But if the first secrets have not stood the Test, why does he desire more of me?

For he might know over and over in two years time, whether my Writings wou'd conduce to him or not.

In one Epistle, in which he boasts of killing a man, he writes thus: Wherefore I again and again intreat you not to cast me off, but do to me according to your wonted Favour. I will on all occasions, as I have promised, in my place, satisfie you; neither will I cause that any thing should therein be desir'd; for which reason also I will effect it both better and sooner.

From these and the like words, which in two Epistles he us'd to me, I could collect nothing of Fraud, and perhaps at that time he meant none. But when he had kill'd that Man, and married another Wife, all his Promises and Obligations were to no purpose. And from that very time, all his endeavours have tended only to do me what hurt he could, and he daily hates me more and more; which at last appears more publick in these his lying Calumnies.

Indeed, I am apt to think the Devil and *that Murder* had possessed his Heart. NB. For his Epistle to me witnesseth, that for fourteen daies together he had sought occasion how he might catch that man with his Wife, and bloodily revenge himself upon him; I suppose, by the instigation of Satan, whereby both the Man was kill'd in his Sins, and the Woman with many wounds compell'd to a lewd kind of Life; of both which Crimes *Farnner* is yet guilty in his own Conscience, and (unless a speedy Repentance follow on his part) he will never be freed from them. But if in a sudden passion he had done it by chance, he might merit some excuse.

But to endeavour it fourteen daies together, is nothing but a Devilish Revenge and Cruelty, which can by no means be excus'd in a Christian, though he do it never so secretly.

But besides, he uses evil Arts; for he drew my Servant to him by Flattery, and receiv'd him into his intimate friendship, notwithstanding he knew I turn'd him away for his infidelity. What he writes, that he bought his Secrets of me at a great price, is a pure falsity. Indeed he forc'd a small Reward upon me, half of which I gave him back again, and what I kept he got over and over by communicating my Secrets to other men, so that he has fully receiv'd what he gave me; and by this his communicating to others, (which was done unknown to me) he broke his Promise; which nevertheless for Peace sake I passed by. Wherefore, if he will confess the Truth, I am sure he can never say that he bought all those Secrets I intrusted him with, at so great a price.

Hitherto we may believe how much Money has come to him; for since he has sent abroad his institory Letters five months ago, (nay, as I am told, two years ago) before I could know it: he could not chuse but get money by it, when forthwith he with my perfidious Servant proceeded to that insolence, as in a knit Society with some of *Frankford*, he caused his Calumnies to be every where spread, and sent abroad, not only througout upper *Germany* and *Belgia*, but also into *France*, and other Foreign Countries, to get Money. Yet, according to my hopes, this instítory Ware-house (by the Grace of GOD) will soon fall.

8. *Plenty of Spirit of Salt.*

IN this Paragraph also he goes on after his manner to disgrace me, accusing me of Lyes, as if it was false, and impossible to prepare fifty pound of Spirit of Salt in one Furnace, and in one day; and adds, that this Spirit is not so good as his, for *Every man for himself:* but this is done by adding Vitriol.

Which Vitriol does not hurt the Spirit of Salt, as is demonstrated in many places of the First Part of my Furnaces; and he denies that fifty pound or above may be prepar'd in one day in my Furnaces, when yet it may be done commodiously enough, and needs no farther proof.

From all which a wise man may easily judge how good a Christian *Farnner* is, whose mouth uttereth nothing but wickedness, contempt, and contention, and except my inward faculties fail me, the envy of his heart, his hatred, lyes, and infernal calumnies, shall be display'd.

What is his spirit of Salt to me, or mine to him? Let him prepare it after his way, and I will do it my way, when need requires: Wherefore does he endeavour to defile my things with his, since they cannot be deservedly reprehended by any man, much less by him.

9. *Spirits of Vitriol, Nitre, Salt, Aqua fortis, Aqua Regia, in plenty; also Sulphur; at Forty R. Dollers.*

IN this place may be seen the inhumane and devilish nature of this wicked fellow; for he scarce utters three words but he proceeds to my disparagement.

But what hath *Glauber* to do with his spirits, for he does not use them? and if he does need them, he can make them without him.

What does he care, if you can prepare them after a better way than he, which yet never can be?

Whatever *Glauber* has writ of these things is worth the reading; and he can defend both himself and it, neither

neither can you or yours ſpot his fame, which is ſo well known to the World.

10. *Mineral Spirits: for twenty R. Dollers.*

HEre *Farnner* ventures to promiſe a way of preparing volatile ſpirits, which is eight years ſince fully deſcribed by *Glauber*, in the ſecond part of his Furnaces, whither I referr the Reader.

11. *Flowers of Minerals and Metals; for Twenty R. Dollers.*

BUt if any man will explore another man's nature, let him permit him to ſpeak, and he ſhall eaſily know what temper he's of; but eſpecially that, of all things, may eaſily be diſcern'd in a drunken or angry man, who can very hardly conceal his internal blemiſhes. In like manner we may ſee by *Farnner* that he endeavours to hide his lying Proceedings in my name. What if I had ſeen his way of preparing metallick flowers, what profit or loſs ſhould I ſuſtain by it? He glories of thoſe things which merit no praiſe. He promiſes to make metallick Flowers under a frixatory Cover, when yet Flowers can't be made under it, for they are not Flowers when the metals are burnt under a frixatory Cover, into a Calx, or reduc'd to aſhes, there is, and ſo remains a heavy Calx: but the Flowers of metals ſhou'd be brought to a very light ſort of Flowers by Sublimation; as is deſcrib'd at large in the Firſt Part of my Furnaces.

Farnner indeed, with his Shop, leaving his filthy knife, ſhould rather have gone to the Chymical School a little, than (being ignorant of Chymical terms) ſold his heavy Calxes of Metals to other men for light Flowers, and deſpiſed *Glauber*'s way of preparing Flowers, which yet has been reprehended by no man. Theſe his Flowers, with his Coral Flowers, are courſe Meal, which don't deſerve the name of Flowers, but Cream. Indeed, if *Farnner* had not ſo vehemently inveighed againſt me, I had not diſplay'd him thus, nor deign'd his vain Proceedings one word of anſwer.

Yet 'tis no matter, though good men are ſometimes in this life bark'd at, and provok'd by mad Dogs, ſince it often happens that by this means excellent things are made publick, which otherwiſe would lie ſecret.

12. *The Quinteſſence.*

HEre you may ſee, candid Reader, that wicked *Farnner*'s endeavours tend to diſturb the quiet of all good men, and deſtroy my well-grounded and yet irrefutable Writings by his fooliſh Opinions, which he ſhall never be able to do, no more than a little Whelp is able to attack an armed man, whom by his barking he cannot hurt.

My Tract which I writ of the Eſſence of Vegetables, and printed at *Norimberg*, under the Title of *The Firſt Part of the* Spagyrick Pharmacopæa; neither *Farnner*, nor any man elſe, could reject or contemn; but that little Tract will defend it ſelf.

I have made publick many and excellent inventions, but no man can ſhew one place wherein I reprehended and brought into contempt other mens Works, as this *Farnner* does. If he would act as a good man ought, and had any thing againſt me, he ſhould ſpeak it to my face, and not abuſe me ſo wickedly behind my back.

13. *All acid Wines.*

IT troubles me Indeed, that I communicated this excellent ſecret of encreaſing the Virtue of acid Wines, and making them better, to *Farnner*. What he writes, that he found out thoſe things, is a pure Lye, which he had of me; when nevertheleſs he is not afraid to tell ſo impudent a Lye, as that he had found out a better foundation of that Secret, which is moſt notoriouſly falſe; for neither he nor any other man, nor I my ſelf, can find any thing better than the pure Eſſence of Wine, conducing to that Work; which Eſſence of Wine, by the ſtrength of its innate fiery Nature and Property, all ſorts of immature Wines may be ripen'd in fermentation, and turn'd to a brisk Staple, and good Wine, in which lies all the Art.

For he that knows this, may alſo correct acid Wines, yet let him have a care that he does not take foul Brandy-wine, as *Farnner* has done, wherewith he has done it, as he ſaies.

This excellent Art, and heretofore unknown, to him that knows how to handle Wines, may ſerve inſtead of many; and this unfaithful *Farnner* might have receiv'd much profit from it, if he had not made it publick; but ſince he has every where publiſh'd it, there ſhall henceforth no profit accrue to him nor me, if I ſhould be deſtitute of better things, for he has defamed this excellent Secret every where by his lying Epiſtles ſent abroad.

As for me, though he has taken from me the great profit which redounded to me from it, by his prating and lyes, I do not this from ſuch a trouble of mind as will happen to him, if he ſhall be forced indeed to want all its fruit.

If this perfidious *Farnner* had hid this Secret, he would have needed no other Arts, neither need he have ſold it for an hundred Duckets, but he might from it have procur'd to himſelf ſufficient whereon to live. A greater damage has happen'd to me by his publication than I can declare; and I very hardly endure that ſo excellent and profitable a Secret ſhould be deſpiſed; neither will any good man approve it, eſpecially they that ſuſtain loſs by it, and for that cauſe will alwaies abhorr him. He might have gotten enough by it, in ſecret, and without detriment to his Neighbour, but that he was minded rather to marr the profit and propagate the damage of not only himſelf, but me, and many others that have knowledge of it; which no man can deny to be a wicked act.

That Reward which *Farnner* gave me for communicating to him my Secrets, in all amounted to but ſixty or ſeventy *Ungarici* (an *Ungaricus* is Nine Shillings of our Money,) which yet, from the communication of thoſe Secrets I truſted him with, he receiv'd again; ſo that all thoſe things which he had of me, coſt him little or nothing. Nevertheleſs, he does not ſtick ro ſay, That he gave me a great ſum of Money for my Secrets, which yet I refuſed to take; and though he twice made a Journey of Fifteen miles to me, that he might get ſomething out of me, yet I deny'd him, and communicated nothing to him, till he came the third time, and learn'd ſome of my Secrets; and afterwards, when he had oblig'd himſelf to work with me in my Laboratory, I communicated more to him. Neither had I ſhew'd him the leaſt of thoſe many Secrets for his Preſent, which will never compenſate

the damage I have ſuſtain'd by him, had not he oblig'd himſelf under the loſs of all his Goods, as alſo his Credit and Reputation, that he, his Wife and Children, ſhould ſerve me ſo long as I ſhould live, as plainly appears from his Obligations given to me.

But if he had given me a Thouſand *Ungarici*, or Duckets, and I had known he would have expos'd this Secret to ſale, I would rather have given him all of it back again, than ſuffer'd it to be made common. Neither can his vain Excuſe, That he expoſes his own inventions, and not mine, to ſale, profit him any thing; when 'tis evident enough, that nothing in the nature of things can be found, which may render ſmall Wines better than the *Anima* or Quinteſſence extracted from other Wines; for the *Anima* of Wine only, and nothing elſe, can encreaſe the ſtrength of Wine. Neither is the compariſon of this melioration of Wines incongruous with two torn Garments, neither of which can be worn; but if either of this is cut, and that which yet is whole and good, is ſewed to the other, and ſo of two torn, one whole Garment is made; then that Garment may be worn, when yet, before, neither of them was uſeful.

The ſame alſo is to be underſtood of ſmall wines that are neither durable nor vendible, but after one Hogſhead is ſtrengthen'd by another, it becomes not only durable, as good Wine, but vendible, and will yield as good a price as two ſmall Hogſheads. And this Secret is both very noble and profitable in thoſe places, where the wines are ſeldom brought to maturity, and for that cauſe are not durable nor ſaleable. For there is a lamentable Complaint among Vintners, that immature wines are not vendible, and they can get no money for them. Thus they ſay, Have we labour'd in vain with our wines a whole year? Look there the wines lie, and no man buys them: in the mean while we ſuffer want and can't make our ſelves merry with our wines, for they neither profit us nor others; unleſs we have preſently ſome other better wine, wherewith to mingle this, and ſo render it vendible, it will ſtrait be corrupted, and turn'd to water. Theſe and the like Complaints I have often heard from Vintners; but if they had the wit of Taylors, that can make one new Garment of two old ones, their affairs would be in a better condition, for after this manner they might preſerve their acid wines, and there would be no need of mixing better wine with them. For which excellent Invention, all men that deal in wines, ought to thank GOD and me.

I pray, who would not have communicated theſe things to a man that had given himſelf for a pledge? But if he muſt not ſtand to theſe Obligations, I can't ſee whom we may truſt. I curſe the unhappy hour wherein this unprofitable ſubject and that perverſe man (if he may be call'd a man) came firſt in my ſight: which troubles and moleſtations he brings upon me in my old Age, which might ſpend its time much better, than by refuting his deteſtable Calumnies. Neither does his wickedneſs to me hurt me only, but my Children alſo.

In his laſt Obligation he promiſes, That if by premature death I ſhould be taken out of the world, that he, for the kindneſſes I had done him, would adopt my Children for his own, and make them his Heirs: but here, in his moſt falſe writing, endeavours all he can to deprive my (yet young) Children of their own, and convert their Goods to himſelf, as indeed he has done.

Further, He in his laſt Obligation alſo ſaies, he humbly pray'd GOD to prolong my Life and Health, but in this place he endeavours by his Cavils and Calumnies to kill me, and if he could do it with his own hand, (which God forbid) I believe he would not ſtick at it: It is a ſmall thing with him to ſpill Man's blood, for he has experienc'd his ability that way.

I indeed eſteem it the Goodneſs of God to me, that it is His will, perhaps, that this ſhould rather turn to my profit than diſadvantage; for hereby I am taught to be wiſer another time, and to ſhun humane Frauds.

14. *All Wines.*

HEre any wiſe man may judge whether or no this thing deſerves to be ſent into Foreign Countries, and there to be ſold at a price; when there is no Country-man that does not know that Wine aſſumes the reliſh of the Herbs, Flowers, *&c.* which are ſteeped in it.

15. *Brandy-Wine of all ſorts of Corn.*

THat *Farnner* brags of this knowledge, he owes it to GOD and me, from whom he had it: For when at firſt he complain'd to me, that he could not keep the Corn from burning in the Still, and ſo make the Brandy-wine ſtink, I upon his intreaty communicated this Secret to him. But becauſe *Farnner* ſo much glories of this knowledge, he ſhall not enjoy it long. I muſt confeſs, indeed, that this Secret is not of leſs value than that whereby wines are meliorated; neither does he get leſs by it: but foraſmuch as I reſolve to buy all his Wares every where of him, I will neither leave him this, that he ſhould be free from the trouble of informing others in this thing, and that otherwiſe would be forced to make long Journeys to buy them of him, may leave off thoſe Journeys, and take this way of preparing it: Take as much Corn as you will, whether Barley, Rye, Oats, or Wheat, ſteep it in ſweet water for ſome days, then place it that it may ſprout after the ſame manner as Corn is Malted for the making of Beer; turn it well for a certain time, leſt it be corrupted by too much heat: then when it is well ſprouted, ſpread it abroad, that it may preſently cool, and it will never ſowre.

But if you would uſe it preſently, then take as much of it as your Deſtillation will require, and in a Kettle full of water, boil it ſo long, till the grains are broken, then pour it into a wooden Veſſel, and when it is luke-warm, add to it the freſh dreggs or grounds of Beer, and let it ferment; when it has fermented enough, which is uſually at the end of two or three daies, then Brandy-wine is made in a common Still, by deſtillation from that Corn; what remains in the Still will ſerve to feed Oxen, Cows, Hoggs, or other Cattel.

But the Brandy-wine which proceeds from thence, muſt be rectified, as the way is, and by this means it is render'd more ſweet and grateful to the reliſh, than any other Brandy made of Corn: the reaſon is this, That all Bread-Corn, of which Brandy-wine ought to be prepared, if it be put to ferment preſently after ſoftening, it is neceſſarily in the ſtill, by boiling, redu-

reduced into a pap, and ſo being corrupted by a duſtion, produces a ſtinking Brandy-wine.

But this protuberating and burſt Corn cannot be burnt, and therefore makes good Brandy.

Alſo the Corn may be broken on a Mill-ſtone, water poured upon it, and diſtilled out of a Still, placed within another, or in a Kettle full of water, ſo alſo it cannot be burnt; yet this way it will yield but little.

NB. But if any man will give this Brandy a reliſh, like that made of the Lees of Wine, then he muſt rectifie it upon the Lees of Wine, for this way by the Oil of Wine, which is plentiful among the Lees, he acquires his ends, and in all things he may uſe this inſtead of that.

NB. Alſo, he that will, may, without this previous coction and fermentation, pour the budding Corn hot into a veſſel of luke-warm water, for by this means the Corn begins to ferment of it ſelf, and needs no other Lees to its fermentation; yet it does not produce ſo ſweet a Brandy, as if it had firſt been boiled: for by coction the ill taſte is taken from the Corn, which the Brandy otherwiſe retains. Further, alſo it produces much more Brandy, if the Corn is ſo boil'd, that it may be broken. And this, good Reader, is a moſt excellent and profitable Secret, and will bring you in much wealth, if you uſe it rightly, and you may make great quantities of it.

Farnner did no man wrong, by taking (according to his own eſtimation) a Hundred Duckets for it, for it is worth much more, eſpecially if the reſidue of the Corn pays the charge. Yet no man hereafter will give him ſo much for it now 'tis made publick.

Indeed it is injurious to me to divulge it, but becauſe it is now in the foul hands of *Farnner*, 'tis better that others alſo enjoy it, than that he only ſhould reap the benefit of it. But though by my communication *Farnner* ſhould put on a Lyons skin for his defence, yet he can't hide his Aſſes ears under it; as appears from this Paragraph, where he writes, that he had ſent four meaſures croſs the Seas, to try if they wou'd bear the Sea-water; for then he thinketh he hath made his Port. Good God! how reſplendant is the Wiſdom and Philoſophy of this *Farnner*! Certainly, if he ſhall make one or two Experiments of this kind, that his Brandy-wine will bear the water, he'll duly merit to be created the chief Profeſſor in the Academy of Idiots, for that will befit him, ſeeing that the reaſon is not hid to him, as he writes; wherefore Drinks are alter'd by the Sea-waters.

But he will make his firſt Experiment in theſe four meaſures, and if it proves well, then he promiſes to teach this Art at a price.

O the blindneſs of this perverſe World ſwelling with Pride! Who ever heard that a good burning ſpirit, whether made of Wine or Corn, will be corrupted by the ſea-water? I grant it may be corrupted, if it be invalid before: But a good and firm burning ſpirit will never be corrupted by ſea, for all wines bear the water, thoſe only excepted which labour with a defect of ſpirit, but ſtrong wines very ſeldom, for the more ſpirits there is in any Liquor, whether Wine, Beer, or Metheglin, it is in the leſs danger of being corrupted.

But if the ſpirit which is in wine, be its preſerver, and defender from Corruption, How comes it to paſs that Brandy-wine, which if well prepar'd, is nothing but ſpirit, ſhould be corrupted? If the Spirit in wine be the Preſerver and Defence of the wine, which yet is weaken'd by a great quantity of water, ſo as the wine remains good, and is ſafe from the corruption of water: Why then ſhould not it defend it ſelf, ſince it is ſo ſtrong and free from water? Who doubts that a concentrated Life is able to perform greater things than a diffuſe and weak life?

Hence you may ſee how great knowledge *Farnner* has drawn from the light of Nature, that he ſhould boaſt ſo.

16. *To ſtrengthen all ſorts of Beers.*

IN this place *Farnner* again ſhews his Aſſes ears, when he writes, That he can ſtrengthen Beers, that they ſhall not be inferiour to Rheniſh wine. Here every wiſe man may diſcern how great and ſtupendious this man's folly is.

Behold, he attributeth the goodneſs of Rheniſh Wine to its ſtrength, which indeed is a great errour; for the goodneſs of Rheniſh-wines conſiſts not in their ſtrength, but ſweetneſs. French Wines are far more fragrant than Rheniſh, yet in ſweetneſs and ſoundneſs it comes not near it. So likewiſe *Hungarian*, *Greek*, *Italian*, and *Spaniſh* Wines, *&c.* are much ſtronger, but for ſweetneſs, as well as goodneſs and wholſomeneſs, Rheniſh wine, far better, although the other excell it in ſtrength. And ſo this is a great abſurdity: Indeed Beer may be ſtrengthen'd, by adding a burning ſpirit to it in fermentation, whereby it may endure the longer; which thing I can't deny, and it ought to be done: but that a Vinegar may be drawn from them like Wine-Vinegar, is a pure ſtory; for though it may happen that Beer may give a ſtrong Vinegar, yet it never yields Wine-Vinegar, for a great difference may be diſcern'd between Wine and Beer-Vinegar, though they have both the ſame ſtrength, if you make trial of both: Whence it appears, that *Farnner* is ignorant what Vinegar is, becauſe he knows not the difference of it.

Strong and right Wine-Vinegar is known by theſe Trials. Firſt, if it be ſhaked in a Glaſs, it by and by receives its clearneſs, and leaves no ſcum, dreggs, or bubbles, on the top, as Beer-Vinegar does: for let it be never ſo ſtrong, it retains its own nature, and cauſes a ſcum, if it be ſhook juſt as the Beer it is made of: but Wine-Vinegar leaves no ſcum. Secondly, the longer Wine-Vinegar is boiled, the ſtronger it is; the reaſon is this, There is naturally in it an innate ſharpneſs, which is not volatile; but the ſharpneſs of Beer-Vinegar conſiſts in its volatility, which in boiling is abated; ſo that the longer it boils, the weaker it is. And theſe are the two chief and moſt certain trials of Vinegars, which *Farnner*'s Vinegar will never bear, and therefore will ſtill be Beer-Vinegar, and does not deſerve that it's Preparation ſhould yield Fifty R. Dollers.

Acid or Sower Beers.

WHat belongs to this, requires nothing of Art, neither is it worthy to be taught at a price when every Country man can do it, by projecting and well ſtirring in a veſſel of acid beer, two or three handfuls of beech aſhes well ſifted, made wet with a little beer, and leting them lie in it about eight days, for then the aſhes by reaſon of the Salt which is in 'em takes away the ſowreneſs of the beer, and make it drinkable.

NB. If the beer be not too ſowre, a handful of ſifted aſhes may be ſewed up in a linen bagg, and put into the Beer through the bung, and there left

for this way the Beer may be preſerv'd from ſowreing and need not be ſtirred nor troubled. Alſo ſome handfuls of wheat put into the beer, draws its ſowerneſs from it, the ſame alſo is done by egg ſhells, Crabs eyes, Tortoiſe ſhells, Sea ſhells, calx *viva*, and ſuch like things which attract the ſharpneſs, and turn it into ſweetneſs.

But whence is it that *Farnner* now ſo abounds in the knowledge of wines and beers, when yet but two years ſince, when he prepar'd and ſold brandy wine and beer, that he complain'd to me, that he had ſuſtained much damage in handling them, ſo that he ſhou'd periſh unleſs he learn'd how to take away and remedy the burning of Corn in the Still, the ill ſmell of his brandy wine and the ſowreneſs of Beer. Why cou'd not he then help himſelf, and beware of thoſe Loſſes? he will object that at that time a certain light ſhone upon him, by whoſe benefit he knew Nature. However true his objection be, it will never induce me to believe that this light cou'd in ſo great a meaſure ſo ſuddenly help him, which is a great abſurdity: for ſo much knowledge is given to no man in a nights ſleep, it is a falſe ſtory. But that my faithful inſtruction, with which I inſtructed him, has enlighten'd him, and like a guiding ſtar led him in the right way, is moſt true, tho he is unworthy of thoſe precious Pearls which like a wild boar he treads in the dirt under his feet.

18. *Vinegar of Corn.*

WHat belongs to this Paragraph, is demonſtrated in the ſixteenth paragraph, that tis impoſſible to make a vinegar of Corn, like that of wine: wherefore this cannot (as he thinks, deſerve fifty R. Dollers.

19. *Vinegar of green Woods.*

INdeed I wonder that *Farnner* is not aſhamed of theſe things which I have many years ſince ſo clearly deſcrib'd or to bring them to light anew, that he might get money by teaching thoſe things to others, which are already publiſhed in the firſt part of *Furnaces*, And ſo he adorns himſelf with other mens Feathers.

But he will object, I have in the trial found theſe things true, and therefore deſcribe them, but he does it to this end, and to no other than that he may cheat them of their mony who did not know that I had ſo long ſince writ of them. He that deſires any of theſe things, may find 'em in the firſt part of my *Furnaces*, and he ſhall not need to give *Farnner*, ten R. Dollers for his inſtruction herein.

20. *Altho* Glauber, *&c.*

HEre he contemns my way of extracting *Tartar* from the lees of wine, when yet it was a year ſince clearly and perſpicuouſly deſcrib'd and publiſhed at *Norimberg*, which *Farnner* cou'd never correct. But he bragg'd that he had found by a certain poſition another compendium, which indeed might be, ſince it is eaſier to add ſomething to an Art once found, than to find the Art it ſelf, but it does not become him to diſſwade men from this Art which is already deſcribed, and which may be had gratis, and to deſpiſe it and bragge among all men of his own inventing a better. What good men will think of theſe bold malignities may be eaſily judg'd: but if I had writ nothing of theſe things, who would havee taught him that there was *Tartar* in the lees of wine? But I not only found and writ what was in them, but alſo largely taught how they might be uſefully extracted.

Yet this trifler dares as impudently, as falſly ſay, that he had corrected it, and added to it, and therefore wou'd not let it go without his price.

After the ſame manner he deals with my other ſecrets (which, tho he had them of me, he braggs that they are his own) with which he proceeds, as with the lees of wine, namely with my Alkaheſt, Panacæa, Melioration of wine, compendious diſtillation of Corn, preparation of vinegar, correction of beer and others in many places.

Whence cou'd he have known what was meant by my Alkaheſt and Panacæa, or how ſmall wines and and beers ſhould be meliorated, how Corn without aduſtion ſhou'd give plenty of burning ſpirit, and whether there was *Tartar* in the lees of wine or not, and how it might be extracted thence, except he had ſeen and learn'd all theſe things of me? of which alſo I had many years ſince publickly made mention in my writings, which is ſo well known that he cannot deny it, how much ſoever he oppoſes the truth.

21. *All Copper Ores.*

IN this place *Farnner* teaches that Copper Ores are to be ſeparated, when, yet they are not ſeparated but melted, that thence the Copper may come forth, which Copper if it contains ſilver being mix'd with a due weight of lead, it is ſeparated: but Mines of copper are never ſeparated, which he does not underſtand, and ſo he betrays his ignorance in theſe terms. This way of ſeparating is ſufficiently known, and every where where copper mines are found, is wrought in abundance and cannot be hid. He that poſſeſſeth Copper mines, will eaſily find men that will thence elicite the copper, and afterwards ſeparate it, neither will any man need to go to *Farnner* on that account. Indeed I wonder at his extream impudence, that he was not afraid to promiſe that he wou'd teach others ſo many Sciences, of which if he knew the half part, his village wou'd not hold all the furnaces he wou'd need for the demonſtration of them.

Further, for theſe and the followiug Sciences, which yet; are the moſt difficult and laborious of all, he requires no money, but for a certain reward promiſes to demonſtrate them all.

22. *From Teſts and Cupels.*

HE has drawn this ſeparation alſo from my writings, that therewith he might fill his calumnious letters: neither do I believe he cou'd do it before he had ſeen me do it. It is done by the powder of coals, as I have plainly deſcribed in my Chymical Colloquie.

23. *Gold and Silver.*

THis Art Lazarus Ercker has deſcribed, but becauſe his way is too hard, I have ſhewn an eaſier in the explication of the wonder of the world, and there the following melting Furnaces are alſo deſcribed, and therefore I need not ſay any thing of them here.

All

All theſe inventions which *Farnner* braggs off as his own, are mine; for my unfaithful Servant taught *Farnner* thoſe Furnaces which he learn'd of me.

And at length,

I have nothing to ſay to theſe four laſt paragraphs, becauſe they don't concern me as the former doe, and *Farnner* himſelf expoſes them as ſpeculations and not as experiments, as I alſo believe that they are only fancies and fooliſh imaginations: yet there is one thing which I muſt anſwer, which he mentions in his third paragraph, that the time will come when *Glauber*'s Alkaheſt muſt be forc'd to hide, altho it is not wholly to be rejected. But if it be ſo unprofitable that it muſt hide, why does he expoſe this to ſale at fifty R. Dollers, and the Panacæa which is prepar'd with it, at thirty? and he has already got ſufficiently by it: if it be ſo improffitable, why then does he offer to Sell it to others knowingly and willingly at a price? If *Farnner* has rightly term'd my Alkaheſt unuſeful and muſt be forc'd to hide, he has ſurely deceiv'd many. But I confidently aſſert, that my Alkaheſt will never hide, but defend it ſelf in all places: Perfidious calumniators, thieves and their accomplices ſhall hide, but not my Alkaheſt. If he has found out better things than I, let him publiſh them as I have done, that every man may judge whether they be true or falſe: Why this boaſting and wicked vanity in deſpiſing others? For truth needs few words and leſs braging. In his writing in which he ſets down the value of every Secret contain'd in the laſt paragraphs, namely, from the twenty firſt to the twenty eighth, he promiſes to teach other men for no certain price, but on courteſy, thoſe ſecrets which yet are the beſt, if he cou'd know them. But if he can effect thoſe things and teach 'em to others, he wou'd not certainly teach them gratis, for 'tis impoſſible for him to build thoſe Furnaces requiſite to the making of thoſe things in half a years time.

From which it ſufficiently appears how ignorant he is of what he writes: Certainly if his wares which he had of me gratis, ſhould find Chapmen, no doubt but in one year he would get ſome thouſands of ducats.

I thought fit to anſwer you theſe things now, that I might ſhut your foul mouth which was ſo wide open to lyes, but if after this you don't ceaſe your lyes and calumnies, you will compel me to uſe other means to bridle your malice. In the mean while I doubt not, but all good men in this ſhort Apology (in which I have not refuted thy lying calumnies with indecent or contentious words, but from thy own obligations and hand writing) will plainly ſee how wickedly and perfidiouſly thou haſt behaved thy ſelf towards me. This damage which thou haſt done me, neither you nor all yours both preſent and future faculties, nor all thy ſervants can ever repair: It remains therefore, that I ſay with Job, God gave, and God has taken away, bleſſed be the name of the Lord. But I don't believe you will eſcape divine puniſhment, to which I commit my cauſe at this time. It is certain that every thing has its time, which I alſo patiently expecting your downfal (when God ſhall take upon him the patronage of a juſt cauſe,) perhaps with theſe my eyes ſhall ſooner ſee than hope. Indeed I wanted not matter to diſpute theſe things more largely, but that for a reaſon known to my ſelf, I was hinder'd in doing it at this time. But as ſoon as I can, God aſſiſting me, I ſhall not be wanting to propoſe to all impartial men in the world, queſtions to be reſolv'd, from which every ingenious and good man may ſee, animadvert and give judgment, how ungrateful, perfidious, unjuſt and inhumane thou haſt been to me.

Miraculum Mundi;

Or, A Plain and Perfect Deſcription of the admirable Nature and Property of that moſt powerful Subject, called by the Antients,

The Univerſal Menſtruum,

OR,

The MERCURY of PHILOSOPHERS.

By which *Vegetables*, *Animals*, and *Minerals* may eaſily be Tranſmuted into moſt Salubrious Medicines, and the Imperfect Metals into Perfect and Permanent.

A Preface to the Reader.

TO whomſoever this little Book (treating of the Propriety, Nature, and Eſſence of that incomparable Subject, by the ancient Philoſophers called, The Univerſal Menſtruum *or* Solvent, *ſhall occurr, and is offended in reading of thoſe great virtues by me aſcribed to it; and becauſe he underſtandeth not the thing, judgeth it not to be credited; I would have him know, that whatſoever power I have attributed to it, that that is in no wiſe a Figment, Dream, or vain Opinion, but to be taken for a Truth, found out by a diligent and manifold Practice. But which will be moſt profitable, for me to proſtitute all my inventions to the World, or conceal them?*

them? For which cause I will (at least for the present) only point at many wonderful things which may be performed by this universal Menstruum, but not treat of them, leaving it free for every man to believe my sayings as far as he pleaseth; but if they shall be credited by no man, it shall not disturb me, it being sufficient for me to have shewed where and by what reason, the truth or secrets of nature are to be found.

As for the Subject whose nature and operations I have determined to touch upon, it is like to that of which I have made mention in my Mineral work, *by the signal name of* Alkaheſt, *which appellation I have there demonstrated, not to be imposed upon it without reason. But seeing that long since the chief Menstruums of some Philosophers, were called by the same name, and that I know not whether theirs were like to mine or mine to theirs in nature and virtues, shall not much trouble me; for it matters little for diverse Menstruums to be called by the same name, although they do not answer one another in all things. For even as wine is wine, although it come from* Germany, Italy, France *or* Spain, *nevertheless each is wine, although the one exceed the other in strength and rellish, as long as the same nature and virtues are found in it, which ought to be in wine: The same is to be judged concerning my* Alkaheſt: *To wit, that if the virtues be agreeable to the name, from whatsoever* Subject *it be extracted, it rightly meriteth the same name, which that it may the better be understood, I mean by the name of* Alkaheſt, *a very hot, fiery, dry, and also humid water void of all corrosive power, by which* Vegetables, Animals, *and* Minerals, *are dissolved without noise, yet not all in the same manner, and elaborated into Salutiferous medicines, as I have shewed in the* first part of my Mineral work. *And because I have written such things of it, many have endeavoured to prepare such a Menstruum, every one from his own Subject; Impostors also have offered to others, a water plainly corrosive instead of it, fasly pretending that they had obtained the secret from me, and that it is the same which I have described in my* Mineral work; *then one sells that putatious* Universal solvent *to a another at a dear rate, whose nativity and preparation lies hid with the seller, that so the blind leading the blind both may fall into the ditch; which thing, when I knew it, I was constrained whether I would or no, to lay open to the Reader, what is properly the nature of my* Alkaheſt, *and what are its virtues and powers, so that those who erre, may have a rule by which they may be able to judge of any other pretended* Alkaheſt, *whether it be mine or not.*

Therefore this incomparable subject is called an universal solvent, because by its benefit, many incredible things are performed in the preparation of good Medicines, and also in the preparation of metals, yet let no man believe that it dissolveth metals swiftly and violently, like aqua fortis, aqua regia, *or other corrosive waters, not in the least, but worketh altogether after another manner,* viz. Vegetables *and* Animals *are dissolved in digestion, by the moist way, in which solution, the pure parts are separated from the impure.*

And Minerals and Metals also being dissolved in the moist way by its benefit, may be washed, purged and maturated, and reduced either into good medicines, or into better metals, but not with the same advantage and celerity as in the dry way, by which very many incredible mutations are presently performed, to be admired by the inexpert, too tedious here to be treated off. Besides those two ways of dissolving, which (that I might demonstrate the possibility of the matter) I have shewed to some; there yet occurrs another far different from those, by which metals and other Subjects are swiftly, meliorated to the eye, and are maturated, depurated, and transmuted into the best of medicines, and into purer bodies: the reasons of which, solution there is no need to expose to every one, chiefly, because that labour requireth a skilful Chymist and there are few who heartily search into the secrets of nature, but most Chymists vexing themselves with vain processes, understand nothing solid in Medicine or in Chymistry, which imaginary Artists, when they happen upon true writings, cannot reach their sence with their dull brains; they speak evil of the Author, disdaining his industry and unwearied labour, in communicating his talent; whence it comes to pass that he which brings forth any thing of good, finding nothing but ingratitude, chuseth rather to carry his talent with him to the grave, than to publish it to his own damage. And this is the only cause, why I have not plainly prosecuted the use of this Menstruum in the preparing of medicines, and meliorating of metals, but have only pointed at what may be effected by the help of it, that it may be made manifest, what is to be judged concerning it, and whether that which is sold for such by others, be like to that described in my Mineral work *or not: I doubt not but many will quickly despond, thinking that their* Alkaheſt *will in no wise perform those things which I here ascribe to my Menstruum, and will also believe the matter not to be so easy, as before they thought it to be, but although it arise from a vile subject, that nevertheless its invention and use is very difficult. For whosoever hath such a menstruum, by which these following things may be effected, he may indeed rejoice in the possession of the* universal solvent *or* Mercury *of* Philosophers, *having a door opened to true medicine and Alchymy. Therefore for the sake of Searchers, I will begin to shew somewhat of its virtues and powers, as far as I may, that the* Magnalia *of* God *may thence be made manifest, and that I may give occasion to every man, to render praise, and thanks to his Creatour, who is the giver of all good.*

Of

Of the Tranſcendent Virtue, Power, Nature, and Property of this Wonderful

Univerſal Menſtruum.

IT is worth our noting, that three Operations eſpecially may be performed by the benefit of this *Menſtruum*.

I. It maturateth all Vegetables and Animals, being diſſolved into a Liquor, and taking away their Venom, converteth them into ſalutary Medicines.

II. It diſſolveth Minerals and Metals, as well by the moiſt as by the dry way, correcteth their venoms, ripeneth and fixeth their crudity, ſo that they may be made good Medicines; and after fixation, yield good and genuine Gold and Silver.

III. Thoſe Metals, Minerals, Stones, and other compact Subjects, not diſſolvable by the aforeſaid waies, it diſſolveth, maturateth, purifieth, and in an hours ſpace exalts Metals, more than the two former Solutions can do in a whole day, whoſe change into better may be obſerved in every hour: It diſſolveth Metals and Minerals into a penetrating ſpirituality, ſo that the Metal is not ſeparated from the *Menſtruum*, but a ſolution is made of both, either by the dry or moiſt way, from which the more pure part of the Metal, or that which is Gold or Silver, after the premiſed fixation, is precipitated by Art, eſpecially if many were jointly diſſolved. Whence it is ſufficiently manifeſt, that in all the Imperfect Metals Gold and Silver is notably abſconded, not diſcoverable by the vulgar Examen of Cupels: which Operation being performed by a *Menſtruum*, prepared in ſo groſs a manner, it is credible, that if this volatile Hermaphrodite and ſpiritual Mercury were again fixed, and rendered Corporeal, that it would be by many degrees more ſubtile, penetrant, and efficacious, for the diſſolving, altering, and perfecting of Bodies, than it was before.

This is its Uſe in general; but ſpecially it abundantly exerts its manifold Virtue; before whoſe deſcription, it ſeems not amiſs to point out the common Name of this ſubject, and what the common People think of it. Which, that I may expedite in few words, know, that it is nothing elſe but the naked ſalt of the Earth, of which *Salt-Peter* is made. But that every ſalt of the Earth, or common *Salt-Peter*, hath thoſe Virtues which I here aſſign to my ſubject, I ſhall in no wiſe ſay, ſeeing that it ought to be diverſly prepared for divers uſes, according to which, thou maiſt expect divers Virtues.

This ſubject is neceſſary to be known by all the Inhabitants of the whole Earth, to all orders and degrees of men, becauſe not to man only, but alſo to every Creature, it is profitable or noxious, according to its various application.

This ſubject ſerveth for *Phyſicians*, *Chirurgions*, and *Apothecaries*, of which they may prepare excellent Medicines againſt the natural Diſeaſes of Men. Whence the truth of that common ſaying of Philoſophers is undoubtedly aſſerted, *viz. That of the greateſt Venom the greateſt Medicine againſt Diſeaſes is to be prepared.* And that Nitre is the worſt of Venoms, I have evinc'd in the ſecond part of my Furnaces, where I preferr it to the *Baſilisk* himſelf; and that from the ſame Nitre, and its mediation, is to be prepared a moſt excellent Medicine. In the Firſt Part of my Mineral Work, for the ſake of Phyſicians, Chirurgions, and others, applying themſelves to Phyſick, I have ſhewed how by the help of my Alkaheſt, Medicines are to be prepared from Vegetables, Animals, and Minerals, far exceeding the ordinary waies of Preparation.

But it is not my mind at preſent to diſcourſe much of Medicines, it may ſuffice to have ſhewed what Virtues this Univerſal ſubject hath, and to what uſes it may be appointed. I ſay, that it may be profitable to all orders of men, as well to the ſuperiour, as to the inferiour, to ſpiritual and ſecular, noble and ignoble, rich and poor: of which orders the Phyſician is not to be deemed the loweſt.

That I may perform my promiſe, what unheard of things may be done, by the benefit of this ſubject, in natural diſeaſes incident to man, who is obnoxious to all kind of miſeries, I will in the next place reveal ſomewhat for his health and comfort.

But this my Medicine, which I deliver, is not of great price, but of great Virtue, and of which the poor as well as rich, may be partakers, and (by the bleſſing of God) may be freed from every curable diſeaſe.

The Preparation.

TAke two or three pounds of this Menſtruum, *whoſe corroſive nature tranſmute by force of fire into a nature not corroſive; and you have the* Menſtruum *prepared, with which you ſhall elaborate this Medicine, in this manner: Diſſolve in this* Menſtruum *as much of the firſt Ens of Gold (which is to be found in all places of the World, but eſpecially in golden Mines more copiouſly) as it will attract in the heat; ſo that a red Solution may be made, which digeſt for ſome daies, with its own weight of the diſſolving Wine; make ſeparation of the pure parts from the impure, by removing the faces which ſever themſelves from the Medicine, by falling to the bottom, this being concentrated by an eaſie heat, will be a red pellucid ſtone, very like to a ſoluble ſalt, which is to be carefully preſerved. This Medicine will be ſecond to none, except the ſtone of Philoſophers, and will be of the ſame goodneſs, after a Hundred Years, that it was the firſt day it was made, performing all things which I ſhew with amazement, for which no mortal man can ever render ſufficient Thanks to God.*

The Uſe of this Medicine in general.

THis Univerſal Medicine will cure every natural diſeaſe both in young and old, ſtrong and weak, in a very ſmall doſe, without any danger, not nauſeating the ſtomach, as the uſual Potions do; and is to be taken in any Liquor, according to the Condition of the Sick, as warm Broth or Gruel, Wine,

Beer or Ale, Water, Milk, &c. from one grain to eight grains, which is the higheſt doſe. It operateth after a diverſe manner, according as the ſtrength of the ſick, or the nature of the diſeaſe requires: If you continue in the Uſe of the preſcribed Doſes, the operation will be inſenſible; it ſtrengtheneth and mundifieth the radical moiſture, and in a wonderful manner expelleth every Evil out of the Body being taken daily, every other or every third day: It preſerveth from accidental Diſeaſes, correcteth Venom, and reſiſteth infectious Airs. But if the Doſe were greater, the Operation will be more evident, by Sweat, Urine, Spitting, and ſometimes by Stool, according as you pleaſe, by encreaſing or leſſening the Doſe; and if the diſpoſition of the Diſeaſe comply, it is cured by a ſmall quantity of this Medicine, without ocular obſervation; but being radicated, requireth a manifeſt operation, if it refuſe to yield to a ſmall Doſe acting inviſibly; becauſe both in preparing and uſing this Medicine, regard is to be had, that you neither err in exceſs or defect, but by obſerving a *Medium*, you ſhall obtain both Profit and Honour.

Thoſe of ripe years may take from one to ſix grains every day, if they have leiſure to attend the Cure, but if not, three grains every fourth day, until there remain no foot-ſteps of the Diſeaſe: taking nothing beſides this Medicine, and keeping that day from the cold Air, and abſtaining three or four hours from Food. In the *Leproſie* and foul Scab, there is no Remedy ſafer than this Medicine, extirpating the Roots of the Evil without trouble. Nor will you ever be fruſtrated in the deſired effect, if the Sick have ſtrength ſufficient to undergo the Cure. [See its Preparation and Uſe more particularly deſcribed, in Part 2. *Phar. Spagyr.*]

After the Deſcription and Uſe of this Medicine, by which the health of Man may be preſerved, and being loſt, may be reſtored, which is far to be preferred to all the Treaſures of the whole World. There now follow other Secrets, ſhewing how by the help of this ſubject a man may acquire an honeſt Living; and, as I have ſaid in the Preface, this ſubject may be profitable to all orders of men in the World, whether ſuperiour or inferiour, Eccleſiaſtical or Political, noble or ignoble, rich or poor, by conferring or admoniſhing ſomewhat of good to every one in his Profeſſion. Therefore I will now begin to teach ſome ſignal uſes of it, that it may be manifeſt to all men, that this is an Univerſal ſubject, which I have alwaies judged ſuch, and that others with me may find it ſo.

In the firſt place, all Foſſiles or Minerals digged out of the Earth, may be perfectly examined by the mediation of this ſubject, what metals they contain, how many, and how much of each: It is an infallible Guide to the diggers and melters of Ores, ſaving them both loſs of time and matter. An excellent Artifice, by which the value of all Minerals may be diſcovered without much labour and charge, being highly neceſſary for Metallurgiſts, of *Germany* eſpecially, being quite undone by a continual War, who may in a ſhort time lay up great Stocks or Treaſures, to be imployed againſt the Enemies of their Country in time of neceſſity: by whoſe benefit alſo rich Mines of gold and ſilver (which otherwiſe would for ever lie neglected) may be diſcovered, when they are ſwiftly and accurately examined.

The Marcaſites of Gold and ſilver being melted by the mediation of this, by a ſingular compendium, hitherto unknown, do afford more metal than by the common way.

The volatile and immature Marcaſites of gold and ſilver, are fixed in the ſpace of three hours, ſo that they yield more metal than they could have done without fixation.

Thoſe three things are very neceſſary and profitable to every Magiſtrate having Mines in his juriſdiction, by which he may obtain much wealth.

All Gold and Silver which is not purely melted from its Marcaſite, is ſwiftly purged from all additament, the Silver is ſeparated from the Gold, by fuſion only, with ſmall labour and coſt, but in great weight. Gold and Silver are eaſily drawn out of old Tin veſſels, the tin being preſerved almoſt in the ſame weight, and being made better than it was before, may ſerve for the ſame uſes to which it is wont to be put.

From *Biſmuth* much ſilver is ſeparated, the *Biſmuth* being preſerved, this ſecret being agreeable to thoſe places which abound with that Mineral.

From old Copper much Silver may be ſeparated, the Copper remaining unhurt, by which Artifice Countries abounding with this metal, may not a little profit themſelves.

Every common ſilver, may in the ſpace of a few hours be exalted into the nature of Gold, the which if it be done four or five times, which may be in a ſhort ſpace of time, it giveth ſo much gold, as affordeth a ſufficient livelihood, over and above the coſts.

Gold may be ſeparated by fuſion, from every addition of Copper, Tin, Iron, Lead, Orpiment, Antimony Arſenick or the like, and be purifyed without Cupels, each being kept apart; profitable for Metallurgiſts and the like, from the ſhortneſs of the time, ſmallneſs of the charge and labour, and much gain,

Every imperfect metal without the mixture of other metals, may be ripened by this ſecret alone in the fire, in the ſpace of an hour, ſo that it will yield Gold and Silver, but without gain.

There is another very gainful augmentation or increaſe of the perfect metals, by the imperfect, anſwering to the Germination or growth of vegetables; for even as every ſeed being caſt into the earth, groweth therein ariſing to be an herb or a tree, and taketh alſo its encreaſe from the ſame by its inbred attractive power; ſo is it here alſo, for *Sol* or *Luna* groweth and encreaſeth in *Saturn*, *Jupiter*, *Venus*, or *Mars*, as in their native ſoil, and are nouriſhed after the manner of herbs, and encreaſe from day to day. An Art not to be deſpiſed by Philoſophers.

By the mediation of this, from all imperfect metals and minerals, yielding nothing by the uſual examen of Cupels, Gold and ſilver is produced in a manifold manner, being an argument that the imperfect metals have ſomewhat of the perfect reconded in them, when they are inverted and ſhew themſelves to our ſight, a work not ingrateful to thoſe who work in Metals.

Theſe are the chief things which I have found may be done in metallick works, by the help of this Subject; yet I make no doubt but there are many more unknown to me, to be revealed to others after me who ſhall make a good beginning from my writings, the which I alſo wiſh from my heart, that the hidden myſteries of the natural wonders of God, may at length be brought to light, for the uſe of mankind.

Among the enumerated Arcanums, ſome perhaps may ſeem of little worth to the Reader; but there

are

are ſome from which may be had a commodious livelihood, ſo that an Artiſt need not be at the will of another, without he pleaſe. O how great a thing is Liberty, which no man can worthily eſteem, who hath not been a Servant himſelf. A piece of Bread is ſweeter to a quiet, prudent man than many dainties, with care, danger, and noiſe. It is happy for him who can ſay with *Paracelſus*, *Alterius non ſit, qui ſuus eſſe poteſt*; *Let him not be anothers, who may be his own.* But it is good for him that would uſe well the Gifts of God, not to be unmindful of his Neighbour, leſt temporary Liberty caſt him head-long into the Dungeon of eternal Slavery. After ſhewing this ſubject to be conducible to all the Inhabitants of the earth, I have deſcribed its uſe in Metallicks, which is not to be indifferently undertaken by every man, but by thoſe only who are concerned in digging of Mines, and melting and ſeparating of Metals, whether they be noble or ignoble, learned (as well ſpiritual as ſecular, exempted from publick offices) or rude, which maintain themſelves from Merchandice, or live upon their Eſtates, all which may receive Fruit from theſe Secrets, but not Husbandmen, Labourers, Ditchers, *&c.* but that to theſe alſo ſomewhat of profit may proceed from my inventions, I will ſhew in order; although the principal will redound to ingenious Artificers, Engravers, Painters, Statuaries, thoſe who adorn Glaſs or Clothes with Silk, Gold, or Silver, and they who make Wax-work.

They who etch upon Copper, may prepare from this ſubject a good corroſive water, by which (the Copper-plates being firſt ſmeared over with a covering fit to defend them, and what Images and lines they pleaſe, being drawn upon them with a ſtile or ſtift) by a very eaſie and compendious manner, they will be eroded or eaten into.

Painters, by the help of this, may prepare for themſelves moſt excellent Colours, as *Ultra-Marine*, *Smalt*, fine red or ſcarlet *Lacca*, *Venice-Ceruſe*, and others neceſſary for their Uſes, which otherwiſe they muſt have from far, as *Italy*, *Holland*, *France*, *&c.* and at a dear rate.

Engravers and *Statuaries* may ſo harden their Tools that they may hold their points long, if they be to cut ſtones.

Embroiderers may put any durable Colour they pleaſe upon the ſilk with which they work.

They who paint Glaſs, by an eaſie work, may thence prepare all Colours or Enamels for Glaſs, ſo that there will be no need to have them from *Venice*.

They who work in Wax, by the benefit of this, may whiten it exceedingly, and colour it as they pleaſe.

Printers may add this ſubject to their Ink, which will cauſe it to adhere moſt firmly to the Paper, and render the Letters very fair.

It is convenient for *Clockmakers* or *Watchmakers*, if a Water be deſtilled from it, which ſoldereth Iron or Steel without Fire, if a drop of that *Aqua fortis* be dropped upon it, whence the Iron growing hot, it preſently waxeth ſoft, as if it had been ſoldered in the fire by the help of Copper.

All *Smiths* may by it harden their Files, and other Iron Tools, as hard as if they had been made of the hardeſt Steel.

Tin-workers or *Pewterers*, may harden their Tin or Pewter, and give to it an elegant whiteneſs, ſo that it will reſemble Silver both in colour and ſound; neither will it eaſily tarniſh, and by reaſon of its hardneſs will endure longer than common Tin or Pewter.

Cabinet-makers may ſtrike an excellent Black upon Pear-tree, Cherry-tree, Box, Walnut-tree, and other hard Woods, which may be uſed for curious Works inſtead of Ebony.

Skinners or *Furriers* may dye their Ermins, Fox-skins, Wolf-skins, and the like Furrs, with a Scarlet, Crimſon, or deep Black colour, far exceeding the natural.

In like manner, *Feather-dyers* may ſwiftly give any laſting colour to their Plumes.

Taylors may take out ſpots or ſtains out of Woollen, Linen, or Silk Garments, and reſtore their beauty.

If *Shoomakers* put old Iron to this ſubject, they may therewith adorn their Leather with an excellent Black.

Weavers may render their Linen threads ſo fine and ſoft, that they ſhall emulate Silk.

Dyers, by this, may give ſo firm and unchangeable a ground to their Cloth, that the ſuperinduced Colours ſhall not be corrupted or ſpoiled by any Wine, Vinegar, Urine, Pickles, Air, or Sun.

Potters may thence prepare a Glaſſy colour, not unlike to the *Indian Porcellane*, of which Veſſels may be made, having the Aſpect of Gold, Silver, or Copper, a ſingular Ornament for Noblemens Tables, hitherto unknown to the World.

Souldiers, *Merchants*, *Travellers*, *Carriers*, and others who are much in the open Air, may of this prepare a Varniſh, in which they may dip a Linen Cloth, which will not permit either Air or Water to paſs through it, with which they may defend their Boots or Clothes, ſo that they may travel dry in the Rain.

They who make Tapeſtry, may reſtore their faint or faded colours, ſo that they ſhall be ſtrong and beautiful.

Miſtriſſes of Families may prepare of it fine Soap or Waſhballs, far exceeding that of *Venice*.

Houſhold-Maids may with it ſcowre or cleanſe their metallick veſſels, ſo as to render them neat and beautiful.

Women may change the yellow, pale, or brown colour of their face and hands into a beautiful whiteneſs.

Old Women may by an eaſie way take away the wrinkles of their face and hands; as alſo, the Corns of their feet, and boil their Linen to ſuch a ſoftneſs, that it ſhall come but little ſhort of Silk.

Gardeners by this ſubject may deſtroy all Inſects, by mixing it with Water, and pouring it into thoſe places where they breed, for they will either die in their holes, or run out to die, becauſe they are not able to abide that fire. It alſo ripeneth Fruits, if a little of this *Menſtruum* be applied to the roots, at the entrance of the Spring; and if a large quantity of Apples be covered well over with it, they may thence prepare a laſting Wine, Vinegar, or burning Spirit.

Bakers may uſe it inſtead of Ferment or Yeaſt, if they diſſolve a few Hops therein.

Brewers may have very ſtrong Ale or Beer by its help, if they extract their Hops with it.

Mead or Metheglin, as alſo Beer and Canary, which are upon the turn, and growing ſowre, may by this be rendered drinkable.

Comb-makers, and other Horn-workers, may by this ſoften their Horns, ſo that they may imprint upon them what Images they pleaſe.

Keepers of Armories may preſerve their poliſhed Arms or Harneſs ſafe from Ruſt, by anointing it over with this ſubject.

Bird-Catchers may by help of this prepare ſuch a Birdlime as will not be hurt either by Cold or Heat.

Souldiers by means of this may prepare from Gold a fulminating Powder, of which the magnitude of a Peaſe being put upon a red-hot Iron plate will give a greater clap, than half a pound, yea, a whole pound of Gun-powder; the ſame may alſo be prepared without Gold, only by the addition of Salt of Tartar and Sulphur; as it is deſcribed in the ſecond Part of our Furnaces.

Engineers and *Makers of Fire-works*, may perform many wonderful things by help of this ſubject.

There may alſo many new Works, belonging to Weaving and the Smith's Art, be thence made, which may be communicated to neighbouring Countries, whereby Money may be brought in lieu thereof to a Countrey impoveriſh'd by War.

If *Vine-dreſſers*, or *Keepers of Vineyards*, pour a little of this ſubject to the Roots of their Vines, they will have ripe Grapes, and *Muſt*, or new Wine ſooner than their Neighbours; of which they may make a good advantage.

Nevertheleſs, Muſt and Wine alſo may be ripened after another manner, in the Hogſhead, without this Art; ſo that they who underſtand the way, may have alwaies good Wine, when others have it ſowre: A Secret very profitable to cold Climates, which for the moſt part produce ſowre or tart Wines. It is alſo agreeable to Countries abounding with Wine, when through a want of the heat of the Sun the Grapes do not ripen well; which may be helped by this Art, ſo that it may be readily ſold.

But becauſe the greater part of men, eſpecially of the meaner ſort, cannot be perſwaded to things which they have never ſeen nor heard of, I well know, that if I ſhould in plain words deſcribe the reaſon and manner of meliorating Wines, ſcarce one man in a Hundred would believe me, but would rather ſay, Our fore-Fathers were wiſe men, and got great Eſtates by Wine, without the knowledge of this Art, nor did they deſire it. If Nature will not ripen our Wines, let them be ſowre; yet notwithſtanding, if ſometimes they will not ſerve the Maſter, they may be drank by the Servants.

Men of this ſort are incurable, neither are they (being old) eaſily tamed; and young men take little care how prudently they manage their Affairs. Hence it comes to paſs, that Antiquity obtains upon all men. But that the Vine-dreſſer may ſee that the preſent Age is more skilful than the former, I will ſet before him only one demonſtrative Example, by which he may plainly ſee how much they differ.

Our fore-Fathers knew not how to make any thing of the fæces or dreggs of Wine, but a burning Spirit or Brandy, which being extracted, the remainder they threw away, or ſometimes mixed it with the Fodder of Cattel, very rarely dried them in the Sun, and burnt them into Pot-aſhes; but by my invention, there may be thence drawn a far greater quantity of burning Spirit, then alſo a large quantity of Tartar, and at laſt the Pot-aſhes, which is a threefold profit. Which if you manage the matter well, from a Pipe of Lees, you will have at the leaſt ſeven or eight Urns (*which will be about a Fifth part, an Urn being four Gallons*) of good Wine, from the reſidue, you will have the burning Spirit, and Tartar, at the laſt the clavellated Aſhes, the profit being four times as much as heretofore, which thing was altogether unknown to our Anceſtors. How many Thouſand weight of Tartar is every year thrown away in *Franconia*, *Suevia*, *Alſatia*, the *Palatinate*, upon the *Rhine*, *Moſell*, and *Danube*, which would be very profitable to thoſe Countries, if the men were Artiſts.

But what doth it ſignifie to teach, if there be none to hear or learn: for it is more adviſeable to ſit ſtill and do nothing, than to be largely imployed to no purpoſe. But I am perſwaded, that after my death, there will be ſome who will underſtand my good will to the World, and ſearch out the truth out of my Writings, to their own great profit. There is an opportunity or ſeaſon for every thing; Trees firſt bring forth Budds, then follow Bloſſoms and Leaves, and laſt of all, Fruit.

There remains yet another thing very profitable to Country-men; the juice of Apples or Pears being preſſed out, by the help of this ſubject, ſuch an Efferveſcency (or working) is promoted, as Wines may be thence made, having the reliſh of the natural, and but little inferiour in durability and ſtrength: and although the beating of the Apples be ſomewhat tedious, (which is now done much quicker by Mills) that labour is recompenſed with a good profit, by the Wine ariſing from the juice; a Secret very neceſſary for cold Countries, which cannot ripen Wines, and yet abound much in Apples, but by this way may ſave much in the price of Wines, for which they uſually pay dear.

I have indeed many Arts relating to Wines, but they belong not to this place, my purpoſe here being to treat of thoſe only, which are adminiſtred by my *Univerſal Menſtruum*: Arts (as I think) hitherto known to none, or at leaſt not divulged, that it may be manifeſt to the Reader what proficiency the World hath made in good things. Whether the matter be credited, or not, ſignifies little to me, I my ſelf alſo might have doubted, if I had not learned by experience; but Judgment ought not to be given raſhly; we are to know, that God doth wonderfully diſpenſe his benefits to thoſe who are his Servants, and whom he hath appointed to be his Inſtruments, to bring his wonders to light.

If Husbandmen moiſten their ſeed with this *Menſtruum*, it will ſooner be ripe, and have larger, fatter grains than ordinary: Which being done, I will ſhew by what means they may make great profit of their grain. The grain being whole, not ground, pour to it warm water, impregnated with this *Menſtruum*, in a Hogſhead well ſtopped, let it ſtand and ferment or work for a time, the water will extract all the ſtrength of the grain, the remaining husks ſerving to feed Hogs: If you ferment Hops with this Liquor, or extract, it will be good Beer: If you will not do this, you may thence draw a very good ſpirit, the reſidue, in a ſhort time, will be Vinegar; and if you be wiſe, you may put this burning Spirit or Wine to many uſes, by which you ſhall have more profit than by ſelling it; a Secret not to be deſpiſed where grain is cheap. I have yet one thing to add among my Wine-Arts, concerning grain, and the Fruits of Trees and Shrubs, which is to be received with thankfulneſs, as a great Gift of God to Mankind. *Viz.* It is found by induſtry and manifold experience, that from Rye, Wheat, Oats, Rice, Millet, alſo from Apples, Pears, Peaches, Cherries, Plumbs, Sloes, Damaſcens,

maſcens, Quinces, Figgs; as alſo from Gooſe-berries, Mulberries, Barberries, Black-berries, Elder-berries, and other-like Fruits of Trees and Shrubs; from all theſe, I ſay, may be prepared, with little labour and coſt, a Drink very like to Wine, both in taſte, ſmell, and ſtrength, being grateful, wholeſome, and durable. For which large bounty, the Inhabitants of cold Climates (which never ſee Grapes) cannot render to God ſufficient Thanks.

There yet remains a manifold uſe of this ſubject in Medicine, which if it were rightly deſcribed, would make a great Volume, which belongs not to this place, but ſhall be done more commodiouſly at another time in a peculiar Treatiſe. It were to be wiſhed, that this ſubject were better known, and more uſed by ingenious Chymiſts and Apothecaries, that ſo many dead Herbs and unprofitable Waters might not be ſet to ſale. What, I pray, would it avail, if the whole Maſs of Blood being inflamed with an intolerable heat (as happeneth in the Plague and other contagious Fevers) you ſhould wrap the head with a moiſtened Roſe-Cake, comfort the Temples, Pulſes, Hands and Feet with Water? think you by this to drive away the Diſeaſe? Not at all, but rather render it worſe, as Experience hath often witneſſed. But it ſeems to me as if a vaporary Bath or Cauldron were too hot, and one ſhould go and cover the Furnace all over with cold linen, to temper the heat, a thing to be laughed at; but the wood which cauſeth the flame being taken out, the Furnace cools of its own accord. By a like reaſon, the malignant Fire of hot Diſeaſes is in the ſpace of a few hours, drawn out from the moſt inward Penetrals of the Heart, by four grains (at the moſt) of a good Medicine, where no place is left for external Coolers, or corroborating Epithems. Which thing I have obſerved not only in one, but in many Experiments; That the Venom being excluded from the Heart, the Body hath returned to its due temper, and by degrees to health and ſtrength.

To what purpoſe are ſo many Ointments, Oils, Emplaſters, *&c.* when a ſmall quantity of a good Medicine is able to effect more than them all? A whole year is often ſpent in the curing a ſmall Ulcer or Wound, and then left worſe than at the beginning, the Bridle (according to the Proverb) being applied to the Horſes Tail, and not to the original of the Diſeaſe. The Fountains of external Ulcers are to be dried within, and not imprudently to be ſtopped up with outward Plaſters, which otherwiſe, without any outward Remedy, by a ſmall quantity of a good Medicine, may be radically cured in the ſpace of a few weeks. Therefore ſuch a Medicine is to be ſought, and all other trifles to be laid aſide: But what doſt thou, ſeeing the World will be deceived, and deſireth no other? For if any Phyſician have a good Medicine, which is much eaſier for the ſick to take, than many ingrateful Potions; this is neither eſteemed nor rewarded, for if he require a Fee or Reward, he is anſwered, That he gave only a few grains of powder, two or three times, which cannot be ſo dear: Hence chuſing a certain thing for an uncertain, he requireth his reward according to his viſits, and preſcribeth Bottles full of Phyſick, which may be long in taking, and he have the fitter opportunity to encreaſe their number.

The ſame thing hath alſo obtained in Chirurgery, for if an honeſt Chirurgeon quickly cureth an outward Evil by the help of a good Medicine, he ſhall not have a due reward, but ſhall be told, That he hath only applied two or three Plaſters, which can be worth but little. Therefore inſtead of being paid for a quick Cure, he reaps nothing but ingratitude; ſo that being better taught, it behoveth him to do like others, by employing a month or more about that Cure, which he could perform in three daies.

For this, and the like cauſes, very few are treated with good Medicines, but Phyſicians ſtudy delaies, after the old manner, if not in reſpect of the ſick, yet at leaſt for their own profit; for if the ſick readily pays his Fees, he, either out of ignorance or voluntary neglect, neglecteth the matter, for which he will have an heavy account to give.

The preſent World doth only this, he that ſtandeth, let him ſtand, and he that falleth, let him lie, none regardeth it; every one taketh care of his own matters; nor will he put his hand to the quenching of the fire. That famous Patron of Art, *Alexander* the Great, who beſtowed upon his Philoſopher *Ariſtotle* more than a Hundred Thouſand Crowns a year, for his Inquiries into Vegetables, Animals, and Minerals, now ceaſeth to be. The moſt wiſe *Erneſtus* Duke of *Bavaria*, and Elector of *Cologne*, What Expence hath he not been at in collecting the Writings of that incomparable *German* Phyſician and Philoſopher, *Paracelſus*, and other ſuch Cheriſhers and Advancers of Arts, our *Germany* hath lately brought forth? but *Mars* (the Sword) aſſerting his Empire, hath baniſhed *Jupiter* and *Mercury* (Juſtice and Arts) ſo that they play leaſt in ſight; but ſure it is, that if they be not quickly reſtored and advanced to their dignity, it will be to the unſpeakable detriment of the Country, and to the great advantage of Strangers; *Which God of His Mercy prevent.*

And now the benevolent Reader hath ſeen, what wonderful and incredible things may be performed by the benefit of this ſubject; yet I will not deny, but that it may alſo ſerve for many more things which I know not, being profitable for all orders of men, ſuperiour and inferiour, learned and illiterate, great and ſmall, according to their ſeveral Vocations and States. But ſome men may ſay, I do indeed believe that many great things may be done by its means; but becauſe thou doſt not together and at once ſhew the way of preparing the Univerſal Medicine or Tincture by its help; there is therefore reaſon to doubt whether it be the *Univerſal Secret Menſtruum* of the ancient Philoſophers, to wit, the *Hermaphrodite Mercury*, ſo much ſpoken of by them, every where to be found, a thing contemptible and vile, to be found in every Dunghil, by nature cold and hot, a great Poiſon, quickly killing and quickly healing, a matter to be found with all men, which the rich and poor equally poſſeſs, which *Adam* brought with him out of *Paradiſe*, and many more Epithets of the Ancients, which are all agreeable to that thing. To this I anſwer, That in my judgment the Ancients had no other Univerſal Mercury, to which all their marks do perfectly agree, and may be applied. Do not all men know it, ſeeing and beholding their own Urine, of which it is generated? Is it not a very vile matter, which we keep not in the Houſe, but throw out of doors, according to the Precept of the Philoſophers, to be ſought in Dung? Is it not a great Poyſon when made into Gun-powder or *Aqua fortis?* and, Have not I ſhewn that a Uni-

verſal Medicine may be made of it? Is it not a meer Fire, and alſo being pure, cold as Ice? and if you will, hath it not equally maſculine and feminine gifts? Doth it not ſo impregnate the imperfect Bodies in the ſpace of a quarter of an hour, that they generate Gold? Is not it ſelf impregnated by the heat of the Fire, that it bringeth forth thoſe Fruits? Is it not highly volatile, and preſently firmly fixed? Is it not a Water both moiſt and dry? a great Corroſive, and yet being rightly prepared, an Enemy to Corroſives? Is it not moſt heavy and moſt light? To what thing, except Nitre, doth this Enigma of the Philoſophers agree? For, What is blacker than a Crow, whiter than a Swan, more hurtful than a Serpent deſtroying many, lighter than the Wind, heavier than Gold? Is not this the true devourer of his own Children (the Metals) the *Azoth* of Philoſophers, the Soap of the Wiſe, the Urine of Boys, Sulphur vive, the Salt of Strangers, the Secret Fire of Philoſophers?

Are not all theſe things in Nitre? But by what method they may be there found, is not my buſineſs to ſhew in this place, let it be ſufficient to have pointed out the ſubject in which they are to be ſought and found, which no man before me hath been ſo kind to do. For further demonſtration, to wit, that from Nitre a true *Univerſal Solvent* (I would not have you imagine it to be *Aqua fortis*) may be prepared, there needeth not. But thou maiſt contradict it if thou canſt, or name another ſubject in which are all thoſe things. Which I know thou canſt not do, if thou could'ſt at once take a view of the whole World.

That I have not written any thing concerning a Tincture to be prepared of it for the Imperfect Metals, (which defect the ancient Philoſophers have ſupplied) thou maiſt think that I have not proceeded ſo far, and that I have wanted time and opportunity to make a farther Progreſs, nor did I ever aſpire to ſo great things, but have contented my ſelf with thoſe of a meaner Rank. But how far I have penetrated by ſearching into Nitre, may be ſeen in the Second Part of my Furnaces, where I have preſcribed ſome notable Proceſſes from a groſs ſubject, of which this is not the leaſt, where I ſhew, that ſome years before, I would have melted a Calx of Gold, and becauſe it would not melt, I added by intervals a Fluxing Powder, prepared of Salts, till all flowed well, then the Crucible being taken out of the Fire, and the matter poured out, when I expected Gold, inſtead of that I found Lead, but the Fluxing Powder was very red, (although made of the whiteſt Salts) being tinged with the *Anima* of Gold, the Gold being diveſted of all its dignity. Which thing, when I had conſidered, believing ſome Secret to lie in the matter, I ſeveral times repeated the labour, but alwaies in vain: the cauſe of which errour was not the ſubject, but my ſelf, who had not obſerved the weights and degree of Fire; or God, who would not that I ſhould make any farther diſcovery. Truly, if that Labour had ſucceeded, I ſhould long ſince have poſſeſſed the Stone of Philoſophers, who am now forced to ſuſtain my Family by meaner things with labour. But paſſing by this, ſee, I pray you, what the moſt accurate *Philippus Paracelſus* aſcribeth to rude Nitre, when he ſaith, *Chymiſtry hath diſcovered the matter to lie in Nitre.* Let *Baſil Valentine*, *Sendivogius*, and the ancient Philoſophers, be conſidered, and you ſhall ſee that all their Sayings are accomodated to the operation of this ſubject, and that I have not attributed too much to it, but rather leſs than is due. I could, had I a mind ſo to do, compoſe all the terms of Philoſophers with this ſubject, but to what purpoſe ſo great a prolixity? He that ſhall once come ſo far as I am, the Secrets of the Philoſophers will be ſufficiently manifeſt to him, and will freely confeſs, that this is the only true *Univerſal Solvent*, and that there is no other. Many have alwaies believed this thing to be prepared of Nitre, but becauſe they were not fully confirmed in their minds, they tried nothing with it, and therefore found nothing. Many men in my time have endeavour'd to fix Nitre into a Tincture, but becauſe they took it crude without a due Preparation and fit Aſſociate, ſuch as it was when they committed it to the Fire, ſuch it remained; but if they had known how to have joined an amicable ſubject with it, perhaps it might have been more profitable. *Baſilius* commandeth to aſſociate it with a brisk and lively female, from whoſe embraces the Queen might bring forth iſſue: All the Philoſophers ſay, that to *Mercury* is to be added its own weight of Gold and Silver, (but not the common) and that of both is to be made one indiſſolvable thing; for while the Gold is diſſolved by the Mercury, in the ſame moment the Mercury is coagulated by the Gold, the ſolution of the Body, and the coagulation of the Mercury, are done both by the ſame Work. Certain it is, that there is one thing among Minerals, which is conjoined and fixed with our Nitre, and during the fixation, paſſeth all colours; but I know not the end of the thing, having never performed that labour, and by reaſon of my great age, think not to repeat it; nor will I be the adviſer of any man, that he ſhould ſearch after an uncertain labour with a certain Loſs: but if any man in doing this ſhall miſs his hope, let him not blame me for giving him the occaſion by this Writing, who have wrote this only for this end, that I might make it manifeſt, that the name of *Univerſal* is not undeſervedly aſſign'd to it: Neither alſo is there any need, that a thing of ſo great moment ſhould be made known to an ungrateful World. Any of thoſe things which I have ſhewn may be done by it, are ſufficient for a man to ſuſtain his Family.

Some man may except, and ask, Who hath revealed to thee, that this is the *Mercury of Philoſophers?* I anſwer, That I know it to be ſuch from the properties, form, and nature aſſigned to it by the Philoſophers, which thou alſo, if thou hadſt Philoſophick eyes, wouldſt acknowledge to be ſuch, which is wont to hide it ſelf from the proud, and to reveal it ſelf to whom it pleaſeth God. If a skilful Gardener ſhould happen into a Garden, where he ſhould ſee that wonderful Vegetable, *Noli me tangere*, (which at the firſt was brought from the *Eaſt Indies*, therefore planted and cheriſhed with great care and admiration in great mens Gardens) of which he had read ſo many portentous things, *viz.* That refuſing every touch, it would fall to the ground. And although he had never before ſeen this Herb with his Eyes, would he not certainly apprehend this to be that very Herb? for the Vertues attributed to it argue that it cannot be any other. So he whoſe eyes it hath pleaſed God to open, ſo that he can apprehend all the Properties to be in a ſubject, which the Philoſophers affirm to be in their Univerſal Mercury, Will he not, acquieſcing in that, deſiſt from ſeeking out another?

Laſtly, *Sal Nitre* is the only growth, generation, and encreaſe of all Vegetables, Animals, and Minerals, as alſo their Deſtruction, and Regeneration, by a perpetual Circulation of the Elements, by which things being

being diſſolved, do again return into the ſame from which they aroſe: For the Nitre of Vegetables in the bodies of Animals, by the intervening digeſtions and ſeparations, is generated into a Mineral Salt, which none will deny: and Nitre or Salt of the Earth, is Vegetable, Mineral, and Animal, which cannot be ſaid of any other ſubject, but the Univerſal Matter. And even as it is the chief Conſerver of Vegetables, Animals, and Minerals, ſo it is alſo their Deſtroyer and Death; therefore by them it is both loved and hated. Vegetables love it, when growing in the Earth, they thence draw their nouriſhment; for when the Earth is dead, or void of Salt, it affordeth neither nouriſhment or encreaſe to ſeed, Chriſt himſelf being witneſs, when he ſaith, *Ye are the Salt of the Earth:* but if the Earth be deſtitute of Salt (or the Salt hath loſt his ſaltneſs) it is altogether dead, and can bring forth no Fruit. An ignorant man ſaith, that Dung maketh the Earth fruitful, but undeſervedly, for not the Dung, but the Salt which lies hid in the Dung, doth this, which is generated of Vegetables after their putrefaction, and again tranſmuted into their ſeeds and roots which are in the Earth; the ſame Animals again receive in their food, whereby their bodies are ſtrengthned and preſerved from Corruption. For no man is ſo rude, but he hath learned by experience, that Salt is the Preſerver of things both living and dead. But an ignorant man may object, that other things alſo have a preſervative Power, as myrrh, aloes, and other Balſamick Liquors, which preſerve Fleſh and Fiſh from putrefaction. To this I anſwer, That it is not myrrh or aloes, but their ſalt, which effecteth this. Honey alſo and ſugar preſerve things, which are not ſalts. I anſwer, That thou underſtandeſt not the nature of Salts; thoſe are ſweet ſalts, the other are bitter ſalts, which by putrefaction are changed into ſowre and acid. Alſo every burning ſpirit of Wine, and other Vegetables, preſerveth other bodies, although they are not in form of ſalt, nevertheleſs it is nothing elſe but the moſt pure volatile ſalt of the Wine; mixed with its ſulphur, which doth this; for none of the Principles is ſincere, and wholly free from the mixture of the reſt. Vinegar doth the ſame thing, and is a meer ſalt, which if time would permit, I could eaſily demonſtrate. What man's ſenſes are ſo dull, that he cannot underſtand one thing to paſs into another, by the mediation of putrefaction, to him even great Volumes would profit nothing. From the ſweeteſt Muſt (or new Wine) Sugar, Honey, by the help of putrefaction and Fermentation alone, is made an acid Tartar, a ſtrong Vinegar, and a volatile burning Spirit; all theſe will preſently return into a nitrous ſalt, which few underſtand, thoſe eſpecially who are believed to know much. Not only Man is delighted with ſalt, without which he cannot be ſound and in health, but alſo all Animals. Mice, above all, are very greedy of Salt, the which if they find not, they lick the ſaline efflorescences of Walls, and make a very nitrous Urine. Pigeons alſo frequent old Walls, which abound with ſalt. Hens pick out the grains of Oats from Horſe-dung, which are full of ſalt, preferring them to freſh Oats, and thence become more fruitful, in laying more Eggs, the ſalt concocting the ſmall ſtones which they ſwallow, in their Ventricles, is the firſt matter of Eggſhells; but if, being ſhut up in Pens or Coops, they have not that ſalt earth, with the ſmall ſand or ſtones, which they uſually devour, or their ſtomachs being weak, doth not digeſt them, the Eggs they lay afterwards, will be ſuch as we call windy Eggs, having no ſhells, or ſuch as are very imperfect. Minerals growing in the bowels of the earth (Experience being witneſs) rejoice in ſalt, from which they aſſociate to themſelves bodies, and make an encreaſe: In like manner, they love it out of the earth, and by it are ripened and meliorated; amongſt which Salts, Nitre, as I have ſaid, is endowed with a ſingular ſympathy towards Metals. On the contrary, Minerals as well as Animals and Vegetables, abhor ſalt, if they be unduly aſſociated with it, for ſo they are corrupted and deſtroyed; for ſalt being adhibited in a due manner, is the only preſerver, augmenter, and perfecter of Vegetables, Animals, and Minerals, which all the Philoſophers confeſs; amongſt whom, *Plato* aſcribeth to ſalt ſomething divine, to whom ſucceeding Ages have aſſented, ſeeking many things in ſalt, yea, even the ſtone of Philoſophers it ſelf; but being ignorant what a true ſalt was, and of the manner of applying and preparing it, they could not make any further progreſs. Hence any man may eaſily ſee why the Ancients called thoſe Secrets by the name of *Alchymy*, *viz.* as a certain handling and melting of ſalt, for which reaſon alſo they familiarly uſed theſe words; *In Fire and Salt conſiſteth the Magiſtery*: Implying, that by the benefit of fire and ſalt, a true Medicine was to be prepared, as well for the health of men, as for the perfection of Metals.

If God prolong my Life, and grant me opportunity, I will hereafter, for the good of Mankind, openly declare what *Salt* and *Fire* are, that the incredible Vertues of thoſe two bodies, as yet unknown to the World, may be made manifeſt to all Men. One thing I will add, that the Philoſophers pointing out the Univerſal matter, ſpeak obſcurely, when they ſay, that it is every where to be found, that the Poor hath it as well as the Rich, and that no man can live without it, whence many have ſought for Air, Rain, Snow in *March*, *May*-dew dreaming the univerſal matter to be in thoſe, and when their labour hath happily ceaſed, they have obtained ſomewhat of a nitrous ſalt. It is certain, that the Stars do impregnate the Air and Clouds with their Catholick ſeed, which preſently falling in form of Rain, Snow, and Dew, render the Earth fruitful and fit for germination, and that they are again drawn upwards by the warmth of the Air, leaving their Nitre in the earth, to be again impregnated by the ſtars, and again to deſcend to conciliate the fertility of the earth, leſt the earth at any time ſhould labour under a want of this univerſal ſeed, but continually applieth it ſelf to the vegetation of things, and preſerveth a perpetual Circulation of the Elements. Hence *Hermes* hath written, that *That which is above is as that which is below.* Yet nevertheleſs, we need not ſeek it among the ſtars, ſeeing that it may ſufficiently be had, by a far ſhorter way, at hand, and before our feet. For ſo much the words of *Hermes* intimate.

The Words of the Secrets of HERMES.

TRue it is, and remote from every cloak of a Lye, that whatſoever is below, is like to that which is above; by this the wonderful things of the work, of one thing, are acquired and perfected, even as alſo things are made of one, by the conſideration of one, ſo all things are made of this one by conjunction. Its Father is the Sun, its Mother the Moon, the Wind carrieth it in its belly, the Earth is its Nurſe, the Mother of all perfection. Its power is perfect, if it be changed into Earth; the ſubtile and thin being ſeparated by the fire from the groſs and thick, and indeed prudently with moderation and wiſdom; this aſcendeth from the Earth unto Heaven, and again deſcendeth from Heaven to the Earth, and receiveth the power and efficacy of the ſuperiours and inferiours. In this manner thou ſhalt acquire the glory of the whole World; thou ſhalt drive away all darkneſs and blindneſs, for this is a Fortitude excelling all other power and ſtrength, for it is able to penetrate and ſubdue all things, as well thoſe which are thick and hard, as thoſe which are ſubtile. In this manner the World was made, and hence its admirable conjunctions and wonderful effects, ſeeing that this is the way by which thoſe wonderful things are effected; and for this reaſon I am called by the name of *Hermes Triſmegiſtus*, ſeeing that I have three parts of the wiſdom and philoſophy of the whole World. So I conclude my Speech which I have made concerning the *Solar Work*.

Theſe are the words of the moſt ancient Philoſopher *Hermes*, who for his perfect knowledge of Nature, is deſervedly ſtiled *The Father of Philoſophers*; in which words he hath ſufficiently hinted, That his little Bird without wings (which flying day and night is not wearied) is the Spirit and Life of the ſuperiour and inferiour Elements, the Conſerver of the ſuperiour and greater, and of the inferiour and leſſer World, and that it lies hid in Nitre: For the better underſtanding of which, let a man throughly conſider the Air, in which the *Univerſal Spirit*, the firſt Ens or Being of all things, dwelleth, without which no Animal can live a quarter of an hour, nor any Vegetable or Mineral be produced; neither can the Sun ſhine, nor the Fire burn. Even as the Excrements of Vegetables, Animals, and Minerals, by a continual Circulation, are tranſmuted into Elements, the Elements into Excrements, and thoſe again return into Aliments, by an unceſſant renovation and tranſmutation, which Man only doth not attain.

The *Husbandman* knoweth that the Leafs, which every year fall from the Trees, afford a new vigour and nouriſhment, that the Excrements of Cattel produce very good Graſs, that the Fæces or Recrements of Minerals, from which a Metal hath been once ſeparated, is in a ſhort time impregnated by the Stars, that being melted, they again yield the ſame Metal which they had done a little before: and the *Scoria* of metals are every where returned to their Mines, where in a years time being recruited by the attractive power of the Univerſal Spirit, they are again impregnated, ſo that they again by melting afford metal. Doth not the Earth, from which *Salt-Petre* hath been extracted, being expoſed to the Air in the interval of ſome months, yield other *Salt-Petre*, and this as often as you will, as if nothing had been extracted from it? Doth not all things which are calcined, *viz.* Lime made of Stones, Shells, Woods, Herbs, from which the Fire hath forced the Univerſal Spirit, by a very ſtrong Appetite or Magnetiſm, draw the Univerſal Spirit again afreſh, and return into a Corporeal Nitre? Is not the heat and vertue of the ſun, the excrement or ſuperfluity of the ſun, by which it is nouriſhed and ſuſtained? If heat were nothing to the ſun, the Air, by its Nitrous Eſſence, could never render it weighty, nor cauſe it to diſtill in fruitful Rains; nor could the Earth bring forth Fruit, and afford freſh nutriment and food to the ſun, its conſerver: Whence it followeth, that an Excrement is alwaies the conſervation and nouriſhment of that thing which makes or ſeparates it. But here *Plato* commandeth to reſt; at another time (God willing) more ſhall be ſpoken. We have heard, that in ſalt eſpecially in Nitre, although ſlighted by the unskilful, there are found moſt potent and profitable vertues, as well for *true Medicine*, as for *Alchymy*. Nor is it reaſonable that any man ſhould be offended with its cheapneſs or low eſteem; but he may rather think, that that which is deſpiſable before the World, and imaginary Philoſophers, is moſt precious with God, and thoſe who know the myſteries of Nature. Therefore it remains, that in the nature of things there is not a better ſubject, by which more and greater wonders may be performed, than *Sal-Nitre*. Therefore, I alſo conſtantly affirm, That of it may be prepared the true *Mercury of Philoſophers*: but I will not ſay, that I know the Preparation of the *Stone of Philoſophers* from it, becauſe I never went ſo far: But thoſe things which I have delivered concerning it in the correction of metals, and other good Arts, Experience alone hath taught me; in which I acquieſce, and all thoſe things, if the matter ſhould require, and it ſhould conduce to a good end; I ſhould not bluſh to demonſtrate ſingly through their parts, that it may be laid open to all men, that all theſe things may be performed, but not by every man; ſeeing that I have not written for that end, that they ſhould be proſtituted to all men, for then I ſhould have wrote more fully, but that they might remain in the power and cuſtody of Friends. It can hardly be believed, what great troubles my Writings have created me, while one accoſts me from this place with long Letters, willing me to unfold this or that Others addreſs me with a great Catalogue of Queſtions, of which, if I ſhould anſwer the tenth part, I ſhould ſcarcely have Bread to eat.

If the LORD ſee good, he will afford me time and occaſion of doing yet better things, but if not, let the Reader accept the *will for the deed*: Truly, there are many Sciences of great moment in my Poſſeſſion, by which I could point out a ſafe path to Poſterity, for the attaining of higher things, but becauſe I have alwaies ſtudied to maintain my Family, with my own honeſt labour, without detriment to my Neighbour, I am (contrary to my *genius*) prohibited to publiſh more, being conſtrained to apply my hands to ancient labours. Some

may

may inferr; If thou haſt found out more, act by others, thy hands being ſuſpended from the Work, let it ſuffice thee to have diſpoſed of thy labours. But he that ſhall thus ſay, confeſſeth himſelf, not to know the World to be perfidious: If I could have been made partaker of faithful Operators, I ſhould long ſince have had a free proſpect of my affairs.

But it is not at that paſs as many believe, men are now perfidious, keeping no promiſes, every one ſeeketh his own, right or wrong; Benefits are rewarded with evil, which hath happened to me more than once; when I have adopted one for a faithful fellow-labourer, the contrary hath happened: For as ſoon as he hath learned any Secret, believing himſelf to be more learned than me, hath feigned divers excuſes to get away, which if he could not effect openly, and with Conſent, he hath attempted it privately; or hath carried himſelf ſo petulantly, that I ſhould thank GOD to be freed from him. Whence it came to paſs, that I alwaies loſt my purpoſe, perceiving the Proverb to be true, *He that will have his buſineſs well done, muſt be both maſter and ſervant.*

But I truſt, that in a ſhort time after my death, thoſe who ſhall diſtribute my Laboratory among them, where I have made a ſtand, will further ſearch out the ſecrets of Nature, and being lighted by my Torch, will come to the deſired end: but it will be much more grateful to me, if my Secrets, which I have found out with great Coſts, Labour, and Care, ſhould be known to many, than that they ſhould be intombed with me, without Uſury. To which end I will alwaies, according to my power, be a moſt ready helper and Counſellor, for the ſake of Poſterity.

Thomas Joha Frieder Caſſell Dawn'd
Apprentice to THE Samuell Speyer Stort Surgeon
ani Apothecary
Penryn Cornwall

EXPLICATION

OF

Miraculum Mundi.

Set forth

In Teſtimony of the truth of that Matter, and for the Advantage of the Lovers and Followers of *ARTS.*

Reader,

IN the firſt place, before I prove and verifie the powers and vertues of the aforeſaid Univerſal ſubject, which I have attributed to it, in every point, it will be neceſſary to make known after what manner the mentioned Salt of the Earth performeth its Operations, that the benevolent Reader may not be confounded, nor imagine that it exerciſeth all its Operations in one only manner and way, to wit, crude, as it is of it ſelf; for it doth not ſo, but it exerteth its power in three manners, forms, or figures. For Example ſake; *Its firſt Uſe is in many Buſineſſes and Arts, as it is ſimply drawn from the Earth, being purified, and is known to all men. It is applied to another uſe, being firſt calcined by fire, and changed and exalted into a more fixed ſubſtance. Again, for another uſe, it is firſt deſtilled into a volatile Spirit,* and Aqua-fortis. *And ſo that ſubject performeth its Operations in Figures, ſimple, as it is in its ſelf, in form of a Sun;* ſecondly, *as a fixed fiery Liquor;* thirdly, *in the figure of a volatile ſpirit, or corroſive* Aqua-fortis; *as ſhall be demonſtrated below, from point to point, in order.*

Point I.

In the first place all Fossiles, by the mediation of this Subject, may be perfectly examined, what Metals they properly contain, how many, and how much of each.

FOr the verifying and demonstrating this first point, I will begin to shew, that Minerals may be most commodiously proved by the Mediation of the Salt of the Earth, and in what manner this is to be done. First, The Mineral is to be finely powdered, whether it be *Gold*, *Silver*, *Copper*, or *Lead*. To a hundred weight of this, add three or four hundred weight of Calcined or fixed Nitre, [Note, *That the small Say weight is here meant*] mix all very well together, put the mixture into a very strong Pot, which is to be shut with its Cover, set it upon a small foot in such a melting Furnace, as is described in the fourth part of my Furnaces, kindle the fire by degrees, and let the minera, or Ore flow well with its liquor in the Pot, like water, then pour it out into a Vessel fit for this purpose, suffer it to cool, then take out the Regulus; if it be ☉, ☽, ♀, or ♄, weigh it in a Probatory Balance, and you shall find how much ☉, ☽, ♀, or ♄, there is in that Ore. NB. That Iron and Tin cannot be proved in this manner, for ♂ is not fusible in such a fire, and ♆ is reduced into *Scoria* by Combustion, by reason of the Salt. NB. That if the Regulus of ☉ or ☽ come not pure, or contain any ♀ or ♄, suffer it to run upon a Test or Cupel, with a little ♄, till it sparkle and shine, and you shall have the Metal fine, which is a proof that may securely be trusted, and according to that a Computation may be made, without any fear of fraud or Sophistication; the Regulus of Copper or Lead, need no other trial, but are judged good. NB. That if the Ore be stubborn, and yields no Regulus in the first melting, let the Pot be again set into the Furnace, (if it be yet whole, putting to the Ore, giving no Regulus, a piece or two of Iron) being covered, least the Coals fall into it, suffer it to flow, then the iron entereth into that untameable Sulphur, existing in the Ore, and hindering it from passing into Regulus, and suffereth the Gold, Silver, Copper, or Lead, contained in that Mineral, to fall down, which is to be poured out into a fit vessel, and the Regulus will settle to the bottom, which being cold is to be separated from the Scoria; but if you will prove whether or no the Gold containeth any Silver, or the Silver any Gold or Copper, or the Lead any Silver or Gold, then suffer the Regulus to flow upon a Cupel, till it sparkle with a Splendour, and afterwards make separation by *Aqua fortis*, and you shall find how much of every Metal is permixed with the other. There is no need to describe this separation at large, because it is every where known, and now very perspicuously taught by *Lazarus Erker*, so that it needs no repetition: I have here shewed, and proved, that by the Mediation of Nitre, Minerals may easily and speedily be examined. Therefore, this first Point being now proved and verified, I give thanks to God, who I trust, will further assist me.

Point II.

The Marchasites of Gold and Silver, being melted by the Mediation of this, by a singular Compendium, hitherto unknown, do afford more Metal than by the common way.

THat which is contained in this second point is not the least amongst my Lucriferous Secrets, but one of the best, which I have always reserved most secret within my own Breast. Many Men have often allured me with fair Speeches, to demonstrate it, but hitherto I have not been prevailed with to do it, not out of envy, or that my self alone should have that art at command, bnt because Faith is hardly any where to be found, it is now reputed an honour to promise many things, and perform few, but a disparagement to keep Promises; for I have often learned to my loss, that when through fair Words, and Promises oftentimes more than I required, I have been perswaded to Communicate this, or that Secret; as soon as it hath been out of my hands, I have found the quite contrary, for instead of a Reward, they have either derided me, or began to quarrel and contend, and in this manner, the Benefits which I have confer'd upon them, have been recompensed with great Impiety.

The Process followeth.

Let there be a Furnace built of good Stone, which is able to endure the Fire, small or great, as you please, or according to the necessity and commodity of your Labour, in the following manner. First build an Arch about a Cubit high from the ground, the which cover and make level above with Iron Plates, or Stone that will hold the Fire, which shall be the foot of the Furnace, the length of which ought to exceed the breadth four times, that is, it ought to be four times as long as broad; by this Arch or foot of the Furnace there is yet another Furnace to be erected, whose bigness within must be half the breadth of the long Furnace, and about two Cubits high from the wind holes, into which the Wood is to be put, and in that Furnace, on that side which adjoineth to the melting Furnace, is to be a hole, through which the flame of the lighted Wood may strike upon the Hearths of the Furnace; and heat them; above, let there be an Iron Cover, to that end that when the wood is put in, the Furnace may be covered with it, and the flame may be forced to enter by the side into the Melting Furnace, and let the Melting Furnace, the Hearth being now perfect, be divided according to its length, into three Chambers or parts, so that every Chamber be square, that is, as long as broad, and between every Chamber let there be a Wall, with a hole in the lower part, that the flame may pass freely into the second and third Chamber, between which two let there be also the like Partition or Wall, with its hole at bottom, and let the third or last Chamber be close, saving its little door, let it have one only hole, by which the flame may pass out, also on one side of the Furnace, there is to be a hole in every Chamber, by which the Hearths may be discerned, and the Minerals and Metals taken out and put in, but the Chambers are not to exceed a Foot, or a Foot and a half, in heighth; in the upper part of which, let there be a Cover or Cap of good Earth, well luted and accommodated to it in such manner, as whensoever need shall require it may be

be removed with a pair of Tongues, and put on again. All theſe things being thus rightly prepared, let a Hearth be made in the firſt Chamber of good Earth, which can ſuſtain the fire, let the Earth not be too fat, or too lean, but of a middle condition; in the ſecond let there be a Teſt made of Argill, or Wood Aſhes, but in the third Chamber, let there be a Hearth of good Earth, and in the Name of the Lord, let the fire be kindled in the ſide Furnace, that the Furnace with its Hearths may be throughly dried. Which being done, let the Ore of ☉ or ☽ being rightly prepared, be put into the laſt Chamber, that it may be made hot by degrees, and burn, but not melt, which may be hindered by the help of the little door, and the fire may be governed at a beck, according as it ſhall be neceſſary, and the Mineral requireth, or ſhall be able to ſuffer; the Minerals are ſometimes to be ſtirred and turned well about in all parts, with an Iron Hook or Ladle, that they may be well Calcined. In the firſt Chamber let there be put ſo much Lead as the Hearth will hold, and when it moveth well, put upon it, ſpoonful after ſpoonful, of the Calcined Mineral in the laſt Chamber, ſtirring it with the Lead, and turning it with an Iron Ladle, and let it be ſo long upon it, till the Lead ſhall have attracted all the Metal, then the Scoriæ are to be taken out with an Iron Ladle fit for this work, and to be kept by themſelves; then again, more of the Calcined Mineral is to be put upon the Lead, and ſo the melting, turning, and taking out of the Scoriæ, is to be continued as long as there is any of the Mineral at hand, or as much as is ſufficient for the Hearth; and if during this labour, the Lead ſhould be impregnated with a ſufficient quantity of Gold or Silver, by the Mineral, (which may be perceived by taking a little out in a Spoon, and examining it upon a Cupel) then let Nitre be burned upon it, and let it be repeated two or three times, for ſo the Lead will be purifyed, grow white, and be rendred ductile, and paſſeth freely in the Teſt, without waſte, which yet would not be if it had not been firſt depurated by Nitre; the Lead into which the Gold and Silver hath paſſed, is to be taken from the Hearth with a Ladle, and the Hearth made of Aſhes, in he middle Chamber is to be filled with it, and the Bellows to be planted againſt it, to blow the Coals to the other ſide, and according to the common manner, the Lead is to be deduced into Salt, and the Cake of Gold or Silver is to be taken out, and afterwards to be throughly depurated in good Teſts: And ſo in that Furnace may be performed three Labours, and more of the Gold and Silver is retained then by any other way, for blowing with Bellows waſtes and deſtroys much of a Metal, and reduceth it by burning into Scoriæ, which the ſweet flame of wood doth not do; the Scoriæ being taken out, ſuffer them to paſs through a high Furnace, that if there be yet any Lead among them, it may be ſaved, to be uſed again in the former Labours, (to wit for attracting Gold and Silver, in the firſt Chamber, from the Minerals Calcined in the laſt) in this manner nothing will be loſt, and not only more Gold and Silver obtained, but alſo without ſo great a charge of Coals as is uſed in the ordinary way. You ſhould have always two of thoſe Furnaces, or more (if you have a great quantity of the Mineral) in your Elaboratory, that whilſt you work in one, the other may be repaired, and when there is need, furniſhed with new Hearths.

This is the beſt and moſt profitable manner of melting the Ores of Gold, Silver, and Lead, containing in themſelves Lune, and this without Coals, and ſtrong blowing, but by the flame of wood only. A. the Foot of the Furnace, B. C. D. the three Chambers, E. F. G. the three little doors of the Chambers, by which the Minerals and Metals are put in and taken out, H. the Cover or Cap of the Furnace, I. the Wind holes, or Regiſters by which the flame is governed, K. three holes in the Walls, or Partitions of the Chambers, through which the flame paſſeth, for the heating of the Chambers and Hearths, L. the Furnace on the ſide, into which is put dry wood, M. the Aſh hole, N. its Cover or Stopper, M. the hole in the ſide, by which the flame is conveyed into the Chambers, P. the Iron Rods, with which the Minerals are turned, whilſt they are in torrefying and the Scoriæ are taken away from the Lead, Q. a Spoon or Ladle, by which the torrefied Mineral is put upon the flowing Lead, and the Lead which is impregnated with Gold and Silver, is removed from the firſt Melting Hearth to the other, R. the Tongs with which the Cakes of Gold and Silver, are taken from the ſecond Hearth, S. the Furnace in which the Cakes of Gold and Silver are perfectly depurated, T. the Teſts, V. the Cineritia. NB. That the Works coming from the firſt Hearth, may alſo be perfectly finiſhed in the ſecond Chamber, but it is better to do it on Teſts fit for this purpoſe. [*The figure of this Furnace is not printed in the Latin Copy, nor to be found among the other Originals.*] NB. That what concerns this Point, is of greater moment than many will believe, becauſe in our Country, there are found in many places rich Mines, abounding with Gold and Silver, which nevertheleſs are not rightly depurated by the common way of Melting, ſo that they afford ſo little, that it will not pay the charge of the Coals; and therefore it is yet unknown how much good Metal they contain, but it lies hid in obſcurity, which nevertheleſs might be very well perfected in this manner, with great profit. I know Mines of this ſort in various places, which I have found very poor, according to the common way of proving, but according to my Method very rich. What Treaſures doth *Hungary*, *Bohemia*, *Carinthia*, *Stiria*, and *Saltsburg* poſſes in their Regions, unknown to them, and yet after an eaſie manner to be obtained? What Treaſures hath *Miſnia*, *Thuringia*, *Brunſwick*, and *Fichtelburgh*, hid in them, and do no good? There is no Man of a ſound mind, but may eaſily by labour and obſervation diſcern what a great difference there is between the common way of Melting, and mine, if he ſeriouſly conſider the matter. A Mine of Lead doth not want an exquiſite Art of melting, becauſe it is of ſmall price, nor will the loſs be great, if ſome of it be burnt in melting, or remain in the Earth. In like manner the vulgar way of melting Copper, by high Furnaces, and ſtrong blowing, is ſufficient. But the Mines of Gold and Silver, are not to be treated ſo groſly, but after a more ſubtile and profitable manner, that nothing of them may be loſt, but may be of greater uſe and profit, than hitherto hath been done. For the Mineral of Gold, although it is not in ſome great Rocky Mountains, yet for the moſt part, it is found in Flints, and Stones containing Iron, or in any crude Mineral in which ofttimes Antimony, red Sulphur, and Arſenick, is mixed together with the Minera of Gold. As may be ſeen in *Carinthia* and its Confines. But how ſhould ſuch a Mine, if melted with Coals after the common manner, yield its fruit without loſs; for whether it be torrefied, or not, if it be caſt upon Coals, and agitated with the ſtrong blaſt of Bellows, that which is immature flieth away, carrying with it

ſelf that which is good; that which remaineth paſſeth into Scoria. For although it ſhould be mixed with Lead, the Minera of Lead, or Salt of Lead, yet they would not remain conjoin'd, but the Lead is eaſily melted, floweth, and leaveth the Ore, which by ſtrong blowing is reduced into Scoria, retaining much gold, which ſo is loſt, as well as the other which flew away in ſmoak, and at the beſt but a very little ſaved, which hath entred the Lead.

NB. But, in my way, it is neceſſary that the Ore ſhould be broken and ſubdued, and thereby forced to yield its Gold, if it be well incorporated with the lead, and the volatile is preſerved with the fixt; add, that the flame lightly ſtriking or playing upon the matter, deſtroyeth nothing, and by this way, there is no metal loſt. That the thing is ſo, I will prove by a certain ſimilitude or compariſon; make proof in what manner you pleaſe, of gold or ſilver Ore, and obſerve how much good metal that contains, afterwards prove the ſame in a great quantity upon Coals, and you ſhall find much leſs in that, than in your ſmall proof; when nevertheleſs the contrary ought to be, becauſe a great fire hath a greater force of acting upon the Ore, than a ſmall one; and this is the only cauſe, becauſe a great quantity requireth a more violent fire than a ſmall one; which is averſe to all crude and volatile Minerals. But by my way, there is found as much, if not more, in a large quantity, as in a ſmall proof. Therefore I will here ſhew yet by another manner of probation, that by the common and uſual way of melting Minerals, all the metal cannot be obtained, and ſometimes ſcarcely half or a third part. To an hundred pounds of the Mineral, reduced into a ſmall powder, add 8, 12, 16, or 18 pound of granulated Lead, or as much as the Mineral ſhall need, mix the Mineral and the powder of Lead, which with a little Spoon are to be committed to a fiery hot Cupel, placed under a Cineritium or Muffle, give a ſtrong heat, and the Lead will attract all the metal from the Ore, and caſt out the Scoria or droſs, which will reſt upon the moving Lead; which being done, you muſt have at hand a hot Iron Rod, with which you may move and ſtir the Scoria every way well, up and down upon the Lead, to the end, that if any good metal ſhould as yet remain in them, the Lead by that moving may lay hold on it, and catch it to it ſelf; afterwards ſuffer the Scoria for a little while to heat and burn upon the Lead, that it may flow well; then let the heat of the fire ſomewhat abate, and the Scoria will become thicker and fit to be drawn out with an Iron rod, which is to be broad at the point, round, and ſharp, that the Scoria may be every where clean and wholly drawn away from the Cupel, which are diligently to be kept, that nothing be loſt, and leſt the future eſſay ſhould be falſe. This being done, drive the Lead remaining in the Cupel with an indifferent heat, then there will remain the gold or ſilver, which that hundred pounds of Ore did contain; that grain or portion is to be taken out and reſerved. NB. That whilſt you are proving the Mineral, you may alſo impoſe another Cupel, of the ſame magnitude and weight, and as much Lead upon it as was mixed with the mineral, without it, ſuffer it to flow alone by it ſelf. The grain or portion which comes to be obtained from the mineral upon the other Cupel, will be what that mineral did contain. Afterwards the two Cupels are to be weighed apart, and as much as this, in which the Ore was wrought, ſhall be heavier than that in which only the Lead flowed, ſo much of Lead or Copper that hundred weight of Ore did contain; and ſo much gold or ſilver as the grain or portion remaining in the Cupel weigheth, and ſo much Scoria or droſs as was removed and drawn out with the Iron Rod.

NB. Some man may object, That the *Scoria* cannot be ſo accurately and purely removed from the Cupel, but ſomewhat will be left behind. I anſwer, That although the removing of the *Scoria* ſhould not be exactly done, which notwithſtanding may be done, if diligence be uſed, becauſe the *Scoria* to be removed are not pure *Scoria*, but as yet contain ſomewhat of the Lead, which may be eaſily as heavy, yea, heavier than the *Scoria* remaining in the Cupel, and which cannot be removed, nevertheleſs the proof will be juſt and good. But if by a melting made in a great quantity, you ſhall find as much ☽ or ☉, ♀ or ♃, (NB. that Iron and Tin cannot be proved in this manner) as the ſmall proof demonſtrated, [I think it ſhould be, if you ſhall not find *&c.* and the character ♃ ſhould be ♄.] believe that you have not rightly proceeded, and that that which is loſt is gone in fume, or by combuſtion, into *Scoria*. Seeing therefore that this proof is of a great weight, and accordingly is to be made by a great melting Work, I will declare that labour more copiouſly. *For example ſake*, I take two Cupels, accomodated to one and the ſame form, I weigh them ſingly, if one be heavier than the other, then with a knife I pare or ſcrape it a little above or below, ſo that they may be of equal weight, afterwards I put them ſide by ſide conjunctly, or one before, and the other behind, under a Cineritium; when they are duly hot, I put upon one the Mineral, mixed with the granulated Lead, and upon the other, the granulated Lead only; then I ſuffer them to flow together, ſeaſonably abſtracting the *Scoria* from that where the Mineral is; then I cauſe both to ceaſe. Now ſuppoſing that I have added to the Hundred weight of Ore, 1200 pounds of Lead, and alſo wrought 1200 pounds of Lead in the other Cupel alone, and each Cupel to have weighed three Lothones, according to the weight of the City, and that I find in that Cupel in which the Mineral was wrought, a portion of Gold or Silver, weighing (according to the probatory weight) nine Lothones, and in the other Cupel, a portion of Silver weighing three Lothones, which the 1200 pounds of Lead yielded: But in regard that I alſo added to the Mineral 1200 pounds of Lead, which alſo have yielded three Lothones, which I ſubſtract from the nine Lothones, and there remaineth ſix Lothones of Gold and Silver, which the Hundred weight of Ore hath yielded. NB. If you would know whether the Mineral alſo containeth Lead and Copper, and how much, then I weigh both the Cupels apart, obſerving how much that in which the Mineral was wrought is heavier than that in which the Lead was wrought alone, and ſo much Lead or Copper I may affirm to have been, together with the Gold and Silver, in that Mineral; ſuppoſe the Cupel in which the Mineral was wrought to weigh 30 pounds, according to the probatory weight, more than that in which the Lead was agitated alone, then I am ſure that there was ſo much Lead or Copper in that Mineral, together with the gold and ſilver (for iron and tin do not enter the Cupel, but paſs into *Scoria*, but the ☉ and ☽ remain on the Cupel) and the remaining weight, to wit, ſeventy pounds, I find all in *Scoria*, for a little flieth away in fume: in this manner it may be obſerved what quantity a hundred pounds of the Ore of Lead or Cop-

per

per containeth of good Metal, and whether it have any gold or ſilver or not; according to which a computation may be made, whether it will pay the Charge in a great quantity, or not, and what gain may be had from it. This is a moſt deſirable proof, invented for the uſe of gold and ſilver, which are neceſſarily by this way yielded in great quantity; if it happen otherwiſe, the errour is to be aſcribed to the working; for the Mines of copper and lead, this proof doth not ſucceed in great quantity, although by it may be certainly known how much of either of them is contained in an hundred weight of Ore, for both theſe metals are eaſily burnt by the fire, and reduced into *Scoria*, which happeneth not to gold and ſilver, if they be rightly handled; only here it is made appear what quantity of *Saturn* or *Venus* is contained in an hundred pounds of Ore of *Saturn* or *Venus*, which is impoſſible to extort in great quantity, by the common and known way: for ſoft and ſulphureous metals of this ſort loſe much, becauſe part is driven away by ſtrong blowing; another part is reduced into *Scoria*: but by my way nothing is loſt thus, and but very little remaineth behind. I know yet another way, and that better too, of perfecting the Minerals of gold, ſilver, copper, and lead, with a certain compendious profit; but ſeeing that in my *Miraculum Mundi* I have made no mention of a Work of this ſort, I ſhall here ſay nothing of it. I alſo know a way of extracting from very poor Copper Mines, all the Copper contained in them, without great labour and coſt; which Mines are every where in great quantity to be found, but are not ſufficient to pay the Charge of melting in the common way; but this my ſecret way will yield great profit, for ſcarcely one pound of Copper will remain behind, and be loſt in an hundred pounds of *Scoria*.

Point III.

The volatile and immature Marcaſites of Sol *and* Luna *are fixed in the ſpace of three hours, ſo that they render a double quantity of Metal, to what they could have done before fixation*, &c.

THis fixation is a ſingular ſecret, in perfecting Antimonial and Arſenical Minerals, which are wholly crude, which commonly yield a little Gold: For when Minerals contain much Antimony, Arſenick, or Orpiment, and are torrefied in the common way, then the Arſenick or Orpiment deſtroyeth much of the Gold, carrying it away in fume; but if they be melted without a foregoing torrefaction, then the blowing forceth away more; if from a Mineral of this ſort, the yellow or red Sulphur, Arſenick, or other rapacious ſubſtances, be diminiſhed or conſumed, by cloſing it in Earthen Veſſels, as many do, then by this means the Mineral is burnt, loſeth its flux and ingreſs into Lead, ſo that much of the gold is deſtroyed, and reduced into *Scoria*; to prevent which, this following way is the beſt: With one part of the mineral mix half a part of Nitre, let it be kindled with a Coal, and fixed, then the Nitre burneth away the greateſt part of the rapacious ſulphur, and fixeth the reſt, ſo that there is but little of the Gold loſt, and it keepeth its flux and ingreſs into Lead; if it be put into the foregoing Furnace, and there wrought, it yieldeth all the gold and ſilver which it containeth, and nothing is loſt. Here ſome may object, and ſay, That although in this manner, more gold may be obtained; yet the Nitre maketh the work dear, which I indeed confeſs to be true, if the Nitre be bought at a dear rate, but if by an artificial Culture, it may alwaies be had at hand, it will coſt little, and this torrefaction and fixation, may be perfected with great profit.

Point IV.

All Gold and Silver not purely melted from its Marcaſite, may be ſwiftly purged from every Additament, the ſilver ſeparated from the Gold, by fuſion only, with a ſmall labour and coſt, but in great weight.

THis way of purifying ☉ and ☽ from all addition quickly, and in an eaſie manner, is a thing moſt profitable, and an Art highly neceſſary to be known by thoſe who handle metals; for it is ſooner done, than by the way of cupellating or blowing off with Lead, but is dearer, by reaſon of the Nitre; nevertheleſs, the labour is eaſie and pleaſant, and it is done in this manner: Let a Crucible of impure gold or ſilver be placed in ſuch a Furnace as is deſcribed and depicted in the Fourth Part of our Furnaces, let it be melted, then caſt in ſome Regulus of Antimony, more or leſs, according to the greater or leſſer impurity of the Gold, and according as it hath more or leſs need of cleanſing for its purification. When all ſhall flow and be clear in the Crucible, caſt into the Crucible upon the metal, at ſeveral times, about ſo much Nitre, as there is of addition to the Gold; let it flow, then the Nitre attracteth the Regulus of Antimony, together with the impurity contained in the Gold, which paſſeth into Scoria. And this Proceſs doth not ſerve only for impure Sol and Luna, but alſo for ſuch Sol and Luna which contain Copper, Iron, Lead, Tin, Chalcitis, Aurichalcum, and other metallick and mineral matters, Tin eſpecially, which is difficult to be ſeparated from Sol and Luna by Lead, without loſs. But in this manner it may be quickly and eaſily done. But that my meaning may be the more rightly underſtood and the leſs errour be committed in working, I will here inſtitute the Proceſs clearly, and in expreſs words. Suppoſe to ℔ j. of gold or ſilver, there be two lothones of Copper, and three lothones of Tin (*a lothone is half an ounce*) which I would ſeparate, and if it be done by the known way of blowing off with Lead, there will need at the leaſt thirty or forty lothones of Lead, and nevertheleſs one part of the *Sol* or *Luna* will be loſt; but by my way to two lothones of Copper, and three lothones of Tin, adjoin five lothones of Regulus of Antimony, then abſtract the Regulus, together with the addition of Copper and Tin, by the mediation of Nitre, which may be done in the Crucible in the ſpace of one hour, which by torrefaction and agitation in the common way, could ſcarcely have been done in 10 or 12 hours; beſides nothing of the Additaments is loſt, all remaineth in the Scoria, from which, afterwards, as well the ♃ as the ♀ and Regulus of Antimony may be recovered, to wit, if the Scoria, in which the ♃, ♀, and Regulus of Antimony is, be put into a Crucible, a live Coal caſt in, and then the Crucible covered with a tyle, let them flow a quarter of an hour, pour all out, and you ſhall find in the bottom of the Cone a little Regulus, in which will be the remaining *Sol* or *Luna*, which the Scoria did prey upon; let them be depurated on a Cupel, if

they be not already pure enough: The Scoria being again melted, caſt in a live Coal, ſuffer all to flow well together, again there will fall another Regulus from the Copper, the ♈ & ♂ remaineth, and neither by Coals nor any other art, can be brought into Regulus; but if theſe Scoria be driven through a probatory Furnace, then they alſo yield the Tin again, and that better than it was before. This Proceſs is not only pleaſant, artificial, ſwift and eaſie, by which gold and ſilver is quickly and purely ſeparated from all addition, but there is alſo hidden in it a great myſtery: But becauſe I have only propoſed to prove thoſe things to be true and natural, of which I have made mention in my *Miraculum Mundi*, let what I have now ſaid ſuffice, and what is here deſir'd may be found perſpicuouſly and ſatisfactorily declared in the following Proceſſes.

Point V.

Gold and Silver are eaſily drawn out of Old Tin or Pewter Veſſels, the Tin being preſerved almoſt in the ſame weight, and being made better than it was before, may ſerve for the ſame uſes to which it is wont to be put.

THis Proceſs alſo is very well performed by the mediation of Nitre, *viz.* in this manner. Let the Tin, in which is ☉ or ☽, be reduced into Aſhes, even as Lead is wont to be prepared, for the working of Minerals; and let there be mixed with it as much powder of Nitre, let the mixture be put in a ſtrong Pot which will endure the fire, upon which put ſubliming Pots, let the mixture be kindled in the lower Pot (which is under the Subliming Pots, and muſt have a little hole in the ſide for that purpoſe) with an Iron Rod, red hot, then the Maſs beginneth to burn, and ſendeth many Flowers into the Subliming Pots, the Tin and Salt-peter remaining in the Pot, take out, and melt in a Crucible, if there be much Lead, then that falleth together with the ☉ and ☽, to the bottom of the Crucible, but the Tin with the Nitre paſſeth into Scoria, which if the melted Maſs be poured out into a Cone, they are ſeparated from the Regulus of Lead, and after cooling may be taken out, which Regulus of Lead, by the addition of other Lead, may again be wrought, and in a ſtrong Crucible be reduced into Scoria with Nitre; then there will remain a little Regulus of Lead, which containeth the ☉ and ☽, which was in the ♈. The firſt and laſt Scoria may be reduced by a ſtrong blaſt in a Probatory Furnace, then the Tin will be again obtained, better, harder, and whiter than it was before; the reaſon is, becauſe the Nitre hath conſumed part of the combuſtible Sulphur, and alſo ſeparated the Lead. Although this Proceſs is not done with any great profit, yet nevertheleſs it ſhews the poſſibility; but he that knoweth how to handle the matter, will ſuffer no loſs, for thoſe ſublimed Flowers are of greater worth than Salt-peter and Tin, becauſe they may be prepared into a good Medicine; they are alſo very available in thoſe curious red Colours for Cloth [*Scarlet, or Bowdy*] exalting them in a wonderful manner, and firmly abiding in the Cloth, ſhining, and giving it a fiery ground.

Point VI.

Much Silver may be ſeparated from Biſmuth, the Biſmuth preſerved, a Secret agreeing to thoſe places which abound with that Mineral.

THis Secret is not of ſo little weight as perhaps it will ſeem to ſome; for no Man even to this day hath proved this in the matter it ſelf and with effect, yet ſeeing that it may eaſily be done, *viz.* in this manner, melt Chalcitis in a Crucible, and caſt upon it ſucceſſively ſo much Nitre, until all the Chalcitis ſhall paſs into Scoria, or green Glaſs, pour out the Maſs into a Cone, then the Silver will ſettle to the bottom in form of a Regulus, which was contained in the Chalcitis, then put the Scoria of the Chalcitis into a Crucible and melt them well for the ſpace of an hour, ſo all the Chalcites will be revived, rendred Corporeal, and a little will be loſt. He therefore that can make the Salt-peter himſelf, and needs not to buy it at a dear rate, will hence reap great profit, otherwiſe not; however it proveth that the Salt of the Earth can perform what is here attributed to it.

Point VII.

From old Copper much Silver is ſeparated, the Copper preſerved unhurt, by which Artifice Regions abounding with this Metal, may reap no ſmall profit.

THat this extraction of Silver from Copper by means of the Salt of the Earth, may be verified, you are to proceed in this manner: Mix with the Copper its own weight of Regulus of Antimony, then melt both together, upon which caſt ſo much Salt-Nitre ſucceſſively or at times, until it turn the Copper together with the Regulus of Antimony into green Scoria, then make the fire ſtronger, and cauſe theſe Scoria to flow like water, and luit a Regulus, which although it be not ſufficiently pure, it may be depurated upon a Cupel with a little Lead, and it yieldeth the Silver which the Copper contained. NB. This proceſs is moſt true, and will never deceive any Man, but I do not ſay that he ſhall obtain Riches by this means, but only prove to be true, what I have aſcribed to it in my *Miraculum Mundi*. NB. But he that knoweth how to fix the Scoria, that is the Copper and Regulus of Antimony with Salt, and to melt them into Artificial Stones, or Enamel, ſo that nothing be loſt, he ſhall be ſure not to undergo the Labour in vain; otherwiſe he may caſt in a live Coal upon the Scoria, from which the Silver is ſeparated, when they are in Flux, and let them flow half an hour, then it leaveth the Regulus of Antimony together with the Copper, which the Nitre hath reduced into Scoria, and afterwards another Regulus, to be applied to uſe, which if all things be well handled, from both, *viz.* from the Regulus of Antimony and Copper, (after their Edulcoration) a green colour for Painting may be extracted, and ſo the Labours will be compenſated, and the gain will be ſo much the greater.

Point

Point VIII.

Every common Silver may in the ſpace of a few hours be exalted into the nature of Gold.

THis Gradation of Silver is performed by the help of a certain Mineral Sulphur, to wit, of ♂ and Antimony, in this manner. Adjoin to ☽ as much Regulus Martis, and again let it be ſeparated from it by Nitre, which labour is performed in the ſpace of an hour, to the remaining Silver adjoin again as much Regulus, which is again to be abſtracted; and let this labour be reiterated five, ſix, eight, or ten times, which may be done in one day, afterwards let the ☽ be diſſolved in Aqua-fortis, then the Gold, which the Nitre by the help of the ☽ hath obtained from the Regulus, will remain in the bottom, which is to be edulcorated, and corporify'd with Borax, the Gold will be good in an excellent degree, but the value thereof is ſcarce enough to pay for the Regulus, and Nitre. But he that knoweth how to make his own Nitre, or can obtain it without price, may reap a conſiderable profit: Eſpecially if he know how to transferr the detracted Scoria into further uſe, which is not here ſought, but is only proved that ☽ may be exalted into ☉ by the help of Regulus *Antimonij Martialis.*

Point IX.

Gold may be ſeparated by fuſion from every addition of Copper, Tin, Iron, Lead, Orpiment, Antimony, Arſenick, or the like, without Cupels, each being kept apart.

THis manner of ſeparating of Metals, from one another, and of depurating ☉ without Cupels, is a moſt pleaſing, fair, and profitable ſecret, by which in the ſeparation of Metals, much time and expence is ſaved, and no detriment to be feared, which no man, even to this day could effect, my ſelf excepted: You are to proceed in this manner. Firſt, the mixt Metal, whether it conſiſt of few or many, is to be granulated, the grains are to be conjoined with a fourth part of powdered Sulphur, ſomewhat moiſtened, and to be ſet on fire in a Crucible luted according to art, which being done, the cover of the Crucible is to be taken off, and the enkindled Metal to be covered with the fourth part of its weight of Antimony NB. That if there be much ♂, ♀, or ☿ in the mixture, then the more Antimony is to be adjoined, that it may draw to it ſelf the imperfect Metals. Therefore when the Maſs flows with the Antimony, inject a little well purified Nitre, dried and pulverized, and when it flows well, the Maſs is to be poured out into a Cone, and the Regulus, if there be any, to be ſhaken out, which will contain the greateſt part of the ☉ which was in that Maſs. NB. If there ſhall be no Regulus, that is a ſign that there was not Nitre enough to ſuffice the crudity, which is to be remedied thus: Return the Maſs into the Crucible, and permit it to flow, which being done, throw in as much filings of Iron, as you judge there is Gold in the Maſs, and mix it with the Maſs with a red hot Iron, cover the Crucible, and give a melting fire for a quarter of an hour, pour it into a Cone, when it is cold ſeparate the Regulus from the Scoria, which will be about the ſame weight with the filings of Iron, which you uſed in the precipitation, purifie the Regulus in a ſmall new Crucible, by the injection of Nitre, if it yieldeth Gold without Silver, then it is a ſign there is Gold yet in the Maſs, therefore it is neceſſary to flux the Maſs again, and precipitate with Iron, if the Regulus be yet golden, then it is to be depurated apart by Nitre, and to be kept; but if it hath more ☽ than ☉, it is a ſign that all the Gold is precipitated, afterwards ſuffer the Maſs to flow again, and inject as much filings of Iron, ſtirring them well with the Maſs, with a red hot iron, permit them to flow well together, then it rendereth as much Regulus of Silver, as there was Iron put in, afterwards alſo the ♀ will be precipitated, and laſt of all, the Scoria are again to be fluxed well being mixed with Nitre, that it may appear whether there be yet any Metal in them. The Regulus of ☽ is alſo depurated in the ſame manner as the Regulus of ☉: Venus, ☿, and other Additaments, are melted by Bellows, ſo that nothing is loſt. This ſeparation of ☉ and ☽ from the viler Metals, by melting, hath been long ſought by many, but found by few. *Lazarus Erker*, in his Writings hath taught by what means ☉ may be ſeparated from ☽ by fuſion, but that ſeparation is unlike to this which I have mentioned, becauſe here it is not only ſhewed how ☉ may be ſeparated from ☽, but alſo from other Metals.

Point X.

Every imperfect Metal, without the mixture of other Metals, may be ripened by this Secret alone in the fire, in an hours ſpace, ſo that it will yield Gold and Silver, but without profit; an indication that the viler Metals, may by Art be promoted into the Nature of the perfect, to the great profit of Metallurgiſts.

THis is done only by the power and virtue of Salt Nitre, whereby the Metal is penetrated, depurated, and fixed into a more perfect, or exalted in maturity, but cannot be performed with much profit in a great quantity, but it proveth that Nitre hath a virtue of tranſmuting every imperfect Metal into perfect, which is done in this manner. Let the Metal be laminated into very thin Plates, whether it be ♀, ♄, or ☿, ♂ is indeed corrected by this way, but melteth not in any Crucible, and ♀ alſo is tranſmuted into other forms, but not into ☉ or ☽. Make in a Crucible *ſtratum ſuper ſtratum* with Saw-duſt, Sulphur, and Nitre, as alſo with the laminated Metal, of which mention is made in the ſecond part of Furnaces; kindle the mixture at the top, then a great and ſuddain flaming fire will ariſe, by which the laminated metal is penetrated, partly fixed, and amended, ſo that if it be wrought on a Cupel with Lead, it leaveth ſome ☽ or ☉, which nevertheleſs before, would have yielded neither, whence it is manifeſt, that the flame excited by the Nitre hath corrected the Metal. NB. That ☿ is firſt to be coagulated, and Chalcitis to be pulverized, before they be commixed with the ſudden fire of Nitre, and enkindled. In theſe Labours, although they may be eſteemed of ſmall moment, a great Miſtery is hidden, which nevertheleſs will be valued by no man, although it ſhould be diſcovered in plain and open words, becauſe the proceſs is mean, coſteth little, and may be performed in the ſpace of a quarter of an hour.

Point XI.

Metals alſo grow up in this ſubject, in the form of Vegetables, before the eye, in the ſpace of two or three hours, to the length of a Finger, or hands breadth, into many branches and twiggs, without Fruit indeed, but is a demonſtration that even Metals themſelves do germinate in it like Vegetables.

THis Point is mentioned only for this end, to ſhew that Nitre hath a power of making Metals to grow after the manner of Vegetables. Which thing the Liquor of Flints alſo performeth, of which mention is made in the Second Part of our Furnaces; but the Liquor of fixed Nitre is better; which is prepared by fixing it with powder of Coals and Flints, which is alſo taught in the Second Part of our Furnaces, ſo that there is no need here to repeat it. If therefore the metals being prepared in little bits, be put into this liquor, they will grow and encreaſe after the manner of Herbs, and ſo quickly, that in a few hours ſpace they will grow to the height of a hands breadth, which is very delightful to the eye, and worthy of a ſingular meditation, whence ſo ſudden an encreaſe ſhould proceed. Certainly many things might be written concerning this matter, but becauſe in this place I have promiſed no more, but to verifie what I have attributed to the ſalt of the earth in my *Miraculum Mundi*; let what is ſaid ſuffice.

Pag 48, Sec Author Part 2. Pag 59.

Point XII.

There is another augmentation or encreaſe of the Perfect Metals, very gainful, by the Imperfect, anſwering to the germination or growth of Vegetables, &c.

AS for this augmentation, it is done by a way far diſtant from the foregoing, *viz.* in this *Sol* and *Luna* are joined with Lead, Tin, and *Venus*, or with Tin alone, where it is to be left for a convenient time, then the Sol attracteth from the Lead or other imperfect metals, a golden Eſſence, is encreaſed and made heavier. The Proceſs is this: Take one lothone (*or half an ounce*) of Gold, eight or ten lothones (*which is four or five ounces*) of Lead, let them be melted together; if you pleaſe, you may add Tin or Copper; put the Crucible, together with the Lead or other imperfect metals, into a ſtrong Crucible, give a temperate and conſtant Fire, that the Lead with the Gold may only flow, but not be white hot; caſt into the Crucible upon it half an ounce of the beſt Nitre, cover the Crucible well, that no Coals fall in, and keep it in a conſtant eaſie fire, then in ſuch a time the Lead, together with the other metals, which were mixed with it, will be turned into Glaſs, but the Gold being pure, is ſeparated ftom the Glaſs by it ſelf, and will adhere to the bottom of the Crucible, which when the Crucible is broken, take out and weigh, and you ſhall find your Gold encreaſed, and that it hath taken weight from the other metals. Although this labour affords no profit, yet it ſheweth how the nature of metals are to be known. There is yet another way of trying this thing, thus, *viz.* Take half an ounce of Gold, join with it 5 or 6 ounces of Lead, and drive away the Lead again upon a good Teſt, till the Gold ſparkle and ſhine, and you ſhall find your Gold to be made much heavier than it was before, which weight it hath drawn from the Lead only.

Point XIII.

By the mediation of this from all Imperfect Metals and Minerals, yielding nothing in the uſual Examen of Cupels, Gold and Silver is produced in a manifold manner, being an Argument that the Imperfect Metals have ſomewhat of the Perfect reconded in them, when they are inverted, and ſhew themſelves to our ſight.

IF we would obtain Gold and Silver from the Imperfect Metals, by the help of Nitre, an equal weight of Regulus of Antimony is to be added to them, that they may be rendred frangible, and fit to be pulverized, ſo that they may be commixed and fixed with Nitre in this manner: Take an ounce, or an ounce and a half of Copper, Lead, Tin, or Chalcitis, melt it with as much Regulus of Antimony; pulverize the mixture, and mix with it its equal weight of the beſt Nitre, put the mixture into a crucible, kindle it with a live coal, then the mixture will be reduced by the Nitre into Scoria, which muſt be melted by a very ſtrong fire, in a Wind Furnace, then the Metal will paſs into a Regulus, but the Regulus will remain in the Scoria, which by the caſting in of a live coal may be precipitated and brought to Regulus again: but weigh the metallick Regulus according to the Hundred weight, and drive it (if it be Lead) upon a Teſt, then you ſhall find it to contain gold and ſilver, which the metal had not before. If the metal be Copper or Chalcitis, a due proportion of Lead is to be added to it, that it may be wrought upon a cupel, then it leaveth gold and ſilver, which without this Operation it would not have done. This Work may alſo be effected by another way, *viz.* Mix ♄ or ☿ with its own weight of Regulus of Antimony, ſuffer it to flow well with the metal in a melting Furnace, inject ſucceſſively by a little at a time, ſo much Nitre as both the Metal and the Regulus did weigh, then let the Regulus and the Metal be fired by the Nitre, that ſome of the ſuperfluous ſulphur may be burnt and the mixture reduced to *Scoria*, afterwards give a ſtrong fire, that the Scoria may be well melted, then the Metal will be ſeparated from the Regulus, which may be teſted, and the correction of the metal, made by the benefit of the Nitre, will be manifeſt.

As for theſe 13 Metallick Labours, they are in themſelves very good, and profitable to be known by every one handling Metals, ſome of which, if they be accurately manag'd, and by a skilful Artiſt, will afford great Gain, and they are all done by the help of the Salt of the Earth. But I will not deny, but that thoſe Labours may alſo be performed by another way, which needeth no Nitre. But I do not now intend to ſay any thing of that, but only to prove that all thoſe Secrets and Tranſmutations may be effectually performed by the contemptible ſalt of the Earth.

In

In Mechanicks.

Point I.

They who Engrave or Etch upon Copper, may of this ſubject prepare a good corroſive Water, by which (the Copper Plates being firſt ſmeared over with a Covering fit to defend them, and what Images or Lines they pleaſe, drawn upon them, with a ſtile or ſtift) by an eaſie and compendious manner, they will be eroded or eaten, which otherwiſe would require a long time to be engraven.

THat a corroſive and graduating *Aqua-fortis* may be prepared of Nitre by deſtillation, needs no proof, the way of making it being every where known, as a thing common, only here it is proved, that this ſhortening of the Engraver's Work may be performed by the Salt of the Earth.

Point II.

Painters by the help of this, may prepare for themſelves moſt excellent Colours, as Ultra-Marine, *blue Smalt, fine red or Scarlet* Lacca, Venice *Ceruſe, and others neceſſary for their Uſes, which otherwiſe they muſt have from far, as* Italy, Holland, France, *&c. and at a dear rate.*

THat excellent colours for Painting, may be made by the ſalt of the Earth, I will thus prove: Blue Smalt is otherwiſe prepared of flowing Sand, Chalcitis, and Potters-aſhes: But if inſtead of thoſe aſhes, you take the fixed ſalt of the Earth, the ſmalt will not be only rendred more open, looſe, and fine, but alſo purer, by reaſon the ſalt of the earth is purer than thoſe aſhes. *Lacca* for the moſt part is made of Flocks ſhorn from crimſon or ſcarlet cloth in the dreſſing, and by a ſingular *lixivium* (inſtead of which Nitre may be taken) the colour is extracted, which is to be precipitated, edulcorated, and dryed upon clean Boards in the ſun, or by a ſtove. Verdigreaſe and Ceruſe are commonly prepared by the help of Vinegar, in Iron Veſſels put in Horſe-dung; but if the Copper or Lead be diſſolved in ſpirit of Nitre, and the Copper precipitated by a *lixivium* of ſalt of Tartar, but the Lead by ſalt water, then edulcorated and dried, the Copper will exhibit a green colour, which may be uſed in all Paintings, and will not corrode and deſtroy other colours, as the common Verdigreaſe is wont to do: And the Ceruſe is rendered more delicate white, and pure than that which is prepared by Vinegar, with which oftentimes much Chalk is mixed to augment it, and is not ſo conducible to Painting, nor to the ſhops, as that which is made *per ſe*, without any mixture.

Point III.

Engravers and Statuaries may ſo harden their Tools, that they may hold their points long, if they be to cut ſtones.

THat Iron may be hardened by Cementation with Salts, ſo that it may ſerve inſtead of Steel, is now openly known; but the iron or ſteel is to be kept in cementation as long as need ſhall be, not with common ſalt alone, but mixed with the powder of coals and ſalt of aſhes; then the Iron grows as hard as ſteel, but ſteel is rendered harder than it was before.

Point IV.

Embroiderers may put any durable Colour they pleaſe upon the Silk with which they work.

IT may be known, that Nitre, as being a depurated ſalt, will eaſily induce colours, and conſtantly preſerve them, yea, exalt them, which many know, they eſpecially who dye cloth with rich grain colours, as Scarlet, Crimſon, *&c.* when they add the ſpirit of Nitre in the boiling, to aluminate it, (as the Dyers call it) the colour is wonderfully exalted, and made much more fiery, ſo that it may be ſold dearer than common Crimſon or Scarlet. This ſpirit of Nitre alſo tingeth Aſhes, Nails, or Hoofs, Quills, or Feathers, with a golden colour, but if the Nitre be fixed by calcination, then it alſo equally exalteth, but not into a red, but a Purple; Dyers uſe Potters aſhes for theſe Works, but fixed Niter is much purer, and rendereth the Work more beautiful than thoſe impure aſhes.

Point V.

They who Paint Glaſs, by an eaſie Work, may thence prepare all Colours or Enamels for Glaſs, ſo that there will be no need to have them from Venice.

THE Painters of Glaſs ſometimes complain, that their fuſory Glaſs or Enamel will not readily flow, and that the Glaſs which they are to colour is melted firſt; the Salt of the Earth being fixed, remedieth this, if the colouring Glaſs be mixed with it in a due proportion, and again melted, for by this means they will be rendered fluxible at pleaſure.

Point VI.

They who work in Wax, by the benefit of this, may whiten it exceedingly, and colour it as they pleaſe.

THat Salts with Water do whiten yellow Wax, being melted thin, and expoſed to the Air, and often ſprinkled with the Salt Water, is ſufficiently known, and wants no proof, but not better than ſalt-Nitre it ſelf.

Point VII.

Printers alſo may add this ſubject to their Ink, which will cauſe it to adhere very firmly to the Paper, and render the Letters very fair.

THat fixed Salts will readily conjoin Ink with Water, is not unknown, and none better than fixed Nitre, which alſo excelleth all ſharp *lixiviums*, having a power of cleanſing Lead, Tin, Copper, or other Veſſels.

Point VIII.

It is convenient for Clock-makers, or Watch-makers, if a Water be deſtilled from it, which ſoldereth Iron or Steel, without fire, if a drop of that Aqua-fortis *be dropped upon it, whence the Iron growing hot, it preſently waxeth ſoft, as if it had been ſoldered in the Fire by the help of Copper.*

IF an *Aqua-fortis* be deſtilled from Niter and calcined Vitriol (NB. that there muſt be no Water or Phlegm in the Spirit) and two little pieces of Iron be melted with it, (between which there muſt be little Filings of Iron) then the Iron groweth hot by the *Aqua-fortis*, which acteth upon it, and the one will be joined to the other by melting, as if it had been done by the Fire. But he that will uſe that water, muſt know how to prepare it himſelf, becauſe ſuch is no where to be found to ſell.

Point IX.

All Smiths may by it harden their Files, and other Iron Tools, as durable, as if they had been made of the hardeſt Steel.

FIxed Salts being mixed with aſhes and powder of coals or ſand, after that they have remained 24 hours in a cloſe Fire, do harden iron like ſteel; as is proved before in the third point.

Point X.

Pewterers may harden their Tin or Pewter, and give to it an elegant whiteneſs, ſo that it will reſemble Silver both in colour and ſound; neither will it eaſily tarniſh, and by reaſon of its hardneſs, will laſt longer than common Pewter.

IF Tin be often melted, and extinguiſhed in a *lixivium* of fixt Nitre, it is made harder than it was before; but if it be put to Nitre in Flux, and ſuffered to melt in it; then alſo it will be more hard. NB. But if the Tin be reduced into Scoria by Nitre, and the Scoria again reduced, it will be rendered harder and fairer, than by the two former ways.

Point XI, XII, XIII.

Cabinet-makers may ſtrike an excellent Black upon Pear-tree, Cherry-tree, Box, Walnut-tree, and other hard Woods, which may be uſed for curious Works inſtead of Ebony. Skinners or Furriers may dye their Ermins, Fox-skins, Wolf-skins, and the like Furs, with a ſcarlet, crimſon, or deep black colour, far exceeding the natural. In like manner Feather-dyers may ſwiftly give any laſting colour to their Plumes.

IF an *Aqua fortis* be deſtilled from Nitre and Vitriol, and a little ſilver diſſolved in it, and Rain water poured thereon (for the weakening of the *Aqua-fortis*) then not only all hard Woods, are blacked by it, ſo that they repreſent Ebony, but alſo skins and feathers are made black as a coal, a ground being firſt laid upon the feathers, skins, or woods, that the Colours may remain and endure firm. Therefore the 11, 12, and 13 points are thus verified together.

Point XIV.

Taylors may take out Spots or Stains, out of Woolen, Linen, or ſilk Garments, and reſtore their Beauty.

OF fixed Nitre is made a Soap, ſo ſubtile and pure, that by it all Spots may be taken out of Garments.

Point XV.

If Shooemakers put old Iron to this ſubject, they may therewith adorn their Leather with an excellent Black.

IF Nitre be diſſolv'd in Vinegar, and old Iron lie ſome time in it, it will make an Ink with which Hides may be blacked with an excellent Black. But there is no need of Nitre for this uſe, for if Iron be put to Aqua Calcis, it effecteth the ſame thing; only mention is made of this in *Miraculum Mundi*, that it might be manifeſt, that this Univerſal Subject may be of uſe, to all and ſingular Artificers.

Point XVI.

Weavers may render their Linen Threds ſo fine and ſoft, that they will emulate ſilk.

ALl Men know that the boiling of Thread in a ſtrong Lixivium renders it ſoft and delicate, but ſeeing that fixed Nitre is better than a ſtrong Lixivium, it will alſo perform this work better than any common Lixivium.

Point XVII.

Dyers by this may give ſo firm and unchangeable a ground, to their Cloth, that the ſuperinduced Colours ſhall not be corrupted, or ſpoiled by any Wine, Vinegar, Urine, Pickles, Air, or Sun.

IF the ſpirit of Nitre be put into the firſt boiling with the Alum and Tartar, for the aluminating the Cloths, it will give a permanent ground, as is already proved in the fourth point.

Point XVIII.

Potters may thence prepare a Glaſſy Colour, not unlike to the Indian Porcellane, *of which Veſſels may be made having the aſpect of Gold, Silver, or Copper, a ſingular Ornament for Noblemens Tables, hitherto unknown to the World.*

THe Glaſing of Earthen Veſſels, that they may appear like a natural Metal, is an egregious art, but it doth not always ſucceed, for the Colours are eaſily burnt and deſtroyed by too much heat, ſo that no Metallick Vitrification can be diſcerned. Veſſels there-

therefore, ought to be glaſed not in a common Potters Furnace, but in a peculiar Furnace, that the fire may be oftner obſerved. If the Vitrification be to repreſent Gold, or Silver, or Copper, then Gold, and Silver, and Copper is alſo to be taken in this manner: Take one part of Gold and Silver, or Copper, Regulus of Antimony two or four parts, melt the Regulus and the Metal, pulveriſe them in an Iron Mortar, and mix them with an equal portion of Nitre, ſuffer the mixture to be fixed in a Crucible, with which mixture the earthen veſſel is to be rubbed over or gilded, afterwards to be committed to a Furnace fit for this purpoſe; if you proceed right, you will obtain a very beautiful Vitrification, as if the Veſſel was gilt with Gold, Silver, or Copper, which will not vaniſh or decay, and will far exceed in beauty and ſplendour the Veſſels which are gilt with thoſe Metals, for thoſe in proceſs of time loſe their ſplendour, but theſe do not as long as the leaſt bit remains.

Point XIX, *and* XX.

Souldiers, Merchants, Travellers, Carriers, Fiſhermen, and others, who are much in the open Air, may of this prepare a Varniſh in which they may dip linen Cloth, which will not permit either Air or Water to paſs through it, with which they may defend their Boots or Cloths, ſo that they may travel dry in the rain. They who make Tapeſtry, may reſtore their faint and faded Colours, ſo that they ſhall be ſtrong and beautiful.

HEre mention is made of a certain mixture in which if Linen Cloth be dipped and dryed will not permit water to paſs through, and it is done in this manner. There is nothing wanting in Linſeed Oyl, but that the humidity be taken from it, which always hindereth its dying; now to effect that, there is no better way, than to boil the Linſeed Oyl gently and gradually with the Flowers of *Lapis Calaminaris* or Saturn, (which are ſublimed by Nitre) ſo long till the Oyl be tenacious, and groweth hard enough for this uſe. NB. That a Linen Cloth immerſed in this mixture, and ſhining Talk being finely laid upon it, may be coloured of any colour, which will very ſtrongly adhere to it, and may ſerve for the making of Tapeſtry. Therefore in this manner the nineteenth and twentieth Points are confirmed.

Point XXI, *and* XXII.

Miſtreſſes of Families, may of it prepare fine Soap or Waſh-balls, far exceeding the Venetian. *Houſhold Maids, may with it ſcour their Metalline Veſſels, ſo as to render them neat and beautiful.*

THat fixed Nitre will waſh and purifie Linen cloth beyond all Soap, no Man will deny, who comprehendeth the matter, concerning which thing, the Ancients have written much, and not in vain, calling Nitre the Soap of the wiſe, but not for the waſhing of Womens Linen, but for the intrinſecal purifying of the imperfect Metals: Their External Purgation may alſo be performed by help thereof, ſo that the twenty ſecond Point is alſo verified.

Point XXIII.

Women may change the Yellow, Pale, or Brown Colour of their Face, and hands, into a beautiful whiteneſs.

THat an Egregious Coſmetick may be made of Nitre, calcined with white Talk (by which ill coloured skins may be whitened) is not to be doubted. For if Nitre fixed by the Regulus of Antimony alone, performeth that, why ſhould it not yet do it better, if it be conjoined with ſome white Mineral Talk in the Calcination?

Point XXIV.

Old Women may by an eaſie way, take away the Wrinkles of their Face and Hands, as alſo the Corns of their Feet, and boil their Linen to ſuch a ſoftneſs, that it ſhall come but little ſhort of Silk.

IT is eaſie to verifie this, to wit if Nitre be fixed with Regulus of Antimony, and ſet in a moiſt Cellar to run into an Oyl, which Liquor will be ſo fiery, that if any hard Skin, or Corn, be often anointed with it, it will ſo ſoften it, that it may be cut away with a Pen-knife, and afterwards other ſmooth and ſoft Skin will grow in its room.

Point XXV.

Gardeners by this ſubject may deſtroy all Inſects, by mixing it with water, and pouring it into thoſe places where they breed, for they will either die in their holes, or run out to die, becauſe they are not able to abide that fire. It alſo ripeneth Fruits, if a little of this Menſtruum be applied to their Roots, at the entrance of the Spring; and if a large quantity of Apples be well covered over with it, they may thence prepare a laſting Wine, Vinegar, or burning Spirit.

IT is not to be doubted, but that fixed Nitre will kill all Worms in the Earth; I have often tried it with good advantage, and found it true, in this manner: Many years ago, I had a Garden, in which was a Bed of Aſparagus, which I covered all over in the Winter with Horſe-dung, to defend it from the Froſt, which occaſioned the breeding of many ſmall Worms like Threads, ſticking to the Roots of the Aſparagus, ſo that they could by no means grow or increaſe, only by reaſon of the great quantity of Worms, which took away the nutriment of the Vegetable for themſelves. And once by chance throwing ſome fixed Nitre expoſed to the Air, and turned into a Liquor, out at a Window into the Garden, it fell upon that place where theſe Worms were, the fixed Nitre was diſſolved by the following Rain, and penetrated the earth; which done, the Worms in great numbers crept out of the earth, becauſe they could not abide that fiery Liquor, the Aſparagus grew up in the ſame place more plentifully and perfectly than before, which moved me alſo to apply this Liquor in other places; by this means the whole Garden was in a very ſhort time freed from Worms.

Point XXVI.

Bakers may uſe it in ſtead of Ferment or Yeaſt, if they diſſolve a few hops therein.

IF pure Nitre with flower be throughly moiſtened with warm water and ſet in a warm place, then, by its own proper power and virtue, it beginneth to ferment, eſpecially if ſome freſh Hops be put to the water, by which alſo other things are promoted to fermentation.

Point XXVII.

Brewers by its help may have very ſtrong Beer, if they extract their Hops therewith.

IN the like manner alſo warm Beer may be excited to fermentation.

Point XXVIII.

Mead, and Metheglin, as alſo Beer, and Canary wine, which are upon the turn, and growing ſowre, may by this be rendred drinkable.

ANy kind of Drink, whether it be Canary, Metheglin, or Beer, which eaſily ſowre in Summer, if you would amend them, to a Tun of the Liquor put about two or three Ounces of fixed Nitre put up in a Linen Rag into the Bung-hole at the top of the Cask, and let it hang down into the Liquor, then in a ſhort time the ſowre Liquor will be rendered drinkable.

Point XXIX.

Comb-makers, and others who work in Horn, may by this ſo ſoften their Horns, that they may imprint upon them what Images they pleaſe.

THat every Horn, or Bone may be ſoftened, if it be ſufficiently boiled in a Lixivium of Nitre, may eaſily be apprehended; which thing another ſtrong Lixivium, not ſo fiery as that of Nitre, will alſo perform.

Point XXX.

Keepers of Armories may preſerve their poliſhed Arms, or Harneſs free from ruſt, by anointing them over with this Subject.

IT is credible, that fixed Nitre will preſerve Iron from Ruſt, ſeeing that it is equally contrary to Corroſives, with a ſimple Aqua-Calcis which performeth the ſame.

Point XXXI.

Bird-catchers, may by the help of this prepare ſuch a Birdlime, as will not be altered by Cold or Heat.

IF a Spirit be diſtill'd from Nitre, and Lapis Calaminaris diſſolved init, and the Spirit again drawn off, there will remain a thick and heavy Oyl, with which the Glue for Wood being throughly humected and diſſolved, it becometh tenacious and viſcous, which will not be dried by the heat of the Sun, but keepeth its unctuoſity in all Seaſons. NB. That Spirit of Salt, or Vitriol, alſo performeth the ſame thing, if any Glue be diſſolved therein.

Point XXXII.

Souldiers may by help of this prepare a fulminating powder from Gold, of which the magnitude of a Pea, put upon a red hot Iron Plate, will give a greater Clap, than half a pound, yea a whole pound of Gun-powder; the ſame may alſo be prepared without Gold, by the addition of Salt of Tartar and Sulphur, as it is deſcribed in the ſecond part of Furnaces.

AS for this point, it needeth no proof; for it is ſufficiently known, that of ☉ diſſolved in Spirit of Nitre (in which alſo was diſſolved Sal Armoniack) and precipitated with Salt of Tartar (or Spirit of Urine, which is better) then edulcorated and dryed, ſuch a powder will be made, which being put upon an Iron, Copper, or Silver Plate, and enkindled by a light heat, fulminateth more ſtrongly than half a pound of common Gun-powder, concerning which, I have treated at large in other of my Writings.

Point XXXIII.

Engineers, and makers of Fire-works, may perform many wonderful things, by the help of this Subject.

THat common Nitre is uſed in the making of Gun-powder, and other Fire-works, wants no Teſtimony, being a thing every where known.

Point XXXIV.

Many new Works belonging to the Weavers, and Smiths Art, may be made thence, which may be Communicated to Neighbouring Countries, in lieu of which, money may be brought into a Country impoveriſhed by War.

AS for this point, it is moſt certain, that by the mentioned Subject, various Manufactures may be perfected, which thing let no Man doubt; but there is no need here to particularize; let it ſuffice that I have verified (by the aſſiſtance of God) thoſe things which I have named, and propoſed to explain in that place.

Point

Point XXXV.

If Keepers of Vineyards, pour a little of this Subject to the Roots of their Vines, they will have ripe Grapes, and new Wine sooner than the rest of their Neighbours, of which they may make a good advantage.

PLebeians, Country-men, Gardeners, Vine-dressers, and the like, who are conversant about the propagation of Vegetables; do say, and believe, that Dung causeth Fertility, and the increase of things: But a Philosopher, penetrating farther into Nature, and who is a most diligent Searcher of her Works, attributeth that to the Salt which is hidden in the Dung, and the matter it self is no otherwise, for by digestion in the Stomachs of Men and Bruits, the essential Salt, as well of Animals, as of Vegetables, is transmuted into a Nitrous Salt, which together with the Excrements passeth out by the Belly, and is used by Men for the propogating of Vegetables of all kinds, but another Salt which doth not participate with that, is separated by another way, to wit, by Urine, the greatest part of which Salt is acid, and contrary to the growth of all Vegetables, (although it carrieth along with it some volatile Salt) it destroyeth, mortifieth, and taketh away from them the power of growing, yea, Life it self, if they be often moistened with it; but the Nitrous Salt reconded in Excrements, on the contrary, vivifieth all Vegetables, and maketh them to encrease, grow strong, and bear Fruit, which all men know. Therefore if it be probable that it is not the Dung, but the Salt which is hidden in the Dung, that causeth fertility and encrease, it will be possible, that an encrease by such a Salt may be procured in all Vegetables equally as with Dung it self, and indeed better, for there is Urine also conjoined with the Dung; which if it be not for some time exposed to the Air and the Rain, for the washing away that sharp Salt, the Dung would avail nothing to the fattening of the Earth, which Country-men know, and therefore they do not presently use their fresh Dung, but lay it in the Fields before Winter; Vine-dressers in their Vineyards; and leave it there all the Winter, to that end, that the Rain may wash out that sharp and hurtful Salt; and this being done, then at length they mix it with their Earth; and the event teacheth them that this fattens more than Dung carried fresh out of Stables, and full of Urine. Therefore if I know how to make a Nitrous Salt, which is reconded not only in the Excrements of Men and Brutes, but also in Rain-water and common Earth, I may use this instead of Dung, (being first purged from its contrary acid) one pound of which will perform more than an hundred weight of Dung; yet in the mean time it conduceth to that purpose, if a little Sheeps-dung be dissolved together with the purified Nitre, in Water, with which the Roots of the Trees are to be moistened or Seeds throughly wetted with the same. And this I have proved more than once, and found, that by the help of Nitre well depurated, an encrease is most powerfully and swiftly promoted, yea, more than can be believed. NB. That I would have none understand me, as if common Nitre were to be taken, which is not at all profitable in these matters.

Point XXXVI.

Nevertheless Must and Wine may be ripened after another manner in the Hogshead, without this Art, so that they who understand the way may have alwaies good Wine, when others have it sowre, &c.

THis is a very fair and profitable Secret in those places, where Wines, by reason of cold, cannot come to maturity, but are forced to remain crude and impotent, which by this Remedy may be brought to maturity in the Hogshead; so that Wine which is eager and sowre, may be made delicate, friendly, generous, and durable. And although I here write nothing but the truth, and what I have often effectually proved, yet I very well know, that but a very few will apprehend or believe it, which matters little to me; I am satisfied, that I have verified what I have written in this point.

Point XXXVII.

There remains yet another thing very profitable to Country-men. The juice of Apples or Pears being pressed out, by the help of this subject, such an effervescency or working is promoted, as Wine may be thence made, having the relish of the natural, and but little inferiour in durability and strength, &c.

IN this point mention is made how the juice of Apples, and Pears, may be corrected, that it may be like to Wine, keeping many years uncorrupted: which certainly is a Secret of great moment and profit. Apples, when ripe, of their own accord fall from the Trees, every thing hath its period; what advantage may be made by this Art in those places, where a great quantity of Fruit groweth; whether is it not better to make this use of them, than to leave them to rot and be lost? I will do what lies in me, and not bury my Talent, that I may be rendered excusable before GOD and the World, although that which I teach may not be received, as becometh it to be used. At length, after my Decease, it will be observed, what is hidden in my Writings, but the *Phrygians* were wise too late. Therefore I again affirm, that all things contained in this point, are purely true, and may be perfectly effected. [*See Apology against* Farnner.]

Point XXXVIII.

If Husband-men moisten their Seed with this Menstruum, *it will sooner be ripe, and have larger and fatter Grains than ordinary: which being done, I will shew by what means they may make great profit of their Grain,* &c.

THE 35 Point confirms the truth of this, That Grain will grow the more plenteously, if it shall be humected with the Nitrous Water above-mentioned, before it be sown, but common Nitre is not here to be understood. The other is also consentaneous to Truth, which is written about the most profitable use of Grain, which none need doubt; for as yet more may be done in that than I have here spo-

ken

ken of, for without much labour and coſt, by that water, every good and kernelly ſubſtance, as I may ſo ſpeak, of Grain, is extracted, which Extract may be kept for many years, as a Treaſure of great moment, of which afterwards, at any time or place, (by the addition of Water of Hops) good Beer may be made, and Vinegar, and burning Spirit; it is alſo of ſuch a very Nutritive ſubſtance, that in caſe of neceſſity it may be uſed inſtead of Bread, one pound of which will afford more nouriſhment than two or three pound of Bread made after the common manner. It may alſo be kept in Garriſons with great commodity: Alſo it may be uſed at Sea, by thoſe who ſail to the *Indies*, and trade about in Ships, when they want Bread; of which by the addition of warm water of Hops, may be made very good Beer, at any time of the year, for it is eaſily and wholly diſſolved in warm water. For this reaſon alſo it may be moſt commodiouſly carried from place to place by Armies in time of War, which in the Field, at any time, Winter or Summer, with the water of Hops, it may be boiled into Beer, and there is no need to carry the water far, becauſe it is to be found in all places; neither are Hops of any great burden; therefore in one only Tun there may be carried of this Extract as much as ſufficeth for the brewing of ſix or eight Tun of Beer; and which is more, by this means, wholeſome Beer may be made in the *Dog-daies*, as well in Camps, as in Cities and Ships, without any fear of impediment or future ſowrneſs; at which time good Beer is not otherwiſe made, becauſe then it is wont preſently to grow ſowre; and many other Commodities are procured by this means, all which to declare, would be ſuperfluous. Let what hath been ſaid ſuffice.

Point XXXIX.

I have yet one thing to add among my Wine-Arts, concerning Grain, and the Fruits of Trees and Shrubs, which is to be received with Thankfulneſs, as a great Gift of God to Mankind, viz. *It is found by induſtry and manifold experience, that from Rie, Wheat, Oats, Rice, Millet; alſo from Apples, Pears, Peaches, Cherries, Plumbs, Sloes, Damſcens, Quinces, Figgs; as alſo from Gooſe-berries, Mulberries, Barberries, Black-berries, Elder-berries, and other like Fruits of Trees and Shrubs; from all theſe, I ſay, may be prepared with little labour and coſt, a Drink very like to Wine, both in taſte, ſmell, and ſtrength, being grateful, wholeſome, and durable,* &c.

IN this point mention is made, That of the Fruit of Trees and other Buſhes and Shrubs, a clear Drink may be made, which is alſo grateful and durable, being like to Wine in taſte, colour, and virtue; which thing, although it may ſeem ſtrange to thoſe who are ignorant of the matter, nevertheleſs it is moſt true; ſo that thoſe things which are contained in this point, may be boldly credited. For what ſhould it profit me to write thoſe things which I am not able to prove, it would only turn to my diſgrace and detriment. For this reaſon I have determined to have ſuch a Laboratory prepared, in which not only the owners of Metallick Mines (if they deſire it of me) may learn the manner by me newly invented, for the compendious melting of Minerals, ſo that they ſhall yield more Metal, than by the known and common manner; but will alſo ſhew other Secrets, that the *Magnalia* and wonders of God may be made manifeſt, and We ſtirred up to give Thanks to the Giver of all Good: Which Elaboratory ſhall continue open for one whole year, which being paſt, it ſhall again be ſhut up and ceaſe; for I purpoſe not to render the whole courſe of my Life obnoxious to thoſe great Labours, but at length to enjoy a quiet tranquility; which thing I am willing that all men ſhould know, that they may ſpare me with their Letters, which it is impoſſible for me to anſwer, much leſs that I ſhould ſee the Perſons, ſeeing that the burden of journying is to me altogether inſupportable; but whatſoever I may perform at home, I will not refuſe. [*See for this point Apology againſt* Farnner.]

Here thou haſt, benevolent Reader, a fundamental Explication of my *Miraculum Mundi*, (as for thoſe laſt points, to wit, 36, 37, 38, and 39, they might indeed have been very commodiouſly explained here, but becauſe this is done at large, in a peculiar Treatiſe, entituled, *The Proſperity of Germany*; there is no need to explain them in this place; therefore what the benevolent Reader finds wanting here, there he ſhall find it at large, to which I remit him) whereby it will appear to all men, unleſs to thoſe who are wilfully blind, that I have not aſcribed too much to the Salt of the Earth, as a univerſal ſubject, but that I have proved to the whole World, that every thing which I have attributed to it, is poſſible, and plainly agreeable to Truth. But that theſe Secrets which I have proved, may be performed by the benefit of the Salt of the Earth, may not be done by other waies, and perhaps nearer, I go not about to deny, but do neceſſarily affirm, that the mentioned Metallicks, as well as the Mechanicks, may be performed after other manners. Only here it is verified, That the Salt of the Earth is deſervedly eſteemed a univerſal ſubject, which no man will deny, nor will be able to refute by Arguments, ſupported by truth, how wiſe ſoever he may ſeem to himſelf. Therefore let its vileneſs offend no man, for the beſt of things is oftentimes hidden in things of ſmall price. Wherefore all men erre, who attribute good to outward ſplendor, in which yet it is not, but is only to be ſought, found, and obtained in things vile, and of low eſteem. **Note this, believe this, otherwiſe thou wilt never attain to any Good.**

But here ſome Man may object in this manner: If Nitre be a Univerſal Menſtruum according to my praiſes of it, it will thence neceſſarily follow, that the ſtone of Philoſophers ſhould be made by it, of which nevertheleſs I have here made no mention. To obviate this Objection, I do indeed readily confeſs, that I have not proceeded in this ſubject, any further than thoſe things which I have now proved; but without doubt it containeth in it ſelf greater things, than are manifeſted to me and others. I have made a beginning, I have ſtrowed the way, let others follow me, and proſecute the thing further, if God ſhall grant it to them; as for me I am content with ſmall things, and do not anxiouſly, or ſollicitouſly aſpire after the higheſt. Yet in the mean time, this I freely confeſs, if I were not ſo old as I am, I ſhould not leave this Matter unaſſay'd. It is not to be doubted, but many men have ſought the Univerſal ſtone in Nitre, but what they have found, that themſelves know; and of this I am the more aſſured, becauſe there Matter in the end of the Work taking fire, hath vaniſhed like a Clap of Thunder; hence the ancient Philoſophers have performed their work in Winter, leſt they ſhould be hurt by Corruſcations; it is moſt

true,

true, and void of all errour, that a moſt noble eſſence of this ſort, obtaining a power of expelling all the Natural Diſeaſes of Mortals, and of tranſmuting all the imperfect Metals into Gold cannot be prepared from an impure Metal, or Mineral, nor alſo of Gold it ſelf. Much leſs of viler and more unlikely things in which Fools are miſerably Occupied, prodigally, and unprofitably waſting their Goods; but in my judgment, it ſhould be no other thing than a Concentrated Aſtral fire, exalted by Art, into the form of a ſtone, without any other Adventitious matter. For in the nature of things, no purer Eſſence can be found, than fire, exerciſing a very great power in all things, eſpecially in Metals: For if we had not fire (I pray conſider it) all Arts, and Mechanicks would grow cold, and be involved in the dark ſilence of Ceſſation. Arts were invented, and draw their Original from the fire, otherwiſe how ſhould Metals be got out of their Minerals, and prepared for uſe? truly they would be of no uſe at all. Therefore the fire containeth more than can be believed. He that doth not know fire to be a moſt powerful Element, knoweth nothing, nor without this, can he find out any thing, neither by any juſt right can he aſſume the Name of a Philoſopher. The fire alone, without the addition of other things, is ſufficient to make Metals of ſtones, and particularly, the beſt Metals out of the vileſt ſtones, provided we know how to uſe it; but univerſally, being concentrated into a ſtony matter; which laſt although I have not experienced, nevertheleſs I have obſerved, if (by the favour of the Almighty) a man could exalt the fire into a Corporeal fixed ſubſtance, he would certainly have a Tincture for men, and the imperfect Metals. But ſome man may object, by what way is this Crown to be obtained? Truly by no other than by Divine Revelation. For the Secrets of God of this ſort, are not ſo eaſily to be found out, nor will they be manifeſted to Impious men, although the whole World is infected with a fooliſh madneſs, who doatingly think by force to extort Gold from things in which it is not, and one that hath underſtanding of the fire and Metals, cannot ſufficiently admire thoſe fooliſh and doltiſh Labours, which they who are Captivated by the hunger of Gold, undertake for the making the ſtone of Philoſophers; many being willing to aſcend the Ladder, are preſently ſollicitous about the uppermoſt Round, when notwithſtanding they are as yet far from the lowermoſt ſtep: But this is a matter of a higher and more diligent ſearch. In the fire, I ſay, are contained Secrets of great moment, yea, inſomuch that ſome Philoſophers (among whom *Plato* is the chief) write that God is moſt clearly diſcerned and apprehended in Fire and Salt. Fire, and the Immortal God alone can make light of darkneſs, which is granted to no Mortal to do; without fire is darkneſs and death: Without fire nothing can live, nothing groweth or encreaſeth.

In ſum, Fire is the moſt Noble, and moſt Potent Work of God in the whole Univerſe, he that knoweth how to uſe it rightly, will have need of no Art. Let the Benevolent Reader alſo take with him my ſmall judgment concerning the great ſtone of the wiſe; let every man believe what he will, and is able to comprehend. Such a work is purely the gift of God, and cannot be learned by the moſt acute powers of an humane mind, if it be not aſſiſted by the benign help of a Divine Inſpiration. And of this I aſſure my ſelf, that in thoſe laſt times, God will raiſe up ſome, to whom he will open the Cabinet of Natures Secrets, that they ſhall be able to do wonderful things in the World, to his glory, the which I indeed heartily wiſh to Poſterity, that they may enjoy, and uſe to the Praiſe and Honour of God, *Amen*.

The *EPILOGUE*.

I Doubt not but many Men conſidering the great good that may be effected by the benefit of Nitre, will be deſirous of knowing how they may attain it in great quantity, that ſo they may not be forced to buy it at a dear rate; which certainly would be a great help not to a few who labour in the fire, and I could wiſh from my Soul, that all honeſt and pious Chymiſts might be able to recover ſome compenſation for the Coals they have conſumed without fruit. But ſeeing that I have made mention of the production or preparation of Nitre, in a peculiar Treatiſe entituled, *The Proſperity of* Germany; it is needleſs here to repeat it. But this I will ſay by way of prediction, that Nitre, being throughly known by my Writings, true Alchymy, or the Tranſmutation of the imperfect Metals into better, will in a ſhort time be as common, as it was in *Egypt* long ſince in the time of the Emperour *Diocleſian*, who could not overcome or ſubdue the *Egyptians*, until he had by many Cruelties extorted their Books from them, which he burnt, and ſo brought them under the yoke of ſervitude. NB. That it is no wonder that the Tranſmutation of Metals ſhould have been ſo common with the *Egyptians* only, ſeeing that Nitre is found in all places of the Land of *Egypt*, and the famous River *Nile* is impregnated with Nitre, which only by its overflowing (which it doth twice in a year) ſo fateneth the whole Country, that it is made very rich and fruitful in all things without dung; for the *Nile* aboundeth with Nitre, as the Sea doth with common Salt. For at certain times of the overflowing, *viz.* in the beginning, the inhabitants are wont to dig deep Pits, that they may remain full of the water, which being afterwards dried up by the Sun, Nitre is very Copiouſly prepared, as common Salt is made in *Spain*, and other hot Regions. This therefore I was willing to diſcover for the information of the Reader; if he be wiſe, and God be propitious to him, he will believe that I have ſaid enough; but if not, an Explication ten times clearer will not help him. Therefore let it ſuffice, that what is here deſired, ſhall be had in thoſe Treatiſes which are entituled, *The Proſperity of* Germany, whereby a man filled with the Love of God, will be greatly delighted.

THE

CONTINUATION

OF

Miraculum Mundi.

In which Nature is clearly laid open to the Eyes of the whole World; demonstrating, that the chief Medicine of Vegetables, Animals, and Minerals, may be prepared of Salt-petre, and that Salt-petre truly merits the Name of an Universal Menstruum.

The PREFACE, to the READER.

THis Treatise, *to which I have given the Title of the* Continuation of Miraculum Mundi, *containeth four excellent* Arcanums, *which I doubt not, but will prove very profitable to the publick. The first of these I offer to Country-men, as Husbandmen, Vine-dressers, Gardeners, and all such who are occupied in Tilling and manuring the Earth, that they may learn a new Method of fattening and enriching their Fields and Gardens, without the usual and customary way of dunging, and thence yearly acquire a greater profit.*

The Second, I give to all Citizens, Merchants and others who have time and leasure, and abounding in riches, know not by what means to augment or improve their Gold and Silver. Which way I will shew them, and how to effect it after a much better and honester manner than putting it to Usury, or incommoding or oppressing their Neighbours.

The Third, I present to all Conscientions Physicians that they may learn to prepare Salutiferous and Efficacious Medicines with small charge, little labour, and in a short time; that (as becomes Christians) they may help and succour the Miseries of the sick, and acquire to themselves an honest livelihood.

The Fourth, I dedicate to all persons of great Name and Authority, by the benefit of which, they may preserve their Health entire, and recover it when lost.

The Omnipotent God give us his Divine Grace, that we may make such use of his fatherly bounty, as may tend to the promoting of his Honour, and the Love of our Neighbour. Amen.

Arcanum I.

Being a Gift given to Husbandmen, keepers of Vineyards, Gardeners, &c.

ALthough I had determined with my self to reserve the Press, mentioned in the first part of *The Prosperity of* Germany, (by which the juice might be pressed out of great Trees, the searching after which hath wearied many Mens Brains) for the third part of the same work; nevertheless, it seems good to me to describe it in this Treatise for the good of the publick. And that chiefly for this reason, because the Omnipotent God hath now revealed to me other manners of extracting Salt-petre, in plenty, out of all Wood, and that without a Press; and not only from Wood, but also from all Vegetables, Animals, and Minerals, so that by an easie business, and in a short time, without a Press and putrefaction, Wood, and Salt may be converted into Salt-petre: Yea, in the space of three or four hours, every Vegetable, or Animal, as also Salts of every kind, may be so transmuted, as that they pass into a Fatt, fervid and sulphureous Salt, which afterwards by the benefit of the Air is animated, and converted into Salt-petre. Such a Salt, although it doth not presently conceive flame, and burn like Salt-petre, yet it is now brought to that pass, that in the manuring or dunging of poor and barren ground, it doth the same thing as the dung of any Cattel is wont to effect. Hence by the same Salt every pure Sand destitute of all fatness, is quickly so fatted, that it is rendered fit for the sowing and bringing forth Corn. Few will believe what Salt can perform, when spoiled of its Corrosive force. Therefore Christ saith not in vain to his Disciples,

Ye

Ye are the Salt of the Earth. That Earth which wanteth Salt is dead; nor can it bring forth Fruit: For this inverted Salt ſerveth not only for ſandy and plainly barren Fields, but alſo for thoſe which are fruitful, that they may be ſowed every year, and bring forth Fruit. Truly it is a great Gift of GOD, of which this ungrateful World is not worthy. It often happens, that a Husbandman, through want of Dung, is forced to let his Fields lie unſown, till he can have an opportunity to ſow them; but what a loſs is this to thoſe who in the mean time muſt pay the Magiſtrates, Taxes, or Duties, for them, and yet make no benefit of them. Were it not better for ſuch to poſſeſs only the Third or Fourth part of what they have of ſuch Land as would yield him every year an encreaſe. Certainly by this means, that Land which otherwiſe is ſcarce able to maintain one Country-man, would be ſufficient for the keeping of ten, if it were fatened after this manner by an inverted wood or ſalt. In like manner alſo Vineyards [*and Hopyards*] might be ſo fattened, that the Labour beſtowed upon them might not be in vain, but they might abound in Fruits.

So alſo Fruit-trees, and Meadows, and Paſtures, which bear but little Graſs, may by the ſame Salt be ſo amended, as to bring forth better Fruit and richer Crops of Graſs. But let this ſuffice, concerning thoſe things in this place, more ſhall follow (God willing) in the Third Part of *The Proſperity of* Germany. In the mean time the Plenty of Corn and Wine will be in part conſumed. But I doubt not but that this excellent Gift of God will be ſought into by good Maſters of Families, be had in eſteem, and even from this time to the World's end, be put to uſe for the promoting of the Divine Honour, and the well-being of many Thouſands of men.

Vid. *Proſp. Germ. p.* 3.

But the manner of expreſſing of Wood by its proper Fire, and again of coagulating this acid juice, by the benefit of the fixed Salt remaining in the burnt Coals or Aſhes, into a Salt fattening of barren ground, or of reducing it into *Salt-Petre* by the benefit of the Air, is indeed an excellent and ſingular Artifice, which rendereth all unprofitable Wood highly profitable and beneficial; yea, theſe are Inventions ſo profitable, as the like hath been yet publiſhed by no man. And this Invention is much better than that of reducing Wood into Pot-aſhes, in which all the acid juice paſſing away in ſmoak, wholly periſheth, and is loſt, and from a great quantity of Wood a very few aſhes remain, and out of them there is found but a little Salt (ſcarcely the Tenth Part) fit for the fattening of ground, or to be turned into *Salt-Petre*. For it is not the aſhes, but the ſalt contained in them, that ſerves to both thoſe purpoſes. Therefore this my method of extracting the juice of wood, and converting it into a good ſalt, is far to be preferred to the making of Pot-aſhes of Wood. Nor doth this preſs ſerve only for the preſſing out the juice of Wood, where Wood is plenty, but it may be alſo uſed with great profit in Mooriſh places where Wood is wanting, and which abound with Turf, which may be uſed inſtead of Wood. For the juice of Turf is equally fit with the juice of Wood for enriching of Land; ſo that no Country hath cauſe to complain that the Creator of all things hath not plentifully provided it with ſome part of that *mundane* Treaſure. Countries that lie high abound with Wood, and the low afford abundance of Turf. Therefore, as in Regions of an higher ſcituation, an unſpeakable quantity of Wood periſheth by putrefaction, and growing, and again rotting, ſerveth for no uſe or benefit; ſo alſo it is in places lower ſcituated, with Turf, in which very often vaſt Tracts yield not the leaſt profit to any man, although in their inward Penetrals are hidden great Treaſures. Seeing that it is ſo in Mooriſh and Marſhy places, if they are overgrown with Graſs, and Beaſts ſhould be ſent to feed upon that Graſs, what profit will thence accrue to men? But if they ſhall be invironed with too much wet or plaſhineſs, (too boggy) ſo that they are impaſſible by men, they are of no utility at all.

There are Marſhy tracts which are covered over (or ſwerded only with Moſs) which neither afford Turf, or nouriſhment for Cattel, inaſmuch as the growth of Graſs, and Turf fit for burning, is hindred, either by too much Sand, or large Moſs. And yet thoſe very tracts being preſſed by Fire, yield a fertile juice, by which the neighbouring Fields (eſpecially the Sandy) may be rendered fruitful. For thoſe Moors or Marſhes contain nothing but that fatneſs which the Rain-water hath collected from the neighbouring, high, and ſandy grounds, and waſhed down with it ſelf into the Valleys, where it concreteth into Moſs; whence of right it ſhould be reſtored to thoſe barren ſandy grounds, to fatten them. And by this means it may be brought to paſs, that great fruitfulneſs may be conferred on much deſert and waſte Land, which brings no profit at all to Mankind. What I ſay, is agreeable to the Truth it ſelf, and perhaps in Proceſs of time, will be found moſt true, and come into uſe in very many places. But at this time, theſe things ſeem to Country-men, meer Dreams, and far exceed the Capacity of their maulted Brains. But as every fat Marſh is able to fatten the adjacent, barren, high, ſandy grounds; ſo the Ocean is the Univerſal Medicine, and nutriment of all high and barren Regions, through which it paſſeth, and by the ſalt contained in it, beſtows upon them fruitfulneſs. [*Vid. Nat. Salium.*] Whence the incredible Providence of the Divine Goodneſs manifeſtly appeareth, for which unceſſant Thanks are to be given to the Almighty by all men, for His Fatherly Care, and great benefits never to be forgotten. But how the Sea-ſalt fatteneth, and maketh fruitful ſandy-ground, which is deſtitute of all fatneſs, ſhall afterwards be exactly demonſtrated. Here, by the way, in the Deſcription of my Preſs, for the preſſing of wood, I was willing to mention this thing. How much better therefore is this my Art and Invention of preſerving the juice, and almoſt the whole *pondus* or weight of the wood (the unprofitable Phlegm only excepted) in that tranſmutation, than the invention of reducing it to Pot-aſhes? For any man of Underſtanding may eaſily ſee, That in that open burning of the wood the noble Sulphur is conſumed by the Fire, and can be of no benefit. But if the buſineſs may be ſo ordered, that the wood ſhall burn, and not conſume it ſelf in burning, but be converted into a ſulphureous Salt, it will be a thing of great moment. He that knoweth how to perform this, hath indeed attained the ſcope, and arrived to the deſired end. Although a Coal be deprived of its juice, nevertheleſs it retains almoſt the ſame quantity that the wood had, whereof it was made. One pound of ſuch Coals being burnt, ſcarce yields an ounce and an half of aſhes, which aſhes afford but a third or fourth part of Salt, fit to be changed into *Salt-Petre*, or to fatten the Earth. Therefore it is no ſmall Art to preſerve the Sulphur of the Coals (whoſe Virtues are great) and to convert it into ſo noble a Salt.

For the acid juice of wood being preſſed out, and reduced to ſweetneſs, will effect far more in the manuring and fattening of Fields, than any one can eaſily believe. Hereafter, if I ſhall ſee it neceſſary, I ſhall publiſh yet more and greater things; but I ſhall yet for ſome time ſuſpend the publication of the Third Part of *The Proſperity of* Germany, till I ſee how things will prove; being aſſured that my Writings for time to come will be more grateful, than to this preſent Age. I will now enter upon the deſcription and uſe of the Preſs ſo often mentioned, for the expreſſing and again coagulating the juice of Wood.

Of the Figure, Uſe, and Utility of the Preſs, by whoſe help the Juice is plentifully preſſed out of Wood, without great labour, fit for the making of Salt-Petre.

The Form or Figure.

FIrſt, Let a round Furnace be built with Bricks of the ſame form with that in the firſt Figure, noted with the Letter A. It muſt be like a Glaſs-maker's Furnace, large at the bottom, and riſing round by degrees to a ſmall point at the top; in the top muſt be a round hole, opening about a foot broad, by which the Wood may be put into the Furnace. To the hole is to be fitted a Cover or Stopper, made of the ſame matter, with the Bricks, and burnt as they are, to ſhut up the hole. On one ſide of the lower part of the Furnace, is to be a door, by which the Coals may be taken out. On the other ſide is to be a little hole, to which an earthen Channel or Pipe of about three or four cubits long, is to be fitted, in which the ſmoak or fume of the wood, forced out by the fire, may be condenſed into an acid juice, and may deſtil into a wooden Veſſel or Barrel, which is to be fitted to the Pipe, to receive the deſtilling acid juice. See the firſt Figure noted with *pag.* 13. at the beginning of this Treatiſe.

A *is the Furnace or Oven wherein the Wood is char'd.*
B, *The Cover of the Furnace.*
C, *The Door at which the Coals are taken out.*
D, *The Canes or Pipes wherein the ſap or juice of the Wood is condenſed, and from thence runs into the Receiver.*
E *is the Veſſel or Receiver into which the Vinegar of Wood runs.*

All things being prepared in the manner aforeſaid, let the Furnace be filled with wood up to the top, and if the wood be not dry enough, intermix with it, in the putting in from the bottom to the top, ſome dry Shrubs or Buſhes, or ſmall Faggot-ſticks, by whoſe help the wood may be the more eaſily kindled. After the wood is kindled, and burns well, the hole in the top of the Furnace is to be cloſe ſhut with its Stopper, that there may be no exit for the ſmoak, but that it may be forced to deſcend and ſeek its paſſage through the lower hole, by the Channel or Pipe. Therefore when the wood begins to burn, and yet can emit no flame, the heat preſſeth out all the juice, and forceth it into the pipe, in which, from the ſmoak, it is changed into an acid Juice or Liquor, which deſtilleth by the Pipe into the appointed receiving Barrel. All the wood being turned into Coals, and emitting no more fume, the whole Furnace, whereſoever it may admit the air; and alſo the hole to which the Pipe is fitted, is to be ſmeared over with wet aſhes, that the Coals in the Furnace being ſuffocated or choaked, may remain entire. The Coals being taken out, may be put to neceſſary uſes, being equal in goodneſs to other Charcoal which Colliers make in Woods. NB. I would have this underſtood, of ſuch wood as is of a pretty good thickneſs, and ſuffers its ſelf to be reduced into Coals; for if you caſt into the Furnace Buſhes or ſmall Bruſhy wood, to preſs out the juice, you will obtain only a Powder of Coals, which after the juice is preſſed out, is to be left in the Furnace open (not ſmeared over, as we taught above) till it paſs into aſhes, which is required for the coagulating the expreſſed juice; as ſhall appear by and by, when we come to ſpeak of its coagulation. NB. When you have no occaſion for Coals, or cannot ſell them, it is neceſſary, that letting the Furnace be open, you ſuffer them to burn to aſhes. If this operation be inſtituted in a place where there are ſtones fit to make Lime of, it would be worth the while to fill the Furnace with a layer of Wood, and another of Stones, from the bottom to the top, which Chymiſts call *Stratum ſuper Stratum*, and after the juice is preſſed out to open the Furnace, that the wood may be turned into aſhes, by doing of which at the ſame time the ſtones will be calcined, and changed into Lime, which being expoſed to the air, (yet ſo that the Rain cannot come to it) will fall to pieces into a fine powder. To this Powder, being mixed with wood-aſhes, the acid juice is to be poured, which was preſſed out of the wood, that thoſe two contrary natures may mutually work upon each other, and well unite: in which operation the ſharp ſpirit of the wood loſeth its Acrimony, and the fixed Salt of the wood and ſtones is altered, ſo that from both there proceedeth a contrary middle nature, and a ſweeter ſalt; which being long expoſed to the air, draweth from thence a Life, and is tranſmuted into the beſt Salt-Petre. NB. This mixture is ſo to be expoſed to the air, that lying under a Covering or Roof, and being open on the ſides, it may be defended from the Rain, and nevertheleſs attract the air. If it ſhall be dried by the air, it muſt be moiſtened again with the Urine of Men or Beaſts, that it may never be throughly dry. If theſe things be rightly performed, you ſhall have plenty of the beſt Salt-petre, from this matter, in the ſpace of a year and an half, or two years at the moſt; which being extracted, purified, and boiled up, ſhooteth into very pure Cryſtals. The reſt of the matter being again laid in its former place, under the covering or ſhed, and being ordered in the ſame manner, as before, will in the ſpace of two years produce new Salt-Petre, which may be extracted and boiled up as before; for that mixture ſtill remaineth good, provided it be moiſtened with Urine when dry, as was ſaid. NB. He that deſireth to acquire Salt-petre ſooner, after the conjunction of the acid ſpirit with the aſhes, and the precipitation and mortification of both, from that conjoined matter, by the pouring on of water, he may extract and boil up the Salt, and then diſſolve the Salt in Urine, and digeſt it by Circulatory Veſſels; by which means he may obtain the beſt ſalt-petre in the ſpace of one year. This labour of preſſing the juice out of Wood, and at the ſame time of making Stones into Lime, may be uſed in all thoſe Cities and Places where wood and ſtones are plenty. But if this operation were to be inſtituted in a Wood, there would be no need of a Furnace built with ſtone, ſeeing that the Pile of Wood might be covered all over with green Turfs, after the

the ſame manner which Colliers uſe in making their Charcoal, only with this difference, that here muſt be a hole in the ſide, to which the duct or pipe is to be adjoined. The juice being preſſed out, the pile or ſtack is to be every where well cloſed, that the Air may have no paſſage, if you would preſerve the Coals. All being cooled, the Coals may be taken out and ſold, or put to neceſſary uſes, ſo that the expreſſed juice, which being received in no Veſſel, would have vaniſhed in ſmoke, plainly coſts nothing; but if you do not deſire Coals, let them be burnt into aſhes, that they may ſerve for the coagulating the ſpirit into ſalt, and afterwards by the help of the air, in a certain ſpace of time tranſmute it into good Salt-Petre.

NB. It is here alſo to be noted, that the expreſſed juice carries along with it a ſharp hot Oyl of a dark reddiſh colour, which is not to be caſt away, but is to be poured upon the Aſhes together with the acid Spirit, that putrefying with the Salts, it may with the reſt put on the nature of Salt-petre. But he that will may apply the ſame to other uſes; foraſmuch as it is profitable for other things. Any Wood expoſed to the Rain, or ſtanding in the Water, eaſily rotting, being anointed with this Oyl, will be preſerved, ſo that it will not ſo eaſily rot, ſeeing that the water cannot adhere to the Wood, but is forced to ſlide off, or is hindered from penetrating the Wood. Carters, or Waggoners may uſe the ſame inſtead of Greaſe to their Wheels and Axle-trees, eſpecially when it is a little thickened with Suet or Roſin. But the beſt uſe of it that I yet know (if you except Salt-petre) is to diſſolve and boil it with a ſharp Lixivium made of Lime and Aſhes, by which it becometh a very hot and penetrant Soap, procuring fertility; if a poor ſandy ground be ſprinkled with the ſame and moiſtened: For it rendereth it very fruitful; which thing it doth not only in Fields, but alſo in Trees and Vines, inſomuch, that one Tun of it avails more in the fatening of Fields, than ten Cart Loads of Horſe-dung or Cow-dung: And a Hogſhead, or Tun of this Soap may be carried into Fields and Vineyards, far remote, more eaſily than ten Loads of Dung, which is carried to Vineyards ſituate in Rocky places with great labour, and no ſmall charge.

NB. If this Soap be uſed for the fattening of Vines, too much of it is not to be uſed at a time, leaſt the Vines grow too fat and luxuriant; therefore its moderate uſe is required, which needs not that exactneſs in the dunging of Arable Land: Although in that an exceſs brings damage, and indeed it is the exceſs of good things that doth harm. A Tree, or Vine being made too fat by dunging, grows luxuriant, and putteth forth more fruit than it can bear and bring to Maturity. The Wood it ſelf becomes too fat and ſoft, ſo that in the Winter it is eaſily injured by the cold. Whence in all things a Mediocrity ought to be obſerved. This Black Soap made of the Oyl of Wood, is truly a very great gift of God, in thoſe places where Sand renders the ground barren. Hence the admirable Wiſdom of our Creator appeareth, as it were thus ſpeaking to us: *Ye rude, and unskilful men, wherefore do you leave this place uncultivated? Becauſe you cannot ſow it with any kind of Grain, I will that it ſhall produce wood, and afford you a matter, with which, if you will, you may render it fat.* For it is ſufficiently known, that Animals, and Vegetables rotting, dung the earth, and render it fat; which thing even the Ruſticks have now learned, that they do the ſame without putrefying or rotting, when they cut down, and burn the Trees and Buſhes, which had grown up in the Fields, during the long time of the War, and ſpread the Aſhes on the ground, by which it is fatned. But that they know not how to ſave, invert, and uſe with the Aſhes for dunging, the acid Spirit, and hot Oyl, which vaniſh in the burning, ought to ſeem ſtrange to none, ſeeing that no man hath hitherto declared it to them. Nevertheleſs, I perſwade my ſelf that this way of dunging of Land, will come into uſe, in proceſs of time, but I believe not quickly [here in *Germany*] by reaſon of that great quantity of grain which every place affordeth in this time of Peace. But if hereafter, a new War ſhould happen (which God avert) and the Fields ſhould lie many years untilled, through the want of Men, Horſes, and other neceſſaries, then I believe, and not before, this neceſſary Art will be ſought after.

But what other things the ſaid juice of Wood is able to effect, we cannot here declare, by reaſon of our intended brevity: Yet this I will add, that if this acid Spirit be rectified, it may be uſed in the preparation of good Medicines, in Mechanick Arts, in the making of many fair Colours, from the extraction of Metals, Minerals, and Stones, and for all things for which common Vinegar is uſed; yea, far more commodiouſly, becauſe it much exceedeth the common Wine, and Beer Vinegar in ſharpneſs. And even it ſelf alone is a Medicine which cureth many incurable Diſeaſes; being mixed with warm water, and uſed in a Bath for waſhing the Body, is far more efficacious than thoſe Baths which iſſue out of the Earth; eſpecially in all Scabs, in Members relaxed by the *French* Palſie, *Paralyſis Gallica* [I ſuppoſe he means the Venereal Lues] in Fiſtulous and ſtinking Ulcers in the Legs and other parts of the Body. Alſo in the Gout, Stone, Cramp, Sciatica, Palſie, Diſeaſes of the Womb, and all ſorts of ſickneſs otherwiſe to be cured by the help of Baths, which this Vinegar preſſed out of Wood, far exceedeth in Salubrious Vertues.

The ſame alſo doth the hot Oyl which is expelled by expreſſion with the Spirit, which exerteth wonderful Virtues in curing thoſe Ulcers and external affects. For which certainly, as a great gift, and to be eaſily found in all places, none of thoſe who are burdened with grievous Diſeaſes, can render ſufficient thanks to the Almighty: But eſpecially the Poor, who have not Money to buy Phyſick.

NB. Here alſo it ought to be obſerved, that thoſe who uſe the Bath tempered with the juice of Wood, ſhould before they enter into it drink ſome ſpoonfuls of this Vinegar. For this Vinegar by penetrating the whole Body, caſteth out all things ſuperfluous and noxious to nature by ſweat, and openeth all Obſtructions of the Liver, Spleen, and Lungs: And eſpecially when the Vinegar is elicited from a Wood, or Herb, which is endowed with peculiar Virtues for the eradicating of thoſe Diſeaſes. As for Example: The acid Spirit of the Vine, Beech, Birch, and the like, taketh away the Obſtructions of the Internal Bowels. That of the Oak, and other hard Woods, cureth the Corruption of the Blood, and all Diſeaſes proceeding thence, as the Pox, Leproſie, external Ulcers of all ſorts, Scabs, Fiſtula, and all open Sores. Alſo all Contractures or Cramps, Falling-ſickneſs, Apoplexy, and Palſie. So the Vinegar of Aſh, Cherry-tree, Plumb-tree, Sloe, or Bullace-tree, Medlar-tree, Arbute-tree, and the like Trees, which bear Fruits having Stones or Kernels, cure the Gout, and the Stone of the Reins and Bladder. That of Balſamick

Herbs, as St. *John*'s Wort, Sage, *Paul*'s Betony, or Fleuellin, Sanicle, Betony, Lung-wort, Liver-wort, Saxifrage, and other like, taketh away the internal Hurts of the Liver and Lungs, and all inward affects arising from Blows, Falls, *&c.* So efficacious a Medicine is this juice of Wood, that the most costly Galenical Compositions are forced to give it place. In making the Bath one Pound of the acid Spirit is to be added to ten pints of water, and this quantity to be augmented, or diminished, according to the condition of the Patient and the Disease.

Before the use of the Bath, some drops of the Oyl may be adjoined to the spoonfulls of Spirit, which so fortifieth the Spirit, that it more readily penetrateth the body, more forcibly accosteth the Disease, and the sooner expelleth it. In Gouty Pains, and in the stone of the Kidneys, the same Oyl being rubbed upon the part with the Spirit, gives a relief not to be contemned. In brief, this juice of Woods and Herbs, if it be duly prepared and used, is able to shame and confound all the Apothecaries Shops of Galenical Medicines, notwithstanding their proud Furniture of Painted and Gilded Glasses and Boxes.

And I do not doubt but in process of time, that Physicians out of a good Conscience, will explode those unprofitable Coctions, and in their room institute better preparations, that God may have his due praise, and the miseries of the sick receive succour.

For although this acid water doth not contain the Virtues of the whole Herb, nevertheless it is to be reputed and used as an efficacious water of Herbs, in Medicine, seeing that that which is used in the Shops hath very little virtue, as daily experience witnesseth: It being nothing but the pure Phlegm of the Herb, the chief Virtues and Essence of the Herb remaining in the supposed fœces, although the water hath carried along with it something of the Smell and Taste. Look upon any dry Herb, which the heat of the Sun or Air hath deprived of all its Phlegm and Humidity, and see whether it be also deprived of its Smell, Taste, and Efficacy. And although in length of time it will lose all its Taste and Smell, nevertheless its chief Virtues yet lie hid in it. Yea, although its *acetum* be drawn from it by distillation, that an unskilful man would think that there remained no virtue at all in the remaining black Coals of Wood or Herbs, yet the most efficacious Virtues yet lie hid in the best Sulphur and Salt. And that great Virtue doth yet remain in the Coals, is not unknown to Rusticks, who in the Winter burn them to warm themselves, and boil their food, which thing they could never do by the Phlegm separated by distillation. Those black and contemptible Coals are of so great vertue, that they emulate the powers and properties of the most Noble Creature the Sun, for which cause they merit the name of Terrestrial Suns. For whatsoever the Astral and Sydereal Sun effecteth in the superiour Firmament, the same doth the Terrestrial Suns, *viz.* Coals, which are its Vicars, also effect. The superiour rendereth all things partakers of Life and Growth, the same doth also the inferiour Suns. In the Winter time when the Sun is far distant from us, all the Vegetables of the Earth are as it were dead: In the Spring upon his return, all things revive, grow, move, increase, and are nourished.

Insects themselves which have hid themselves in Holes and Caverns of the Earth to fly from Cold, and have lain as dead, do again come forth into the light. All which effects are produced by the superiour Sun. The same things also the inferiour Sun can effect. For when Flies, Spiders, and other like Insects in any Parlour or Chamber, to shun the cold, betake themselves to Holes and Chinks, and there lie as it were dead; the first heat they perceive by the making of a fire in that room, recover their former life, and again creep out of their hiding places, as upon the Suns approaching us in the Spring. Yea, if in such a Room made hot, there had been before reposited great Insects, as Frogs, Snakes, Lizards, and the like, as also Herbs killed by the cold, they would revive, recover strength and grow equally as if they had been illustrated by the Rays of the great Elementary Sun. Therefore if this Contemptible Coal, which in the judgment of the unskilful is deprived of all its Juice and Virtue, can perform these things; what a Medicine think you may be prepared by the help of Art of such a Coal?

But some Putatious Physician may here ask; who can prepare any Medicine from so dry and insipid a Coal? It can neither be dissolved by the strongest Corrosive Liquor, nor by the most intense fire, if no air come to it: of which, if the least Portion shall touch it, it presently conceiveth flame, and is consumed, so that nothing of it remains but a few ashes mixt with a little Salt. And those Virtues which refresh all things living, and revive the dead, all perish by Combustion, and vanish in smoak, which could they be taken and preserved, might doubtless afford a Medicine of great moment. To this I answer: wherefore cannot so great an efficacy be preserved, and used for the making of a good Medicine, before that it vanisheth by burning, and flieth into the air? Whatsoever Philosopher is ignorant of the manner of effecting this, truly he is a weak Philosopher, who ought to blush in that he setteth himself before others, and contemneth them who exceed himself in Learning and Science. He that knoweth not how to use any palpable and coagulated matter, before it be consumed by burning, and vanisheth away, by what means will he elicit the same out of its Chaos, and concentrate it? But that the way of freeing this Noble Sulphur from its Bonds and Keepers, is not known to every one, is no wonder. For it will not come at every call. Of all the Philosophers, there is none who more clearly and openly teacheth by what means it may be delivered from its Bonds, than *Sandivogius*, who expresly saith, *That this Sulphur lies hid and is held Captive in an obscure or dark prison, and kept by very strong keepers. But that Salt only in the conflict or fight, gave him a deadly wound.* No Man hath spoken more clearly than this worthy Author. Therefore he that knoweth not how to extricate that Vital virtue from its bonds, and how to use it in Medicine, let him read the above cited *Sandivogius*, who will clearly instruct him. If he cannot learn of him, there is no reason why any one should labour to help him.

I will propose the matter by a similitude; a Man is compounded of three things, *viz.* Body, Soul, and Spirit; The *Body* is visible, immoveable, gross, earthy, and corruptible: The *Spirit* is invisible, movable, living, and nevertheless mortal; But the *Soul* of Man, which is his most noble part, is immortal.

In like manner, there is also a certain *Anima* or Vital Principle in Vegetables and Minerals, although there are few who know how to extract it. Therefore as in Man the Soul is the most noble part; to which the Spirit is inferiour, and the Body the lowest or vilest; so it is also with Vegetables and Minerals. To acquire the *Anima* or Vital Principle of any Vegetable or Mineral, that fixed and constant *Anima* is to be

be ſeparated by the help of Art, from the groſs, unprofitable, and dead body. For as long as the groſs body adhereth to this noble Principle, ſo long it cannot move it ſelf in a due manner, nor demonſtrate its nobility, but is held Captive by its groſs body, till it be ſet at liberty, by ſome body who knows how to diſſolve its bonds. Being freed from its bonds, and the groſs body laid aſide, it can preſently exert its power. Therefore let this be the principal care of Phyſicians, that inſtead of a body dead, and deſtitute of Virtue, they labour to attain the fixed and living *Anima* of Vegetables, that uſing that in the cure of diſeaſes they may perform far greater things than now they do.

I have here inſerted this diſcourſe, only for this cauſe, that I might ſhew that a whole or intire body is of very little moment, and that that thing whereby any Good is to be effected in Medicine, is to be found only in the moſt noble part, to wit, the *Anima*.

And even, as in Minerals, beſides a fixed and incombuſtible Sulphur, there is alſo found another, combuſtible and fugacious: ſo alſo there is found a twofold Sulphur in Vegetables, in the deſtilling of which, by a Retort, an Oil is expelled, together with the acid Spirit and Phlegm, which indeed hath its virtues, but can in no wiſe perform thoſe things which that part remaining in the black Coals is wont to effect. For by how much a Medicine ſhall be more fixed and conſtant, by ſo much the more do they enter and encounter long and fixed diſeaſes; ſo on the contrary, fugacious medicines are found leſs efficacious in eradicating the ſame.

What I have ſaid concerning Vegetables, *viz.* That there is in them a volatile and fugacious ſpirit, and a conſtant fixed *Anima*; the ſame is alſo to be underſtood of Minerals, which beſides a combuſtible Sulphur, poſſeſs alſo a fixed and conſtant *Anima*.

But whoſoever knoweth how to conjoin the *Anima* of Vegetables with the *Anima* of Minerals, hath obtained a Medicine which is able, after a wonderful manner, to corroborate the Vital Spirit in Man. For the *Animæ* of Vegetables and Minerals, are the Rays of the Sun coagulated, which neceſſarily contain a vivifying or enlivening power, ſeeing that the ſun maketh all things partakers of Life.

And a man, if he only beholds the ſun, or its Vicar the fire, the earthly ſun, although he be in ſome very deep and cold place under ground, where he cannot feel its warming and enlivening power; yet he ſhall perceive his Heart to be recreated and ſtrengthened by the bare aſpect of it: But how much greater a recreation and corroboration would he perceive, if he ſhould take the *Anima* of Wine, or of ſome other Herb conjoined with the *Animæ* of Gold, for the curing of his body, with both which it hath a great familiarity; for like rejoiceth in like, and deſireth to be joined to it: And therefore it ought to ſeem ſtrange to no man, that I aſſert, the *humidum radicale* of the humane body may be augmented by the *Animæ* of Vegetables and of Gold: For the *Anima* of Vegetables is nothing elſe but an eſſential univerſal ſalt, which is found in all things.

Seeing therefore that Philoſophers confeſs, that the redneſs of gold and whiteneſs of ſilver may be encreaſed by its own univerſal ſalt, it is reaſonable for us to acquieſs in the ſame opinion, and to maintain it againſt thoſe that erre. A viſible and palpable demonſtration is to be credited. Nevertheleſs I eaſily perſwade my ſelf, that this diſcourſe of mine will not be credited by many, which I cannot help. It contenteth me, that I have written the Truth, and lighted a Candle to my Neighbour.

After one and the ſame manner, of Wood of little or no worth, I have ſhewed the making of *Salt-petre*, for *Souldiers*, *Gardeners*, *Vintners*, and *Husbandmen*, fit for the dunging of Orchards, Vineyards, Fields, and Meadows; of commodious Baths, for the Sick; of a good Vinegar for Chymiſts and Apothecaries, neceſſary for many extractions. It now remains, that I alſo offer a Gift to the Owners of Metallick Mines. If they ſhall humect or moiſten the *Calx viva*, or Lime made of ſtones, in the Preſs, as we have taught, with the *Acetum* or Vinegar of Wood, they ſhall obtain a cheap Flux, by which thoſe hard and untractable ſtones digged out of metallick Veins, may eaſily be melted; for the acid ſpirit of Wood is fixed by the Lime, and converted into a ſalt, cauſing an eaſie Flux. Nevertheleſs, this ſalt will be of greater profit to Husband-men, for the dunging and fattening their Fields (for whoſe ſake I alſo deſcribe it) than in the melting of Mineral bodies. Phyſicians may uſe the noble and efficacious juice of Wood, for the happy cure of many incurable diſeaſes, and to their own honour and profit. This Vinegar of Wood being expoſed in Hogſheads to the cold in Winter, that it may be frozen to Ice, the Phlegm only freezeth, but the ſharp ſpirit, with the Oil, is not turned into Ice, but remaineth in the middle of the Hogſhead ſo ſharp, that it corrodeth metals like *Aqua-fortis*. If Princes and Great men would be pleaſed to take care that the Wood in their Dominions (otherwiſe rotting in the Woods) might be turned into *Salt-Petre*, they would do well, and it would not repent them of their labour, ſeeing there is a time at hand, in which *Salt-Petre* will be much wanted.

There is yet another ſecret, which for the ſake of Country-men I ought to diſcover, which will yield them no ſmall profit; which is this: If Hop-poles be burnt at the ends which are to go into the Earth, and thoſe burnt ends dipt in the Oil of Wood, that they may imbibe or ſuck in that fatneſs, and afterwards ſet into the earth, they admit no humidity or moiſture, which otherwiſe they are wont to do, being every year diminiſhed in that part which ſtandeth in the earth. It alſo cometh to paſs, that they communicate their fatneſs to the vines and ſtalks of the Hops to which they are joined, and render them more fat and fruitful, by this means affording a twofold profit, firſt in preſerving the Hop-poles from rotting a longer time than they are wont to laſt. The other is, That the Roots of the Vines and Hops, drawing fatneſs and nouriſhment from the bottoms of the poles grow the faſter, and are more fruitful. Moreover, thoſe ends of the poles, in length of time growing rotten, yet there is no loſs of the Oil, but ſtill the ſame profit remaineth, ſeeing that thoſe rotten ends of the poles being taken up and planted again in the earth with the Roots of Hops, they will afford them nouriſhment for ſome years, better than if they had been dunged with dung. In like manner, by the help of this Oil of Wood, ſtrong and durable quick-hedges may be made for the fencing in of Vineyards, Orchards, Gardens, and Hop-yards, by which Beaſts and Thieves may be kept out. For this purpoſe the ſharp end of the ſtakes fit for the Hedges, are to be put into the Fire till they grow black, and then whilſt they are hot, be dipped into the Oil, that they may well imbibe the ſame.

With theſe, being drove into the ground after the uſual manner, an Hedge may be made by planting a young ſhoot or ſet of Thorn, Crab-tree, *&c.* all along between the Stakes. Thoſe ſets or ſprigs, which

otherwiſe, growing but ſlowly, are many years before they come to a requiſite height and thickneſs, their roots now obtaining fatneſs and nouriſhment from this Oil, arrive to maturity in leſs than half the uſual time, and become a thick and ſtrong Quick-hedge before the Stakes are rotten. Moreover, there is no danger of wild Beaſts coming into thoſe places where the Hedge ſtakes are imbrewed with this Oil, ſeeing that wild Beaſts ſhun all ſtrong odours, and dare not approach them. If you ſhall imbibe Hempen-Cords, or ſuch as are made of the Bark of Trees twiſted together with Graſs, with the ſaid Oil, and then bind them about Fruit-trees, it will hinder the creeping up of Spiders, Ants, or Piſmires, Palmer or Canker-Worms, and other the like Inſects, which are wont to damnifie Fruit; inaſmuch as thoſe Inſects plainly abhor ſuch hot Oils. *By this means alſo may Rats and Mice be hindered from creeping up Hovel-poſts, and devouring the Grain.*

There is yet another manner of promoting the dunging of Fields, and the happy growth of Seeds, and not only thoſe Fields which are lean and ſandy, to which Cow-dung may be uſed, but alſo thoſe which are hard and craggy, in which neither ſand nor any duſt of Earth is found.

But in making manifeſt this Artifice to the whole World, my intention is not that the World ſhould thereby be inriched with great profit, as I have endeavoured by deſcribing the manner of Dunging poor Sandy Land, by the acid juice of Wood. My Scope or end is only this, That every man may ſee and conſider how many wonderful things may be effected with wood and ſhrubs, which are every where found in great quantity, and nevertheleſs are of no uſe or profit.

Who would credit any man, affirming, that it might be effected, that not only Grain, but all ſorts of Trees, and excellent Vines ſhould grow in any hard and naked Rock, without the addition of any Earth or Dung? Truly, I believe that there is no man in the World, to whom this will ſeem likely. This will more amaze *Farmner*, with his whole Crew, than my *Miraculum Mundi* did. Yet becauſe the thing may be done, I cannot forbear to divulge the Artifice, only to this end, that I may ſubject the Divine Wonders to the eyes of the blinded World. But yet it cannot be, but that it will be profitable in many places, in thoſe eſpecially which lie near Rivers, and afford Wine; ſuch are thoſe which lie upon the *Mœne*, *Moſell*, *Necker*, *Rhine*, *Danube*, and other the like Rivers, where great and craggy Mountains frequently occurr; in which having the heat of the Sun all the day, Vines might be commodiouſly planted, if Earth and Dung could be carried thither. Certainly Vines grow no where better than in Rocks and Craggs, into whoſe clefts and cracks they inſinuate their roots, that they may thence attract to themſelves nouriſhment, which few other Plants are wont to do: And becauſe for the moſt part much Wood grows about ſuch Rocks, it would be worth while to preſs out its juice, by which the hard Rocks might be reduced into a ſoft Duſt, fit for the Reception of Vines, which might be performed by this operation; which nevertheleſs would not be neceſſary to undertake, but for the manifeſting of the wonders of God to the unskilful, and ſhewing that ſuch things may be done. If any deſireth to plant in a place of this ſort, in which Vines or Trees growing freely in rocky and ſtony places, as Cherry-trees, Plumb-trees, Service-trees, and others, bearing Fruits which have Stones; at the beginning, a little hole is to be cut in the Rock by the help of Maſons Tools, which is to be filled with the Vinegar of Wood; which being done, the hole is to be covered to keep off the Rain. After ſome daies, let him ſee whether the Vinegar hath inſinuated it ſelf into the Rock, and again fill up the hole with freſh Vinegar, and cover it with a Stone, as before. And this Labour is to be repeated in the Summer time ſo often, till the Rock hath drunk up much Vinegar, and be thereby ſo ſoftned for the ſpace of an Ell in length, breadth, and depth, that it may be eaſily dug up with a ſharp Inſtrument, and become a great hole; the matter digged out is again to be caſt into the hole, and to be again filled with the Vinegar of Wood, and covered with ſtones, and ſo left till all the matter grows ſo ſoft, that it may be crumbled to pieces with the fingers. And in the *Autumn*, when Trees have loſt their Leaves, or in the *Spring*, before the Leaves come forth, *viz.* in the Month of *March*, Vines or Trees are to be planted in the matter contained in the hole, and the matter to be trampled cloſe down about their Roots, then all to be wetted by the pouring on of Water, and the event to be committed to God. So the Vines or Trees grow as well as if they had been planted in other manured ground. The reaſon is this; Becauſe the Rocks conſiſting not of Sand, but of ſtones, fit for the making of Lime, do contain much *Salt-Petre*, as alſo the acid juice of Wood, partaketh of the ſame nature, this, by corroding the Rock, diſſolveth the *Salt-Petre* in the ſtone, and ſetteth it free, and at the ſame time loſeth its own corroſive Acrimony, ſo that it cannot hurt the Roots of Vegetables, but is like to Cow-dung or rather better, for it fatteneth and nouriſheth the Roots better. Therefore a Tree or Vine planted after this manner in a Rock, if it ſhall once put forth, afterwards dieth not, but the Roots inſinuating themſelves into the Clefts of the Rock, ſeek their own nouriſhment. Nevertheleſs every Winter when the Leaves are fallen off, ſome of that acid juice is to be poured to the Trunk of the Tree or Vine, that during the Winter, it may again ſoften ſome Portion of the ſtone, which will afford new matter of nouriſhment to the Roots. And by thus affuſing of freſh juice every year, there will be no need of Earth or Dung, ſeeing that the Stone is changed into earth and dung by the juice of the wood.

Although this *Arcanum* will ſeem a thing impoſſible to many, yet it is moſt true, of which, if any will make trial, he may eaſily do it in this manner: Let him get a ſtone which doth not conſiſt of ſand, but of ſuch of which Lime is made, which being expoſed to the Sun, let him pour upon it the acid Liquor of Wood; which when the ſtone ſhall have well imbibed or drank in, let him pour on more, and repeat this labour ſo often, till the ſtone be rendered ſo ſoft, as it may be rubbed to powder between the fingers. In this matter, rubbed or ground ſmall, let him ſow any Seed, which will ſprout forth thence, as if it had been ſowed in any good earth: The reaſon we have already declared, *viz.* becauſe the ſtone is converted into earth, having its own *Salt-Petre*, or proper Dung in it ſelf, and moreover, changing the juice of wood into *Salt-Petre*. He who rightly underſtandeth and followeth my Doctrine, and ſhall ſet about the Work with diligence, will with-

without doubt attain his end. But if he tries with a Sandy ſtone, he will effect nothing. For ſtones of this ſort want a nouriſhing Salt, and they wholly refuſe ſolution by the Liquor of Wood, ſo far are they from imbibing, coagulating, and changing it into a Dung y Salt. But after the following manner any one may prove, that natural Salt-Petre may be made of the ſtones of which Lime is made, and the juice of Wood. Let him take ſome pieces of this ſort of Lime-ſtone, not yet burnt (for when burnt, it is much more facile, as I have taught) and immerge or dip them all over in the Vinegar of Wood, and dry them in the heat of the Sun, or ſome other warm place, and let him repeat this labour ſo often until they be ſo ſoft that they may be rubbed or ground to pieces like Earth. From this ground matter extract the Salt with Rain-water, which will be plainly like to Salt-Petre. So of the Stone is made Earth; of the Salt of that Stone, and the Vinegar of Wood, Salt-Petre; or a ſalt equally ſerving with the Dung of Cows or Sheep, for the dunging of all Vegetables.

Nevertheleſs we have not written theſe things to that end, as if it were neceſſary to plant Rocks with Vines, by the help of the Vinegar of Wood. Our purpoſe is only to ſet forth how the great efficacy of the juice of Wood may be known, and how by its help, fertility may be procured even to the hardeſt Rocks, which being hitherto unknown and unheard of, my diligent ſearch and enquiry hath now brought to light. Let it not ſeem abſurd to any, that I aſcribe ſo great power to the Vinegar of Wood; for common Vinegar doth the ſame thing in ſoftening of hard Rocks: Why then ſhould not this acid juice of Wood do it, which far exceeds the common in ſtrength and ſharpneſs? It is ſaid, that *Hannibal* made a paſſage through the *Alps*, for himſelf and his Army, ſoftening the Rocks by the benefit of Vinegar; what Vinegar that was, Hiſtories do not mention. Perhaps it was the Vinegar of Wine; but if he had had the Vinegar of Wood, he might ſooner have attained his deſire.

This *Arcanum*, without doubt, will give occaſion of finding out many other profitable things, by the help of this Vinegar. I have opened the way, let another come, who by ſearching further may enlarge it, that thereby ſome perfection may the ſooner be acquired. There are many things lie hidden in Nature, which through our ſloth and negligence not being ſought after, yield no profit to Mankind. But I doubt not but time will produce ſedulous men, who will make a further progreſs in this Vinegar, ſo that much profit may redound from it.

There is found another kind of ſtones, which for the moſt part is uſed for the building of Houſes, which being ſoft, is eaſily cut, ſo that ſteps or ſtairs, and Window-frames are made of it. It is to be reduced by the help of Fire into a Calx of a white, aſhy, and reddiſh colour; it alſo refuſeth to be melted; nor is it like to Sandy ſtones, but is Partaker of both natures, and contains much Salt-Petre. But neither by its reduction into a Calx, nor by the pouring on of water, can it be extorted from them, except it be firſt prepared after a ſingular manner, for then it yields to water; concerning which thing I have written a peculiar Treatiſe, which God willing ſhall ſhortly come forth. There are whole Mountains of this ſort of ſtone, containing a great Treaſure of Salt-Petre, which hath hitherto been known to none.

Theſe few things I was willing to offer to Country-men, concerning the preſſing of wood, and the utility thereof. The Circulatory Veſſels in which the juice of the wood, and all the ſalts of the Air are animated by an unceſſant motion, and converted into Salt-Petre, I will not divulge at this time, but reſerve them for my ſelf and my Friends. [*Theſe are deſcribed in the Third Part of* The Proſperity of *Germany*.]

In the mean time this excellent Art will not ſleep, but will be exerciſed in many places. Now whoſoever ſhall need the ſame, he will know what is to be done. For I have determined to beſtow the ſame for the good of my Neighbour, leſt it ſhould be buried with me in oblivion.

I have alſo an Artificial Invention (*which is taught in The Proſperity of* Germany) of turning common ſalt in the ſpace of a few hours, ſo that it ſhall be plainly like Salt-Petre, for the enriching of poor, lean fields; and yet an hundred weight of it will ſcarce coſt a *Doller* (*which is about* 4*s.* 6*d.*) Which is indeed a ſingular Gift of God in theſe laſt times, which will be highly profitable both to the Rich and Poor, in all places of the World. For if the Culture of Wine and Corn ſhall every where become better, and more profitable, by the help of this Art, it cannot be, but that all men will receive profit, and obtain a more commodious way of living.

For by this Art, not only all Fields, whether they have lately brought forth Fruit, or whether they have lain fallow, and for ſome time brought forth nothing, are brought to that condition, that they may bear Fruit every year: but alſo barren places, which would never bring forth any Fruit, are rendered fertile, and fit to bear Fruit; ſo that no place can be found in the world, how barren ſoever it be, which by this *medium* may not be rendered fertile. Moreover, this Art is to be greatly eſteemed, becauſe by it ground may be fattened in thoſe places where no Cattel are found, and therefore afford no dung; ſeeing that hitherto no other than the ordinary way of dunging hath been known.

So alſo in places far remote from the Dwellings of men, to which Dung cannot be carried, this Art may be exerciſed with great profit; eſpecially when Dung is difficult to be procured, or coſts dear, and is not carried to thoſe remote places without great charge, for which reaſon they cannot be tilled, but are forced to lie uncultivated.

Seeing that one Hogſhead of my fattening Salt can effect more than ſome Cart-loads of common Dung. Nevertheleſs this is to be noted, That when any Field dunged with the ſaid ſalt, is to be ſowed with Corn, the ſeed is firſt to be macerated or ſteeped for one night in water, in which that ſalt is diſſolved. For being ſo prepared, it will grow faſter than if it had been committed to the Earth, without any foregoing maceration.

Conſider, when the Souldiers have taken away the Horſes and Carts, carried away the Oxen, devoured the Cows and Sheep, and waſted the whole Country, by what means ſhall the waſted Fields be dunged and reſtored to the Husband-man, that returning to their former fruitfulneſs, he may reap from them the expected Fruit.

Indeed, in time of Peace, when Horſes and Oxen abound both for the ploughing of the ground, and making of Dung, Dung is alwaies of worth, there never being too much of it, and therefore this my Invention may bring not a little profit. Whence it may be of a far greater advantage in thoſe pla-

ces, where (by the Divine permiſſion) thoſe Locuſts have eaten up all things. Ought we not then to receive ſo excellent a Gift of God with all Thankfulneſs?

The Omnipotent GOD give to us all His Grace, that we may ſhun all temporal and carnal Security, as the deceitful ſnare of the Devil, and ſeek after that which is eternal, conſtant, and perpetual. Amen.

Arcanum II.

Being a Gift preſented to rich Merchants, &c. *that they may improve their Money and Eſtates without Uſury.*

ALthough I had determined to treat of this *Arcanum*, with other excellent uſes of *Salt-Petre* in the emendation of Metals, in the Third Part of *The Proſperity of* Germany; yet for certain reaſons I have deferred the publiſhing of that Book for ſome time; but conſidering my profitable Inventions of making *Salt-Petre*, and not doubting but that there will be found men who will put *Salt-Petre* to better uſes than that of making Gun-powder, I could not forbear here to deſcribe one good and profitable uſe of the ſaid ſalt in the emendation of Metals, which is free for any boldly to experience, ſeeing that I have written the very Truth. He that ſhall follow the ſence of my words, and hath ſome skill in metallick Labours, will not loſe his pains, but will thence reap no contemptible profit. But if any man would perſwade himſelf that ſuch a work is to be done without labour and trouble, and great Maſſes of Gold to be obtained with idleneſs, he will be greatly deceived, not conſidering that this requires his putting his hand to the plough, and uſing great diligence.

I have deſcribed the following Operation openly and clearly; affirming, that it will ſucceed to the Operator, according to my deſcription. If any ſhall erre in the performance, let him blame himſelf and his own ignorance, and not me. For in this proceſs all things are plain, and to be underſtood according to the Letter, and may alſo be performed by an eaſie imitation.

The manner of the Operation.

R. of Copper one part, of Gold or Silver two parts, and of *Regulus Martis* three parts, all which melt together in a good and well-covered Crucible, taking great heed that no Coals fall into the Crucible and corrupt the Work. All being melted, and the cover taken off, yet warily that no Coals fall into the Crucible, caſt in as much *Salt-Petre*, well dried and powdered, as there is of Copper and *Regulus* in the Crucible, to the melted matter, and again cover the Crucible, with the ſame caution about the Coals, which ſo put about the Crucible, that they may not lie upon its Cover, but it may be at liberty, to be commodiouſly lifted up with the Tongs for the inſpecting the Maſs in the Crucible. For if the Fire ſhould be too great, the *Salt-Petre* would boil over the Crucible, and inferr loſs. And this may eaſily happen, ſeeing that the *Salt-Petre* entring and working upon the *Regulus* and Copper, ſwelleth and riſeth up. Wherefore it is neceſſary, that this Work ſhould be done in ſuch a Furnace, as I have deſcribed in the Fourth Part of my Furnaces, having its doors, by which the Fire may be governed, and rendered ſtronger or weaker.

After that the *Salt-Petre* hath imbibed the *Regulus* and Copper, and turned them into a reddiſh *Scoria*, which is wont to be done in the ſpace of a quarter or half an hour, the lower door being opened, the upper one muſt be ſhut, that the Fire becoming ſtronger, may melt the *Scoria*, till they flow like water; which when you ſee, by lifting up the Cover a little, remove the Coals about the upper part of the Crucible, and take off the Cover, and having taken good hold of the Crucible with your Tongs, lift it out of the Furnace, and pour out the melted matter into a melting Cup or Cone, [*Such a one is deſcribed by its Figure in the Fourth Part of Furnaces.*] being firſt heat, and well ſmeared within with Wax; in the bottom of which, when cold, there will be a *Regulus* of pure Gold, which being freed from the Scoria, will be ſo much encreaſed in weight, as it hath attracted from the Copper and *Regulus Martis*, which will be the fiftieth part of the weight of the Gold.

The red Scoria, which have a fiery taſte upon the Tongue, contain the Salt-Petre, Copper, and *Regulus* reduced into a Scoria; which if you would ſeparate from the Salt-petre, as ſoon as you have parted it from the *Regulus*, put it again into the Crucible in the Furnace, put a Coal to it in the Crucible, which being well covered, let it again flow well for a quarter of an hour. In this Operation, the Coal or Coals put to the Metals, *viz.* the Copper and *Regulus* of Antimony, will ſeparate them by precipitation from the Salt-Petre, ſo that they will become a *Regulus* together, and the fixed Salt-Petre will be ſeparated, and reſt upon the *Regulus*, from which being cooled, it may be removed by knocking it off. If the operation be rightly performed, you will recover almoſt all the *Regulus* and Copper: but little alſo of the Salt-Petre is loſt, which hath now put on another nature, becomes fixt, and anſwereth in virtue to the ſalt of Tartar. NB. Becauſe thoſe Scoria cannot be ſo perfectly removed from the Salt-Petre by the Coals, but it ſtill retaineth ſomewhat of the Copper and *Regulus*, which the Coals could not precipitate; they may be kept in ſome warm place, leſt they be diſſolved by the air, till you have a quantity of them; which being reduced by burning Coals, may yield their Metal. Of which more ſhall be ſaid anon.

This Labour, although it ſquares not with the capacity of the rude and unskilful, nevertheleſs it is eaſie to be done by thoſe who have any knowledge in the melting of Metals. But all the manners of operating cannot be ſo accurately delivered, that every unskilful man ſhould preſently be rendered capable of underſtanding them; I write the Truth openly, and he that well underſtandeth me, may rejoice with profit. I write not to unskilful *Tyro*'s, but only to thoſe who know how to handle Metals in the Fire. It may be here asked, Whether this augmentation of the Gold, ariſeth from the Copper, or from the *Regulus* of Antimony? I anſwer, from both, but more from the Copper than from the *Regulus*. For there is no Copper or Antimony found, from which Gold is not elicited after the aforeſaid manner, ſeeing that there is in both an inviſible and ſpiritual Gold, nevertheleſs one containeth more than another; and being

being melted with Gold, give it forth to the ſame, which alſo attracteth it. Therefore as often as Copper, and Regulus of Antimony, and Salt-petre ſhall be melted together with Gold, ſo often will the Gold receive an encreaſe; ſo that this Labour being repeated eight or ten times every day, there will be an augmentation of the Gold not to be contemned, for beſides all the Coſt, it will afford the daily Gain of one Floren out of an hundred. (*A Floren is* 2 *s. in* Germany, *about two and twenty pence value in our Money.*) This is certainly a profit to thoſe who will put their Money to Uſury, much more honourable and ſafe than their truſting it in the hands of others.

But ſeeing that this Labour is to be performed in Crucibles, (and that too in large ones, if the gain aforeſaid be expected) it doth not want its trouble and difficulties; for if a man will uſe great Crucibles, he can hardly perform the Operation above three or four times in a day; and if he uſe ſmall ones, although it be ten or eleven times repeated in a day, yet the profit will be very ſmall. I will therefore here appoint a way to do it without Crucibles, upon Hearths inſtead of Crucibles, which neither let out the melted matter by running over, or by their cracking or breaking, as Crucibles are wont to do, but alwaies remaining in the Oven or Furnace, ſave the trouble of putting in and taking out of the Fire. For Crucibles, how good ſoever they be, being expoſed to the cold Air, by taking out, and thence being ſuddenly again put into a great heat, are very eaſily broken. From whence it is manifeſt, that great danger of loſing ſome of the Gold attends the uſe of great Crucibles, ſo that their uſe is to be abſtained from, altho' the Work it ſelf be of great profit. But good ſtrong Hearths may be uſed for this Labour, without all danger; for as long as they are left in the Furnace, ſo long they are good, and the melted Maſs doth not flow out. If I had not found out this way of working with Hearths, I ſhould not have divulged this operation, which is as followeth.

The manner of preparing the Hearths or Teſts.

AN Iron Ring or Hoop is to be made, either ſquare or round, of the thickneſs of one finger, and four fingers high (or deep) one ſide being a little narrower or leſſer in compaſs than the other; being well ſmoothed or poliſhed on its inſide, having two ears or handles, whoſe magnitude and ſpace will be known by the quantity of the matter which is to be daily handled. To prepare the Focus or Hearth, place your Ring or Hoop upon ſome ſmooth ſtone, and then put into it, ſo ſtanding, your Earth, being firſt rightly prepared, (*for this purpoſe our* Stafford-ſhire *Clay is excellent, as alſo for making of Crucibles to abide the Fire*) ſo that it may a little exceed the upper ſuperficies of your Hoop, force it down ſtrongly with a broad Iron Hammer, by beating or knocking it in, and what riſeth above the top of the Hoop, cut off with a Knife, that it may be even with the Ring; then remove it with the Ring, and ſtrew upon the ſtone ſome fine ſand, or rather the fine powder of broken Crucibles, upon which ſet the Ring, with the bottom upwards, that the other ſide, which before lay upon the ſtone, may be wrought in with the Hammer, as the firſt, ſo that the Ring or Mould may be exactly filled with the Earth. The Focus or Hearth being prepared in this manner, the larger ſide thereof is to be ſo excavated or hollowed away by a bowed or crooked Knife, having two handles, ſo that the rotundity declining from the Superfices of the Ring, even to its middle, where inclining it ſelf, it may keep the thickneſs almoſt of a finger at the top or ſuperficities of the Ring, and ſo it will become like a Veſſel or Pan, having a round or ſpherical Cavity, ſuch Hearths or Teſts are wont to be prepared of Aſhes, for the bringing of Gold and Silver to a purity in Metallick Mines, Mints, *&c.* at length that hollowed roundneſs is every where to be ſmoothed with a ſmooth and round Hammer or Mallet, and after the ſmoothing, the whole Teſt being inverted with the Hoop, is to be ſet upon a Board, without ſtirring it; if the inſide of the Hoop or Ring were before beſmeared well with Oil, it will the eaſier come off of the Teſt, which being expoſed to the Air, and dried a little, is then to be ſet in the heat of the Sun or warm Furnace, that all the humidity being taken away, it may obtain its requiſite dryneſs, before it be put into the Furnace to endure the Fire; for except it be very well dried, it will crack or chap in the Furnace, and be wholly unprofitable for this Work.

The Teſt being taken out of the Ring, and ſet by, the inſide of the Ring is again to be anointed with Oil or Greaſe, for the making of another Teſt, of which ſo many are to be made as need requires, or the quantity of the prepared Earth will allow. The earth that was left in the hollowing of the firſt being mixed with the reſt, whilſt it is yet moiſt, ſerveth again, ſo that there is no waſte or loſs of the Earth. The ſame earth alſo ſerves for the making of the Covers or arched Roofs with which the Teſts are to be covered, to keep the Coals from falling into the melted matter. NB. There is no need of having two Hammers, ſeeing that one ſufficeth, having one end of a hands breadth, and ſmooth, and the other end round.

The way of making the Covers of the Teſts, which are called Muffles.

FIrſt, a Type or Mold is to be made of Wood, anſwering to the bigneſs of the Teſt, but not with one Handle, as thoſe are made for the purifying of ſilver, but with two oblong Necks, and without Chaps or Chinks, which otherwiſe are wont to happen, that ſo the Cover may remain entire. Then to this wooden Mould the Earth is to be applied, and the Cover to be wrought in the uſual manner.

Of the Figure of the Furnace.

THE Furnace is ſo to be built, that it may have within-ſide the ſpace of an hands breadth all round the Teſt from its Walls, for Coals, the Teſt ſtanding in the middle; ſo that the magnitude of the Furnace is to be proportionable to that of the Teſt, and may be either round or ſquare, provided it be built with good Bricks, or fit Stones, and Lute, or Earth rightly prepared. There ought to be at leaſt a ſpan between the bottom and the grate, which alſo ought not to be faſtened to the Furnace, but ſtanding upon four Feet, that it may be taken in and out by the foreſide of the Furnace (when need requires) being alwaies open. Let the Furnace riſe above the Grate the heighth of a ſpan, being every way cloſe, having no door. Upon this heighth of a ſpan a hole is to be left of an hands breadth and heighth, by

which the Teſt may be inſpected, and the mixed Metals put in and taken out, and the Fire may have its paſſage. NB. But if the Teſt ſhould be above a ſpan over, which would alſo cauſe the Furnace to be the greater; then that hole being too little, would not allow a ſufficient paſſage for the Fire; therefore the hole is to bear a due proportion to them. From this hole, nouriſhing the Fire by its ventilation, the Furnace is yet to be carried up the heighth of two ſpans, to its upper hole or top, where the Coals are to be put in. Moreover, an Iron Cover is to be made with hollow Superficies, with Iron-Buttons, or little Knobs infixed, by which the Lute being put on, may ſtick faſt; the Convex or upper part of the Cover muſt have a Handle, by which it may be lifted up when the Coals are to be put in, and afterwards put down again to ſhut the Furnace. *See the Figure of this Furnace, in all its parts, at the beginning of this* Continuation of Miraculum Mundi, *noted at the top with Pag.* 62.

A, *The Furnace, as it is working.*
B, *The lower part of the Furnace open.*
C, *The upper part of the ſame.*
D, *The Grate.*
E, *The Hearth or Teſt.*
F, *The Muffle that belongs to the Hearth.*
G, *The Cover of the Furnace, with which it is to be covered when the Coals are in and at work.*
H, *The Vent for the Smoak.*

When you will work with the Furnace, firſt put in the Grate, and upon it the foot or prop made of firm Lute, and upon it the prepared Teſt, and upon the Teſt its Cover or Muffle, the foremoſt neck of which ought to come cloſe to the hole on the foreſide of the Furnace, and the hindmoſt neck to touch the back of the ſame. The foot alſo which ſupports the Teſt, ought to touch the fore-part of the Furnace, that the ſpace between the Teſt and the Wall of the Furnace, may be well ſtopt or cloſed. Alſo, if the neck of the Cover or Muffle doth not fit cloſe enough to the foremoſt Wall, the joints are to be well cloſed with Lute mixed with Hair, that the Fire may have no paſſage by them, but may paſs through the hindmoſt neck of the ſaid Cover, and under the Cover it ſelf into the Teſt, and thence out of the foremoſt neck. If the Fire ſhall have any other paſſage by the foremoſt neck, the heat will not be ſufficient to melt the Metal. Therefore the chief Artifice concerning this thing, is the building of the Furnace in due form and proportion. An Iron door is to be fitted to the Furnace under the Grate, for the governing the Fire, by which it may be encreaſed or diminiſhed, as need ſhall require. And the other hole in the ſuperiour and fore-part of the Furnace, by which the Metals are put in and taken out of the Teſt, is alſo to have a door, that neceſſity requiring, the fire may be governed, and if too great, it may be reſtrained. To this alſo a little Chimney or Funnel is to be fitted, which may receive and carry away the noxious fumes of the Metals and Coals, that they may not hurt the Operator. All theſe things being rightly prepared, the Furnace being well dried, is to be filled with Coals, and to be covered with its Cover, a lighted Coal or two being put next the Grate, the doors are to be ſhut, that the Fire may kindle by degrees, by which the danger of breaking the Teſt, and its Cover, the Muffle, by a ſudden heat, may be avoided. The Furnace, Teſt, and Muffle, being all red hot, the Metals (*viz.* the Gold which is to be augmented, and the Copper and *Regulus* of Antimony, from which the augmentation is expected) are to be put upon the Teſt with an Iron Ladle, the great door below, and the little one above, are to be opened, that the Fire growing more powerful, may forthwith melt the Metals on the Teſt, which being rightly melted, a little dry Salt-petre in powder is to be caſt in upon them with an Iron Ladle, which will preſently change a portion of the melted matter into a Scoria: When it flows no longer, but ceaſeth from operating on the Metals, lying upon them like Droſs, a little more Salt-petre is to be caſt upon the melted Metals, which will again change part of them into Scoria. This Injection of Salt-Petre is to be continued ſo long, until the Scoria ſhall be no longer hard, but remain liquid like Water, which is a ſign that the Salt-petre hath abſtracted the Copper and *Regulus* of Antimony from the Gold, and its operation to be finiſhed. And ſo much *Regulus* of Antimony and Copper is not to be put upon the Teſt, [I believe the word *not* is an errour of the Printer, in the Copy, and ought to be left out] that it, when a due portion of Salt-Petre ſhall be added, may be full to the brim, and the Coals not be burnt out in vain, in the empty Teſt, which is well to be noted. The fluid Scoria of the Salt-Petre, Copper, and *Regulus* of Antimony, are ſo long to be kept in Flux upon the Gold, as you think the Teſt can ſuffer it; for by how much the longer the Gold ſhall remain in its Flux, under theſe Scoria, ſo much the more of ſpiritual Gold it will attract from them, and render it corporeal; and the Gain will be ſo much the greater. Nevertheleſs, for the greater certainty ſake, after the Scoria have lain ten or twelve hours in Flux upon the Gold, they may be taken out of the Teſt, to ſee whether the Teſt be yet ſtrong enough to ſuſtain them longer in flux, becauſe in a continual flux they are wont to attenuate and perforate the Teſt with holes, eſpecially if they were not prepared of good Earth, which is able to endure the Fire. Therefore, if you find the teſt yet ſtrong and thick, and not perforated with holes, you may again add the Scoria to the Gold lying in the teſt, and keep them ſo long in flux, as you think the teſt will hold good. When the Scoria condenſe themſelves, and flow with difficulty, a little freſh Salt-petre is to be added, by which being reduced to a thinner flux, they may give nouriſhment and encreaſe to the Gold, which in this operation hath the place of a ſeed, as the Copper and *Regulus* of Antimony ſupply the place of the earth, by affording aliment and augmentation to the Gold; the Salt-petre is in the ſtead of Rain, which moiſteneth the Earth, and rendereth it fruitful; therefore by how much the longer the Gold lieth and groweth in this Earth, ſo much the more encreaſe it obtaineth. After the teſt is no longer fit to bear the fire, or you would leave working, open the lower door of the Furnace, and take off the Cover from the top, that the heat of the fire may be diverted from the teſt, and the Scoria grow thick, and the Gold under them hard, draw out the Scoria by degrees with an Iron Hook, from the Gold, that it may remain in the teſt intire, and in one compact Maſs, and not be mixed with the Scoria, like Grains, and occaſion loſs. All the Scoria being taken out, the Gold is to be freed from the teſt with a thin ſharp-pointed Iron, then taken out with the tongs, and weighed, to ſee what encreaſe it hath got.

NB. That

NB. That as long as the Teſt keeps firm and good, it were better not to take out the maſs, but to be left upon the Gold in continual flux. This is a Labour not to be deſpiſed, ſeeing that the firſt Coals being burnt out, more are to be added only ; ſo that this operation may be continued for ſome daies, without intermiſſiion, provided the Teſts be well made, which alſo ought to be done if you expect any profit; of which you need in no wiſe doubt, if the operation be rightly inſtituted ; eſpecially if the Antimony and Iron, of which the Regulus is made, be good: For the more Gold the Antimony, Iron, and Copper ſhall contain, the more volatile Gold the fixed Gold which is melted under them, will attract to it ſelf. But if you want ſuch Metals as are rich in Gold, and are forced to be content with the common, the Gold will nevertheleſs get an encreaſe in the Operation. NB. When Metals containing Gold are to be had, there is no need to keep the firſt *Scoria* in ſo long a flux upon the Gold, ſeeing that preſently after the Copper and Regulus of Antimony ſhall be turned into Scoria by the Salt-petre, they may be removed from the Gold with an Iron Hook, and new Metals forthwith added, and again reduced into Scoria by the Salt-petre. This labour of removing the Scoria, and adding freſh Metals, being long continued, will add the greater encreaſe to the Gold, becauſe Copper, Iron, and Antimony contain much corporeal Gold, which in their reduction into Scoria, aſſociateth it ſelf with the Gold. Therefore when thoſe Scoria are withdrawn, and new Metals added, it cannot be, but the encreaſe of the Gold muſt be greater than proceedeth from the firſt Scoria, in which only the ſpiritual Gold is rendered corporeal. The addition of freſh Metals, and the abſtraction of the Scoria repeated 10, 15, yea 20 times a day, muſt neceſſarily give a great encreaſe to the Gold, if the Metals contain both corporeal and ſpiritual Gold. The abſtracted Scoria may be reduced in a Teſt of the ſame Furnace (of which Teſts there ought to be many in readineſs) and the Copper and Regulus precipitated from them, and put to other uſes, of which my other Writings every where make mention. And they are precipitated by the Powder of Coals, or Antimony. The way of precipitation is this; the Salt-petre hath abſorbed the Sulphureous Metals, *viz.* the Copper and *Regulus Martis*, and changed them into Scoria. Now, if to theſe Scoria ſome other Sulphur be injected, which the Salt-petre coveteth more than the Copper and Regulus of Antimony, it layeth hold on that, by which thoſe Metals which it had firſt abſorbed, are diſmiſſed, and fall to the bottom. But the Regulus and Copper cannot be ſo ſeparated by precipitation, but that ſomewhat of them will yet adhere to the Salt-petre. Theſe may be fixed together, that they may render Gold again in fuſion, or the fixt Nitre may be extracted from the Scoria, with Rain-water, to be uſed for other Labours ; as ſhall be taught hereafter. The reſidue of the Scoria will be yet of uſe to Potters, to glaze their Earthen Veſſels. But if the Scoria and Salt-petre be not ſeparated, but left together, they may be uſed with greater profit for the making of Salt-petre, or for the dunging of Land (of which we ſhall preſently ſpeak) than if they be ſeparated. The manner of doing theſe things ſhall be deſcribed in their order. But firſt it ſeems good to me to exhibit a proof, by which every one may know the certainty of this matter, *viz.* that this work doth not only afford a profit to the Operator, not to be contemned, but alſo that the Gold doth obtain a true and certain encreaſe from the Copper and Regulus of Antimony, whereby the Work may be undertaken with the greater boldneſs and confidence; which I thus demonſtrate. Take a ſmall piece of ſilver, freed from its gold by *Aqua fortis*, that you may be ſure there is no Gold in it : to which, in fuſion, adjoin ſo much Copper and Antimonial Regulus, as being reduced into Scoria by Salt-petre, and again ſeparated from the ſilver, may leave it malleable and ductile. This being diſſolved in *Aqua fortis*, will leave at the bottom undiſſolved a reddiſh powder of gold, which it hath attracted to it ſelf from the Copper and Regulus of Antimony. Now, ſo much as there ſhall be of this Gold, ſo much and no more corporeal Gold did the Copper and Regulus contain, which the Silver hath abſorbed. The Scoria poſſeſs no more corporeal Gold, but yet abound with ſpiritual, which you may find by the following Experiment. Cover thoſe Scoria put into a new Crucible with Powder of Coals, and ſet the Crucible into a ſmall Wind-Furnace, that they may melt. In this melting, the Nitre will rather enter the Sulphur of the Coals, than that of the Metals; and aſſociating it ſelf to that, diſmiſſeth the Copper and Regulus. Which being done, pour out the melted Maſs into a Cone, and when it is cold, ſeparate the Regulus ſeparated to the bottom, which will be the ſame Copper and Regulus of Antimony which the ſilver hath deprived of their corporeal gold ; which is demonſtrated as followeth : Take a bit of Silver, cleared from its Gold, which join with the ſaid Regulus by melting, and reduce the melted maſs by Salt-petre into Scoria, as before, pour the maſs into a Cone, and being cold, ſeparate the Silver. This being diſſolved in *Aqua fortis*, leaves at the bottom no reddiſh powder, as the firſt ſilver did. By which it clearly appears, that the Copper and Regulus of Antimony had yielded all their corporeal Gold to the Silver in fuſion, which nevertheleſs can afford no gain, except the Labour be many times repeated with freſh Copper and Regulus. But becauſe this repetition is wont to require no ſmall quantity of Copper, Regulus of Antimony, and Salt-petre, to bring the ſilver to a golden nature ; and moreover, every one knoweth not how to make profit of the Copper and Regulus, deprived of their Gold, or to put them to other uſes, and that Salt-petre is not ſeldom ſold at a great price, no great profit can accrue by this Labour to ſuch. Nevertheleſs, they will obtain no ſmall gain, who after the extraction of the gold, know how to uſe the Copper, Antimonial Regulus, and Salt-petre, which I have ſhewed in many places of my Writings. But thoſe Metals being melted with Gold, and turned into Scoria by ſalt-petre, bring far greater profit than when wrought with ſilver. For ſomewhat of the ſilver is conſumed, as well as ſomewhat acquired by it; but nothing of the gold is loſt, if the Crucible be firm, that nothing run out. NB. If any gain be expected from ſilver, ſuch Iron, Antimony, and Copper are to be uſed, as are pregnant with Gold, and to be often abſtracted from the ſilver, and the metals themſelves afterwards to be put to other uſes, bringing profit, to ſay nothing of the Salt-petre, which may be made at a far cheaper rate (that it can be bought) by thoſe who ſeek profit from Silver. I have inſtanced theſe Experiments, to demonſtrate that every Cop-

per, and every *Regulus Martis* contain ſomewhat of corporeal Gold, and being reduced into Scoria, do yield it to the adjoined Gold or Silver; and that nothing more can be extorted from them, except being reduced into Scoria by Nitre, they be for ſome time kept in Flux upon the ſilver, or Gold which is better, that their ſpiritual Gold may inſinuate it ſelf into the corporeal, and augment it, which the following Experiment ſheweth.

Take of Copper, and Regulus of Antimony, deprived of all corporeal gold, by the addition of other gold, what quantity you will, melt them with gold, and convert the Copper and Regulus into Scoria, after the uſual manner, with *Salt-Petre*, which keep in Flux upon the Gold for 6, 8, or 10 hours, and then pour all out into a Cone; the gold being ſeparated from the ſcoria, and weighed, will ſhew what it hath gained in this operation. This encreaſe from the twofold matter added, *viz.* the *Copper* and *Regulus Martis*, is profit; which notwithſtanding proceeds more from the one than the other, as this Experiment will prove. Take one part of ſilver, which holds no gold, and one part of *Regulus Martis*, being melted in a Crucible, reduce them, as hath been often ſaid, by ſalt-petre, into ſcoria, and being well melted, pour them out into a ſmall Ingot; which when cold, ſeparate the ſcoria from the ſilver with a Hammer; the ſilver will be pure white, and of very eaſie fuſion, but will contain nothing of gold. NB. If to the ſilver and Regulus of Antimony, you ſhall alſo add Copper, and then turn all into ſcoria by the help of ſalt-petre, and when well melted, pour them into an Ingot, ſo that the ſcoria flow upon the ſilver. This ſilver being ſeparated from the ſcoria with a Hammer, or by lying a while in water, you ſhall find that part which was covered by the melted ſcoria, to be all over ſo gilt, that you can ſcarce rub it off with your fingers, which Gold hath adjoined it ſelf to the Silver, chiefly from the Copper. For if more Gold had proceeded from the Regulus, the melted Silver would alſo neceſſarily have been gilded by that, which yet without the addition of Copper is not wont to be. Nevertheleſs, let no man perſwade himſelf that the Regulus of Antimony being omitted, the ſame augmentation would happen, becauſe the greateſt part of the Gold proceeds from the Copper. For without the Regulus, the Copper would not ſuffer it ſelf to be reduced into Scoria by the Salt-petre; ſo that neceſſity requireth, that all thoſe matters ſhould be conjoined in the ſaid manner, to acquire any profit.

Here thou haſt, benevolent Reader, Specimens ſufficient for the trying the truth and certainty of this thing: It's free for every man to enter upon the preſcribed way with greater and longer Operations, that he may attain the deſired profit.

What I have many times ſaid, I ſay again, That this Operation is true, and brings great profit, provided it be inſtituted in a due manner. The Salt-Petre is the chief thing required in this Operation, which he that knows how to prepare with ſmall coſt, and underſtands what I have written, may boldly undertake the Work; but he that muſt buy it at a dear rate, I will not adviſe to meddle with it. He that cannot underſtand what I write, 'tis better for him to ſpare his labour and charge, and employ himſelf in thoſe things which do not exceed his capacity.

It behoveth me now to ſhew the uſe and benefit which the ſcoria which are left in this Operation are of, that there may be no waſte or loſs. But the quantity of ſcoria in this Operation will be more or leſs, according as it ſhall be exerciſed. If good Antimony, Copper, and Iron, which contain corporeal Gold, may be had in plenty, and Salt-petre alſo cheap, the loſs will not be great, if the ſcoria ſhould not be altogether put to the beſt advantage. For if there be enough of the Copper, *Regulus-Martis*, and Salt-petre to be had, they are to be reduced into ſcoria, flowing upon the Gold, that with it they may leave the Gold contained in them. But here no regard is had to the ſpiritual or fugacious Gold which they contain, which is laid aſide with the ſcoria, and new Copper and Regulus is put to the Gold, and the ſcoria again laid aſide for other uſes, ſo that in one and the ſame day, this labour of adding new matter, and as oft ſeparating the ſcoria, may be repeated ten or twelve times. Whence it comes to paſs, that the Gold is every time inriched, and attracteth more corporeal Gold from thoſe matters in one day, than it could do in fourteen daies, if they contained only ſpiritual Gold. But on the contrary, a great quantity of Copper, Regulus, and Salt-petre are required for this labour, which if they cannot be had cheap, the charge will be the greater, ſeeing that thoſe Metals which are pregnant with corporeal Gold, will abundantly compenſate the charge, eſpecially if benefit be made of the ſcoria, which we will preſently ſhew. But if a quantity of the ſaid matters be wanting, and vulgar Antimony and Copper be uſed for the extracting the ſpiritual Gold only, there will not be made ſo many *Scoria*; but it ſufficeth, that the firſt ſcoria be left ſo long in flux upon the gold or ſilver, until they have yielded ſome augmentation to the ſame. And in the mean time, the addition of no other thing is required, but Salt-petre, of which a little is to be injected to the hardened ſcoria, to render them more fuſile, and to cover the Gold the better with their flux. This way will not coſt ſo much, beſides a good quantity of Coals: Nor will the Work it ſelf be ſo troubleſome, ſeeing that it need be inſpected only once in two or three hours, and any Boy may govern the fire. Or if the Furnace be ſo built, that (like a dull *Henry*) the Coals conſtantly ſliding down, the fire may feed it ſelf, the Operation may be continued night and day without any looking after. In the working the other way with Metals containing corporeal Gold, there is more labour and care, ſeeing that every hour the ſcoria ought to be removed, and new metals to be added. Therefore every man may chuſe that which is moſt convenient for him.

Moreover, where neither Antimony, Copper, or Iron abounding with corporeal Gold, are to be had, the Operation may be inſtituted in another manner, and applied to the making of ſalt-petre in abundance, and with ſmall coſts. For after the Regulus and Copper, in flux upon the gold, are reduced to ſcoria, they are not to be removed, as otherwiſe they are wont, but the Copper with the Regulus muſt be precipitated from the Nitre, by the Powder of Coals, in which precipitation the gold taketh to it ſelf the metal reduced into ſcoria, ſo that the fixt Nitre only is to be removed, which is afterwards to be put to other uſes: And the Copper and Regulus, by the addition of new ſalt-petre, are again to be reduced to ſcoria, and to be precipitated from the Nitre by the Powder of Coals, and the Nitre again removed. So the Copper and Regulus will alwaies re-

remain in flux upon the gold in the Teſt, and nothing but the added Nitre will be every time ſeparated.

NB. This Labour doth not indeed draw forth ſo much gold as that which hath new metals added every time to the gold; but yet it excelleth that in which the Metals are kept in a continual flux upon the gold, without the addition of new; for as often as the Copper, with the Regulus, are burnt by the Nitre, ſo often the Nitre burneth and conſumeth ſomewhat of their ſuperfluous ſulphur, and by how much the more the combuſtible ſulphur is burnt and conſumed, by ſo much the more the ſpiritual gold in it is diſſolved, and adjoineth it ſelf to the corporeal gold, to get it ſelf a body.

And this is the difference of thoſe Operations, of which a man may chuſe which he pleaſeth, or rather that which fits the matters, he hath at hand. Whichſoever he ſhall undertake, it will afford a profit not to be ſlighted, eſpecially if he pay not too dear for his Nitre, or can make it himſelf at a cheap rate.

How Profit may be made of the Scoria *which remain after this Operation.*

IT behoveth the ſtudious of Art to know, that there is a difference in the ſcoria removed from the gold by the forementioned Operations. Thoſe which are removed from the gold only remaining in the teſt, and in which the Nitre, Antimony, and Copper remain mixt, are metallick, from which the Copper and Regulus may be precipitated and ſeparated, by the caſting in of crude Antimony or Powder of Coals. The ſcoria from which the Metals are already precipitated in the teſt, are nothing but fixt Nitre. The ſcoria alſo differ, in which the Metals are precipitated by Antimony, from thoſe which are precipitated by Coals; thoſe partake more of ſulphur, theſe leſs; for the ſulphur of coals differs in its nature from the ſulphur of antimony, and requireth that a difference be obſerved, and that either ſcoria being put to its due uſe, it may bring the deſired profit. And this is the difference: When the Copper, with the *Regulus-Martis*, is precipitated by coals, that the Copper, with the Regulus of Antimony, is precipitated, but the Iron which was in the Regulus admitteth not of precipitation, but remaineth in the ſcoria; whence it comes to paſs, that the Regulus, after precipitation, is found to be lighter than when it was put into the Crucible. Therefore what the precipitated Regulus hath loſt, neceſſarily remaineth in the ſcoria; for which cauſe thoſe ſcoria are of more hard and difficult fuſion than thoſe which remain after the precipitation with Antimony: For when the metals are precipitated by the caſting in of Antimony, to one pound of ſcoria, an ounce, and ſometimes more, of Antimony, is caſt in, which precipitateth all the Copper and the Regulus attracted by the Nitre, and giveth a more ready fuſion to the ſcoria. But nothing more plainly ſheweth the difference, than the pouring of water upon the ſcoria, to make a *lixivium*. The ſcoria upon which the coals were caſt, yield a clearer and ſharper *lixivium* than thoſe on which Antimony was caſt. On the contrary, the Antimonial ſcoria, by reaſon of the Antimonial combuſtible ſulphur, are of a drier nature and property.

The beſt thing in both the ſcoria, is the fixt Nitre, which is to be drawn out of them by Water, and may be put to various uſes, with no ſmall profit.

In the firſt place, from thoſe ſcoria a good Medicinal Tincture may be drawn by the affuſion of ſpirit of Wine, of which mention is made in divers places of my Writings. Thoſe ſcoria far excel all Dung, and alſo common ſalt-petre it ſelf, in promoting of vegetation. Nevertheleſs, they are firſt to be made more temperate, becauſe they are too fiery to be uſed alone. They alſo effectually promote the augmentation of Gold, and alſo the health of the humane body, by their moſt pure Eſſence extracted by the ſpirit of Wine.

They may without injury be called *The Philoſophick Dung*, becauſe they augment the growing power in Vegetables, Animals, and Minerals, neither in Operations of this kind is there any Equal in the world.

Their ſmell is like that of humane Excrements; nor are they unlike to them in Aſpect, but moſt efficacious in their uſe. There are many things of great moment yet lie hid in them, all which it is not for me to deſcribe. Thoſe things which I have hitherto written, I have often done with my own hands, and proved by many Experiments. What I deliver is not from hear-ſay, or the reading of others Books, being reſolved to publiſh thoſe things only, which an infallible Experience hath taught me, ſo that every man may boldly, and without any doubting, give credit to them.

Moreover, this fixed Nitre is endowed with the ſame virtue with other ſtrong *lixiviums*: Nevertheleſs, it is more efficacious than that of any common Wood, inaſmuch as Nitre exceedeth the fixed ſalt of Wood in its maturity. The reſidue of the ſcoria from which the *lixivium* is extracted, ſerveth for the glazing of earthen Veſſels.

He that deſireth to know more of fixed Nitre, may find it in my *Furnaces*, as alſo in my *Pharmac. Spagyric.* and eſpecially in *The Explication of Miraculum Mundi*; where he will meet with many things worthy of admiration. For the Philoſophick Dung, ſee the 35 Article of *The Explication of Miraculum Mundi*, my Apology againſt *Farnner*, and the Deſcription of my Preſs for Wood, in this Treatiſe; in which places he may find thoſe things which will abundantly ſatisfie him. Concerning this Univerſal (tho' contemptible) ſubject Nitre, we will treat more, God willing, in the following ſecond part of *Miraculum Mundi*.

Here we have ſhewed the well-minded Reader, how by this one only Operation, he may encreaſe or augment his Gold, inrich his Fields with a fruitful ſoil, and preſerve his health; ſo that there will be none who may not receive profit from it.

I cannot but here commemorate what ſome time happened to me in this Operation. When the Copper and *Regulus-Martis* were mixed by melting together, and reduced into ſcoria by Nitre, the matter thence proceeding was wonderful, appearing in variety of fair Colours, emulating a Peacocks Tail. Therefore when I ſaw ſuch various colours, I preſently thought with my ſelf, whether that matter might not be fit for making a Tincture, which might change the imperfect Metals into Gold; ſeeing that I had read in ſome Philoſophers, that there is more Tincture in Iron and Copper than in Gold, which gave me an occaſion of conſidering whether

this conjunction of *Mars* and *Venus*, might not be the Adultery ſpoken of by the Poets, or rather the Vitriol of the Philoſophers; for this matter retaineth a very fair greeneſs, not only in the fire, but alſo out of it, as well wet as dry. Whence I began to perſwade my ſelf, that Iron was the Gold of Philoſophers, Copper their *Luna*, and Antimony their *Argent-vive*, and Nitre to perform the Office of a *Solvent* or Bath, in which they are diſſolved and digeſted. Being moved with all theſe things, that I might make a trial, according to my ſimplicity, I put all the ſaid matters into a Glaſs, and committed it to *Vulcan*, (or the Fire) which being adminiſtred by degrees, all the matter paſſed together into a black colour; to which a very fair greenneſs, with variegated colours reſembling the Tail of a Peacock, ſucceeded, which continued in the Fire for ſome weeks. But ſeeing that it would not at all be changed, I being wearied with the tediouſneſs, took the fair matter out of the glaſs, and put it into a Crucible, which I ſet in a Glaſs-makers Furnace, that I might perform this Operation with the leſs Labour: And after three daies I again took it out, and I found all the matter changed into a glaſs of a bloody colour, but not tranſparent. The Crucible being broken, I found in the bottom a little Regulus of an Iron-like colour, which being teſted with Lead, yielded white Silver, which being diſſolved in *Aqua-fortis*, left no Gold at the bottom. Being ſtrook with admiration, I began to think whence that Silver ſhould proceed, ſeeing that I did not expect Silver, but Gold; at length being ſatisfied in that, I was of opinion, that from this ſubject by one and the ſame labour, might be made both a red and a white Tincture; but I have not hitherto had time and opportunity to try the truth of the matter experimentally. Whatſoever I have here written, is only that I might afford matter to others who are deſirous of ſeeking, by whoſe diligent ſearches ſome good may be obtained. This Admonition I alſo think neceſſary, That they who endeavour to bring any ſubject to a conſtancy in the Fire, by fixing, as the Chymiſts call it, that they lute and cloſe well their Veſſels, leſt the Air (which is a great impediment to the Operation) ſhould hinder the Work.

For Example. A Wood-coal, for the greateſt part, conſiſteth of a fugacious and immature Sulphur, mixt with a few fæces, being put into an open Crucible, and ſet in a ſmall Fire, it is preſently burnt, and being all conſumed, leaveth nothing in the Crucible, but a few Salt-aſhes; but being put into a Crucible well cloſed and defended from the Air, and committed to a great Fire, and therein kept for many years, yet would loſe nothing of its weight, colour and body, but would remain a black Coal, without any alteration. But on the contrary, if any Mercurial ſalt be added to the Coal in a due weight, and be encloſed with it in a crucible but one day, and kept in the fire, the coal will be changed into a red, fiery, heavy ſtone, more Metallick than Vegetable, whoſe admirable Virtues the Tongue cannot declare. Seeing therefore that from any fugacious and volatile Vegetable in ſo ſhort a time a conſtant fixed thing may be made by Art, Why ſhould not the ſame be made much better of ſome Mineral or Metal, which is much nearer to Fixity? And although theſe coals black the hand, nevertheleſs they contain much good, which he that knows how to come at, will by the ſame eaſily make his hands white again, and draw that from it which is more conducive to the health of Man's Body, than from all the coſtly and fading things in the whole World. *A Word is enough to the Wiſe.* Although I have here ſhewed, that ſulphurated Nitre is a true Medicine for Animals, Vegetables, and Minerals, yet I would not be underſtood as if I affirmed there was no other, which is not my intention, ſeeing that if this Medicine were to be generally uſed for Vegetables, it would be too coſtly, [*and there are other things deſcribed in this Book for that purpoſe, which are far cheaper*] and I have ſhewed it only to the end that the wonderful Works of GOD might be manifeſt to thoſe who are willing to try. For if any one will macerate the ſeed of any Vegetable in the Tincture drawn from ſulphurated Nitre, by the Spirit of Wine, in a warm Bath, he may from that macerated ſeed produce a growing Herb, in a few hours ſpace.

A Tincture of this ſort will effect more in curing of Diſeaſes, than a whole Apothecary's Shop. But he that knoweth how to join ſome ſpiritual Gold with this Tincture, that the Gold may thence attract to it ſelf nouriſhment and encreaſe, as a Vegetable doth from the Earth, will eaſily obtain a Univerſal Medicine. But if any think that I mean ſuch a Medicine as changeth the imperfect Metals into Gold, in flux, he is miſtaken, for that is to be attributed to the Stone of Philoſophers only. But I call it Univerſal, as it is the chief Medicine of Animals, Vegetables, and Metals, which I intend alwaies to keep by me, ready prepared, that I may render others partakers thereof. I intend alſo this Winter to prepare a great quantity of the Univerſal Medicine for Vegetables, by the benefit whereof Grain may be made to grow in meer Sand, that ſo this Invention may become profitable to many men, provided they will but undertake the work: Not that I intend to prepare this of Nitre, which is too coſtly for the Dunging of Fields. For common Salt, which is abundantly cheaper, in a few hours, may be ſo changed, that loſing its corroſive Nature and Property, it becomes plainly like Nitre in taſte, figure, and virtue, but not inflamable, and excelleth the Dung of Cattel for dunging of Land. Neither let any man fear that this Preparation of common Salt requireth much labour or trouble, or is difficult to be done; for he that ſhall ſee the Operation but once, will eaſily be able to underſtand and imitate the ſame.

Hence, ſeeing that in all places there are many barren Fields to be found, it cannot be, but that great profit may be acquired by it.

Arcanum III.

A Gift offered to all diligent Phyſicians.

The profitable uſe of Salt-Petre, *in the Concentration of* Metals, *and Preparation of Excellent* Medicines.

ALthough in the Firſt Part of *Miraculum Mundi* I have deſcribed divers concentrations and emendations of Metals; nevertheleſs in thoſe there is nothing common with that *Arcanum*, which I intend

tend here to deſcribe. For thoſe *Arcana* concern only the emendation of the imperfect Metals; but this alſo treateth of the Preparation of many excellent Medicines.

The manner of concentrating and amending of Metals by Nitre.

FIrſt, a Man is to be made of Iron, having two noſes on his head, and on his crown a mouth, which may be opened, and again cloſe ſhut. This, if it be to be uſed for the concentration of Metals, is to be ſo inſerted into another man, made of Iron or Stone, that the inward head only may come forth of the outward man, but the reſt of his body or belly may remain hidden in the belly of the exteriour man. And to each noſe of the head, glaſs receivers are to be applied, to receive the vapours aſcending from the hot ſtomach. When you uſe this man, you muſt render him bloody with fire, to make him hungry and greedy of Food. When he grows extreamly hungry, he is to be fed with a white Swan: When that Food ſhall be given to this Iron man, an admirable Water will aſcend from his fiery ſtomach into his head, and thence by his two noſes flow into the appointed Receivers; a Water, I ſay, which will be a true and efficacious *Aqua-vitæ*; for the Iron man conſumeth the whole ſwan by digeſting it, and changeth it into a moſt excellent and profitable Food for the King and Queen, by which they are corroborated, augmented, and grow. But before the Swan yieldeth up her ſpirit, ſhe ſingeth her Swan-like ſong, which being ended, her breath expireth with a ſtrong wind, and leaveth her roaſted body for meat for the King, but her *anima* or ſpirit ſhe conſecrateth to the gods, that thence may be made a *Salamander*, a wholſome Medicament for men and metals.

This manner of operating, by which metals are wont to be concentrated, I was willing to deſcribe in this Enigma, that it may be known to be no Fable, but that the ſame manner hath been deſcribed by other Philoſophers before me. This appears from the ſixth Key of *Baſil*, where he delivers the like manner. *Baſilius* writeth concerning *Salt-Petre* ſpeaking of it ſelf; *When my End is threatned, &c.* From which words it is manifeſt, that he uſed the ſame way for the particular and univerſal emendation of Metals, as alſo for the preparing of excellent Medicines. But becauſe this Enigma is a little too obſcure for the unskilful, I think good to interpret it word by word.

The Iron man is the deſtilling Veſſel, which I have deſcribed in the Second Part of my Furnaces. This is put into another Iron or Stone Furnace, and the fire under it. To the noſes or pipes of the upper part, ſome Receivers are to be ſo applied, that at leaſt three Glaſs-Receivers may be applied to one noſe, the firſt of which is to be firmly luted to the noſe; the ſecond muſt enter the perforated belly of the firſt Glaſs, by a Pipe; and in like manner the third muſt be inſerted into the belly of the ſecond; the Pipe of the ſecond Glaſs, which entereth the belly of the firſt, is to be well luted; the third is not to be luted to the belly of the ſecond, but to remain open, that the expiring gaſs may go out of the ſecond into the third. To the other noſe alſo three or four Receivers are to be applied after the ſame manner, but ſo that the laſt may remain unluted. The white Swan is the *Amalgama* of Tin and *Argent-vive*, to which Nitre is added; and it is done as preſently you ſhall hear. [*See the Figure of this Furnace, before the beginning of this Treatiſe, noted with* pag. 96.]

A *is the Furnace.*
B, *The Veſſel in the Furnace.*
C, *The Hole with an hollow Verge, through which the Swan is conveyed into the Veſſel.*
D, *The Tongs holding the Cover with which the Veſſel is to be covered as ſoon as the Swan is put in.*
E, *An Iron Ladle, wherewith the Swan is put into the Veſſel.*
F, *The Receiver.*
G, *The Bench that ſupports the Receiver.*
H, *The Laborator.*

R. one part of Tin, melt it in a Crucible, when it is melted, take the Crucible out of the Fire, and pour out the melted Tin into another earthen Veſſel, and mix therewith one part of *Argent-vive*, which will preſently be abſorbed by the Tin, but the Tin will become ſo brittle and friable, that it may be ground upon a ſtone to fine powder. With this fine powder mix two parts of good and pure *Salt-Petre*, by grinding them well together, till the *Amalgama* cannot be known from the *Salt-Petre*, but one white powder be made of both. This powder is *The Swan of Baſilius*, of which he prepareth Meat for the King; but I call it *The Fulmen of Jove*, by which all Metals are deſtroyed and reduced into nothing. And from this nothing, Metals much better and more noble are generated *de novo*. Concerning this deſtruction and regeneration of Metals, conſult *Paracelſus*'s Book of *The Vexation of Alchymiſts*, and the Third Part of my *Mineral Work*, and you ſhall find, that *Paracelſus* hath involved this Operation in obſcure words, as alſo *Baſilius*, who delivereth the ſame in his ſixth Key, with the ſame obſcurity, which here, without any covering, I have openly and clearly made manifeſt.

NB. I would have the ſtudious of this Noble Science know, that *Jupiter* alone, or Tin mixt with Glaſs only, in this artificial deſtillation by the fiery man, yields that medicinal ſpirit, without the addition of *Argent-vive*, and leaveth the meat or augment of ☉ and ☽ in the bottom. But that our Anceſtors have adjoined *Mercury* or *Argent-vive*, I alſo by experience have found it profitable. But it is chiefly done for this end, that the Tin being rendered friable and fit for grinding, may the better be mixed with the Nitre; for it would be laborious and troubleſome to file the Tin to mix and deſtil with the Nitre, as *Baptiſta Porta* teacheth in his Natural Magick. This reduction into Powder by Mercury, is performed in a very ſhort time, and wonderfully promoteth the Labour, whilſt the Mercury acting upon the porous Jupiter, penetrateth him, and rendereth him compact. On the contrary, *The Fulmen of* Jove burneth the wings of Mercury, and maketh him remain ſtable; ſo Jupiter is an help to Mercury, and Mercury to Jupiter, and both become more noble by the power and efficacy of Salt-petre; for Jupiter poſſeſſeth much combuſtible ſulphur, which nevertheleſs burneth not *per ſe*, without ſome help; in the effecting of which *Salt-Petre* is a Maſter, having neither ſuperiour nor equal. Well doth *Baſil* ſay, that ſulphur only is

Nitre's beſt Friend, and alſo its worſt Enemy, which we have found to be moſt true, in this operation.

When the Tin and Nitre grow hot together, they take Flame like Gun-powder; the purer part, like ſome ſubtile ſpirit, vaniſheth into the Air, and the more fixed, ſtable, and better remaineth at the bottom; for the noxious and ſuperfluous Sulphur of the Tin is burnt by the Salt-Petre, which being ſeparated, the reſt of the Tin acquireth a more compact and better body. The Mercury alſo adjoined in this operation, yieldeth whatſoever good he hath, offering his Spirit for Medicine, and his Body for the encreaſe of Gold or Silver; ſo that more profit accrues by the addition of Mercury, than if Jupiter were fulminated by Nitre alone. Very few will believe how noble a Sulphur there is hid in Jupiter, which can be made manifeſt by Nitre only. Truly Mercury can by no way be better deceived and overcome, than by the Fulmen of *Jove*, which caſts a terrour upon all the gods. Therefore they are very wary, leſt they be touched with that Thunder, and ſlain with ſudden death. If Jupiter were deſtitute of his moſt efficacious Thunder, neither his father ♄, nor ☉, nor ☽, with the reſt of the gods, would be ſubject to him. Mars, Venus, and Mercury would only ſport themſelves with him. Mars would ſhew him his Sword, ♀ would intangle him with her amorous Net, and ☿, the deluder of all dreaming Alchymiſts, would fly away, and laugh at him. *Volens nolens* they all fear Jupiter, and muſt allow him the Empire; the converſation of *Jove* is perilous to all the Metals, even as it often brings ſubjects into no ſmall danger, to converſe with their Prince. Hence the vulgar Proverb, *Procul a jove, procul a fulmine*; He that keeps from the fire, is not in danger of being burnt.

But leaving thoſe things, we will now addreſs our ſelves to the operation it ſelf, and plainly ſhew how it is to be performed. And firſt, let the ſtudious know that this Work requires a diligent and skilful Operator; but he who knows not how with skill to handle the Fire, I adviſe him to abſtain from this Work. The Art is true and excellent, ſo that he that underſtands but a little, may ſee the whole Work to ſtand upon a firm foundation drawn from Nature. He that knows the nature of Metals and Minerals, knows that the goodneſs and perfection of Gold and Silver, the beſt of Metals, conſiſts in a ſtable, fixed, and incombuſtible matter, and on the contrary, that the imperfection of the imperfect Metals, proceedeth from a combuſtible and ſtinking Sulphur only; which ſuperfluous Sulphur, if it ſhall be any way ſeparated from them, that which remaineth, ought neceſſarily to be purer, more fuſible, and conſtant in the fire. There are many waies by which that ſuperfluous and combuſtible Sulphur is ſeparated from Metals; of which mention is made in the Mineral Work, and the fourth part of Furnaces. In this operation, the manner of ſeparating it by combuſtion, is performed by Nitre. In this Treatiſe alſo other waies are indicated, yet Nitre is to be uſed in them all.

But the ſtudious of Art ought to know that in this Operation, not only the ſuperfluous Sulphur of Jupiter and ☿ may be ſeparated and conſumed by burning and each Metal concentrated and amended, but alſo to both, or to ♃ alone other Metals may be added, and by the help of Salt-petre may be fulminated and concentred; for the Fulmen of *Jove* doth not only concenter and amend his own proper body, but alſo other Metals adjoined to him. Nor do I know a nearer way of deſtroying Gold and Silver quickly, than the Fulmen of *Jove*, which ſo deſtroyeth all the Metals, that afterwards without the addition of other things, they cannot by any force of fire be reduced to their former fuſile bodies, inaſmuch as in melting *per ſe*, they alwaies paſs into Glaſs, every one being tinged with that colour which is proper to the metal. Gold is changed into a very elegant glaſs, like to a *Ruby*; the glaſs of Silver hath the colour of a *Chryſolyte*; the glaſs of Copper hath a green and red colour like a Jaſper; the glaſs of Mars differs not much from it; the glaſſes of Tin and Lead remain white. Theſe Glaſſes being (by an artificial reduction) reduced into their bodies, are much better and nobler than they were before. This ſudden fire alſo clippeth the wings of Mercury, ſo that part of him is conſtrained with the ♃ to abide the fire. That ſwift fluxing powder which is compounded of Nitre, Tartar, and Sulphur, mentioned in the ſecond part of my Furnaces, is alſo not to be contemned; for when that maſs is mixed with ☿, and kindled by a live Coal, the ☿ is altered, as when it is to ſuffer the fire, it maketh a cracking noiſe, till it breaks through the fire, but being apprehended by the Fulmen of *Jove*, it hath no time allowed it to cry out; for when it beginneth to feel the heat, it ſingeth a Swan-like ſong, but before it can break out from the Fulmen it is killed. *Baſilius* calleth this *The Song of the Swan*, alluding to what the Ancients have delivered concerning that Bird, *viz.* That when ſhe is old, and ready to die, ſhe ſings a ſong, which being ended, ſhe preſently dieth. This Saying the vulgar believe of that Bird, which yet is falſe, ſeeing that I never yet heard any man ſay that he had heard the Song of a dying Swan. The ancient Philoſophers hereby meant our Metallick Swan. But let any one enquire, whether the *Amalgama* of ♃ and ☿ may be compared with a Swan; becauſe it may every way be broken, within and without, it is like to the Feathers of the ſaid Bird, and therefore the Philoſophers have not unfitly called it a Swan. As for its ſinging, it is thus; When the *Amalgama* is mixt with Salt-Petre, and wrapt up in Papers, and one after another of them caſt into the Iron man, the ☿ with the ♃ beginneth to ſing a Song like the fine Note of ſome Bird, which endureth no longer than the crowing of a Cock, ſeeing that the flame preſently followeth, which maketh the ſeparation.

But that any one may be more certain of this matter, I will openly and clearly expound the Operation word by word.

℞. of Tin and ☿ each ℔ j. make an *Amalgama*, as I have taught above; grind this with ℔ ij. of pure Salt-Petre, freed from all its fæces, reducing the whole maſs into a minute powder, till the *Amalgama* can be no more felt by the fingers. This fine powder diſtribute into ſixty equal parts, more or leſs, and put each part into a Paper, ſo that every Paper may contain about two Iothones, or an ounce, wrap them up: This quantity is not to be exceeded, eſpecially if the Iron man and the Receivers be not large; for the leſſer Veſſels require the leſs of the matter: For the matter being caſt into the red-hot Veſſel in Papers, when it taketh flame, giveth a crack or puff like Gun-powder, which is kindled with a Coal. The Labour is eaſie, which may be called *The Work of Women*, or *Play of Boys*. For as ſoon as one Paper is enkindled, the vapours aſcending with ſmoak and wind,

wind, pass into the Receivers, which being quietly settled, another Paper is presently to be cast in, that it may sing its Swan-like Song, and pass into the Receivers in a fume. This casting in of the Papers is so long to be continued till they are all spent. You can scarcely put in above ten Papers, or fifteen at the most, in an hour; for if one Paper be cast in too soon after another, the ascending Spirits of the ☿ and ☽ would not all settle, but some would fly out at the hole of the last Receiver, and be lost. By this means the Iron man is nourished by degrees with his food, *viz.* the white Swan, even as Infants are successively fed by their Mothers.

After all the Papers are in, the fire is to be let go out of its own accord; and when all the Spirits are condensed in the Receivers, the Receivers are to be removed one after another, in which is the *Anima* of Tin and Mercury, and of that metal which was added, of a white or ashy colour, if Tin and Mercury only were used. But if Gold was added, it will be of a purple colour; if Silver, of a yellow; if Copper, the colour will be reddish. And this is not only to be understood of the matter which passeth into the Receiver, but also of that which remains in the bottom of the Iron man. The *Anima* hideth it self in the corporeal flowers which ascend into the Receivers, by which it is the more easily acquired, and which otherwise, perhaps, by reason of its great subtilty, would be very difficult to obtain. If you can put your hand into the Receivers, you may take out the flowers with a bent spoon, which hide the *Anima*; but if not, with an Iron Wier fitted for the scraping them off, or by washing them out with Water, which are to be handled further, as you shall presently hear.

The mass remaining in the stomach of the Iron man, being taken out when it is cold, hath a fiery nature and a white colour, if it were only of Tin and Nitre, but if any other metal was added, the colour will be varied, as above. This mass cannot be reduced to its former body by Fire alone, how vehement soever it be, seeing that when it is melted, it runneth into glass, and that too very difficultly. Nevertheless, by the following operation it may be reduced to its pristine Body: Put it into a very strong Crucible, which cover, and set in a Wind-Furnace that will give a very strong Fire (such as is my Fourth Furnace) the Fire being raised by degrees, let it be made white-hot, and when it is so, the Cover being a little removed, throw into the fiery mass a little Sulphur, Antimony, or Coals in fine powder, put on the Cover again, and lastly, cover the Crucible over with Coals, that all the matter may flow well. In this operation the combustible Sulphur will enter the fixt Nitre, and separate it from the fixed Metal, and with the same, whatsoever of Sulphur, Antimony, or Coals was added, will be turned into black Scoria. The Tin, with the Mercury, and the Metal, if any were added, separateth it self from the Scoria, and returneth into a metallick body, which after it is poured out and cold, is to be separated from the Scoria. Jupiter hath the aspect of his former body, but is amended, as the proof will shew him that pleaseth to make it; the remaining Scoria are to be kept, because an excellent universal Medicine may be made of them. The *Regulus* being melted again, is again to be amalgamated with its own weight of Mercury, which *Amalgama* is to be mixed with its equal weight of Nitre, and put up into Papers, and again cast into the Iron man, as we have shewed before, that the Flowers and *Anima* may be collected and added to the former. The remaining mass is to be precipitated with sulphur, as before, and the Scoria being separated from the Regulus, to be added to the former, and the Regulus to be again brought with Mercury to an *Amalgama*, that with Nitre the Flowers and *Anima* may be again elicited. This Labour is to be so often repeated, until half the Regulus be converted into scoria: That part which remains being examined by the Cupel, will shew how much gold and silver is generated by this Labour. Which profit will serve to buy other Coals and Metals to carry on the Work. The *Anima* which passed into the Receivers yieldeth a most excellent medicine; so do also the scoria which were reserved at divers times, afford one little inferiour to that; and how they are to be handled, we will teach in order. Therefore by this only operation a universal medicine for humane and metallick bodies is acquired particularly, and from the remaining part, an amended metal paying the necessary costs which are required for the continuing the great Work.

How therefore particularly of Tin and Copper often fulminated, one may get a profit not to be contemned, I will clearly shew; forasmuch as I have not performed that labour only once, but many times; in like manner I will deliver the way and mode whereby an excellent medicine may be prepared for the curing of all curable Diseases, which also I have often done. But how a Universal medicine may be prepared of the *Anima* of metals, for humane and metallick bodies, I cannot teach; for I have not hitherto had time and opportunity of perfecting so great a Work. Nevertheless, I do not at all doubt, but that the Philosophick stone may be made of this *Anima:* But by what means I think this may be effected, (saving to every man his own judgment) I will not conceal from the studious of the Divine Wonders. What I have done with my hands, I can render others the more certain of; those things which I have not done, I leave as they are. The beginning of the Labour I have clearly enough proposed; from which, if any man cannot learn more, 'tis best for him to abstain from this kind of Labour.

All the Philosophers cry out with one voice, *Fix the volatile, and volatilize the fixt*, and you shall have the true universal medicine. From which scope he will not erre, who shall take good subjects for his work. Therefore, because in this our operation, Gold (besides the rest of the metals) being endowed with a most pure body, is rendered volatile and fugacious, and stript of its *Anima*, verily it will be credible, that of the *Anima* of Gold, if the *Anima* of Mercury shall be joined with it and digested to fixation, may be made the *Salamander* constant in the Fire. The purple *Anima* of Gold and Mercury which hath passed into the Receivers, I free from the Flowers of Tin, by washing it out with the sweet universal Water, known to every one, filtring it through Paper, coagulate it, and then fix it into a tinging stone. And I doubt not, but some good thing will thence proceed.

From the scoria remaining after the reduction, you may easily extract a medicine. Nevertheless, those scoria are divers, and have a diverse nature; for those which remain after the operation with Tin

and Argent-vive, are of another nature and property than those which proceed from the working with other Metals adjoined to those two, as Gold, Silver, Copper, or Iron. Every Metal hath its own proper powers and virtues, which in the extraction of the Scoria go forth together, and render that Extract more noble, or else diminish its virtues. Gold and Silver have a different nature and properties from Copper and Iron. Nevertheless Copper and Iron are not malignant or hurtful in the Scoria, but also possess great virtues. Nevertheless the greatest virtues which are elicited from the Scoria, are to be taken for a Tincture of Sulphur; for the Metals being destroyed by fulmination, and again reduced into a body, leave but a very small part in the Scoria, seeing that their greatest part returneth into a metallick body. Therefore the Scoria principally consist of fixt Nitre, and that Sulphur by which the destroyed Metals are again reduced into a metallick body from the Nitre. The Scoria of the Metals destroyed and precipitated by Coals, or common Sulphur, have one and the same nature, virtues, and properties. The Scoria of that reduction made by Antimony, partake of another nature, to wit, of a grosser and stronger than those which are made by common Sulphur or Coals, for they sometimes cause vomiting, which the other do not.

And this I would note, that because Antimony as yet containeth many Arsenical qualities, common Sulphur containeth but few, and Coals none at all; that therefore also the Scoria made by these, are safer than the other; nevertheless, I confess that those are somewhat cruder, and more immature than those made with Antimony; but being extracted with Spirit of Wine, yield an excellent Tincture, which is a kind of a Universal Medicine; for it is sufficiently known, that no subjects (Gold and Silver excepted) are found fitter for Medicine, than Antimony and common Sulphur. And because Wood-Coals exactly answer to this common Sulphur in their nature, properties, powers, and virtue, therefore I commend the Scoria's made by them, and prefer them to those prepared by Mineral Sulphur and Antimony; not that there is a greater efficacy in Coals than in Antimony and common Sulphur, but because those of Coals dissolved by fixt Nitre, are rendered more apt and easie to render their virtues to Spirit of Wine, are of a more easie extraction, and are somewhat more familiar to the animal nature, than common Sulphur and Antimony. But the Medicine prepared of either of those Scoria, is efficacious, and differeth but little in its external species and colour. All the difference in those Tinctures, is, That that which is extracted from the Antimonial Scoria, if it be taken in a little the larger dose, before fixation, causeth vomiting, and operateth more forcibly than the other two. All three after the manner of sulphurs, gild silver, help the growth of Vegetables, by dunging, and nourish and augment Gold being made spiritual, and closed up in the moist way.

And although I do not yet know what it can perform in the transmutation of Metals, yet I am perswaded, that if it were fixed and rendered constant in the Fire, and made to have ingress into metals, that it would effect something in transmutation. It sufficeth me at this time to have indicated the way by which a universal Remedy against all curable Diseases, is to be prepared of the remaining Scoria. He that desires to know more, let him set to his hand, and search farther; the way is opened to him: But if he desires somewhat better, let him set upon the Spirit of Mercury and Gold, which is forced into the Receivers, and search for it in that. As for the remaining parts, *viz.* the metallick flowers, and the running Argent-vive, which passed together into the Receivers, the running Argent-vive may be separated from the Flowers, and used again for the like labour, by amalgamating it with Jupiter. The Flowers are again to be reduced with the fulminated metals, that nothing of the Gold and Silver may be lost; so this labour being continued, will give a perpetual encrease of Gold and Silver, besides the tinging *Anima*, and the Expences will be only for the Salt-Petre, which will be little to those who know how to make Salt-Petre themselves, for the making of which, I have shewed the way; so that without any great labour, trouble, and cost, not only an honest livelihood may be gotten, but also a good medicine, for the relief and comfort of the forsaken Sick.

But before I conclude this my concentration of metals by Salt-petre, I think fit here to adjoin some admonitions for the benefit of the studious of these Labours. When in the reduction of the metals destroyed by the Fulmen of *Jove*, the scoria are left too long upon the gold, and not poured off in due time, they (after a certain magnetick manner) attract the remaining *Anima* which the Fulmen hath left in the Gold, and leave the whole pale. If Argent-vive be amalgamated afresh with this pale Gold, and this Labour sometimes repeated, the Gold will be wholly spoil'd of its *Anima*, being partly driven into the Receivers, and that which is left attracted by the scoria, then the gold loseth all its colour, and the scoria put on a bloody colour. From this red scoria the Tincture is to be extracted, by a certain singular Artifice, and to be used in the known manner. The pale Gold recovereth its yellow colour by Iron, Copper or Antimony.

Moreover, this is also to be observed, When by the Fulmen of *Jove* the *anima* of ☉ and ☿ is propelled into the Receivers, the Receivers being taken off, the Flowers which hide the *Anima*, are to be taken out, and kept in Glasses close stopt. For the said *Anima* of ☉ and ☿ is so spiritual, volatile, and fugacious, that like a Bird it presently flies away, and leaves an empty Nest; the truth of which thing I have experienced. *He that will not believe what I say, let him try, and he will find it to be true.*

But that I may shew the studious of the Hermetick Medicine how he may experience this matter, I will declare by what chance I my self came to know it.

At a certain time, when I had taken the *anima* of Gold and Mercury, made by the Fulmen of *Jove*, out of the Receivers, not clearing one Receiver so well, but that somewhat of the *anima* remained therein; I put in some ounces of Water, that I might thereby the better wash out the remaining Flowers: In the mean time, some more urgent business called me away, I set the Receiver with the Water in it, upon a Table in my Laboratory, before or near a Window, and forgetting it, left it there for some daies; the Cold being then very sharp, in that time had frozen all into Ice; I coming into my Laboratory, to see if some Glasses, in which were Water, were not broken by the Ice, as is usual,

I found

I found ſome wholly filled with Ice, and ſeeing this Receiver to lie there, I preſently believed that Receiver to be broken by the Froſt; but taking it up in my hand, I found that the Water in it was not frozen, but remained clear, therefore I rejoiced that the Glaſs remained unhurt, and wondered much whence it ſhould proceed; but I could impute it to no other thing, but to the hot ſpirit of Gold and Mercury, of which notwithſtanding there could not above three or four grains remain in the Glaſs, which although ſo very little, preſerved ſome ounces of Water from freezing. From that time weighing the matter more diligently, I found an incredible heat in that *Anima*. Let others enquire and ſearch what may be performed by ſuch a heat; this I know, that hereafter there will be ſedulous Artiſts, who will thank me for this my faithful Inſtitution.

For it is very likely, that this ſubtile and fiery Spirit of Gold and Mercury, ſuch as it yet is before fixation, may be preſently uſed with great profit, in the taking away many occult Diſeaſes of the Body. Moreover, it is to be obſerved, That if Metals, whether Gold, Silver, or Copper be to be conjoined by amalgamation with Tin and Argent-vive, they ought firſt to be reduced into pure and ſhining Calces, that they may be the more readily received by the Mercury: But only a fourth or ſixth part of the Calx is to be added in the Amalgamation, leſt the Tin (by too great a quantity of the Calx) be hindered in fulminating, for the whole operation conſiſteth in a right fulmination. But leſt any ſhould erre in working, he may firſt make trial, whether all things be well mixed and prepared, by putting half a dram of the mixture into a ſmall Crucible, and upon that a live Coal, and beholding the Fulmen with an intent eye, that he may ſee what colour it gives: If it riſeth ſo white and clear, that it dazleth the eyes, as the looking upon the Sun is wont to do, all things are rightly and orderly mixt; the ſmoak is tinged with the colour of the adjoined Metal, as Purple from Gold, Blue from Silver, Green from Copper, but Tin and Argent-vive only give White. Alſo from the Maſs remaining in the Crucible, it may be ſeen whether the Fulmen be rightly performed, *viz.* if the *Caput Mort.* or reſiding Maſs be porous, and fiery upon the Tongue, being touched therewith. The Colours alſo of that Maſs are various, according to the added Metal; Tin and Argent-vive alone leave a fiery white matter.

NB Neither is this to be paſſed by, being of no ſmall moment, *viz.* If you ſeek not a Medicine, but only the emendation of Metals, it is not neceſſary to add Mercury with the Metals, but the Gold, Silver, or Copper may be melted with Tin, for ſo they become a brittle Maſs, which may be powdered in a Mortar, and mixed with an equal weight, or a little more, of Salt petre, and put into a ſtrong Crucible, and covered, then put into a circular fire, ſo that the fire may approach it by degrees, till the Crucible and Matter be hot, and at length taking flame, may be enkindled and diſperſed. In which operation many Flowers flie away, and a fiery Maſs remaineth in the bottom, which is again to be reduced into a metallick body in a ſtrong Crucible, in a Wind-Furnace, by the addition of ſome combuſtible ſulphur, and after the reduction, to be reduced again into powder, and mixed with freſh Nitre, and again treated in the ſame manner, by ſometimes repeating the former Labour. At length that Maſs being reduced in a Crucible, the Gold, Silver, or Copper will be found augmented by the Tin.

NB. Becauſe in this operation, not a little of the Metals flies away in fume, the Crucible may be ſet in ſome Wall, and on the Wall over it ſome Veſſels or ſubliming Pots capacious enough may be faſtened over it, that the Metals being kindled by the Fulmen, the elevated Flowers may be preſerved and advanced to a purer Metal than they were before. This Labour doth not differ much from the Operation of *Baſilius*, in which Salt-petre ſaith, *My Lover is a cheerful or pleaſant Woman*, &c.

There are only two feminine Metals, *viz.* *Luna* and *Venus*, either of which ſerveth to this Labour, yet this is more profitable than that, yea, and the ſame Labour giveth an augment to Sol, Mars, and Saturn, which are not feminine. When Tin is melted with ♀ or ☽, theſe pleaſant females are elevated with joy, they ſing, dance, and ſuffer themſelves to be handled in what manner ſoever it ſhall pleaſe one to treat them, therefore they are called *brisk or pleaſant Women*. This is an Operation not to be contemned, foraſmuch as it well compenſateth the Labour, and requireth but ſmall coſts beſides the *Salt-Petre*, and alſo may be wrought in a great quantity, but our former with Mercury is better. There is yet more lies hid in this operation, but I think it not neceſſary here to recount all things. Let the Reader kindly accept of this, and ſhortly (God willing) more and better ſhall follow.

Whatſoever I have here written, is the very truth, and confirmed by many Experiments, in which every one may ſafely confide, and if he operates aright, will find the truth; for all things here delivered, are to be underſtood according to the Letter, and ſo to be obſerved in all the Labours.

NB

A

TREATISE

Of an Universal Medicine;

OR,

A True Aurum Potabile.

Being an accurate Description of a True Universal Medicine, and of its admirable Virtue and Efficacy which it sheweth upon the *Vegetables*, *Animals*, and *Minerals*. A Gift presented unto all such Noblemen as are desirous to preserve their Health, and to attain to a Long Life; it being an *Universal Medicine*, or *A True Aurum Potabile*.

AFter that I had by GOD'S assistance described three excellent Processes in the Continuation of the Miraculum Mundi, *and had bestowed the same on men of several orders, that thereby they might the easilier, and with a safer Conscience, provide themselves with Food and Raiment: I was also desirous of tendering some small Present to Noblemen too, and such who are of eminent power and authority, and whom I had not forgotten to present with some Gift, which may serve for the preservation of their good health for a long time, and for the restauration of it when lost.*

For it is a thing of the greatest Concernment for the Nobles, and such men as are placed in the degree of Power and Authority, to have the fruition of bodily health, whereby they may wisely rule over the subjects committed unto them by God, and may use a sound mind about the defence of the Good, and the punishment of the Ungodly. Now a sound mind inhabiting in a sound body, doth proceed (next after the Divine Grace) out of a sound Heart and Brain. And it cannot be, that a publick Government can be rightly and well administred without a good Health; and this is as clear and evident as the noonday light is. Forasmuch therefore as the safety and preservation of all Kingdoms and Republicks is placed in the Wisdom of their Rulers and Magistrates, and that imprudence and ignorance of the Rulers is wont to ruin their Subjects, it is a thing of the highest consequence to save the Head of the whole Kingdom or Country sound, whole, cheerful, prudent and ingenious, and that he be not made unfit or uncapable for the Government, by diseases, sadness, slothfulness, and stupidity. Therefore the love of my Neighbour constrains me to publish this Universal Medicine for the sake of the Great ones of the World, seeing it is so much conducive to the perpetual felicity and happiness of a sound and good Government; for no man can be said to be a sound man, if he be not of a sound constitution of Body. What benefit, I pray, can a sick man bring to himself, or to other men? Verily none at all, but is rather an hindrance and detriment both to himself, and unto others likewise: For when the Head is ill, there are a great many Members must serve it; but if the Head be sound and well, it exerciseth the governance of the whole Body very happily.

What profit has a man that is tormented with Sicknesses and Dolours, of all his vast Wealth and Riches, since he can neither use them nor enjoy them, looking upon them with a kind of nauseate, and at last leaving them with grief behind. Certainly a sound body is to be preferred far before all the Treasures of this World, and no body will gain-say this. He is to be judged the Happiest man, that possesseth those two the greatest Gifts of God, viz. *good Health and Riches. Sickness and Poverty are to be esteemed worse than even Death it self.*

We sometimes see, that pious Magistrates and Governours are snatcht away, and killed with small Diseases, which otherwise might have yet Ruled very many years over their subjects, had they had but good Medicaments, by help whereof they might have been succoured.

As for the way of Conserving good Health, and recovering it when lost, this little Book doth most exactly shew the same, which I commend unto all those who are desirous of its preservation.

Of

Of a Universal Medicine, OR, AURUM POTABILE.

THE Medicine that is honoured with the Title of *Universal* must be of this property, *viz.* to operate universally upon the three Kingdoms, *viz.* the Vegetable, Animal, and the Mineral, and to be able to succour each of them, as a most high Medicine should do. Whatsoever now does not abound with such an excellent property, the Title of *Universal* is falsly attributed unto it; nor is it worthy such a Noble Name.

Therefore it doth, in the first place, behove me really, and in very deed, to demonstrate in this Book which treats of such a Universal medicine, that this same medicine which is so intituled, doth also possess those very same virtues and properties which a Universal medicine ought to have. And farther, Such a Universal medicine ought not only to be a most friendly Auxiliary and Helper, universally, to those three Kingdoms, *viz.* the Vegetable, Animal, and Mineral, but it is likewise necessary that it be also preparable out of all those three Kingdoms, Vegetable, Animal, and Mineral, and that too out of each apart, without the addition of any peregrine thing, and without any great labour, for the benefit and profit as well of the Poor as of the Rich.

They therefore do extreamly erre who are of such a foolish opinion, as to Dream that the matter of the universal medicine is only produced in such or such a place, and is to be fetch'd out of this or that Country with a great deal of Labour and Charges.

This opinion is Diametrically opposite to the common Vogue and Saying of all true Philosophers, who do unanimously confess, that their matter is every where to be found, and every one has it, and it is in the possession both of the Poor and of the Rich: And this verily is so open and evident a Saying, that nothing can be spoken more apparently.

For my part, I do affirm, that this Art is Vegetable, Animal, and Mineral, and that there is not a man to be found in the whole World, that has not the knowledge of this universal matter, and that does not use the same. Yea more, I do also affirm, that even a new-born Infant cannot live without it.

I have already accurately demonstrated in many places of the Writings I have hitherto published, that Nitre is found in all the things of the whole World; and so not only in all Vegetables, Animals, and Minerals, but also in the very Elements themselves, *viz.* in the Earth, in the Water, in the Air, in the Fire: And for this reason it both may, and deservedly ought to be called a Universal matter; for without the Elements can no man live. And now, whether any one believes this which I here mention, or does not credit it, 'tis all a case to me, what I have said I have said, nor need I say more. And thus much let suffice concerning the universal matter.

The Preparation I have openly enough treated of in many places of my Writings, but especially in my *Miraculum Mundi*, and in the other Writings thereunto appertaining; and therefore I forbear to make any more prolix declaration, and to multiply any more words about it.

But yet notwithstanding, I do here adjoin thus much, and confess, that although I have several times prepared that universal medicine, yet the Preparation thereof has not at all times answered my desires; nor hath it as yet been ever brought by me unto the utmost perfection and fixation, because I have wanted both time and opportunity of accomplishing it, and many other Impediments have hindered me from compassing the same according to my mind. But as concerning what Progress I have therein made, and that I can as yet perform or finish the same in three daies time; this, I say, I will consecrate to eternal memory, and in no case hold my peace, but speak on, for the instructions sake of Posterity.

And this I do to this end, that the omnipotence and bounty of God may be the more manifest, and that His Divine Name may be honoured the more, and that many Thousands of Sick people may be succoured with a most present and speedy Remedy.

This is the only cause that stirred me up to make this Discourse of the universal medicine; for I neither would, nor indeed ought I to burthen my Conscience by the concealment thereof, nor to hide and bury with me in my Grave, such a noble Gift of God, and the Talent which of His Gracious Benignity He hath been pleased to bestow upon me.

But yet I would not that any one should perswade himself that he shall (by his soothing words and large promises of golden mountains) squeeze out from me the Preparation of the same, whereby he may make use thereof to lead his Life in Pleasures, Pride, and Impiety, and so hurt poor mankind. No, let such an one be assured, that I will never do so, for it is not in my power to reveal to every one such a great Gift, and which is of God, and not of Man, but 'tis in the power of God alone so to do: And as for my self, I would much rather die, than to reveal and prostitute it to a wicked man. Besides, I would not have any one to suppose, that whereas I call this medicine of mine Universal, it is therefore able to transmute the Imperfect metals into Gold, so as to furnish one with such vast Treasures as the Philosophers attribute unto their universal medicine: No, for I am as yet ignorant of such a transmutation, nor indeed do I covet it, or gape thereafter, but give unto God only most great Thanks for that medicine, by which (being vouchsafed me of His meer bounty) I am able to succour the miserable, sick, tormented, and diseased ones, and celebrate the glory and benignity of the Lord. I do withal readily confess, that I have not as hitherto received any benefit at all therefrom about the bet-

tering of the Metals thereby ; nor do I at all seek after any benefits in that kind of way, being contented with that Medicine, advanced to such a pass, as whereby it may be able to suffice me to get Food and Raiment by God's help. I covet not after abundance of Riches, and do only beg of God, that He would neither afflict me with Poverty and Want, nor bestow on me too much Satiety and Fulness, lest I should be lifted up with Pride, and say, *Who is the Lord ?* Nay verily, if I could with this Medicine get my self great benefit, as to the metallick affairs, yet would I not do it, nor would I lay out such a great Gift of God, upon temporary things, thereby to rob the poor, miserable, sick people of the same, for whose sake God was pleased to bestow it.

Perhaps it may so come to pass, that this my Medicine may, by the labour of diligent searchers, be brought to such a pass, as to be capable of exercising its power upon the lesser and imperfect metals, and that by a fruitful or profitable amending and correcting them: But this is a thing that God reserves to Himself, as posited in His alone good pleasure, whose Grace and Favour we must with a patient expectation wait for: Mean while we may lawfully enjoy this most excellent medicine, which being a most certain Argument of the verity and power, arising from such a notable Art, doth abundantly serve to stop the shameless mouths, and break the mischievous Teeth of all *Farnnerian* Asses. But yet notwithstanding some or other of them may haply spue out some poisonous stuff out of his shameless mouth, and say, With what right can I impose the name of *Universal Medicine* upon this Medicine of mine, seeing that I do not in the least deny, that it is not available to bring me any benefit out of the metals, but can only heal the Diseases of the Sick: Whereas the Philosophers do on the contrary attest, that their Universal medicine hath such virtues as are wont to transmute the lesser or meaner metals into Gold, and that with most exceeding profit.

For answer to such as these, I say, that although this medicine of mine which is here treated of, hath not hitherto brought me any profit by the melioration of the metals, yet it demonstrates it self to be universal, and to be worthy that fame Title; for I have been hindered through want of time and other letts (as I said afore) from hitherto bringing it unto perfection and fixation. And I pray who can tell what God will be pleased to vouchsafe in process of time. A new-born Infant cannot well be upbraided (if wanting wit and judgment it does not attempt and effect some great matters) and be on this wise twitted. Ho! it is not a man, 'tis beardless, it understands nothing, it lies along and cannot help it self, it has nothing but what they reach out unto it. Well, well, let the Infant but arrive unto its due age, and let its due meat and drink be administred unto it, and then in length of time it will attain to a requisite stature and strength, and will propagate and multiply its own kind. For if there be but once the humane form, there will not proceed ought else thencefrom, but a perfect man. Just so stands the case with my medicine, which is exceeding like to a new-born Infant, whereto regard being had, according to a Philosophical manner, there will be no doubt, but that it will arrive unto a due perfection.

And now, the things which it doth even already perform, do all of them sufficiently argue and testifie, that process of time both can & indeed must produce thereout of some better thing; even as a good Parent wisheth for nothing more, than that (whilst himself is living) his Children may grow up to man's estate, and be happily married, and by a new Offspring preserve his Name and Stock, and yield their help towards the multiplication of mankind, and he himself is wondrously joyed in his Grandchildren: But yet in the mean while he cannot be at all certain that his Life shall be so long prorogued, as to have a fruition of so much happiness, and therefore must commit the whole affair to God's pleasure, and patiently wait upon him, and see what that Omnipotent Creator (who indeed shewed unto *Moses* the Promised Land, but granted him not so long Life as to enter thereinto) will do with him and his; even so hath the Lord shewed unto me the Promised Land, but whether or no I am worthy to arrive so far as to enjoy the pleasant Fruits thereof, GOD only knows; His merciful bounty hath bestowed upon me in my old Age a Philosophical Infant, which doth exceedingly rejoice me: But yet verily am I utterly ignorant whether or no He will vouchsafe unto me so long a Life, as to see the virile or man-like age thereof.

Therefore, like as a Father, unto whom in his old Age the Divine Bounty hath vouchsafed an Heir, tho' (haply) he well knows that the said Heir cannot possibly arrive unto man's estate, during his (*viz.* the Father's) life, yet nevertheless he is exceedingly joyed, in that he hath an Heir to keep up his Name, and which will in time trace his Father's footsteps (*viz.* have more Children): Even just so doth my new-born Philosophical Infant exceedingly rejoice me, though haply I know that my Life will not last so long, as to be a Possessor of the same, in the state of its being advanced unto perfection. However, I doubt not but that God will stir up other nursing Fathers to this tender Infant, that being educated and nourished by them, it may arrive unto a Man-like strength, and unto virile powers and virtues, and may become serviceable to the advancement of the Honour of God, and to the succouring of many Thousands of sick People. The way of attaining this, I have, according to my simple judgment, too and agen, and peicemeal as it were, opened and revealed in divers places of my Work, *viz.* how it may be most commodiously effected, and therefore I judge it needless to treat thereof any farther in this place.

Of the Nature, Form, Properties, and admirable Virtue and Efficacy of my True Aurum Potabile.

AS touching the form of this same new-born Infant, I would have the well-minded Reader know, that it is like unto a poor, naked, tender Babe, of no splendour, of a simple aspect, but yet carries within it self all the colours of the whole World, which by how much the older it grows, so much the fairer colours doth it yield. The Fire affords it nutriment, and clothes it with Garments of various colours, and makes it strong, fair, noble, and potent, insomuch that it may not undeservedly be termed its Father. Being born out of the Earth its Mother, it loves

loves it, and uſeth it for its nutriment, until that arriving unto full years, it becomes like its Father the Fire, and leaves its Mother the Earth, and like a Lord of full age, bears rule over its Hereditary Poſſeſſions. But during its Minority and Infancy, all its actions are look'd on as childiſh, but yet ſo that preſently (or even now) appears what kind of notable man he will be, making good that Proverb; *Urit mature quod vult urtica manere.*

That which will a Nettle be,
Stings betimes, truſt you me.

For ſeeing that a new-born Infant doth abound with ſo much virtue, as to be able to do ſo much good, What would not he be capable of effecting, ſhould he attain to a ripeneſs of years? It will be therefore worth while to hear and ſee what virtues it is able to exerciſe upon Vegetables, Animals, and Minerals; and firſt, we will treat about the Vegetables.

By what way a Trial is to be made, whether or no this Aurum Potabile, *or* Aqua-vitæ of the Philoſophers, *be a moſt high Medicine for the Vegetables.*

EVery body knows, that the Vegetables which are to grow up, and be multiplied, muſt be alſo nouriſhed. This nouriſhment now is nothing elſe but a ſulphureous Salt, whether it hath its Riſe from the Vegetables, or from the Animals, or from the Minerals; for 'tis all a caſe to the Vegetables, from whatſoever it proceeds, ſo that they have but their nutriment, by which they may grow, be encreaſed, and be multiplied. The Husband-man uſeth the Dung of any Cattel or Sheep, to dung his Lands withal, that the Seed ſown in the dunged Earth, may thence extract the Salt, and convert it into its own nutriment, and ſo grow up, and be encreaſed; and beſides this kind of Dunging he knows none.

But the true Naturaliſt makes uſe of the Excrements of other Animals, yea, and the Minerals themſelves too, for the dunging of the Ground; concerning which thing, I have written at large in my other Writings, and eſpecially in my *Miraculum Mundi*; and therefore there's no need at all of making any farther repetition of the ſame here. Foraſmuch therefore as my *Aurum Potabile* is alſo a ſulphureous Salt, but yet far ſtronger, and more efficacious than that which lies in the common Dung of Beaſts and Cattel, and ſo conſequently promotes the accretion or growth, and multiplication of all the Vegetables in a wonderful maner. I have judged it a thing worth while to ſet down in this place the uſe thereof in the melioration of the Vegetables, that ſo it may be evidently demonſtrated, that this my Potable Gold is the moſt excellent Medicine for all the Vegetables, and that their *Particular* Medicine which doth firſt proceed from the Dung of Sheep and Cattel, doth afterwards diſplay its virtues by an *Univerſal* operation. For if the *Dung* of Horſes, Cows, and Sheep (as 'tis barely Dung) could but ſuccour Men and Metals, like as it brings a medical or helping ſuccour unto the Vegetables, then might it by the ſame reaſon be likewiſe called *Univerſal.*

But whereas it is an helper to the Vegetables only, and hath no conjoining familiarity with the Minerals and Animals, therefore is it rightly and deſervedly to be referred to the order of particular Medicines, which are helpful to the Vegetables only. But yet notwithſtanding, the Salt being extracted out of thoſe ſorts of Dung, and converted into Salt-petre, (which is a thing eaſily done) doth then admit of being tranſmuted into a *Univerſal Medicine*: But now, afore ſuch a Tranſmutation be made, it does not exceed the order or bounds of *Particular* Medicaments. But this *Aurum Potabile* of mine merits the name of a true Univerſal Medicine, as being not only a moſt high Medicine for the Vegetables, but alſo for the Animals and Minerals too, and this ſhall be perfectly demonſtrated as follows.

You muſt get ſome Veſſels made of the beſt Earth, and ſtrong, and ſuch as being well burnt in the Fire, become like a Stone. And amongſt ſuch Earths, the *Colen*, *Siburg*, *Waldenberg*, and other ſuch-like natured Earths, are the fitteſt for this Work; let them be made very thick, and ſuch as will not imbibe any Water. If you want ſuch as theſe, cauſe then your Veſſels to be made of Glaſs; for every porous kind of Earth, though it be glazed over with Lead-glaſs, yet it is not ſo fit for this kind of operation; therefore you muſt of neceſſity provide your ſelf with fit and convenient Veſſels, and have a moſt eſpecial regard to this admonition. Let ſuch a Veſſel be a ſpan long, or high, or deep, and let it have the ſame breadth or largeneſs, and let its bottom be perforated with ſome ſmall holes, like as thoſe Pots which are made for the keeping of Flowers in are wont to be: The Pots being thus prepared and filled up top-full, with clear and lean Sand, you may put or plant therein three or four Seeds of ſuch Herbs that you have a mind to plant, that ſo if haply one of them comes not to good, the ſecond, third, or fourth may. When the ſeeds are on this wiſe put in the ſaid Sand, and ſhall have been moiſtened with our Univerſal Water, the Pots muſt then be ſet abroad to the Sun and Air, that ſo the Seeds may ſpring up and grow; which ſeeds, if good, and not too old, will in a few daies time, grow up out of the Sand, as if they had been in any other fat Earth. Now, when they ſhall have ſprouted up ſo high as a fingers length, you muſt leave in your ſaid Pots two of the biggeſt and ſtrongeſt ſtalks or ſprouts, and pluck up the others, leſt they ſhould impede each others growth; and you muſt let them have room enough in the Pot to grow.

This Veſſel thus filled with ſand, and planted with ſeeds, is to be ſet upon another ſtrong Diſh or Platter, and which is made of the like ſort of Stone-like Earth, that ſo if that medicinal water ſhould happen to penetrate and deſtil through the ſand, it may not be loſt, but being ſaved, may be again poured into the pot-full of ſand. Moreover, you muſt diligently take heed that no Rain-water fall therein and waſh away that medicinal water, and ſo take from the Herbs their nutriment. The ſand muſt not be too much wetted, but lie alwaies ſomewhat moiſt, leſt by being quite dry, or too wet, the whole Work be corrupted by either the exceſs or defect of the due temperament: All things here preſcribed being duly obſerved, the Herb ſprings up in a ſhort time, and bears Flowers and Fruits ſooner and better, than if it had grown in other dunged Earth. The Colours become fairer, the Odours will be ſtronger, the Virtues alſo will be greater, and theſe Herbs do likewiſe lon-

ger keep their virtues, and are not so corruptible as others are. After that all the humidity which you poured first on, shall have been consumed by the Sun and the Air, so as that it is plainly vanisht, there must some other Rain-water (wherein a little of that potable Gold shall have been dissolved) be again poured on upon the Sand, that so the Herb may have its due supply of nourishment, so long as it shall be a-growing, for the whole World knows, that there does not grow ought at all out of sand, which is only wetted with bare Rain-water.

Likewise by the help of this Universal Medicine all kinds of Herbs and Plants may be made apt to germinate and grow even in mid-Winter, and may be at any time amended, if so be that dissolved Liquor be but poured on upon the Roots. So will they be sooner ripe, and yield their Flowers and Fruits much speedier than those that are dunged after the common way; yea, and more too. I say, that as to their virtues and efficacy, they are to be preferred far before the common ones. The bare simple Universal Medicine is wont to shew so much efficacy, as is here mentioned: But now some metallick Ferment being added thereunto, makes it far more efficacious; for by means thereof, the Herbs acquire greater and better virtues.

If there be adjoined thereunto an aureous ferment, the Herbs will not only get the virtues of the Gold, but will also appear spotted here and there, in their Leaves and Flowers, with golden spots like little Stars, and will wonderfully please the sight by their delicate aspect.

If a Silver Ferment be thereto added, the Herbs will be impregnated with Silvery virtues, and be painted with silver spots as they grow. The Herbs being by this means bettered with a golden Ferment for the Heart, and with a Silver Ferment for the Brain, do with a more admirable efficacy succour those Members. And if the great ones of the World did for their Health's sake take care for the nourishing such Herbs as these in their Gardens, there's no doubt at all to be made, but that they would thencefrom obtain most great benefits. For, besides their wonderfully delighting the sight with their beauty and delicateness, and besides their admirable virtues, in which they far excel the common Herbs, they do likewise bring this exceeding great profit, *viz.* they may be made use of instead of my *Aurum Potabile*, which perhaps some great men may be averse from taking, through the perswasions of their ignorant Physicians, who most-an-end do, by reason of their sottish stupidity and ignorance, snarle and bite at such kind of eminent Medicines, and divert their Lords and Masters from the using of them, as if they were so many Poisons.

If therefore (to free themselves from that needless care) they did but make use of these Herbs instead of my Potable Gold, they would however, by the help of such Vegetables, enjoy so much of the efficacy of my Potable Gold, as to keep themselves in good Health, or to recover it, being lost.

Besides too, the said Potable Gold may be most commodiously and fitly applied to the use of Mankind, not only by the help of the Vegetables, but also of the Animals too, and that on this wise.

Hens (or Pullets, *&c.*) are to be a while nourished with Oats, Barley, Wheat, or other kind of Grain, macerated with the Liquor of that Universal Medicine; and being nourished therewithal, they will by concoction or digestion transmute those Medicinal Virtues into their Flesh, and so be far more efficacious and nobler than the flesh of other Hens or Poultry. The Dung likewise of such Fowls may be saved, and mixt with Sand, and Herbs be therein planted, which by this means will be rendered better than the common Herbs, because they assume to themselves the Reliques of that Liquor which the Fowls did not consume, and by digestion transmute into their Flesh, and so do convert it into their proper juice, so that there is not any thing at all of that Liquor lost, but the whole of it passeth into most notable profit.

Verily this is an excellent and admirable Transplantation of an Universal Medicine, into the Vegetables and Animals, the which the tender great ones of the World may make use of with the greatest security.

Such now as these (*viz.* the great ones) seeing that this Universal Medicine of mine doth not at all hurt the tender seeds of Herbs, or the young Pullen, but rather bestows on them a greater efficacy and strength, will doubtlesly be induced to believe and understand thus much, *viz.* that this same Medicine will in no case prove hurtful unto Men, who as to tenderness, cannot be like the seeds of Herbs, or like tender Pullen.

If this Medicine be of so great an efficacy as to be capable of transmuting some venenate Mineral, such as Mercury is, into true Gold, and that in a few hours space, as we shall see and hear by and by, it must necessarily follow, that it is not infected with any malignity or venom, for the malignity of one thing does not amend or correct the malignity of another thing, but rather makes it worser.

From hence it is apparently manifest, that that Potable Gold does not at all partake of any malignity, but is a most wholsome Medicine for both Vegetables, Animals, and Minerals: Which thing, if any one will not give credit unto, or shall not be capable to understand the same, I know not what other help to afford him; for minding my own affairs, I have propounded and set down all things out of a good and sincere mind; if so be that any one hath ought that is better, let him produce it out-right, and not despise those things which he does not understand, lest haply he hazardeth his good name, as that convicted Lyar *Farmer* hath done, and be derided, and made a laughing-stock to the common People.

But *Farmer's* setting upon me with his calumnies and slanders, hath ministred unto me an occasion of answering, and of defending my self: Upon this occasion of my replying, there have sprung up, and come forth to the Light most excellent Secrets and *Arcana's* of Nature. Surely I should never have so openly published my knowledge in natural things, but should have lain hidden in quiet, had not that Blood-sucker and secret Murtherer thrown me out of my tranquility by his venomous biting.

But that it may not seem a thing strange and absurd, that I write, that this *Aurum Potabile* of mine doth induce into the growing Herbs a golden Nature, it seems a thing expedient unto me, to confirm the business by some true Histories.

In the *Hungarian* and *Transylvanian* Chronicles, it is mentioned, That in those Countries, in which the soil or ground hath every where about in the Mountains, an aureous or golden nature, and from whence, for this Thousand years, even to this very day, much Gold hath been, and yearly is digged out by the Gold-

Miners,

Miners, and been molten, and coined into Moneys, there have been oft-times found ſuch Vines, as have not only had their Leaves, but alſo the Grapes too gilded over, as it were, with Gold, juſt as if they had been artificially gilt. Nor is this an old Wife's Fable, but a thing moſt certainly true, and which many have affirmed unto me for a moſt undoubted Truth, ſome of which Perſons have had their Habitations in thoſe places, and otherſome of them do even live there at this day. About ſome ſix years ſince, when I lived in *Franconia*, it chanced, that a Vine to whoſe Roots I laid Gold opened, and reduced into its firſt Ens, produced Bunches of Grapes, whoſe Stones were gilded: Which Story I have mentioned more at large in the Conſolation of Navigators. And but very lately a certain Nobleman of *Hungary*, told me for a moſt certain Truth, that not far from *Cremnitz*, being one of the Mountain Cities of *Hungaria*, a certain Husbandman found in his Vineyard a piece of corporeal Gold, above an Ell long, grown out of a Stone, and twined round about the ſaid Stone, a little piece of which was given me by the ſaid Nobleman, becauſe of the Novelty and Wonders ſake.

But put caſe that this were not true, which notwithſtanding is very true and indubitable, as being a thing known to the whole World, that ſuch gilded Grapes are often found in *Hungaria* and *Tranſylvania*; yet however, thoſe things that I have mentioned, and attributed unto my Potable Gold, are moſt aſſuredly true.

Nor can I alleadge any other cauſe for theſe gilded Grapes and Leaves in *Hungaria*, but this, that the Earth there is impregnated with golden vapours, or with the not yet hardened and coagulated firſt Ens of Gold, and that aureous water being mixt with the Rain-water, inſinuates it ſelf into the Roots and from thence aſcends up into the Boughs and Grapes, and in them manifeſts it ſelf, and becomes viſible.

Even thus alſo is it with my *Aurum Potabile*, (which is like to a ſpiritual Gold) if it be diſſolved with common Rain-water, and be therewithal commixt, and the ſand (in which the ſeeds of the Vegetables were ſown) be moiſtened with that Liquor, the nutriment is attracted out of the ſand by the Vegetable Herbs, and being attracted, renders them partakers of an aureous nature: And this experience teſtifies to be a thing moſt true; nor can it be otherwiſe.

By theſe few things here ſpoken, every body (as I ſuppoſe) will ſufficiently enough perceive, that my *Aurum Potabile* is a moſt high Medicine for the Vegetables. Now we will likewiſe prove by ſome few but yet clear and convincing Arguments, that it is a moſt high Medicine for the Minerals too.

the poſſibility thereof, both in the moiſt and in the dry way.

In the firſt place, it is behoveful for every one to know, that the ſaid *Aurum Potabile*, when brought to its due perfection, and ſuch as my ſelf know, hath the reſemblance of a bright and clear water, is of a burning, hot, and fiery taſte upon the tongue, and gives out a ſulphureous, but yet pleaſant odour.

But ſome may ſay, What can any ſuch virtues be in a clear Water? What reaſon have you to call it Potable Gold, for that ought to be yellow or red? To ſuch an one I anſwer, That in the whiteneſs is a redneſs hidden, which is not diſcernable in its tender Infancy; but when by the help of the Fire it arrives to a greater age, then it diſcovers it ſelf, and ſhews forth its comelineſs and excellency together with moſt eminent ſtrength and efficacy: For thus ſay the Philoſophers, *Unleſs you make our Gold white, you cannot make it red.* And in another place, *If any one knows how to deſtroy Gold, ſo as it ſhall be Gold no more, he hath arrived to a moſt great Secret.* And again, in another place, *Our Gold is not common Gold, but Gold potential, not formal (or Gold in power, not in ſhape).* Such Sayings and Sentences the whole Troop of the Philoſophers is full of; by which it is exactly demonſtrated, that the true *Aurum Potabile* ought not to be preſently red, as to the outward view, but that it merits this Title, if there be but only that golden and red virtue and efficacy lying hidden in its internal principle. For if this whiteneſs did not cover over an hidden redneſs, it could never poſſibly become red. Now my *Aurum Potabile* being coagulated by the means of fire, and reduced to a ſtability in the fire, is turned into a ſtone of a blood-red colour, and yields not in the melting any corporeal Gold, unleſs a metallick body be adjoined unto it, into which the Spiritual and Philoſophical Gold, betakes it ſelf, that ſo cloathing it ſelf with a body, it may become Corporeal.

This potable Gold of mine is, *Lac Virginis*, or the *Virgins Milk*, which is coagulated with a ſmall heat. This *Coagulum* paſſeth into (or becomes) the *Dragons-blood*, which being coagulated, muſt neceſſarily yield the conſtant or durable *Salamander*. I confeſs, that hitherto I have not prepared it; nor had I any opportunity to prepare it, but remain contented with my *Lac Virginis*, as with a moſt excellent Univerſal Medicine, patiently expecting what the Divine Grace will in time to come beſtow upon me.

But that I may proceed on to ſhew that my *Aurum Potabile* doth likewiſe heal the Minerals, amend them, and make them golden, I will here ſet down ſome waies of doing the ſame both in the dry, and in the moiſt way.

Of the Uſe of my Aurum Potabile *in the melioration of the* Minerals.

AS concerning the bettering of the Minerals by my Potable Gold, thus ſtands the caſe: It is capable of exhibiting to thoſe that are inquiſitive after the tranſmutation of the Metals, and would make trial of the ſame, ſome moſt exact proofs of

The manner of trying (by the moiſt way) whether or no my Aurum Potabile *be a true Philoſophical Volatile Gold.*

TAke of my potable Gold ʒ j. and ℈ j. or ʒ ſs. of common Quick-ſilver, put them into a ſtrong Glaſs, and ſo ſmall, as that it may be half full with this matter. (NB. The glaſs muſt have a round

bottom, whether it be a piece of some small Bolt-head, or of some small Phial, that so the Mercury may gather it self into one Ball in the bottom) and place your glass, with the potable Gold and Quick-silver, in Sand, to the heighth of the Liquor, then heat it, and leave it for about one hour in a sufficient heat, that the Phlegm being exhaled, the potable gold may stay behind in the form of a white Salt: This done, pour agen upon that Salt so much Rain-water as it evaporated in the boiling, or fill the glass so full with Rain-water, as it was before full of the *Aurum Potabile*, that so lying a while upon the said Salt, it may dissolve it, which is hereby again turned into the same potable Gold, having the same colour, the same taste, and the same virtues as it had before. The Mercury being freed from the said potable Gold, which is to be poured off, is found to be hard, and fix in the bottom like the best gold, and of the same bigness or quantity, as when it was put into the glass. NB. If by some errour committed the *Argent-vive* be not enough tinged and brought to a due degree, but hath gotten some blackness, it is to be taken out of the glass, and put into some little Crucible, and to be heated red-hot with live Coals, that so it may receive the due golden colour; which said colour it will get, and will be like the best Duckat Gold, and will abide good and firm in all trials. But that *Aurum Potabile* which was used about the coagulation of the Quick-silver, may be often made use of about the same labour; but yet you are to note, that you alwaies take each time less and less Quick-silver to this operation, because the potable Gold doth in each of those successive labours lose by little and little its virtues.

This way of coagulating of Mercury may be likewise used about the coagulation of other Minerals and Metals, provided that the said metals be reduced into thin Plates or Leaves, and so put in; for being put in too thick, they cannot be totally digested in so short a time by the *Aurum Potabile*, into the due degree of Perfection, but remain (as their inside part) crude, and therefore an accurate regard is hereunto to be had. If this Labour be rightly done, the Metals will be throughly transmuted into pure and good Gold, and that of the same magnitude, figure, and form they were of when you put them in; but yet one metal is sooner transmuted, and more commodiously than another, according as it shall be of a nearer affinity unto gold. NB. If the Metal be not in a due manner proceeded withal, but be as yet black when it is taken out of the potable Gold, it is then to be well heated red-hot, that so it may get its golden colour. And if there be even yet any doubt left, let him put it in ♄, and purge it by the Cineritium, or the Cupel, that so he may be assured of having true gold, and may be freed from all kind of scruple and doubt; for neither ♄ nor ♁ will take away ought therefrom; which thing the proof it self will most clearly demonstrate.

The manner of making a Trial, by the dry way, concerning the Transmutation of the Imperfect Metals, by my Potable Gold.

TAke of my potable gold, or *Lac Virginis*, ℥ j. and put it in a glass dish; which done, and the dish placed in sand, evaporate all the humidity, until there remain about almost half an ounce of white Salt; put this Salt in a Crucible, with ☽ j. or ʒ ss. of the Plates of Silver, or Copper, or Iron, for Tin & Lead need not be laminated: Place your Crucible, together with the Salt and the Metal, amongst Wood-Coals, and the Salt will presently melt like Wax, and penetrate all the whole Metal, and transmute it into gold; and this operation is done in one quarter of an hour, or half an hour at the utmost. The molten Salt being poured forth out of the Crucible, you will find in the same Crucible the Plate of the Metal, of the same quantity and shape it was of when put in, and throughly transmuted into pure good gold. The Tin and the Lead will be molten into Granes, as being of easie fusion, which Granes will have the nature of pure good gold. If the Crucible should be too much heated with too intense a Fire, it may also happen, that even the ☽, Copper, and Iron too may melt into granes. And this I thought good to inform the Studious of.

These (O thou Lover of Arts) are the too Examens and Proofs of my potable gold, and of trying it both by the dry and the moist way, which if thou shalt rightly perform, thou shalt not erre from the mark. But now I must needs confess, that this Transmutation is not gainful, and I have already said before, that my divulging of all these things is only to this end, *viz.* visibly to shew the possibility of the Art. For although that the gold gotten by these proofs be true, and purely good, and passing all the usual Trials, yet nevertheless it brings no profit, because this *Aurum Potabile* requires so much expences, (afore it arrives unto this degree of power) as that the gold gotten by the benefit thereof, cannot countervail the same. Nay, if it should be somewhat profitable in this way, yet would that man do much amiss, that should waste away and imploy so kingly a Medicine for the getting of a little Gold, seeing there are other waies to get Gold by. And verily, it would be a great sin and shame for a man to consume such a most excellent and eminent Medicine for a little mony's sake. Neither is it for this end, that I have thus mentioned what I have here said, *viz.* to use it about the making of Gold; for my aim is only this, that all the world may see that there are men to be found, even at this very day, upon whom the Divine Grace hath bestowed the Art of preparing and making most excellent Medicaments. I do not envy, that other men should learn something out of my Writings, and take the opportunity of advancing this Work to a farther perfection: But I would not have the impious ones at all to perswade themselves that they shall obtain this Instrument to do evilly, and to exercise their wickedness by; God, who knows what He has to do, will not do those things which are (perhaps) liking and pleasing to our fancies. I can every hour demonstrate the truth of what I have written, with which demonstration I rest satisfied.

I can

I can eaſily conjecture that various men will paſs various cenſures upon my Writings, but this is what I am not able to prevent; nor indeed do I much care, but I do herein comfort my ſelf, in that I have written an undoubted Truth, and can defend it even before the whole World. I can withal readily gueſs, that ſome or other may object againſt me, and ſay as followeth, *viz.* That my Potable Gold is a bare ſolution of common Gold, which being adjoined unto the other Metals, is by them precipitated, and ſo reduced into its former body; and this cannot be ſaid to be a true tranſmutation of the Gold. To refel this objection therefore, I demand, Whether or no the common corporeal Gold can be diſſolved without ſome corroſive Liquor? For this *Aurum Potabile* of mine is void of all corroſion, and is a fiery water, moſt extreamly contrary unto all corroſives: Seeing it is nothing elſe but fixed Nitre, or a ſulphureous Salt, betwixt which Salts verily, and common Gold, there is no familiarity at all; nor are there any ſuch virtues therein, as to diſſolve the Gold: But put Caſe it could ſo be, that the body of common Gold ſhould be diſſolved with thoſe fixed Salts, and that by ſuch a Solution it ſhould diſſolve (or make) my *Aurum Potabile*, verily it would neceſſarily follow, that ſuch a ſolution of Gold would be of a yellow or red colour. But now 'tis not ſo with mine, for my *Aurum Potabile* is ſo clear and bright, as that it far exceeds the bright tranſparency of even Fountain-water it ſelf: Beſides too, the ſolution of corporeal Gold tingeth the hair, hands, and nails with a black colour; but on the contrary, my Potable Gold does not ſo at all, and therefore juſtly and deſervedly, it both may and ought to bear the Title of *Philoſophical Gold*; for all the Philoſophers that have been true Poſſeſſors of an Univerſal Medicine, do confeſs in expreſs words, *That their Gold, or the ſolution thereof, doth not at all colour the hands*, by which Character and Sign they diſtinguiſh betwixt the vulgar and philoſophical Gold.

From hence it neceſſarily follows, that my *Aurum Potabile* is prepared of the true Philoſophical Gold, ſeeing it does not tinge the hands with any colour.

But put caſe that a Solution of common Gold ſhould be made by the help of ſome *menſtruum* that is not corroſive, (but ſuch is not my ſolution) yet notwithſtanding, it would not throughly tinge the Imperfect Metals and common Quick-ſilver in digeſtion with them, and tranſmute them, but would cover over (as it were) their Superficies only with the colour of the precipitated Gold, like as is wont to be with all other ſolutions of Gold, and ſuch a powder performing the ſame effect, may be prepared of common gold; the way of the Preparation thereof I have delivered in my Writings. Silver being therewithal laid over, is as well gilt, as if it had been done with Gold and Quick-ſilver: The ſuperficies therefore is only gilded over, but the body of the Silver it ſelf is not at all tranſmuted, but abides in its former ſtate. So Gold diſſolved in ſpirit of Salt, doth, by the help of the Vitriol of Venus, gild over the Superficies of any Iron, but the Iron retains its Irony property and nature: If to ſuch a ſolution plenty of Water be poured, and *Argent-vive*, Tin, Lead, Iron, or *Biſmuth*, be put thereinto, the gold is wont to precipitate out of the corroſive water, in the form of a porous Sponge, and to adhere to the metal therein-to put. Now, as ſoon as ever the water is ſhook about, the precipitated gold diſperſeth it ſelf abroad in the water, like a troubled muddineſs, and the Metal is the ſame as it was before putting in, without any tranſmutation at all.

Moreover, if any Solution of common gold could tinge the whole body of the imperfect metals (but yet this can never be) it would neceſſarily gild over the external ſuperficies of the Metals, and eſpecially the external ſuperficies of pure Luna, when rubbed or ſmeared over with the ſame; and even this now my *Aurum Potabile* does not do; but if it be ſmeared upon Silver, it colours and paints it with all kinds of colours, and as infinite as appear in the Peacock's Tail, and in ſuch wiſe too, as that they cannot be eaſily rubbed out; and theſe Colours are an undoubted Argument, that this my *Aurum Potabile* is not the vulgar Gold, but the ſecret Gold of the Philoſophers.

All theſe, and other the like Objections, I could moſt eaſily prevent by due and fitting Anſwers, if they ſhould be objected againſt me; but I think no body will be ſo audacious, as (without producing any better things) to oppoſe himſelf againſt thoſe things which in the judgment of the whole World are accounted for good.

Of the Uſe of my True Aurum Potabile *in* Medicine.

TO what purpoſe ſhould I make many words of the moſt great Efficacy and Virtues of my Potable Gold in Medicine? I do not deem it a thing neceſſary to write a large Book concerning them, for ſuch kind of Writings do many times more hurt than good: For there is ſuch an odd cuſtom of Writing ſo prevalent, as that ſome men bluſh not oft-times to aſcribe ſuch great virtues to ſome coloured Brandy-wine, as can hardly be attributed even to *Aurum Potabile* it ſelf. I confeſs, that many times there lies more Virtue in ſome very vile mean thing, than in precious and ſumptuous Pearls.

But ſeeing that every one cannot diſcern the true from the falſe, and is conſtrained (on the contrary) to give credit unto thoſe things which he draws in by his Ears, it cannot poſſibly be, but that he erre from the Truth, and often chuſe the evil inſtead of the good; which defect is eaſily helped by making trial, and proving them, for this way is wont to try the Truth of things.

Should I but deſcribe in an accurate manner the Virtues of my Potable Gold, it would fill a large Volume: And this is not my intent in this place, but (God permitting) it ſhall ſhortly be effected in a little Book, wherein ſhall be comprized many other of my beſt Medicaments, and ſhall ſhortly come abroad under the Title of *Glauber's Pharmacopœia*: And in this place I will in few words hint out the Uſe of my *Aurum Potabile*.

Therefore, foraſmuch as my Potable Gold is (as I have already frequently repeated) a concentrated Fire, and reduced into a liquid form, and all its whole Eſſence may be ſaid to reſemble nothing elſe but ſome tender penetrating Fire, yet void of flame, every one may readily conjecture what it is helpful for, and what uſe it is of in Medicine.

Amongst all the Elements, the pureſt, ſubtileſt, moſt penetrative, and moſt efficacious, is Fire, and this is granted by every body; for the force of the Fire, *viz.* its heat penetrates even the moſt compact bodies, as Metals, and Glaſs; nor is there any thing that can ſtop its way; the Water, Earth, and Air are eaſily ſhut out. The Omnipotent God Himſelf is compared with Fire, from whom all things receive Spirit and Life, and without whom nothing can live or move it ſelf, for without him, all things are dead, hard, and cold; as appears in the bodies of men and other Animals, which being alive, are alwaies hot, but being dead, become more cold than any Ice.

Therefore, as long as that ſmall ſpark of Life in Man, and other Animals, is fed and nouriſhed with its due Food and Drink, ſo long alſo doth it attract its nutriment, and continues in its vigorouſneſs.

But as ſoon as it is deſtitute of its nutrition, and that it be taken thencefrom, the Life doth preſently begin to be debilitated, and to fade, like as a kindled Lamp, if Oil be not poured thereunto, doth at laſt go out, and extinguiſheth.

Seeing now that the Life of a Man is a meer fire, and is fed and ſuſtained by a ſuitable Food and Drink only, like to a Lamp, which (without the pouring on of Oil, and without Air, without which no fire can burn, nor any Life live) cannot conſerve its light. Some or other may demand, What the reaſon is, that ſuch men are ſo eaſily ſeized on by Diſeaſes, who have no want of the beſt Food and Drink, and which too is moſt fit for the ſuſtaining of Life? Hereto I anſwer, That in ſuch kind of men, the groſs, crude, tenacious, and cold humours do ſhut up the paſſage to the point and ſpark of Life, whereby it is deprived of the nutriment, being hereby kept back. For an Example of which, Take a kindled Lamp, in which the Wiek or Cotten is furred and clogg'd up with the Dreggs of impure Oil, whereby the Oil can have no farther acceſs to the burning Flame; and hence it comes to paſs, that it goes out, and vaniſheth, and dies, though there be ſtore enough of Oil. So likewiſe is it with an old Tree, though there be ſtore of Dung thereto applied, yet the vegetation is not alwaies, and for ever, but all things die at laſt. Now, the crude, groſs, and clammy humours inſinuating themſelves into the Roots, do haſten on this death, and the Roots being ſtopt or clogged, the due nutriment is withdrawn or with-held from the Tree, like as is wont to happen in Men, and in burning Lamps, as we ſaid but now.

All things have their natural Cauſes, the which thing God Himſelf hath doubtleſly ſo ordained and implanted in Nature, that all things in their order haſtening on to their deſtruction, nothing may be found wholly conſtant and ſtable in natural things, but be all ſubject to decay and death, and that Eternity alone, and Divine ſtability, (or the durability of cœleſtial things only) might be laid open.

Bright clear Water, having its courſe through Channels and Wooden Pipes, doth, after many years time, at length fill them with Dirt, ſtops them up, and bars up its own way and current. This is the Operation of the clear and cold Water of Fountains; the hot Baths do it far ſooner, as appars in the *Aquisgrane* Baths, and others, in which the *Aquaducts* and conveyances for the Water are to be frequently opened and cleanſed, whereby the Water may have the freer paſſage. But thoſe Waters, which being hot, do (when cool) preſently let fall their fæces in the Veſſels, and ſtop or furr them up, do moſt ſpeedily of all ſhew this ſame operation. The ſame is alſo done in open Veſſels, if, *viz.* the clear and tranſparent Water of Fountains be ſeveral times heated in a Copper, and be agen ſo often cooled, there doth then at length ſtick on to the inſide of the Copper a tenacious ſlimineſs, which at laſt is turned into an hard Stone.

If now the pure and bright Water of a Fountain effecteth ſuch an operation, What, think you, would that Water do, which in its own nature is troubled or muddy, thick, ſaltiſh, and ſlimy. Hence it is that not only new-preſt Wines, or that thickiſh, muddyiſh Muſt, do let fall their fæces to the bottom, and faſten their Tartar to the ſides of the Barrel, but even the old Wines do likewiſe do the ſame, but not ſo much as the new ones do.

Now then, ſeeing that ſuch kind of troubled drinks are uſed by men for nutriment, it is clearly neceſſary, that (the internal Bowels of the body being ſtopt by their dregginеſs) their nouriſhing property of the Life muſt with-draw, like as the feculent Oil withdraws from the light of the Lamp: For all thoſe things which a man feeds upon, and daily drinks, do in proceſs of time ſtop up the paſſages of the internal bowels and conveyances in the body of man, and ſo deſpoil the vital Fire of its nutriment. Therefore by how much the more this nutriment of the Life is withdrawn, ſo much the ſooner is the light or vital Fire extinguiſhed, and the cold and darkſome death approacheth the nearer, and becomes ſuperiour. From hence aroſe that old Proverb, *Eat ſuch things as are well cook'd or baked; Drink ſuch drinks as are clear; Speak ſuch things as are true, that ſo you may be long-lived.*

But now ſome may ſay, I will therefore ſhun troubled drinks, and feed upon well-dreſt and well-prepared Meats, that ſo by ſhunning the way for Death's entrance, I may enjoy a long-life. I confeſs, 'tis well ſaid, for ſobriety in meat and drink, and the ſhunning of groſs and crude meats, and troubled drinks, do much help to conſerve health: But yet it does not follow, that he ſhall not be at length ſubject to Diſeaſes, nor die; for there is no meat that is ſo well cook'd, and no drink that is ſo clear, but it carries with it its hidden fæces, with which the internal Veſſels may in a longer proceſs of time, be ſtopt up, and Diſeaſes introduced, even as we ſhewed but now, by an example drawn from Fountain-water, which in proceſs of time ſtops up its own paſſages: And by the ſame reaſon too muſt thoſe Trees that are in the higheſt tops of the Mountains at length die, when (though they are nouriſhed with moſt clear Rain-water) their nutrition is with-held from them by the ſtopping up the pores of the Roots.

But yet I do not ſay that an Oak, or ſome other wild Tree, in wild places, which is nouriſhed only with the Rain-water, and the Leaves which yearly fall off, dures no longer than ſome Fruit-bearing Tree does, which is dunged and nouriſhed in the Gardens with ſingular care and labour: No, for it is known, that an Oak doth many times endure and live a Thouſand years; whereas on the contrary, ſuch a tilled or tenderly-kept Tree ſcarce attains to the Hundredth year, and this is to be imputed to the diverſity of nutriments. The Stag in the Woods, and the Crow in the Air, live above an Hundred years, but being caught and finely fed, they ſcarce live Fifty years. A man that lives barely upon Bread and Water, will doubtleſs prolong his Life to far more years than if he uſed

uſed delicate food and drink; and this is a moſt manifeſt thing, and yet men lay it not to heart, but by enjoying too great a plenty of delicacies, they burthen Nature with too great a load, from whence obſtructions of the bowels do ariſe, and a way laid for Diſeaſes to enter in. A Tree that is dunged with too much Dung, gets to it ſelf, together and at once, too much fatneſs, and this choaks up the Roots and hinders nutrition, whereby the body and boughs thereof cannot be ſupplied, and ſo conſequently Death muſt enter in, and put out the Life of that Tree. What Counſel now? You will haply ſay, If that obſtructions be the principal cauſes of Diſeaſes and Death, are there no Remedies, by whoſe help ſuch like obſtructions may be prevented; or (if they already are made) be wholly removed and taken away? Yes, I ſay, that both may be done, *viz.* a timely prevention, and alſo a thorough abolition of them, when they have gotten head; and this to be done by ſuch kind of Medicaments which are friendly to Nature, and contrary unto the things from which thoſe obſtructions and conſtipations have their riſe; for cold, tenacious, impure, and watery humours muſt neceſſarily be attenuated, mollified, cut, and opened by heating, attenuating, inciding, or cutting, penetrating, and fiery Medicaments; for daily Experience teacheth, that it is a thing clearly impoſſible for obſtructions to be taken away, what kind ſoever they be of, without the help of warming and penetrative Medicaments. And amongſt all thoſe Medicines, theſe are found to be the moſt certain and moſt efficacious, *viz.* the volatile Spirit of common Salt, or of Vitriol, void of corroſiveneſs; the volatile ſpirit of crude Tartar; the ſpirit of Urine, and of Salt-Armoniack, and other the like fiery Spirits, which do exerciſe their Virtues with moſt excellent ſucceſs in the taking away of thoſe kind of obſtructions. But foraſmuch as thoſe volatile ſpirits do for the moſt part ſet upon and reſolve ſuch obſtructions as are but beginning, and not as yet confirmed, but do not ſeize upon the more fixt and inveterate ones, as having not ſo much ſtrength as to ſubdue and caſt out them, for they are to be caſt forth by their like, that is, by the more fixt Medicaments; which thing no ſkilful Phyſician will gain-ſay. The whole drift therefore of the buſineſs lies in this, *viz.* by what means ſuch kind of Medicaments may be gotten, as by whoſe help not only the newly-riſen obſtructions, but alſo the inveterate and confirmed ones too, may be driven out of the body of man. Now, this cannot be effected by Herbs, and ſuch-like natured things, as is ſufficiently witneſſed by this preſent Age, for no body that is ſubject to thoſe kind of obſtructions, is cured by the help of the Herbs, and ſuch-like things. For after that the ſick Patient hath a long time uſed the palliative Cure in vain, Death at length comes forcing in, and ſnatcheth him away after his licking in many Pots full of ſuch ſtuff, which notwithſtanding, by ſome good Medicine might have been eaſily prevented: For, I pray, how can it poſſibly be, that a cold, groſs, crude, and not well-prepared Medicine ſhould draw forth cold and groſs humours, which ſhould be heated, cut, and mollified? 'Tis juſt as if a man would melt one piece of Ice with another piece of Ice, and ſo reduce it into Water; but yet it will never be done without fire or heat. And therefore a penetrating, fiery, living, and good Medicament, is to be applied unto thoſe cold and tenacious obſtructions, to heat, extenuate, and ſcowre them out; and the Syrups, Conſerves, and the cold, dead, and mucous or ſlimy Juleps ſhould be removed.

Verily, I cannot ſufficiently enough wonder, when I think upon the ſmall regard that is had to the Life of Man, and how raſhly and wantonly it is neglected, out of meer pure ignorance.

The preſent World is ſo blind and perverſe, as that it neither will nor can believe this, though it be ſhown it even with ones fingers: But yet this ſtubborn perverſeneſs does not hurt any ſo much as it does the Innocent, who underſtand not theſe things, and are even conſtrained to credit thoſe things only which they hear of; all other things they commit to Chance and Time, together with the reſt of thoſe errours, unto which, as likewiſe unto other abuſes, this endeavour of mine, will (if God ſo pleaſe) ſome time hereafter adminiſter ſome Redreſs.

We do therefore conclude and determine, that the principal and chiefeſt occaſion and cauſe of Diſeaſes and Death, are theſe ſlimy, groſs, tenacious humours, which by little and little ſeize on and ſtop up the internal bowels of the body, and withdraw (or withhold) from the radical humidity its nutriment, and ſo debilitates the vital fire more and more, and at length quite extinguiſh it.

Now, to remove and throw off theſe Furrings, there is no other Remedy, but that the paſſages of the internal bowels be kept open and clean, or that they be opened and unlocked, as 'twere, if already ſtopt up.

Now this thing my *Aurum Potabile* can perfectly effect; a better Medicine than which, and one more apt and fit to open all the obſtructions of the body of man, 'twill not be ſo eaſie a matter to find; for it is in its nature a ſubtile, fiery, penetrating eſſence, warming all cold affects, attenuating the groſs, inciding or cutting the tenacious, and conſuming, and drying up all humours and Wateriſhneſs; inſomuch that (being made uſe of) it doth inhibit and impede the generation (or growth) of all kind of obſtructions, and by mollifying and inciding them when they are already generated, doth wholly take them away: Upon this accompt, by its corroborating the radical moiſture and vital ſpirit, and preſerving it ſafe and ſound, it gets the preheminence over all other ſuch Medicaments as perform the ſame effect: Moſt worthy is it therefore to be called and eſteemed the concentrated center of all Medicaments. For all thoſe virtues which are found ſimple and divers or diſtinct in any of the Vegetables, Animals, and Minerals, and which do, by a *Particular* Efficacy, ſet upon Diſeaſes; are concentrated in my *Aurum Potabile*, and being collected into one, do diſplay all the virtues of thoſe particulars univerſally, and therefore do theſe virtues diſcover it to be well worthy the name of an Univerſal Medicine: For this Medicament does not only exceed all other Medicaments in the moſt ſpeedy operation of its virtues in the curing of the bodies of men, but alſo it plainly abounds with the ſame admirable virtues in the bettering of the Vegetables and Minerals; and therefore it is to be preferred beyond all others, and to be extolled with the higheſt Praiſes.

But now, if in caſe it ſhould abound with far more noble and more efficacious virtues, (as to the taming and ſubduing the Diſeaſes of men) then it already hath; and yet, on the contrary, ſhould effect nothing

by those its virtues in the melioration or amending of the Vegetables and Minerals, it could not possibly claim to it self the Title of an Universal Medicine, but would be rank'd amongst the number of *Particular* Medicaments, as tending only to the curing of the Diseases of Animals. But now, seeing that (as we said before) my *Aurum Potabile* doth most powerfully help not only men, in the Animal Kingdom, but likewise in all the Vegetables and Minerals, (out of the Dominion of which three Kingdoms, *viz.* Animal, Vegetable, and Mineral, there is nothing in all Nature to be found) and is a most high Medicine unto them all; therefore also the Name and Title of a *Universal Medicine* doth rightly and properly appertain thereunto.

The Philosophers do indeed ascribe thus much unto their Universal Medicine, *viz.* that it is able to heal all the Diseases of Mankind, and of the imperfect Metals, and their defects, and transmute the said metals into perfect Gold. But concerning its being the supream medicine for Vegetables too, that they are silent in: Why they silently pass this over, for my part, I cannot certainly tell, nor do I deem it necessary to expound the same: 'Tis sufficient that my self have proceeded farther, and do manifestly declare, that it will perform the same in the Vegetables too.

But yet I would that every one should understand me aright, and not count me so simple, as if I did liken or compare my *Aurum Potabile* with that great Stone of the Philosophers, which transmutes vast quantities of imperfect metals into most pure Gold by projection: No, no, I do not ascribe such great Virtues unto my Medicine, which it has not in it, but yet withal I cannot tell, whether or no in process of time some better thing may not arise therefrom.

Farther too, the Philosophers say of their Medicine, that it can make variously-coloured precious Stones, agreeable in any colour to the natural ones, out of all kinds of Flints. And now, perhaps some or other will require this of my *Aurum Potabile*; to whom I reply, as afore, so agen now at present, that my *Aurum Potabile* is as yet imperfect, and is but in its infancy, which haply (being brought by the benefit of the fire unto perfection) will effect the self-same thing: But in the state which at present it is in, and whereunto my self have brought it, and 'tis at present constituted in, it is turned in three hours space in a covered Crucible, into a transparent Stone, red like blood, and resembling a Ruby: Of which, if a little bit be cast into molten glass, it makes it green, yellow, sky-colour'd, or even black too; according to the moreness or lesness of the quantity thrown in, or according as it is longer or lesser while kept in Flux. If now it operates these things, whilst unfixt and immature, any one may easily conjecture what it would effect, were it brought to a perfect constancy in the fire.

But it tingeth some sorts of the white Flints, kept for some hours in the Fire, with various colours, and transmutes Sulphur it self into most excellent Gold; which effect makes me more admire, than all the things that I ever heard of; and how this betided me, it will be worth the while, at present, to make mention of. I did once put some ounces of my said *Aurum Potabile* in a porcelane dish, as they call it, and placed it in Sand, that by the evaporation of the Phlegm, I might reduce it into a Salt: But whilst I was absent, the heat of the Fire being too much encreased, a good part of the Liquor boil'd over the Dish, and spilt it self into the Sand, Now when I came to look to it, I perceived that the Liquor which boild over the dish had hidden it self in the hot sand, I took out the said sand, which with the *Aurum Potabile* was gathered into one body or mass, and I put it in a glass, and poured Rainwater thereupon, and placed the Glass in hot Sand; then I put the Water with which I extracted the Salt, into a Tunnel, together with the sand which was to have the salt separated from it, and so I separated by a Filter the Liquor thus impregnated with the salt, from the sand, which said Liquor past through transparent, and unchanged in colour and taste: But now this sand, which was white at first, was clad now with a red colour, which stirred in me an exceeding admiration, that this Potable Gold of mine should tinge the sand. This sand I put in a Cupel, and brought it to the Test, and it yielded me pure good gold; and this made me wonder the more; for verily it is a wondrous transmutation, and such as I never heard of.

Upon this account do I perswade my self, that a piece of Crystal may by a bare digestion in this potable Gold, be digested into a precious Stone, but I have never as yet tried it, but yet I will try it, if God prolong my Life.

Having made this trial with the sand, I presently conjectured, that the sand which I planted my Herbs in, and which I moistened with my *Aurum Potabile*, did not impart the full virtues, and all the qualities of the gold to the Herbs, implanted therein, but did retain the better part to it self, for its own melioration, and afforded but the smallest portion thereof to the Herbs: Nor did this conjecture deceive me, for upon this occasion I searcht farther into this business, and found it even so. And therefore, for the future, I used no more sand, for the communicating the golden virtues and faculties unto the Herbs, but instead thereof, I used Sawdust, in which I began to sow or implant the Herbs, for Wood is not endowed with such powerful or strong virtues, as to be capable of extracting the aureous Essence out of the Potable Gold, like as the sand doth.

Upon this accompt therefore any rotten Wood or even the Sawdust of Wood will be more fit for this Work of planting, than sand it self is, for the sand attracts to it self the most principal virtues of the *Aurum Potabile*, and thereby doth better it self, and bestows upon the Vegetables some small Reliques only. Had I not accidentally found this effect, the sand would have robb'd me of much benefit.

Moreover, this thing likewise, which is well worth the knowing, must not be passed over in this place, *viz.* that what herbs soever are (by the help of my *Aurum Potabile*) grown up, they are all of them greater and stronger than the common sort are, and do far exceed them in colour, taste, smell, and in all virtuous qualities. The reason is this, because the said *Universal Medicine* is a meer fire, and bestows its fiery vigour upon the Vegetables and Herbs: For it is a thing sufficiently known, that by how much hotter the Countries be, so much the more efficacious Herbs do they produce.

The Herbs that grow in the lower *Holland* Countries, are not comparable to those which the upper *Germany* (which is of a drier and hotter soil and that

air) doth produce, neither in odour, ſavour, nor virtues. Nor doth High-*Germany* produce Herbs of that efficacy and bigneſs as *France* doth, which is of a hotter and drier air than *Germany* is; for in *Germany* Roſemary will hardly preſerve it ſelf ſafe from being injured by the Winter ſeaſon; whereas in the French Deſarts it grows ſo exceedingly well, as that it runs up like Trees, capable of defending one againſt the Rain, the which thing is not uſual in the more cold Countries. Verily moſt excellent Honey is brought from *Marſeilles*, (where the Bees ſuck it out of the Roſemary Flowers) into *Germany*, *Holland*, and other Countries, wherewith excellent Metheglin is made, and other Fruits and Flowers conſerved therewithal. But that Honey which the Bees are wont to gather in *Holland* and *Friezland*, about in the moiſt Meadows and mooriſh Fields, from the Flowers there growing, hath ſcarce any odour at all, but yet it is in goodneſs beyond that which the Bees gather from the ſtrong-ſmelling Flowers of wild Trees, or from the Bloſſoms found in the barren Broomy Thickets. By this therefore it appears, that there is a vaſt difference between the Virtues of the Herbs in this or that Country, and that ſuch men are not a little deceived, who without any regard had, eſteeming of all the *Europæan* Herbs alike, do attribute to the Herbs of the Northern Countries, as *Denmark*, *Swedeland*, *Norway*, *Poland*, the ſelf-ſame Virtues as the ancient Phyſicians aſcribed to theirs, in the more Southern Countries. And thus do our modern Galeniſts, affirming that their moiſt Herbs in theſe cold Countries are of equivalent Virtues to thoſe Herbs which the ancient Phyſicians have made mention of; but Experience ſufficiently teſtifies what effects they ſhew, and what errours the ſaid Galeniſts commit.

Avicenn, *Averroes*, *Æginet a*, and the pillager *Galen*, were not *Germans*, *Swedes*, *Danes*, or *Polonians*, but dwelt in thoſe hot Countries, wherein the ſoil or earth was day and night heated with the Solar rays, and impregnated with an aureous property, and ſo communicated to the Herbs wonderful Virtues and admirable Efficacy. Extreamly therefore do they erre, that dare attribute the very ſelf-ſame virtues to the Herbs of our colder Countries. But I confeſs, that by the benefit of Art, the ſelf-ſame virtues may be beſtowed on the Herbs, even in our moſt cold Lands, which thoſe Authors attribute to their *Arabian* Vegetables; *Where Nature ends, there the Artiſt muſt begin*, ſay all the Philoſophers, but eſpecially *Hermes*, who is, as it were, the Father of all the Philoſophers, doth clearly and openly teſtifie the ſame in his *Smaragdine Table*, ſaying, *That which is beneath, is like that which is above; and that which is above, is like that which is below, for the accompliſhment of the Miracles of one thing*, &c.

And albeit that theſe words are expounded with divers Explications, yet notwithſtanding, the general ſenſe and meaning of them points at nothing elſe but the ſuperiour and inferiour ☉, which generates all things, and brings them to perfection: We cannot by any force draw unto us the upper ☉, much leſs enjoin him to make our Lands partakers of his more hot beams, and to fill the Herbs that grow therein with the ſelf-ſame virtues that the *Arabian* Vegetables were endowed with: Alas, the Sun neither hears nor knows us, but proceeds on in its accuſtomed courſe, and diſchargeth that Office which was impoſed on it by the Divine Power. If we are deſirous of bettering thoſe gifts of Nature that are vouchſafed unto us, then muſt we ſet about the Work of Art, and ſee whether or no it (being an imitator of Nature) can afford us any help. And this it will do very eaſily, inſomuch that our *Europæan* Earth may bring forth as efficacious Herbs as the *Arabian* ſoil doth, and that with ſmall Coſts and Labours; ſo that there is no need of my more chargable *Aurum Potabile* for the accompliſhment of that buſineſs; for a ſulphureous and fluid ſalt Water will perfectly effect the ſame, ſeeing that in ſalt and ſulphur the Solar beams are abundantly concentrated and coagulated. This is our Terreſtrial ☉, by the virtue whereof all things do grow, which if we do but know how rightly to fit and order, we ſhould verily effect the very ſelf-ſame thing by the help of Art, that the ſuperiour and natural Sun operates in the Herbs, after its natural kind of way.

He now that neither underſtands nor apprehends theſe things, is not at all worthy to be accounted a Philoſopher, but follows after blind Leaders, and hurries others as well as himſelf into darkneſs. The Sun performs its courſe in the Firmament, according to its accuſtomed manner, and cannot be rendered either greater or leſſer: But we have the inferiour Sun in our power, and can accommodate it to our Herbs according as we liſt our ſelves, and in what quantity we pleaſe.

Upon this accompt *Art doth far outſtrip Nature*; and 'tis in our power, by the help thereof, (*viz.* of Art) to outſtrip it, if ſo be we have it and know how to uſe it. But this Diſcourſe of mine hath been more large than I intended, and minds me of deſiſting therefrom. I ſuppoſe I have ſpoken enough for a wiſe man's inſtruction; and thus much I thought it was expedient for me to hint by way of a Parentheſis.

But yet however, that I may the more clearly and more perſpicuouſly ſet down all matters, that ſo every one may ſee and apprehend, that I have ſet before them the meer pure naked Truth; I judge it expedient to inſert here yet more Examples and Inſtructions, that ſo whoever has a mind to make trial, may in very deed experiment the Truth of this thing.

Coagulate my Potable Gold into a red Salt, and put in 3, 4, 5, 6, 7, 8, 12 grains, more or leſs, into half an ounce of Cryſtal glaſs melted in a Crucible, that lying in the ſuperficies thereof, the ſaid grains of *Aurum Potabile* Salt may be molten. This done, the glaſs will preſently attract into it ſelf the Tincture, and become of a Jacynth colour, and ſo delicate, that it is not a whit inferiour in colour to the natural Jacynth. NB. If the melting be continued yet longer, the glaſs will be tinged with a golden, green, sky-coloured colour, and at laſt with a black-colour too, if it be too long left in the fire.

He that deſires to make a Ruby, let him put the bare coagulated Potable Gold (without the addition of any peregrine thing) into a pure and covered Crucible, and there leave it in fuſion for ſome hours, and he will get ſuch a delicate blood-like coloured glaſs, as is capable of refreſhing a man's nature, when debilitated with the multiplicity of cares, troubles, and labours, and this by a bare looking thereupon. And any one may eaſily conjecture what a refreſhment it will be to a man's mind, when (after abundance of vain-ſpent labours, and exceeding earneſt expectations of the Bleſſing of God upon them, he doth at laſt ſee with his own eyes, that that thing is poſſible to be effected, which with ſuch an incredible, ardent a deſire

he hath so long a time sought after. Without doubt the seeing of the promised Land did affect *Moses* with an unexpressible joy, though he never entred thereinto.

What man knows by looking upon the seed of any thing, what colours and what figure the Plant is of, that will proceed therefrom? but in its growing up by a due nutrition, it doth at length become manifest, which afore lay therein hidden: Even so the true first Ens of Gold lies hidden in my *Aurum Potabile*, and is not visible to the sight, much less doth that appear which shall or may by Art be made thereout of, before it shall have arrived unto its constant fixity or fixation, (as the Chymists phrase it) by the help of the fire. And therefore must there be a patient expectation until this Infant wax ripe, and attaining unto a man-like estate, it performs man-like actions.

Who would ever have believed that there lies hidden in an Egg the whole essence of a Bird, with all its Members, Feathers, and whatever else appertains thereunto, but that it is a thing so thoroughly common? The Must of Wine, if drank in too great a quantity, hurts the stomach, weakens it, and causeth Colick pains; and the same Liquor, after it is become a strong and clear Wine, corroborates the stomach and the whole body, and so at length lays off those virtues or properties which it held hidden in it self whilst it was Must. He that knows a Vegetable Seed, an Animal Egg, or a Mineral *primum* Ens, doth at last also come to know, that from a Seed there must proceed an Herb, from an Egg a Bird, and from the first Ens of Minerals an Universal Medicine: But he whose understanding cannot comprehend these things, but contemns them, as an abject or contemptible Seed, Egg, and first Ens of Minerals, *viz.* a sulphureous Salt, such a one doth even ignorantly despise the Herb, the Bird, and the Universal Medicine hidden therein. Therefore no body should contemn those things that he has no knowledge of. And seeing it is clearly perceptible, that the first Ens of Gold hides within it the true Universal Medicine, and which Time, Art, and Nature will really produce unto the Light: Therefore there is no reason why any one should undervalue my Potable Gold, or despise it, because it is as yet in its infancy, and is like some common salt water; but he should rather think thus with himself, that it is like the white of an Egg, which hides within its inward bowels, as I may so say, its yolk, which in process of time will bring forth a most delicate Bird.

But these things which I have already spoken of the nature and properties of my *Aurum Potabile* may suffice; its Medicinal use shall shortly be clearly described amongst my chiefest Medicaments, and so be published, together with them. But he that is minded to make use of the same in the mean while, may safely do it, and without any kind of hazard at all, for it operates nothing else, but what is conducive to the good health of man's body, corroborating the debilitated radical humidity or vital spirit, and confirming it, by which the life of man is nourished, encreased, and conserved many years in a wish'd-for, healthful estate, just as a Lamp is kept alive by the pouring on of Oil, or the vigour of the Fire by the apposition of Wood thereunto, by which it is preserved from extinguishing and dying: But yet the use thereof must be warily and judiciously admitted, because being a meer pure fire, it must be moderately adhibited. At the beginning of administring it, one or two drops may be given in Wine, Ale, or other Drink, unto the Sick, but best of all in the spirit of Wine: Then the next following day one little drop more may be added, and so the Dose may each day be augmented by the apposition of one small drop, until it work by Sweat and Urine, and sometimes also gently by Stool.

This Operation being made (and on this wise active) then the Doses are to be in like manner daily lessened by the omission of one drop at a time, until the Sickness be happily removed, and so the Sick need no farther use of the same.

All things being thus rightly instituted, it will manifestly appear, that all Sicknesses, yea, the hidden ones too, are expulsed by this Medicament, and even as it were consumed. like as Wood is consumed by a burning fire, in such wise, as that nothing at all of it remains, save the fixed Salt, but is all reduced into a Nothing: For all Diseases, as we shewed afore, have their rise from moist humours, which nothing can heal and remedy more commodiously and safely than this *Aurum Potabile* of mine, which is such a vehement resister of all over-abounding humidities, opening, inciding, consuming, and dispelling them, just as the ☉ consumes Water in a Vessel, and wasts it away by evaporation. Hence it is, that it both cures, and by way of a preservative, prevents the *Leprosie*, *French-Pox*, *Quartane*, and all other *Fevers*; the *Scurvy*, *Epilepsie*, *Apoplexy*, *Hypocondriack Melancholy*, *the Stone in the Reins and Bladder*, the *Gout*, and all the *Diseases of the Matrix*, both known and unknown, and the various Sicknesses of Women, as also the dreadful *Plague*, with all the evil effects arising therefrom. For it is found, that nothing is subject to Corruption and Death, but an abounding Phlegm, or an immature humidity which is wont most speedily to pass into a putrefaction.

From hence it is clearly manifest, that the sanguine man, which is endowed with a drier temperature, has a far better fruition of his health than the phlegmatick man hath, who abounds with moisture.

Dry Sugar dures many years, but being moistened, it turns sowre, and becomes ropy and ill-savour'd, tho' it be a Salt, and is mixt with other corruptible Vegetables to preserve them.

From hence may it be seen, that a superfluous humidity opens the Gate for Death to enter in by, and seize upon the Life: But on the contrary, a temperate siccity preserves all things in an healthful state, and barrs up the passage against any corruption. The Roof of a curious and stately-built House being full of chinks and holes, lets the Rain in, which moistens all the whole structure, and causeth it to rot and spoil: But if the holes in the Roof be stopt, and the windows by which the Rain beats in be shut, and the windows on the other side of the house, where the wet beats not in, be on the contrary opened, that the warm Air passing in, thereby may throughly dry up all the moisture, and so inhibit or put a stop to the Progress of Putrefaction, then the whole frame and building will be kept sound and good, which otherwise would be rotted and quite spoiled. Such men as live in the mooriſh fenny Countries, and feed upon a wateriſh Meat and phlegmy Drink, are for the most part of an unsound temperature, and troubled with Catarrhs and the Scurvy. But on the other hand, those that inhabit high and lofty places, and have the fruition of a drier and purer Air, and that feed upon such meats as are more conducive unto health; these men know nothing of those watery sicknesses, but have flouriſhing and strong bodies, and have firm, compact, and excellently well

well tempered fleſh. And this difference is not found only to be in Men, but alſo in all other things. For not only Bread, Fleſh, Fruit, and ſuch other things as are uſed for daily food, do grow mouldy much ſooner in the moiſt places, and ſo corrupt, but alſo even Metals themſelves too, as Iron, Copper, Tin, and the like, even theſe cannot ſhun the corruption of the Air, but are laid over with Ruſt, which (in a drier air) they do not ſo eaſily contract.

By all theſe circumſtances it is ſo clearly evidenced, that ſuperfluous moiſture is to all things alwaies hurtful, and gives an inlet unto Corruption, that I think there is no body that will dare to ſay any thing to the contrary.

And therefore ſeeing that this *Aurum Potabile* of mine doth (amongſt all other Medicaments, what Title ſoever dignified with) moſt notably excel in the taking away of Corruptions, and may be moſt ſafely made uſe of both for preſervation from, and curing of Diſeaſes, it ought to be accounted and eſteemed of as an *Univerſal Medicine*, and that very deſervedly, and which gives place to none.

Theſe few things I was willing to deſcribe here in this place, concerning the uſe, efficacy, and virtues of my Potable Gold, in the curing of the Vegetables, Animals, and Minerals. There ſhall ſuddenly follow more concerning the ſame, in *The Deſcription of the uſe of my Principal Medicaments.*

It now remains, that I make ſome brief mention of the preparation of my aforeſaid Potable Gold, although I have already often done the ſame in many places of my Writings, and have very clearly ſhown the ſame, but yet after a Philoſophical manner, and without ſetting down any Receipt, but here and there by piecemeal; as for example, in my *Miraculum Mundi*, in its *Expoſition* and *Continuation*, where it is briefly deſcribed, ſo as that it therefore needs not any farther illuſtration.

But yet, that I may abundantly ſatisfie all men, I do (by way of over-plus) admoniſh every one, that he do not think that this ſubject is to be ſought after from foreign and far remote places, with a great deal of coſts and charges; for the matter out of which my *Aurum Potabile* is made, is in every place, and offers it ſelf even in a manner *gratis*, to the moſt poor as well as the richeſt, and without Coſts, and is brought to its perfection in three daies ſpace: To that perfection, I ſay, (that you may rightly underſtand my mind) as its infancy requires, *viz.* ſo as to become a *Lac Virginis*, or a clear Univerſal Medicinal Water, which I call *Aurum Potabile*, and in which the moſt precious Dragon's-blood lies hidden, which is to be tranſmuted in a certain limitted time, by fixation, into a conſtant Salamander; the which I have not as yet ever effected, and therefore forbear to uſe more words, reſting ſatisfied with this my *Aurum Potabile*, which I have many a time prepared by my labour, and here treat of, and forbear to multiply any more words about things of greater moment. In the mean time I doubt not, but that (if time and labour be beſtowed hereabouts) this *Aurum Potabile* would arrive unto the utmoſt fixity and conſtancy, both in the moiſt and in the dry way.

Farthermore, I deny not, but that this ſame *Aurum Potabile* may be made of all the things of the whole World, but yet eaſier and ſooner out of one ſubject than another. *There is no Infant that is born ſo poor, but that he neceſſarily enjoys that ſubject, and cannot live without it:* Therefore ſome of the ancient Philoſophers have written, *That* Adam *and* Eve *had the ſame matter in* Paradiſe; when as yet they had no cloathing.

Mary the Propheteſs and Siſter of *Moſes*, calls it, *The Work of three hours*; another calls it, *The Philoſophical Work of ſeven daies*: I *Glauber*, being a new Diſciple of *Hermes*, do moſt truly affirm, That this my *Aurum Potabile*, which I here treat of, may be perfected not only in three daies, but even in three hours ſpace, and that out of ſuch ſubjects as are every where to be found, and which all men know and make uſe of, and cannot be without.

I ſpeak the pure naked Truth, without hiding it under any Coverings of ſimilitudes or enigmatical expreſſions. And that no body may think that theſe my Writings are not to be underſtood according to the Letter, but that they conceal all things under an hidden meaning, I do again affirm this third time, that the *Aurum Potabile* which I write of, may be made of any Vegetable, Animal, and Mineral, but yet ſooner out of one than another. For although any one may prepare it out of a piece of Wood, Bread, or Fleſh, and out of an handful of Straw, Leaves, or Graſs, yet notwithſtanding, it may be eaſier made out of an handful of the ſalt of any Vegetables and Animals, as being their concentrated center; and this I bequeath to the whole World as an infallible Truth. But I would have every one rightly to underſtand me, what Salt I here point at, *viz.* I mean no other, but that which is to be found in all things.

But that the true meaning of my words may be yet the clearer and openlier diſcloſed, I will adjoin a ſhort but fundamental Diſcourſe. It is not ſufficient for a lover of Art, that is inflamed with a deſire of obtaining ſome good thing, barely to read over ſuch or ſuch a Philoſopher, and preſently to perſwade himſelf, that by the meer reading, he ſhall forthwith underſtand clearly and perſpicuouſly the Art treated of. No, but he muſt accurately meditate, and conſider what that is which he ſeeks for, whence it hath its original, and by what means or what way he may obtain it. For if we will make our ſearch from the utmoſt and extreameſt Coaſts (or Bounds as it were) even to the inmoſt bowels or center, we ſhall find, that God was One and alone from Eternity, even till the time wherein it pleaſed him to create viſible things for His own glory and delight. And when He went about doing this, He ſaid, *Let it be:* Aſſoon as this *Fiat*, or *Let be*, was pronounced by God, it began to move it ſelf, and to change (or turn) into four Elements, out of which Elements there afterwards aroſe all thoſe Creatures, which can be diſcerned with our Eyes, and without the four Elements they could neither be nor conſiſt, and without them even Nature her ſelf can bring forth nothing.

Now, if any one would endeavour after what is purer and better than thoſe things which are generated from the Elements, he muſt make his attempts by *ART*, the which, by overcoming or outſtripping *NATURE*, hath its tendency to that Butt whereunto Nature cannot attain; and he muſt there begin his operation where Nature ended hers, as not knowing how to make any farther progreſs: For then is a *Quinteſſence* obtained, which exceeds Nature one degree, and cannot be promoted by Art any farther.

But if any one has a deſire of obtaining any better and greater thing than this ſame *Quinteſſence*, he muſt then proceed ſome other way; for (as we ſaid but now) Art cannot make any farther progreſs beyond

a Quinteſſence: And therefore neceſſity requires, that there be made a regreſs or retrogradation unto the Center from which the very Elements themſelves have their original. This Center is that Divine *Fiat* or *Univerſal Hermaphroditick Salt*, participating of both natures, which being the true *Primum Mobile*, comprehends hidden in it ſelf two contraries, which acting one upon another, do bring forth the three Principles of the three Kingdoms, *Vegetable*, *Animal* and *Mineral*, and do nouriſh them by the four Elements, and multiply them, and this is the common courſe of nature.

But now Art makes a much farther progreſs, and reduceth the *Circumference* to the *Center*, and doth not permit unto that *Center* or *Primum Mobile*, that the *Patient* be overcome or ſubdued by the *Agent*, by the operating of thoſe two contraries upon each other, nor does it ſuffer it to paſs into thoſe three kingdoms, *viz.* *Vegetable*, *Animal*, and *Mineral*, as into its Circumference, but doth ſo ſubdue, and keep, and bridle in that *Primum Mobile*, that it does not divide or dilate its Virtues by a large circumferential walk, as it were, but doth in a manner ſwallow them down into its own ſelf, or concenter them; juſt as if a Dragon ſhould bite off his own venomous Tail, and therewithal nouriſh himſelf, when he cannot light upon any other Food, and ſo by this means becomes a moſt high Medicine. And therefore moſt wiſely ſaid *Hermes*, *Our Dragon doth not die, but by its Brother and Sister*. It is a thing neceſſary, that one Fire ſhould overcome the other, and tranſmute it into a more noble eſſence. Such a fire as this, is my *Alkaheſtical Arcanum*, or true *Aurum Potabile*, with which wonderful things may be effected. It is a tranſparent clear Water, wherein the colour and form of Fire lieth hidden and introverted; but yet that internal Fire is eaſily and ſpeedily manifeſtable, and educible unto view, by either the dry or moiſt Fire. The dry way is done by the heat and fire of common Wood-Coals; and as for the moiſt way, a well-rectified Spirit of Wine is to be uſed, and ſuch as is void of all its Phlegm. Take therefore of the dry and concentrated Fire ℥ j. put it into ℥ iij. of the moiſt Fire or Spirit of Wine, which moiſt fire will preſently ſwallow up the dry one. Theſe being both of them digeſted by a due heat of Fire for ſome hours, in a long-neck'd Phial or Bolthead, will put on a blood-red colour, and will manifeſt and expoſe to view its concentrated Virtues, with curious colours, and with a pleaſant taſte and ſmell, by which heart-corroborating qualities it far excels all other Aromatical Eſſences, that ſerve for the ſtrengthening of the heart; for thoſe properties which afore lay turned inwards, and were ſhut up in its inmoſt bowels, are all of them drawn forth and made viſible, and become ſubject to the external diſtinguiſhing ſenſes. By this means the abject and little Infant which was clad in a white colour, becomes a ſpeaking, ſtrong, and prudent man, and this very *Lac Virginis* it ſelf is changed into the moſt efficacious *Dragons-blood*. This now is the moſt true *Aqua-vitæ*, and the moſt true *Wine of Health*, ſome few drops of which being daily taken, do conſerve good health, and beſtow long Life.

Many honeſt men have with their own eyes ſeen at my Houſe the admirable and moſt ſpeedy effects of my often-mentioned true Potable Gold, and eſpecially its operative efficacy in the tranſmutation of the Imperfect Metals.

If therefore ſuch a one as is troubled with grievous Diſeaſes, and who finds no help in thoſe vulgar, commonly-known Galenical Medicaments, ſhall need the help of this my *Aurum Potabile*, I will out of Chriſtian Charity willingly beſtow upon him ſo much thereof, as may be requiſite for the recovery of his former health; and this I will the rather do, that the wonderful miraculous deeds of the Divine Power may be made known in theſe laſt times.

No body ſhall fiſh out from me more Directions than thoſe which I have too and agen hidden in my Writings, concerning this *Aurum Potabile*; let it ſuffice every one, that he can find this Medicine ready prepared in my hands, the which ſcarce one of an hundred would be able to make, were he a Poſſeſſor of the Secret.

This Medicine ſhall lie ready prepared by me as long as I live; I will not deny it to any body; nay more, I will openly ſhew the uſe thereof too, unto ſome of my friends, in the melioration of both the Vegetables, Animals and Minerals themſelves, that ſo the Wonders of GOD, and the poſſibility of Art may be manifeſted, and come to light.

And now, may it pleaſe the Omnipotent GOD, who is the beginning and the end of all things, to inſpire us, out of His meer Grace and Mercy, and implant in our cold hearts, which are ſtopt up with darkneſs, the warming heating ſpark of His Holy, Eternal, Infinite, and all-correcting Light, that it may therein, as in ſome ſaltiſh and ſulphureous Earth, be nouriſhed, and grow up like a little Seed, and bring forth Fruit a Thouſand fold, to the Salvation of all our Souls. *Amen.*

THE

THE

SECOND PART

OF

Miraculum Mundi.

In which is described the Magnificent Coming of

ELIAS THE ARTIST;

And that the wonderful *Salt of Philosophers* is the most Excellent Medicine of *Vegetables*, *Animals*, and *Minerals*.

By the help of which, not only *Vegetables* do grow, and are multiplied; Diseases of Men and Animals, whether internal or external, are miraculously Cured, and Imperfect Metals really changed into *Sol* and *Luna*; yea, pure *Sol* rendered able to sustain the Force of Fire beyond the natural 24th. to the 28th. degree; but also from every Plant natural *Sol* is extracted, and disposed to *fixedness*, for multiplication of it self.

THE PREFACE.

Candid Reader,

AMong ancient Philosophers of the Heathen, as Chaldees, Egyptians, Persians, Greeks, *and* Romans, *yea, and the* Hebrews *themselves, it was a long-received Custom, enigmatically to propose what they esteemed most worthy of consideration, lest such Secrets should either be divulged or lost; to the end, that unworthy persons having regard to the Letter only, and not respecting the Sence expressed in those words, might know nothing at all of them: But contrarily, the Worthy, enlightened with the Light of GOD and Nature, well understanding what is signified by those Words, might thence reap most profitable Fruit. The Truth of this is sufficiently proved by the Writings of ancient Philosophers; also by the Books of* Moses, *and the Histories of the Prophets. For all these, or the greatest part of them, do indeed need another explication, than the Letter it self seems to inferr, because some occult matter is in that contained.*

In like manner our Christian Philosophers, both ancient and modern, discovered their Arcanum's *enigmatically; as, among many other,* Basilius *and* Paracelsus *did: For, although these men delivered all things true, yet they are understood by very few: Which hath been the occasion of Contempt and Reproaches, with which ignorant men, and the evilly-disposed, asperse all Philosophers (among whom Kings themselves, and divers Princes, in times past have been, and are yet found) and say,* There is no such thing in Nature, as the Transmutation of Metals into a better state; *and that* The Universal Tincture or Stone of Philosophers was never found by any Man. *Truly it is a matter worthy of sharp Reproof, and not to be suffered, that the Chymical Writings of many excellent pious men, should (although most consonant to Verity) be so maliciously rejected, and proclaimed false. This is rather due to Chymical Mountebanks, (understanding nothing less than Chymistry) because they expose to sale the Philosophers Stone unto others: This sort of men have rendered Chymistry so vile and abject at this day, as many men judge it a Reproach to be called* Chymists.

That we might, as far as is possible, prevent this evil, and demonstrate those things to be true, which the abovenamed Writers have left to us, under the Title of The Salt of Ancient Philosophers, *which by* Paracelsus *is called* Elias *the Artist; we resolved to effect the same thus.*

Paracelsus *treating of the Transmutation of Metals, because he was not willing to insignize* The Salt of Philosophers *with its true name, referrs the Reader to* Elias the Artist, *who, he saith, when he comes, will teach the way by which the Transmutation of Metals may be effected. Here Men imagine Wonders, and generally regarding the words themselves, expect the coming of a certain Man sent from GOD, whom they believe, shall in the later Ages of the World, discover occult Arts, and make known the Secrets of Nature. Whereas, if the Name* Elias the Artist *be rightly considered, or a transposition of the Letters be made, we read* Artis Salia, *and these Salts indicate* Elias the Artist *of* Paracelsus. *These perform Wonders, so as a man possessing the Salt of Art, or knowing the nature thereof, may effect Wonders.* Elias the Artist *to such a man appears to be the cause of effecting marvellous things.*

Basilius, *in his Testament, did very obscurely describe this Salt, where he sheweth the way of making* The Stone of Philosophers *of common Vitriol; yet no man is able from those Writings to gather which way he should prepare the same.*

Also he that considers the words of Paracelsus, *where he foretells the coming of* Elias the Artist, *will find, that in that he describes Vitriol, both obscurely and openly; obscurely indeed in his Treatise entituled,* The Tincture of Naturalists; *openly, in that which he left, touching Vitriol in Species. He would not expresly say, that* Elias the Artist, *or* The Salt of Art, *was expresly contained in Vitriol; only this he was willing to shew to Posterity,* viz. *That the Art of changing vile Metals into better, was descended from the Ancients unto him, and with him should perish, until the coming of* Elias the Artist, *who should shew the true Transmutation of Metals,* viz. *in the* 58th. *year of the following Age. This time many have expected with grief and trouble, but in vain hitherto.*

Many Philosophers, besides Paracelsus, *have predicted the Coming of* Elias the Artist, *who coming from the* North, *attended with a strong Lion, shall teach Arts, find out and manifest the secret Treasures of Nature, and dispose the various mutations of mundane things for the benefit of Mankind. These have many men in vain believed to be spoken touching some one man; for if we consult the Writings of those men, who have set down this Prediction, we shall find them not to have intended a* Man, *but* Salt-petre *only, and his Brother the* Salt of Art: *Hence it is that they cry out,* O our Salt! O our Salt-petre! O our Radical Salt! *Hence also it is, that they write,* If GOD had not created this Salt, it had been impossible to make our Medicine; *and various expressions like to this, in many places of their Writings they use, as I have declared in several of my Tracts, especially in the Third Part of* The Prosperity of *Germany, where (among other things) I said,* I hoped that in time to come, by me should be unto all men exhibited *Salt-Petre,* or *The Salt of Art,* sitting (like some Monarch) in a Triumphal Chariot.

I doing this, take Paracelsus *out of his Sepulchre, and (as himself predicted) turn him towards the Orient, that is, I expose him to the Light, by which the verity of that Prediction may be discerned by All.*

Perhaps my Disciples may do the same; and they seeing the verity of the Transmutation of Metals, or restoring the Sick to health in a way unheard of, draw me after I am dead, or whilst I live, out of the Sepulchre into which my evil-minded Enemies have cast me. And when they do these things, they will effect so notable a mutation in Medicine *and* Alchymy, *as indeed for the future there will be even no Artist, who will not see and understand the frauds, ignorance, or hatred of the proud and high-flown Adversaries of Art and Truth, and justly oppose themselves against such malicious Enemies of true Verity. Thus may those who have long before been blind, receive sight, profess themselves to have been Opposers of Truth, and strenuously labour to suppress and amend what's amiss. In such a time not only true* Medicine, *and the most noble Art of* Chymistry *would begin to flourish, but also all Arts would ascend to a greater degree of perfection; and so one Age will exhibit it self much more excellent than others. Wherefore my Prayer is, that the Gates may be opened to divine and natural* Arcanums, *that* Elias the Artist, *and the* Salt of Art *would discover the predicted* Golden Age, *and that the most Wise GOD would unto pious men grant an entrance into the* Land of Promise, *that they may thence bring Fruits, and present them to their Neighbours, for the Honour of GOD most high, and the solace and comfort of the Needy.* Amen.

Indeed Paracelsus *makes some mention of this Salt in his Works, calling it* Sal Enixum; *but we in our Treatise (published in the year* 1658.*) of the nature of Salts, have somewhat more largely expounded the matter, calling that* Sal Mirabile. *In the present Treatise of the Salts of Art it is expresly called* Elias the Artist; *the verity of which Appellation, we shall by the help of GOD clearly demonstrate,* viz. *that* Elias the Artist *of* Paracelsus *signifies no other than the* Salt of Philosophers, *prepared of* Salt-petre, common Salt, *or* Vitriol. *Indeed it is in taste like* Salt-petre, *yet it is not inflammable, although it may be procured by Art.* Paracelsus *and* Basilius *made it of* Vitriol, *as several parts of their Writings shew, which for better knowledge sake I shall here insert.*

Elias *and* Elisha, *what men they were, and what miracles they wrought, Sacred Letters shew. The Miracles they wrought were Divine; the same almost is our Salt able to perform in a natural way: Therefore not without reason have we called it* The Monarch of the World, *or* Elias the Artist; *for there is no subject found in the nature of things, by help of which we are able to do the same, as may be effected by the benefit of This. The truth of this all Animals, Vegetables, and Minerals do witness, as we shall demonstrate variously anon.*

But some One may say, Since Chymistry *is treated of in so various Tongues, and there are found almost infinite numbers of Chymical Books, How comes it to pass, that this Salt hath so long remained unknown, even until this day, and it was never so clearly described by any Writer, as we thence could understand what it is, or which way it should be made? I answer, Writers and Readers also are found of a twofold condition. They, who writ by the guidance of Experience, did all acknowledge, and obscurely describe this Salt: Otherwise they, who compiled their Books from the Writings of others, being ignorant of the thing it self, proposed nothing but Fictions, leading the Reader into a Labyrinth and various By-paths.*

Writers are diligently to be considered; regard is not so much to be had of their Words as of their Sence; if this be minded by you, you will find none of the true Writers, who did not make mention of this Salt, which, as it is manifest to those that understand, so it is hid from those who are yet ignorant of these things. You may find very many, who in Writings seek the Stone of Philosophers, *and yet are ignorant what they seek, or what the Stone is, whether it be something black or white, hot or cold. And if such a thing should be presented to those men, they would neglect it, and after their fashion leaving the most precious Jewel, proceed to please themselves in Dung. Many men handle this Salt with their hands, yet what they have in their hands they know not, because they are blind, and their arrogant mind instigates them to betake themselves to things more vile. But on the contrary,*

ry, not a few may be found, who will divulge none of those excellent things which they know. Oh, how happy is he that studies Taciturnity! he is permitted to lead a quiet life. I indeed do seriously bewail my so liberal Communication of Secrets, but I did that to discover the Wonders of GOD, to serve my Neighbour, and to preserve our Art. Egregious things would often be exhibited to the World, did not the high Ingratitude of mortals deterr the Writer, and prevent his good intention. When they find a man endowed with the Knowledge of some things beyond others, they flock about him, entreating him to impart his Secrets to them: there are found divers of this sort. The Wealthy come, the Needy come, and men of a middle condition also come. The first sort of men being, for the most part, very covetous, will return nothing in exchange; the second sort have not any thing to give; but the third only we have sometimes found grateful. What we have acquired with very great labour, we cannot easily impart to Enemies. Yet it often happens, that those who are judged good, are afterward found evil, and in a Farnnerian manner, for Benefits received, return Calumnies and Reproaches. Therefore, in such cases there is need of great circumspection, and we must not discover all we know, lest afterward we repent. But as for my self, I have not changed my mind, I have begun to make known the Wonders of the Omnipotent, and will go on (GOD willing) and kindle an unextinguishable Light to this blind World. In this Treatise I shall only describe the wonderful Virtues of the Salt of Art, reserving the way of preparing or use to my Friends; for what are our Arms, we must not cast them away, lest our Enemies take them up, and wound us with them, after the example of Farnner.

I speak of the Salt of Art, the Virtues of which I know, I will not communicate its Preparation or Use; all shall be open to my Friends, (yet with respect of persons) more than is fit, is already discovered to Enemies. Is there any reason we should cast Pearls before Swine? If what others obscurely treated of, I should here openly communicate to Enemies, would they, think you, cease to do evil, and begin to do well? Although I purpose not at all to discover the Preparation and Use of this Sal Mirabile, yet I doubt not, but that I shall prepare and make easie the way for finding it out; so as in a few years space all Europe will see Alchymy flourish, and not so much any other way, as from the discovery of this Salt.

Of other Arts, which we shall perceive to arrive to a more excellent state, the reason is the same. It is sufficient that I have shewed such an incomparable Salt is found in the nature of things; yea, I demonstrate the place where it may be found. If Columbus had not told us, That the Occidental part of the Earth did abound with Gold and Silver, who could have found the same, to bring such Treasures thence to us? If some One had not revealed, that gold, silver, and precious stones were contained in Caverns of the Earth, and Pearls to be found in the Sea, who (doubting the event) would ever have been at those vast charges of Diggings and Fishings? But now we all know such Treasures are to be found there, none refuseth to search for them. And although they are not obvious to all, yet that they are in being no man doubts; even so I judge it to be with our Sal Mirabile. The virtues of it I deliver, which are great, and with most easie labour, and a very little direction; other things may be thereby obtained. The only moving cause why I propose these things, is the most Wise GOD, whose wonderful Works I neither would nor could hide or keep to my self any longer.

THE

SECOND PART

OF

Miraculum Mundi, &c.

I. *Of the Original of this* Salt.

TOuching the Original of this Salt, I have before shewed which way it should be made of F. and common Salt. Yet I would not have these words be so taken, as if the same could be prepared no other way than this. The methods of preparing it are various; for it may be prepared of G. only, without the mixture of common salt, yea, of allume, sulphur, or common salt, without the addition of H. or without the benefit of the Fire of any other salt. No salt can be found, which is not a commodious matter for this salt of Art; yet it may be collected from one more easily, and more copiously than from another. But because we exhibited one only way of preparing that before, as well for other reasons, as because of want of time, and lest we should be too tedious to the Reader; therefore we now think it convenient to signifie, that these wonderful salts may be prepared, and that they are endowed with special virtues denied to others, which they exercise, as well universally as particularly, in Vegetables, Animals, and Minerals. For, Who can deny that salt to be of another nature, which remains after the Destillation of spirit of common salt, and that which is left in the Destillation of *Aqua-fortis* or *R.* although they be salts of a most diverse nature, of which these are prepared?

Yet every one of theſe is endowed with power of diſſolving and fixing. But that which is made of *Sal Armoniack* volatilizeth all bodies ſo, as the ſouls of them paſs over by Alembick; in like manner a ſpirit ſeparated from *Sal Armoniack*, by the help of C. manifeſts other virtues and properties, than thoſe which are found in the Spirit of common Salt. To one more accurately conſidering theſe, *Arcanums* of great note will exhibit themſelves: But more of theſe elſewhere.

Of the Name of this Univerſal Salt.

ON this Salt we impoſe the name of, *The Univerſal Salt of Philoſophers*, reſpecting thoſe excellent Powers and Virtues, with which it is endowed above any other Salt. We deſervedly call it Univerſal, becauſe it is the higheſt of thoſe Medicaments which proceed from Minerals, Animals, or Vegetables; as in the following Treatiſe ſhall be demonſtrated: Of Philoſophers is added, becauſe the demonſtration of this matter is neceſſarily grounded on Philoſophick foundations.

Of the Virtues of this Univerſal Salt.

TOuching its virtues, they are innumerable, and we judge it impoſſible to diſcover them all; for if I ſhould undertake only to write what I know of the virtues thereof, a whole years time, day and night labouring, would ſcarcely ſuffice. Perhaps GOD will diſcover more to others; perhaps they, who are younger than I, may find what is to me unknown. By me the firſt, by me the Guide is opened to the Searcher an entrance to things more excellent.

My purpoſe is to communicate to others thoſe things, which the moſt Bountiful GOD hath largely conferred on me, for His Honour, and the profit of my Neighbour: I intend, I ſay, to divulge the wonderful Works of GOD, but at this time (by reaſon of various buſineſſes and hindrances) I ſhall only make mention of ſome of the virtues, which I find to be in my *Sal Mirabile*, or Salt of Art, reſerving the more ſpecial explanation of all things to a more commodious time.

This Salt is rightly called Univerſal, becauſe it is the principal Medicament of the three Kingdoms, *viz.* of Animals, Vegetables, and Minerals, and hath power to perfect and augment the ſame. I remember that heretofore I have attributed to Nitre the Dignity of this, and not without reaſon; yet in many things it is inferiour to this *Sal Mirabile*, ſo as it deſerves not to be compared with the ſame. Therefore in no wiſe correſpondent to Verity are thoſe Writings, which teach, That by the help of a certain Corroſive, a tranſparent Salt may be extracted from a Metal, and that ſalt, diſſolvable in water, is the true Salt of the Wiſe. Such Writings are of no other uſe, than to ſeduce the Ignorant by Lyes.

For the ſalt in which a Metal is diſſolved, deſerves no more to be called or eſteemed a ſimple ſalt, but receives the condition of a metallick Vitriol, whether that Vitriol is green or yellow, of *Sol* and *Luna*; or white, of *Mercury*, *Jupiter*, and *Saturn*; or bleWiſh-green, of *Mars* and *Venus*; for what is to be an Univerſal Medicine, extending it ſelf to all Kingdoms, muſt neceſſarily have no extraneous thing mixed with it. This is conſentaneous even to the Judgment of Ruſticks.

The true Univerſal Salt ſhould be partaker of no metallick matter; but altogether pure, and moſt eaſily able to put on the nature of all things contained in the kingdoms of Vegetables, Minerals, and Animals, and ſo exhibit it ſelf a moſt excellent Medicine. And ſince theſe Properties are moſt fully found in our Univerſal ſalt, there is no reaſon we ſhould aſcribe to it leſs Honour, or not preferr it before all ſalts.

Intending to expoſe the Verity of theſe ſayings to all, we begin firſt with Vegetables.

Of the wonderful power of the Univerſal Salt *in the kingdom of* Vegetables.

I Said in my *Miracle of the World*, and the Continuation thereof, that a ſulphureous ſweet ſalt is the moſt excellent Medicament of all Vegetables: The Truth of which no man hath cauſe to doubt; for I have ſhewed in various places, that barren grounds are made fruitful by the addition of that. Of this ſalt, which we may uſe inſtead of Dung, there is great diverſity, for it is prepared of Wood-aſhes, of Stones burnt to Lime, and of other bodies putrefied by length of time. But the Chief of all theſe is Salt-petre, being the ſalt of Vegetables, Animals, and Minerals putrefied, eſpecially becauſe it is endowed with a certain occult and ſweet Fire. Alſo the ſignature proper to it, clearly expoſeth to our ſight its augmentative virtue; for it exhibits not it ſelf in a Cubical form, as is obſerved in corroſive ſalts, (altogether adverſe to the augmentation of Bodies) but Dart-like or acuminate. By this ſignature Nature intended to ſhew of what condition and virtue ſalt-petre is. And indeed, if Experience be conſulted, the things we have propoſed will be found true, *viz.* that in Nitre is a principal Virtue, augmenting Bodies. As for example: R. what Corn you will, ſteep it for a night and day in Rain-water, wherein Nitre is diſſolved, commit it to the earth, and you will find, that it not only ſhoots up more copious ſtalks and ears, and hath a more ſwift germination and ripening, but alſo is endowed with a much more acceptable taſte, than other Corn in the vulgar manner produced by the help of the Dungs of Animals. But of this matter, more at large elſewhere.

Pure Nitre is a ſalt genited in old Stables, from the Dung and Urine of Animals. Urine and Dung are no other than Vegetables themſelves, putrefied by digeſtion in the ſtomachs of Animals; which concoction is wont to be perfected in 24 hours ſpace: But Vegetables and Animals, out of the ſtomachs of Animals, cannot be putrefied without long time, eſpecially when they have acquired ſome undue hardneſs.

Thus

Thus we ſee Putrefaction differs in reſpect of time, yet it acknowledgeth no diverſity; for whether it be made in the ſtomach of an Animal, or out of it, it is all one, and never different in virtues. By this *medium* the Vegetable kind hath its propagation and encreaſe, but altogether in a ruſtical manner, becauſe a better way is not yet known.

Indeed, unto Philoſophers is known a more eaſie and more compendious way of reducing Vegetables, Animals, and Minerals to their firſt matter, or into a ſulphureous ſweet Salt; yet they reſerved the ſame among their *Arcanums*, leſt ſuch a moſt noble Art ſhould be made too common.

As it is altogether impoſſible that the ſeed of any Vegetable ſet in dry Herbs ſhould grow, or Man himſelf, or any other Animal, ſhould be able to ſuſtain Life, encreaſe, or be multiplied, with the only uſe of Sand or Flints; but earth moiſtened with a ſaline liquor, is required, unto which the ſeed muſt be committed; and in Man ſuch Aliment muſt be digeſted in the ſtomach, as will eaſily be changed into nutriment of the Parts: ſo it is impoſſible to augment Metals, unleſs they have been before reduced to their firſt matter, and ſo ſpiritually conjoined each to other, as one may give nouriſhment and encreaſe to the other. All theſe things are far more eaſily and more readily performed by Art than by Nature.

By Art that all Vegetable, Animal, and Mineral ſubjects may moſt eaſily and ſwiftly be reduced to their firſt matter, which is a ſulphureous ſweet Salt; and by that means be multiplied, the true Univerſal Salt clearly demonſtrates; which ſalt, if we obſerve its ſignature or long figure) is not only more excellent than Salt-petre, but is alſo generated eaſily in the air. We have diſcerned ſand or a ſtone to imbibe this ſalt, if expoſed to the air, and from an ingenited virtue thence to grow, yea, and that which firſt grew being taken away, in a few daies ſpace another hath ſhewed it ſelf, and ſo to Infinity. Indeed theſe things ſeem impoſſible, but they are not ſo to him who rightly knows Nature; for that augmentation is effected in a Magnetical manner, of which we do more fully treat in another place.

Hence, not without good cauſe, do we aſcribe to this Univerſal ſalt the title of HERO, and a moſt rich and liberal Monarch.

The PROCESS.

A moſt eaſie Way of acquiring Spirit of Salt *together with the* Sal Mirabile.

R. of common ſalt two parts, diſſolve it in a ſufficient quantity of common water; pour *A.* upon the ſolution; put the mixture into a glaſs Body, or a glaſs Retort well coated, or elſe into an earthen Body or Retort. If a Body, ſet on an Head, and begin to deſtil with Fire of ſand, encreaſing your Fire gradually; with the firſt heat comes off the unſavoury Phlegm, which gather apart; when the Liquor comes forth ſowriſh, change your Receiver, and receive the ſowre ſpirit: Continue the operation till no more ſpirits will ariſe, then let out the Fire, and permit the Veſſel to ſtand in ſand till all is cooled, when cold, take it out, and if it be unbroke, fill it again with the aforeſaid matter, and proceed as we taught: The Phlegm is not to be caſt away, but muſt be kept, that in it may be diſſolved Salt (becauſe it is better than common Water) for another deſtillation. Thus from every pound of ſalt you will have ℔ j. of the beſt and moſt pure ſpirit. Diſſolve the ſalt remaining in the Body or Retort (if neither be broke) in Water, filter and evaporate the Water, let it cryſtallize, the Cryſtals will be white, endowed with wonderful Virtues, to be declared here following.

Note, If the Glaſs be broke, there will be no neceſſity of diſſolving the Salt, it will be enough to take out the dried *Sal Mirabile*, and reſerve it for Uſe.

Note, This deſtillation may be performed in a ſilver Body, for ſo doing, we ſhall be free from all danger of breaking; yet the Veſſel muſt be made of very pure Silver, void of all Copper, leſt thoſe moſt ſharp ſpirits do attract the Copper from the Silver, and ſo the Body become altogether porous and ſoft. Although in the ſalt is no property agreeing with ſilver, yet every deſtillation it raceth off ſome of the ſilver, which that you may ſave, gather the white Powder left in the Filtre, after filtration of the diſſolved ſalt. Dry this Powder, moiſtened with a ſtrong *Lixivium*, and melt it in a Crucible into ſilver; yet you muſt not inſtitute this melting of the ſilver *per ſe*, becauſe it hath acquired ſuch volatility from the ſpirit of ſalt, as it will fume all away.

And although every deſtillation ſome quantity of the ſilver be raced off, yet you may deſtil the ſame matter ſome hundreds of times in the ſame Body, before you ſhall need a new one. Thus we ſhall have the leſs need of Glaſſes, and ſooner perform the deſtillations, becauſe a ſtrong Fire may be given at firſt, without fear of breaking the Veſſel.

A yet more compendious way is, when we ſet the Body alone upon a Trivet, and by putting Fire under it, extract the ſpirit; for ſo we ſhall need no Furnace, unleſs we will, for better conſtringing the heat: Nor will any great quantity of Coals be ſpent in ſuch extraction, becauſe ℔ j. of ſalt may be deſtilled with two or three ℔ of Coals.

This ſpirit being of it ſelf ſufficiently clear, and of a grateful taſte, needs no rectification.

Yea, it is able to effect more than we aſcribe to it in our Writings. Alſo the remaining ſalt effects other incredible things, beſides thoſe we aſcribed to it in our Treatiſe of the nature of ſalts.

Plainly, after the very ſame manner as we have taught ſpirit of ſalt to be prepared, ſo may alſo be made *Aqua-fortis* and *Aqua-regis*. Inſtead of ſalt, take Nitre, and you will have *Aqua-fortis*; and if to a ſolution of Salt and Nitre, equal parts, you add a ſufficient quantity of B. you will, by help of Deſtillation, acquire *Aqua-regis*.

Therefore ſince the infallible *Baſis* and Foundation of *Medicine* and *Alchymy* is C. or elſe D. it is now known to us, which way, and for little Charge, we may produce large quantities of this Medicine; whereas in the vulgar way great Coſts and Labour is required; and the more eaſily we can obtain it, the more abundantly profitable will it be to us, eſpecially when we intend to beſtow time in the tranſmutation of the more vile Metals. Wherefore its principal Uſe is directed to the Preparation of F. as is ſaid moſt eaſily. Hence alſo the ſpirit of ſalt and *Sal Mirabile* may duly be uſed in true Medicine and fruitful Alchymy.

Of a Lyon and Panther is produced a moſt ſharp-ſighted Lynx; yea, of a Lyon and Eagle is genited a moſt potent Dragon, vomiting Fire, flying on high, and carrying up in the air an Horſe, with a man ſit-

ting upon him. Although theſe can do very much, yet they could not preſerve the moſt noble Art of Alchymy from being accounted unprofitable and neglected by evil-minded and ignorant men. Yet at length an unſatiable *Gulo* conſuming all things, being genited of a Dog and a Wolf, reſtored the ſame to a due ſplendour. This dares to demonſtrate the ſpecies of Metals to be mutable, contrary to the opinion of *Ariſtotle*, and by this means plainly ſhew and confirm, that *Alchymy* is moſt profitable, and contemned without cauſe. *Alchymy* ſtands obliged to this, becauſe by the ſame it hath recovered its priſtine and truly royal honours; to this, becauſe it both acquires favour and praiſe.

Of the Utility which our Salt of Art *contributes unto all Men, of what ſtate or condition ſoever they be.*

THE Utility of this is very great, for if ſeeds, before they be ſowed, be ſteeped in it, they will yield an incredible encreaſe; which is a thing of very great concern to all men dwelling on the Earth, becauſe they ſhall never ſuſtain the want of Bread.

And will not the Husband-man, gathering in his Fruits for leſs labour and charge than in the vulgar manner, be able the more certainly to pay his Dues to the Magiſtrate?

Of Artificers alſo the Reaſon is the ſame; becauſe they being hereby better able to exerciſe their Crafts, may alſo return the benefits thereof to their ſuperiours.

Unto Phyſicians, by the help of this, are known more excellent Medicaments, and they being preſent, more ſpeedy and certain relief is procured to the ſick.

So is it with Apothecaries, Chirurgions, and their Medicines, Plaſters, and Unguents, which by this are more perfectly prepared, and therefore the Cure is ſooner, and more happily abſolved, than by Medicines vulgarly known.

And I believe every Artificer and Trading Man, when he can perform his Work with leſs labour and charge, and acquire his Wares for leſs trouble and coſt, will ſell his Commodities to his Neighbours, at a cheaper rate than he could before he found the benefit of this ſalt.

Husbandmen and Gardeners, and other ſuch labouring men, when they can more eaſily, ſooner, and more abundantly reap their Fruits than before, cannot chuſe but ſell to the buyers for leſs price than they could afford them at when they had no benefit of this.

Thus we generally ſee, of how great Utility our *Salt of Art* is, or what benefits may thence redound to men of every condition. What man, conſidering theſe things, will not imploy all his faculties that he may become the Maſter of ſuch a ſalt, whence he may not only benefit himſelf, but his Neighbour alſo?

Of the Uſe of this Sal Mirabile *in Medicine.*

1. THis ſalt ought to be numbred among Univerſal Purgers, for by a Magnetick Virtue it extracts all ſorts of noxious humours out of the Body.

2. This purging Property is augmented by Metallick or Mineral Bodies diſſolved in it.

3. For expelling all depraved humours, the moſt profitable to be diſſolved in it, is Antimony; when the Medicine is to be appropriated to the Heart, Gold; when to the Brain, Silver; to the Liver, Spleen, and Reins, Iron; to the Lungs, Tin and Sulphur; to the Habit of the Body, Copper and Mercury.

4. If purging Vegetables, Minerals, and Animals be boiled in the Water in which this ſalt is diſſolved, and that decoction be uſed in a Clyſter, we know all corrupt humours will be evacuated thereby.

5. In all thoſe Perſons, young or old, which cannot or will not take purging Medicaments, either by the mouth, or otherwiſe, it will be very profitable to free their bodies from corrupt humours, to make ſuppoſitories of Honey and this ſalt mixed.

6. In *Head-achs*, all *Fevers*, and the *Epilepſie*, it will deſerve the praiſes of a ſuitable Purger.

7. In *Catarrhs*, when the Head is full of Phlegmatick Humours, half a grane, or a whole grane of this ſnuffed up the Noſtrils early in the morning, or in the day-time, wonderfully evacuates the Phlegm.

8. It is an admirable Remedy in Affects of the Jaws, and parts adjacent, as the Tongue, Tonſils, Cheeks, and Gums, having their original from a ſharp Catarrh falling down, and oftentimes conjoined with Ulceration and Corruption, as is frequently known to happen in Scorbutick Diſeaſes. For it extracts the humours cauſing the *Evil*, and heals the part vitiated, if it (diſſolved in Water) be often uſed hot as a *Gargariſm*, and the uſe of Purging not neglected.

9. In like manner, in the *Tooth-ach* it performs Wonders, drawing out the Humours cauſing dolour in the Teeth; if as much as will lie on the point of a knife, or ℥j. of it, be applied, tied up in a fine Cloth, to the aking Tooth, yet after the uſe of ſome gentle Purgation.

10. It is a famous Medicine in Affects of the Eyes and Ears, drawing their Original from a *Catarrh*, provided the uſe of ſome Purging Medicine be not neglected.

11. This ſalt is egregiouſly uſeful, and eſpecially after Metallick Bodies have been diſſolved in it, againſt green Wounds of the Body and old Fiſtula's.

12. If it be mixed with a due quantity of common Water, and thence a Bath be made, it admirably clears away the *Scab* and like Affects of the skin, better than natural Baths themſelves; for by its famous power of attracting depraved Humours, lying between the skin and fleſh, and producing ſuch Affects, it heals and extracts the ſame, eſpecially if that power be helped by ſome other Medicine.

13. It extracts Humours of every kind, ſharp, gnawing, or which are moſt firmly inherent in the external parts, or which often produce Vermin like Lice, and cannot be removed by Baths or Unguents.

14. This uſed internally and externally, (*viz.* in a Bath) extracts the Water out of Dropſical perſons; and this it effects ſo much the more powerfully, if Gold be diſſolved in it.

15. It

15. It is a famous Medicine for removing Dolours of the Gout, or diminiſhing the ſame.

16. Inwardly given, it is conducent againſt bloody Fluxes of every kind.

17. Alſo externally applied, it wonderfully ſtops Blood in Wounds, eſpecially if after it is calcined and reduced to Powder, it be mixed with Cobwebbs or Peacocks Dung, or which is better, when Steel hath been diſſolved in it.

18. It kills and expels all Worms.

19. In *Fractures of Bones*, and in *Ruptures*, it is a moſt excellent Medicament.

20. It, diſſolved in Water, and put upon the body, not only preſerves Inſects from Corruption, but alſo greater Animals, and Man; yet it may be uſed in a more dry form.

21. It is an excellent Conditure not only of Animals but alſo of Plants and Flowers.

22. It preſerves bodies diſſected from rottenneſs, ſtink, and dryneſs; contrary to what we have obſerved Turpentine, Spirit of Wine, Aloes and Myrrh to do; yea, from decay, as we have ſeen done in Salt-water.

23. It of Gold produceth an excellent *Elixir*, in a few daies, ſome granes of which uſed either liquid or dry, moſt gently expels depraved Humours by Urine, Sweat, and Seidge. Such an Univerſal *Arcanum* was never before this time known to Mortals; we liberally give it, for the Honour of GOD, and Health of our Neighbour.

24. It ſo prepareth Gold, as by the help of Alcolizate ſpirit of Wine, it paſſeth the Alembick of a golden colour, and is a famous Medicament.

25. Alſo by the help of that (although after another manner) a blue Tincture may be extracted from Gold, of excellent uſe in Medicine and Alchymy.

26. It is able to impreſs the nature of Vegetables on all Metals; ſo as Metals this way prepared, and added to the Roots of Herbs, impart to thoſe Herbs the nature of the Metal applied. How famous the uſe of ſuch Metallick Medicines will be in Medicine, it is eaſie to underſtand.

Of the Utilities of the Salt of Art, *in various ARTS.*

1. IT ſuddenly coagulates River-Water, Rain-Water, or any deſtilled Water, ſo as it becomes Ice, and may be carried in Paper, a Sack, or Wooden-Box or Cheſt, whereſoever you will, and be diſſolved when need is, ſo as the ſalt may be ſeparated from the Water; which ſalt is not at all changed by the Water, but may oftentimes again be uſed for like Coagulations.

2. After the ſame manner Wine, Vinegar, Beer, Metheglin, and like Drinks, may be reduced by coagulation into a clear ſubſtance, and again be moſt eaſily diſſolved.

3. Alſo by help of that may be coagulated ſaline ſpirits, as, *Aqua-fortis*, *Aqua-Regis*, ſpirit of Salt, ſpirit or oil of Vitriol, and the like, ſo as they will become hard ſalts, without any change or corruption, portable in Paper or wooden Boxes, to other places, where being diſſolved when need is, they exhibit a Liquor diſtinct from the ſalt, the ſalt in the mean while keeping its coagulating Virtues intire.

4. To Honey and Syrup it gives the conſiſtency of ſugar.

5. Fountains may be ſo ſtopped with it, as their flowing to be ſtayed.

6. It changeth wood in proceſs of time into a moſt hard ſtone.

7. It abſtracts the ſuperfluous Phlegm from Wine, Beer, Vinegar, and ſpirit of Wine, ſo as they become the ſtronger.

8. It ſeparates the Phlegm from ſubtile Mineral-ſpirits, whence they are made volatile and more powerful.

9. It takes away from Wine, Beer, Vinegar, and ſpirit of Wine, its ungrateful taſte or odour, and unto them alſo gives greater clearneſs.

10. Alſo it corrects the unſavory ſmell of Veſſels, ſo as we may commodiouſly uſe them.

11. It preſerves for a long time all Fruits, as Cherries, Apples, Pears, Grapes, Garlick, yea, Hens-Eggs, and whatſoever may be changed by the air, and otherwiſe would be corrupted.

12. Unto *Painters* it may be a *Baſis* for their Colours.

13. The ſeeds of Vegetables moiſtened in it, are wonderfully multiplied, ſo as from one only grane 10, 20, or 30 ears will ariſe: And the ſame will be effected, if the ſalt it ſelf be committed to the earth.

14. It cauſeth the Earth long to keep the Rain-Waters it receiveth. Hence muſt neceſſarily ariſe great profit to the Fruits.

15. This applied to the Roots of Trees, recovers them, though almoſt dead before, and makes them fruitful.

16. Yea, Animals ſuffocated or drowned in Waters, as Dogs, Cats, Mice, and Inſects, by help of it may again be reſtored to life.

17. It attracts the breathings of many men lying together in one Chamber, and coagulates the ſame as ſnow or ice; not indeed by any reall co-touching, but being included in ſome Glaſs, and hung up by a Thread. Even ſo, in a Magnetick manner have we obſerved ſuch breath or vapour to adhere to the outſide of Glaſs like true Ice. But this is a Winter operation.

18. Flowers and odoriferous Herbs, by addition of this, may be preſerved without change of odour, taſte, or colour.

19. By the benefit of this ſalt, various colours and very many odoriferous ſpecies may be prepared; whence the Roots of Plants, if they be applied to them) attract the colour or odour, which they communicate to the Herbs themſelves.

20. It takes away the bitterneſs of Oil-Olive, rendering it ſweet and clear, better than boiling can do.

21. Linſeed-Oil being mixed with it, is preſently clarified, and freed from its Aquoſity, which otherwiſe cannot be effected in many daies. [See more in the Second Century.]

Of the Use of the Salt of Art *in* Alchymy.

1. IT dissolves and fixeth all Vegetables, Animals, and Minerals.

2. In three hours space it reduceth all the aforesaid into their first matter, whence most excellent Medicaments are made, and whence proceeds a product of Metals, new and more excellent than others.

3. It demonstrates, that in all Herbs, none excepted, there is volatile ☉, and teacheth which way it should be fixed.

4. It adds strength to *Aqua-fortis*, *Aqua-Regis*, and spirit of salt.

5. In a few hours space, it extracts the soul from Gold, so as it ascends by Alembick, and becomes a very excellent Medicament.

6. To the white body of ☉, and of other Metals, spoiled of its soul, it restores the same.

7. In a very short time it reduceth Gold to such an essence, as it may be united with the seeds of Vegetables, and communicate it self to the Herbs.

8. It extracts Gold, Silver, and Copper from Metals most compendiously, and with very great profit, in a dry way, without fusion or any addition.

9. It gives more noble qualities to metals, whilst they are washed in it, so as even by the help of such a Lotion, Iron can join it self with Mercury, yea, become fluid and ductile, like Copper, which is a thing very profitable.

10. It brings imperfect Metals by graduation to maturity, and so changeth them into ☉ and ☽, as well by the dry as humid way.

11. It can ripen every iron into steel.

12. By the help of this, Iron may be changed into Copper, Copper inte Silver, and Silver into Gold, either by the humid or dry way. Also every Gold may be brought to the 28th. degree, yea, to a true Tincture. But of the last I have as yet made no experiment; nevertheless, it seems not to be impossible, because there is no metal which may not be changed into another, and indeed more excellent metal; yea, we know that common ☉ keeping its colour, may be exalted. And although the way of making this Tincture is not yet certainly known, yet there will be some one, that shall succeed us, to whom GOD will grant the knowledge of the same, who shall stop the mouthes of all slanderous and evil-minded men, and discover their malice.

But some one may say, How shall we know this colour of Gold to be true Gold, and not Copper? To him I answer; For this Process neither Copper nor any other Metal is required; only a Vegetable Sulphur with the Salt of Art absolves that. Whence then should the Copper have access to the Gold? To say, from the Vegetable Sulphur, is nothing: for that must be numbred among Miracles. Hence, if that should be Copper, we see it may well be demonstrated, that all Metals yea, and *The Philosophers stone* it self, may be prepared of Vegetables. Which is a saying most nearly correspondent to Truth: for there is no Plant, yea, I say, no Excrement, no not humane Dung, which exhibit not true Gold, or a true Tincture. Therefore this colour, which we find to have access to Gold, by help of the *Sal Mirabile*, and Vegetable Sulphur, argues not Copper, but true Gold. The Elementary Rays of ☉ have passed into Sulphur in the coagulation in Herbs; this, by help of the Salt of Art, is changed into Tincture, when fixed, and added to Gold, becomes corporeal.

From these and the like, we judge the certainty of the Transmutation of Metals to be sufficiently manifest to every one. Indeed many have endeavoured to demonstrate this, but none more clearly than I have done, because this appertains to *Sal Mirabile* only. Therefore let Ignorants cease to gain-say GOD and the Truth, lest they be severely punished.

These, and various such-like Transmutations, may be performed with very great profit; therefore I judge it needless to speak more of them. Occasion of knowing many things offers it self to Posterity, if GOD give the Blessing. For the Utilities of this Salt are daily more and more known to my Disciples, so as it cannot otherwise be, than that all *Europe* by the help of this Salt only, shall see true Alchymy flourish. Whence, and not undeservedly, it is called the *Salt of Art*, or *Elias the Artist*, who entring into the World, should communicate various Arts to the same. Here you now have him, teaching those things which alwaies were accounted impossible.

The World not contented with this *Elias*, must necessarily expect another. The Jews considering the abject state of Christ, esteemed him unworthy the Honours of the before propheſied of *Messias*, altho' with their own eyes they saw very many Miracles wrought by him. If the same happen at this day in this case, what wonder is it? It is very hard to believe, that such a wonderful Salt can be found in most abject Vitriol.

Could such men know the nature of common Vitriol exposed to the eyes of all men, they would easily understand more to be contained in the same, than I have attributed to my *Sal Mirabile*. It is better something should be reserved to Posterity, than all things laid open to our Age. I have begun, let others proceed.

Paracelsus, in that Chapter he writ of Vitriol, saith, By help of this every Iron may be changed into the best Copper; but which way, something more excellent, *viz.* Iron, may be changed into Gold, *Elias the Artist* (which we call the *Salt of Art*) when he comes, will demonstrate, That the occult virtues contained in Vitriol may be more known to every man, what this Author left in Writing, touching Vitriol, I thought good here to insert.

Therefore, since I in this Treatise denominate my *Salt of Art*, *Elias the Artist* long since predicted, some one may properly say, *My* Glauber, *you proclaim your* Sal Mirabile *to be* Elias the Artist; *but in* Paracelsus's *Writings we read, That when he comes, he will teach the way of transmuting Iron into Gold; now shew us which way your* Sal Mirabile *can do this.* I answer, That here is nothing of impossibility, I have obscurely in this and other places shewed; but which way the Operation is to be instituted, I have not declared: because I my self have not as yet obtained a perfect understanding of the same. Nevertheless, that it is possible we have often observed; for Iron hath access to Gold, and so augments it even as it augments Copper.

For when Copper is dissolved in a certain salt, and the solution is poured upon thin Iron Plates, not only the Copper and Iron settle to the bottom, and so becomes Copper again, but also whilst the coction is performing, a great quantity of the Iron hath access to the Copper, so as you take out more Copper than you put in. I bring for a true Testimony of this Experiment,

periment, the Saying of that moſt true Writer, *Lazarus Ercker*, in his Probatory Book, where he ſaith, He had often obſerved, that Iron Inſtruments in length of time were changed into Copper, without any depravation of their Figure. Yet it is credible, that this Mutation is from Spirits, not from Bodies, becauſe Spirits are endowed with a greater penetrative power.

Since the Writings of this man are in the hands of few, I thought good here to inſert what he hath left written, touching the Tranſmutation of Iron into Copper.

Whether Copper *may be made of* Iron.

Courteous Reader,

I *Did for a long time perſiſt in denying, That Iron in Coppery Waters, ſuch as are made of Vitriol, green Tartar, and the like, could be precipitated into Copper; nor could I in any wiſe believe, that any encreaſe could come to Copper, from Iron; but daily Experience hath taught the contrary,* viz. *That in Mines and Mountains of Vitriol, were left Iron Inſtruments, which after long time were changed wholly into Copper. For although precipitation of Copper is made, by the benefit of Iron, yet the ſame quantity of that, as is put in, is not taken out again. Notwithſtanding this, here it is to be obſerv'd, that together with the Copper, which is ſo precipitated, Silver alſo (if any be) ſettles to the bottom. Therefore they ſeem to do well, who for Precipitation of Silver, beſides Copper caſt alſo into the* Aqua-fortis *Plates of Iron: And ſo in one and the ſame Operation, Silver and Copper ſettle to the bottom, and we ſave all, which the ſeparatory Water did contain.*

As it is manifeſt, Copper may be made of Iron, ſo alſo that the ſame may be changed into Gold, is moſt eaſily demonſtrated. That it is poſſible, I have often obſerved, although without profit, becauſe the true way of Operating was then unknown to me.

Iron is not changed into Copper in every ſolution, but in that which is in certain Determinate Salts. For, if you diſſolve ℥ ſs. of Copper in *Aqua-fortis*, and to repreſs the ſharpneſs of the *Aqua-fortis* add a little common Water, caſt in Plates of Iron, or duly inſtitute coction; ℥ ſs. of Copper will indeed be precipitated by the Iron, but the Iron not changed into Copper. The certain reaſon of this, we believe, is, becauſe no Salt having power of Graduation, was added to the *Aqua-fortis*. Of Gold, the reaſon is the ſame, if it be diſſolved in *Aqua-regis*; for the Gold is here found to be precipitated alone, and the Iron not changed into Gold, becauſe of the defect of ſalt convenient for gradation.

But if a ſolution of Copper or Gold be made in ſpirit of ſalt, and Iron caſt into that ſolution, then not only the Copper or Gold ſettles to the bottom with the Iron, but alſo in this ſolution part of the Iron paſſeth into Copper or Gold, becauſe the ſpirit of ſalt more potently acts upon the Iron, and introduceth Tincture better than *Aqua-fortis*.

Although any Iron, as you ſee, may be changed into Copper or Gold, yet no profit is thence to be expected, for commonly ſome part of the Gold remains in the ſolution, and is not precipitated; and which way this may be ſeparated from the Water is not known to all. Therefore it is better to omit this Operation, than to labour and be at charge to no purpoſe: For reduction of this Gold, mixt with the ſolution, experienced men are required, which will do all things with judgment, and are not contented with that only which expoſeth it ſelf to ſight.

Yet I do not in any wiſe think that ſuch gradation cannot be inſtituted without profit. If we can really tranſmute a very ſmall Particle of Iron into Gold or Copper, Why may we not alſo do the ſame in a greater quantity? It is our faults if we do it not, who are ignorant how to uſe rightly Salts of gradation, ſufficiently able to compleat the work. That the way of effecting that was known to *Paracelſus*, I doubt not; yet he would not communicate it to the ungrateful World, but referred the divulgation thereof to the coming of *Elias the Artiſt*, and that not without Reaſon. I doubt not, but that this gradation may be performed with very great profit, by help of my *Sal Mirabile*, or *Salt of Art*; yet I cannot ſubſcribe to it as an infallible certainty. I have other things now in hand to ſpeak of: My Labours and almoſt incredible Charges have diſcovered various ſecrets, which I publickly communicate for the profit of my Neighbour. Other things may be effected in time, by which (Darkneſs being diſcuſſed) Light may be given to the World, and the Miracles of the Omnipotent G O D be expoſed to the view of all. *Here is need of Labour.*

That Gradation of Iron may be made by the help of appropriate ſalts, ſo as to be changed into Copper, Silver, or Gold, our *Sal Mirabile* plainly enough declares, whether the gradation be inſtituted in an humid way, or Cementation made in the dry.

Now it remains, that we demonſtrate, that ſuch gradation may be made by ſpirits, having power of perfecting and fixing, ſo as no conſumption of the Iron be, as we ſee done in the addition of *Aqua-fortis*. It is ſure that the ſame gradation which *Lazarus Ercker* ſaid, he obſerved in the aforeſaid Mountains, is of like condition; and ſince we poſſeſs ſuch Spirits, we alſo, remote from Mountains, may effect the ſame. I cannot believe that any other can (if he would) teach us the way of preparing ſuch ſpirits, beſides *Elias the Artiſt*.

In what relates to me, I ſay, that this gradation of Iron may be the better performed, Copper, Silver, and Gold muſt firſt be reduced into Vitriol, having power to effect gradation, and that indeed by the benefit of the *Salt of Art*. I have more than once, by the help of the *Salt of Art*, changed ſilver or gold into a green Vitriol: I need not ſpeak of Copper, the mutation of which is far more eaſie, yet the other is not very difficult, and indeed in an humid way. For I have not ſeldome (when it happened that the Iron being conſumed, my labour was to no purpoſe) had one end of an Iron Wier changed into Copper, and the other into Gold. If time will permit, for my Friends ſake, and that they may be mindful of me, I will repeat the ſame labour. But the principal thing, which infers difficulty in this Operation, is a too great corroſion of the Iron by the Vitriol.

Note. Beſides this, there are other things, which cauſe difficulty, and ſo render the labour invalid, in the dry way as well as in the humid, *viz.* the aptneſs of Glaſſes to break in the humid, and of Cruci-

bles in the dry way; whence it comes to paſs, that the *Sal Mirabile* cannot be kept in them a due time, but runs out.

The gradation of iron into gold, in what way ſoever made, without gold can very difficultly be perfected; and if a glaſs happen to break, Who ſhall be able to gather up what runs out? The loſs of one gradation, by the breaking of the Veſſel, and outflowing of the Liquor, will ſcarcely be repaired with 5 or 6 other gradations compleated without loſs. Therefore it is beſt to deſiſt from ſuch Works.

Of that Operation, which is performed by the dry way, the reaſon is the ſame. For here the gold, which is added for gradation, is almoſt all loſt, without regard to the breaking of Crucibles, which by that means cannot contain the *Salt of Art* its due time: And beſides all this, the ſubſtance of the Crucible will imbibe ſome of it, and together with the ſame part of the Gold; and, Who can without loſs extract it thence? Yea, we think the Crucibles drink in a greater quantity of the gold, than we acquire by the gradation, although our Work ſucceed well. By Experience it is manifeſt to me, that when there are eight parts of Gold, but one part of Iron in gradation is changed into Gold, which way ſoever the Work is performed. What will it avail to ſpend our time in perfecting thoſe things, the event of which is very uncertain? This is the reaſon why very many with me have refuſed this profitable Operation.

We conſidering the poſſibility of the matter, whether it was poſſible to prevent thoſe difficulties, began to labour, but to no purpoſe, a great while, until at length it pleaſed the Higheſt Giver of all Good things to hear our Prayers, and opened to us the way of preparing ſuch Glaſſes, as (although not luted, are able to bear the vehemency of Fire without coating; and Crucibles alſo we know how to harden ſo, as they will continually keep Metals in Flux. I now hope, if GOD hinder not, for better ſucceſs.

A man not fearing the breaking of Glaſſes and Crucibles, might perform egregious things, this way handling Metals, according to his will inſtituting gradations and fixations, and ſo reduce Metals to due maturity, even as the ſun, by continual digeſtion, ripeneth Fruits: For no man, if he fear breaking of his Veſſel, and loſs of his matter, is able to keep the ſame till its final compleatment in a Glaſs or Crucible.

By the benefit of either of theſe inventions, ſuch things may be effected in Medicine and Alchymy, as before were impoſſible to be done.

Yet let no man ſollicite me (conſidering the great labour and vaſt charge I have expended thereon) to divulge this ſecret. Nevertheleſs, that it may not be buried with me, I purpoſe to communicate that to two of my moſt loving Friends, adding (beſides many other *Arcanums*) a ſuccinct Explanation of this ſecond part of the *Miracle of the World*. It will concern theſe men to uſe the ſame for the Honour of GOD, and good of their Neighbour. I did not this to profit our ſelves, becauſe they are rich enough and I live contented with what I have, but only that the ſuſtentation of the Poor might be chiefly regarded.

Iron may alſo another way be changed into Gold or Copper, *viz.* by the help of fiery ſpirits, which *Salt-Petre* (the Couſin-German of our *Salt of Art*) exhibits, and of which I have very plainly diſcourſed in a ſpecial Treatiſe, not yet publiſhed. That you may ſee the poſſibility, I will declare the matter by example.

Make a Fulmen of Tartar, Sulphur, and Nitre mixt, to this add of the *Minera* (or Ore) of Copper, Silver, or Gold, never expoſed to the vehemency of Fire, but ſtill endowed with its own Sulphur, endowed with power of tinging and perfecting Gradation an eighth part. Put ℥ ſs. or ℥ j. of the mixture into a Crucible at one time, and ſet this Crucible under the Receiving Veſſels of our fifth Furnace, and with a live Coal kindle the Fulmen, and then the Orifice being well cloſed, you will find and obſerve the Gradation of Iron unto Copper, Gold, or Silver, according to the diverſity of matter added to the Fulmen. Here moſt commodiouſly may be uſed Steel-Needles; theſe I have often drawn out of a Crucible, wholly changed into Gold.

Note. He who intends to make Gradation with Gold, muſt neceſſarily apply Receivers, in which he may collect the volatile Spirits of Gold. If a man be contented with a very ſmall quantity, he needs not uſe Receivers, afterward (being firſt aſſured of the certainty of the Operation) he may build a Furnace fit for it. I built ſuch a Furnace, in which the laſt Summer, for my Friends ſake, I performed this Operation.

Note. If a ſufficient abundance of good Metals be wanting, that your labour may not be in vain, it will be requiſite to make the ſame ſpiritual with Salt-Petre, before they be added to the Fulmen. If you would make trial of graduating into Gold, to ℥ j. of the Fulmen, you may add ʒ j. of fulminating Gold (precipitated with ſpirit of Urine, not with *Lixivium*) and your endeavour will have good ſucceſs, if you proceed right.

By help of this Fulmen, all Metals may be changed into Gold or Silver; that is, the true Regal Cement of ancient Philoſophers, which they alwaies kept ſecret; only *Paracelſus*, in his Preface to the Book of Cements, was willing to make ſome ſmall diſcovery; *You muſt not* (ſaith he) *ſo much regard the Ingredients of the Cement, but the way of cementing is only to be conſidered, the Fire only, which is in it, muſt be endowed with power of fixing and graduating*. Yea, in his Book of Vitriol he almoſt ſpeaks the ſame.

But ſome one may ſay, What is that Regal Cement, or what is the way of uſing the ſame? Although this hath been alwaies kept as a Secret, yet I in theſe laſt times communicate the ſame to All. There is indeed no Metal, which may not (even without the addition of any other thing having power of perfecting Gradation) by the help of this only, be turned into gold; as in our work of ♄ we largely ſhew. Yet this Operation is not done with ſo great profit, as that which adds Powders perfecting gradations to the Cement; nevertheleſs it is ſufficient to ſhew the poſſibility.

But that the Doctrine of *Elias the Artiſt* may be more manifeſt by the aforeſaid *Paracelſus*, we thought good here to ſubjoin his own words at large, which take as follows.

THE

THE BOOK
OF
Philip Theophrastus Bombast

Of Hohenheim, *Monarch of Philosophers, Prince of Spagyrists, Chief of Astronomers, Paradoxical Physician, and great Master of Mechanick Secrets.*

TOUCHING

The TINCTURE of Natural Things,

Against Sophisters born since the Flood, in the Age of Our LORD JESUS CHRIST the Son of GOD.

THE PREFACE.

SInce thou, Sophister, *with foolish and lying Words, hast reproached me in all places, because I was born in* Helvetia, *that I am rude, and understand or know nothing; also, that being one Letter more than a Physician, I rove and wander about from one Region to another: Therefore I purpose in this small Treatise to discover and lay open to the World, ignorant and unexperienced men; also that in the first Age good Arts were in being; and what your Art is able to effect against mine and mine against yours, and what is to be judged of either, and how Posterity in the Age of Grace will imitate me.*

Consider Hermes, Archelaus, *and others in the First Age, what* Spagyrists *they were, and how great Philosophers. That they were such, is witnessed even by their Enemies, who are thy Patrons, (or Idols rather at this time) O Sophister. But if this had not been testified by your Authentick Fathers and falsly-reputed Saints; yet the ancient* Smaragdine-Table *discovers more of Art and Experience in* Medicine, Alchymy, Magick, *and other like Sciences, than can ever be taught by you and all your Tribe. If from the Precedent you do not yet understand what, and how great Treasures these be, tell me why no Prince or King was able to subjugate the* Egyptians? *Then why did* Diocletian *the Emperour command all Books of Chymistry (how many soever they were he could come by) to be burnt? For their Books being destroyed, they were long since compelled to bear such an intolerable Yoke, as will in time fall upon the neck of thee and thy Collegues, O Sophister.*

In this Middle Age the Monarchy of all Arts is at length derived to me, Theophrastus Paracelsus, *Prince of Philosophy and Medicine; for unto this am I chosen by GOD, that I may extinguish all Phantasies of devised, putatitious, and false Works, and presumptuous Words, whether they be the Placets of* Aristotle, Galen, Avicen, Mesue, *or any other Follower of them. And my Theory proceeding from the Light of Nature, shall never fail through its unconstancy, nor be changed, but begin to flourish in the* 58*th. year of the following Age. Then the Practice following, it shall be proved by admirable and incredible Signs, so as it shall be openly manifest to Mechanicks and the Common People, how constant and unmoved the* Paracelsick Art *stands against the Trifles of Sophisters; in the mean while that Sophistick Art hath need of Papal and Imperial Privileges, to strengthen and uphold its Impertinencies. But whereas I am by thee, O Sophister, accounted a Beggar and Vagabond, the* Danube *and the* Rhine, *I being silent, shall answer for me to thee. Often hath those impertinently-devised Calumnies of thine against me, displeased many Princes and Earls, also Imperial Cities, Noblemen, and Knights; for I have a Treasure in a certain City of* Forum Julij, *called* Weiden, *hid in the Hospital there, which neither thou* Leo the Roman, *nor thou* Charles the German, *with all your Substance, are able to purchase. Although a signate Star fell upon the* Arcanum *of your Names, yet it was known by none but the Sons of the Divine* Spagyrick Art. *Wherefore since, thou Verminous and Lowsie Sophister, judgest the Monarch of Secrets to be an ignorant Fool and prodigal Decocter, I will now, in the middle Age, openly discover (as an honourable prosecution of those things I have asserted) the Virtues and Preparation of that Tincture, for the profit and honour of the Lovers of Truth, and that the Contemners of true Arts may be reduced to Beggary. The latter Age will be illustrated and honoured with this* Arcanum, *as the Gift of GOD, and manifest Endowment of the true Spirit, so as from the Beginning of the World the like sprout of Understanding and Wisdom was scarcely ever heard of. In the mean while, Vice shall not be able to suppress the Just, nor the Riches or power of those that are evil, be any Damage to the Upright.*

Of Philip Theophraſtus Paracelſus

His Tincture of Natural Things, &c.

CHAP. I.

I *Philip Theophraſtus Paracelſus Bombaſt*, ſay, That (after the manifeſtation of Divine Grace) many waies to the Tincture of natural things, were found out, which did all finally tend to the ſame ſcope and end: For *Hermes Triſmegiſtus* the *Egyptian* ſet about this Work, according to his own Reaſon. *Orus* the *Grecian* obſerved the ſame Proceſs. *Hali* the *Arabian* perſiſted in his own order; but *Albertus Magnus* followed a Proceſs very prolix. Every one of theſe proceeded in his own manner, yet they all attained to one and the ſame end at laſt, *viz.* to long Life, and an honeſt ſuſtentation and Conſervation of the ſame in this vale of miſeries. At this time, I *Theophraſtus Paracelſus Bombaſt*, Monarch of Secrets, am endowed with peculiar Gifts of GOD, *viz.* in ſuch a manner, as every ſearcher of this high natural Work muſt needs imitate and follow me, whether he be an *Italian*, *Polonian*, *French-man*, *German*, or whatſoever he is, and whoſoever he is. Hither muſt you all, Philoſophers, Aſtronomers, and Spagyriſts, how high ſoever you be, come after me. I by my own immenſe Labours, will ſhew and open to you, Alchymiſts and Doctors, that corporeal Regeneration. I will teach you that Tincture, Arcanum, or Quinteſſence, in which the Foundations of all Myſteries and Works are latent: For every man may and ought to give credit to another in thoſe things only, which he hath experienced by Fire. If any one, otherwiſe than by this experience, offer any thing in Chymiſtry, he is not to be believed, becauſe the true muſt be ſeparated from the falſe by Experience in Fire. Aſſuredly the Light of Nature was created for this end, *viz.* that by it the trial or Proof of every thing ſhould appear; yet to thoſe only who walk in that Light. With this Light we ſhall be taught by the beſt demonſtrations, That all thoſe who ever before me entred this ſo difficult Province, with their proper phantaſies and acute ſpeculations, have made trial to their own hurt. Therefore, by my Foundation, many Ruſticks have been made Noble-men; but on the contrary, by the putatitious and opinionative Art of thoſe men, of Nobles, many have been tranſmuted into Ruſticks; becauſe they could bear golden Mountains in their Heads, before they had put their Hands into Coals. But firſt are to be learned *Digeſtions*, *Deſtillations*, *Sublimations*, *Reverberations*, *Extractions*, *Solutions*, *Coagulations*, *Fermentations*, *Fixations*, and every Inſtrument requiſite for this Work, is to be known by uſe, as Glaſſes, Cucurbits, Circulatories, Veſſels of *Hermes*, Earthen Veſſels, Balneums, Wind-Furnaces, Reverberatories, and other ſuch-like; as alſo a Marble, Mortars, and Coals; ſo may you at length proceed in *Alchymy* and *Medicine*.

But as long as you by Phantaſie and Opinion adhere to your Fictitious Books, you will be apt for, and predeſtinated to none of theſe.

CHAP. II.

Of the Definition of the Subject and Matter of the Tincture of Natural Things.

BEfore I come to the Proceſs of the Tincture, it is convenient I ſhould diſcover to you the Subject thereof; for this was alwaies kept ſecret (with a peculiar concealment) by the Lovers of Verity. Therefore the matter of the Tincture (here you muſt underſtand me in a Spagyrick ſence) is a certain thing, which from three paſſeth into, or remains in one Eſſence, by the Art of *Vulcan*. But that I may ſignifie the ſame to you by its Name; according to ancient uſe, it is by many called the *Red-Lion*, but by few known. This, by the help of Nature, and the Art of the Artiſt, may be tranſmuted into a white Eagle, and of one two be made; yet then the golden ſplendour ſhines not ſo much to the Artiſt, for they two kept in one ſhine more. Now, if you underſtand not the uſe of Caballiſts and ancient Aſtronomers, thou art not born of GOD for the *Spagyrick Art*, nor by Nature choſen for the *Vulcanick Work*, nor created to open thy mouth in *Alchymiſtick Arts*. Therefore, the matter of the Tincture is a very rich Pearl, and a moſt precious Treaſure, and the nobleſt thing (next to the manifeſtation of the moſt High) and moſt worthy of humane conſideration, that can be in the earth. This is the LILI of *Alchymy* and *Medicine*, which Philoſophers have ſo diligently ſought, but through defect of intire knowledge, and perfect Preparation, they attained not to the perfect end thereof. By their Searches and Experiences, a Beginning only of the Tincture is given to us; but the true Foundation which my Collegues

ſhould

ſhould imitate, was left to me; wherefore no man muſt mix his Vizors with our Intentions. I, after my long Experiences, deſervedly correct Spagyriſts and ſeparate the falſe or erroneous from the true, having by continual Searches found out thoſe things, by reaſon of which I may juſtly reprehend and alter many and diverſe things. Yet had I found the Experiments of the Ancients more excellent than my own, I would not have ſuſtained ſo great Labours, as I willingly undertook for the ſake, profit, and honour of all good Alchymiſts, *&c.* Therefore, ſince the ſubject of the Tincture is ſo ſufficiently declared, as a more faithful diſcovery cannot, nor muſt be made between two Brothers, I will enter upon the Preparation thereof; and after I have poſited the Experiences of the Firſt Age, I will alſo add my own Inventions, unto which, in time to come, the Age of Grace will adhere, whomſoever thou (*Sophiſter*) from thy own Philoſophy in the mean while ſhalt conſtitute Patriarchs or Principals.

CHAP. III.

Of the Proceſs of the Ancients in preparing the Tincture; and of a more ſhort way found out by Paracelſus.

ANcient *Spagyriſts* putrefied *Lili* for a Philoſophick Month, and then deſtilled from it the humid Spirits, ſo long as until the dry were elevated: The *Caput Mortuum* they again imbibed with the humid Spirits, and from it, by deſtillation, often abſtracted them, and continued this Operation ſo long, as until the dry Spirits were wholly elevated. Then they united the abſtracted humours and dry ſpirits by a Pellican together, 3 or 4 times, until all the *Lili* remained dry in the bottom.

Although the firſt Experience followed this Proceſs before fixation, nevertheleſs our Anceſtors often obtained their wiſhed end perfectly. But they would have had a more ſhort way of coming to the *Red-Lyon*'s Treaſure, if they had learned the Concordancy of Aſtronomy with Alchymy, as I have demonſtrated it in the *Apocalyps* of *Hermes*. Yet ſince every day (as Chriſt ſpake for the comfort of the faithful) hath its proper Care, the Labour of *Spagyriſts* before me was vaſt and great, which now by help of the Holy Spirit aſſiſting, will be eaſed and lightned by my Theory and Practice, and declared to all thoſe, who abide conſtant in their Labours with patience; for I am experienced in the Property of Nature, and know the Eſſences and Conditions thereof, and the conjunction as well as reſolution of the ſame. Which is the higheſt and greateſt thing in Nature, never yet known to Sophiſters.

When the firſt Age had the firſt Experience of the Tincture, *Spagyriſts* of one ſimple made two; but afterward, when in the middle Age that Invention was loſt, their Succeſſors, by diligent ſearch, at length happened on the two names of that ſimple, and with one denomination called it *Lili*, as the ſubject of the Tincture: Then the Imitators of Nature putrefied this matter (no otherwiſe than as Seed in the Earth) for its due time; becauſe before this Corruption, nothing could of it be produced, nor any *Arcanum* diſcover it ſelf; and after putrefaction, they abſtracted the humid ſpirits from the matter, until by the force of Fire they were dried and ſublimed; that this way (no otherwiſe than as the Husband-man waits on the Seaſons of the year) the ſaid ſpirits might come to maturity, as one thing is wont to riſe and fall after another. And laſtly, as after Spring the Summer appears, they incorporated thoſe Fruits and dry Spirits, and brought the Magiſtery of the Tincture ſo far, until it ſhould come to its Harveſt, and diſpoſe it ſelf to ripeneſs.

CHAP. IV.

Of the Proceſs of preparing the Tincture of Natural Things, *abbreviated by* Paracelſus.

ANcient *Spagyriſts* would not have undergone ſo prolix a Labour, and made ſuch tedious Reiterations, if they had learned their Work from my School, and in their labour followed the Rules of the ſame, but would full as well have obtained their end with much leſs Labour and Charge. At this time, in which *Theophraſtus Paracelſus*, the Monarch of Secrets, comes, is the Seaſon of Invention, which was hid from all Spagyriſts before me. Wherefore I only ſay; Take the Blood of a Roſie colour from the Lyon, and the Gluten from the Eagle, which, after you have joined them together, coagulate according to the old Proceſs. Thus you will have the Tincture of Philoſophers, which infinite men have ſought, but very few found.

Whether thou wilt or no, Sophiſter, this Magiſtery is in Nature, and is a wondrous Work of GOD above Nature, and the moſt precious Treaſure in this Vale of Miſeries. If you conſider it externally, it appears to be that which tranſmutes ſome vile thing into another much more noble than it was before. Yet that Miracle is produced by a Spagyriſt, becauſe he had patience, and was not weary, and by the Art of his Preparation did corrupt the vile extrinſecal Body, and from thence raiſed up another and moſt precious Eſſence. If thou haſt learned, or knoweſt any like thing by the light of *Ariſtotle*, or from the Rules of *Serapio*, produce it here, and bring it to light by experience. Now keep the Law of the Schools, as becomes a Lover of Honour, and a Doctor. But if thou knoweſt nothing, or art able to do nothing, Why doſt thou contemn me, as an irrational *Helvetian* Calf, and accuſe me to be a Vagabond Circulator? Art is another Nature, and a peculiar World, as Experience witneſſeth and demonſtrates againſt thee and thy Idols. Therefore the Alchymiſt ſometimes compounds certain Simples, which he afterwards, according to his neceſſity, corrupts, and thence prepares another thing. For ſo, very often of many, one thing is at length made, which effects more than Nature *per ſe* is able to do; as is ſufficiently manifeſt in *Gaſtaynum*, where of *Saturn Venus* is made; in *Carynthia*, of *Venus Luna*; and in *Hungary*, of *Luna Sol*. Not to mention other

Transmutations of Natural things (sufficiently known to Magicians) which bring greater wonders to Light than *Ovid* speaks of in his *Metamorphosis*.

But that you may rightly understand me, seek your Lion in the *Orient*, and your Eagle toward the *South*, which are to be assumed for this Work. You cannot find better Instruments than *Hungary* and *Histria* produce. But if you would deduce that from Unity, through Duality into Trinity, with an equal permutation of either, then you must direct your Journey towards the *South*, for in *Cyprus* thou canst not obtain all thou desirest; yet here we must discourse no farther than at present we have declared. Of these *Arcanums*, which exhibit transmutations, there are many more, although known by few; and should they by the Lord GOD be manifested to any one, the rumour of this Art would not therefore presently break forth, but the Omnipotent, together with it, would give understanding to conceal these and other things, until the Coming of *Elias the Artist*, in which time nothing shall be so hid, as not to be revealed. You very clearly see (although there is no need to speak of this here, which may by some be taken in derision) in the fire of sulphur, is a great Tincture of *Gemms*, which indeed exalts them more sublimely than Nature *per se* is able to do. But this Gradation of Metals and Gemms must in this place be omitted by me, because I have very sufficiently writ thereof in my *Secrets of Secrets*, in *The Book of Vexations of Alchymists*, and in other places. As I have begun our Ancestors Process of the *Tincture of Natural Things*, so I will perfectly conclude the same.

CHAP. V.

Of the Conclusion of the Process of the Ancients, made by Paracelsus.

LAstly, the ancient *Spagyrists*, by a certain orderly augmentation of Fire, long continued, fixed their pellicanate and dry *Lili*, until from blackness, through a change of all colours, it became red as Blood, and with its colour had put on the condition of a *Salamander*. Rightly indeed did they proceed in such a Labour; and it is equal and fit, that every man, who would compass this Pearl, should proceed after the same manner. To declare this more clearly to thee, would be very difficult for me, if you have not in the school of Alchymists learned to observe the degrees of Fire, and also to change your Vessels. If you have done this, then you will see, that as soon as your *Lili* shall be made hot in the Physical Egg, it will with wonderful apparitions become blacker than a Crow, afterward, in success of time, whiter than a Swan; and lastly, passing through yellowness, become more red than any blood. *Seek, seek* (saith the first Spagyrist) *and you shall find, knock and it shall be opened unto you.* It would be an impious and uncomely thing to put Meat into the mouth of so perfidious a Bird. He should rather be suffered to flie out, as I, and all others before me were compelled to do. Therefore follow the true Art; for this will lead thee to the perfect knowledge of That. There is no reason to set down any thing here more amply or clearly than I have already done; let thy *Pharisaick* Schools teach thee what they will, from their own unstable and tottering Foundation, it will not reach their end or scope; but after you shall, as accurately as is possible, have learned Alchymistick Industry, nothing then in the nature of things will be so difficult, but it, by help of this Art, may be manifest to thee. Indeed, Nature her self brings forth nothing to light, which is brought to its highest perfection; as in this place may be seen by the Unity or Union of our Duality; but Man should, by Spagyrick preparations, deduce it to that, unto which it was ordained by Nature.

Thus far have I said enough of the Process of the Ancients, and of my correction of *The Tincture of Natural Things*, as to its preparation.

Now, we having this Treasure of the *Egyptians* in our hands, it concerns us to convert the same to our profit, which is two-foldly offered to us from this Spagyrick Magistery. In the first way, how it may be applied for Renovation of the body; in the second, how it is to be used for Transmutation of Metals: Therefore, since I *Theophrastus Paracelsus* am experienced in both diversly (according as the signs of the Work, both in experience and proof, have appeared better and more perfectly to me than any other) I will describe and propose the same.

CHAP. VI.

Of the Transmutation of Metals by Projection of the Medicine.

IF the Tincture of Naturalists be to be used in Transmutation, one pound of it is first to be projected upon a thousand pounds of ☉ in Flux; then your Medicine will be prepared for transmuting the Leprous humour of Metals. This is a wonderful Work in the Light of Nature, *viz.* that by this Spagyrick Magistery or Operation, that which before was such a Metal, should perish, and become another Metal. That renders *Aristotle*, with his evilly-founded Philosophy, a Fool: The Countrymen in *Hungaria* casting Iron for a convenient time into a certain Fountain called *Zipferbrunnen*, find it consumed into a *Ferrugo* (or Iron scurf) which melted in a strong Fire with Bellows, is presently pure Copper, which never more returns into Iron. Likewise, in the Mountain *Kuttenberg* (as it is commonly called) they strein a *Lixivium* from *Marcasites*, in which Iron is presently changed into the best Copper, highly gradated, and more malleable than other natural Copper. These, and many such like, are better known to simple men than to Sophisters, for these men transmute one species into another; yet these Arts remain for the most part absconded, by reason of the notable contempt of Ignorant men, and also partly by reason of the just Envy of Artificers. In *Istria* I have often brought Venus beyond the 24 (*alias* 38) degrees, so as the colour of Sol could not ascend higher, and it was constant in Antimony, or in the Quartal Examen; this indeed I used in all Cases, as the other.

Although

Although ancient Artiſts were earneſtly deſirous of this *Arcanum*, and ſought the ſame with very great diligence, yet very few could after perfect Preparation deduce it to its end. For the Tranſmutation of a Minor-Metal into a better, brings with it many difficulties and hinderances; as when Tin is to be tranſmuted into Silver, or Copper into Gold. Perhaps GOD will have the Magnalia of Nature hid from many Men, by reaſon of their Sins. For ſometimes it hath happened, that when this Tincture hath been prepared by Artiſts, and they could not bring Projection to effect, that the ſame (through their neglect and careleſſneſs in keeping of it) hath been devoured by Hens, whoſe Feathers afterward fell off, and grew new again, as I my ſelf have ſeen. This way, by abuſe, through negligence of Artiſts, came Tranſmutation into Medicine and Alchymy. For when they could not uſe that Tincture according to their own deſire, they converted the ſame to Renovate Men, as you ſhall hear more at large in the following Chapter.

CHAP. VII.

Of the Renovation of Men.

SOme of the firſt and ancient Phyſicians in *Egypt*, by this Tincture, lived 150 years. Alſo the Life of many was produced and prolonged for ſeveral Ages, according as we find it clearly recorded in divers Hiſtories, which ſeems a thing almoſt incredible. For its Virtue is ſo admirable, as it extends the ſtrength and vigour of the Body further than is poſſible by Nature, and Conſerves it in that degree ſo firmly, as it lives ſafe from all Infirmities. And although it be grown aged, yet it appears as in a youthful Conſtitution.

Therefore this Tincture is an Univerſal Medicine, like an inviſible Fire conſuming all Diſeaſes, howſoever they are predominant. Its Doſe is very ſmall, but the Operation of it moſt potent. With it, by me, the Leproſie, Venereal Lues, Dropſie, Epilepſie, Colick, Roſy-drop, [*Gutta Roſacea*] and like Diſeaſes, have been cured and healed; alſo, the Wolf, Cancer, *Noli me tangere*, Fiſtula's, and other internal Diſeaſes, more certainly, than can be believed; of which *Germany*, *France*, *Italy*, *Polonia*, *Bohemia*, &c. will give a Teſtimony large enough.

Now, thou Sophiſter, behold *Theophraſtus Paracelſus*, and conſider how your *Apollo*, *Machaon*, and *Hippocrates*, natural Phyſicians, ſought this Tincture for reſiſting Diſeaſes, becauſe all Phyſicians aim at long Life, and by this Univerſal, they, for the moſt part, obtained it, and that very efficaciouſly; and according to their own Arbitriment, named it the Tincture of Naturaliſts. For in all Medicine, what can be greater, than ſuch a cleanſing of the Body, by which every Superfluity in it, is totally eradicated, and tranſmuted? The Seed being ſound, all things are perfect. What profits the evilly founded purgation of Sophiſters, ſince it removes nothing of that, which ſhould be taken away? Wherefore the moſt excellent Foundation of a true Phyſician is, Regeneration of Nature, and Reſtoration of Youth: Then, that new Eſſence, expels all whatſoever is adverſe to its ſelf. For this Regeneration, the Powers and Virtues of the Tincture of Naturaliſts were ſtrangely found out, and until our time uſed by true Spagyriſts, and abſconded as a Secret.

Of VITRIOL.

NAture generates a Salt, called *Vitriol*. This is a peculiar kind ſeparated from all other Salts, poſſeſſing alſo Virtues different from them. Its Virtues are ſo many, and ſo famous, as of right they ought to be deſcribed in this Book. For, a perfect Cure of the Jaundice is latent in Vitriol, alſo of the Gravel and Stone in the Reins or Bladder, of all Feavers, Worms, Falling-ſickneſs, *&c.* And in Conſtipations of the Body, it is a famous Deopilative: In the mean while of other Virtues in this Chapter to be mentioned, I here am ſilent. The Deſcription of this is to be directed both to Medicine and Alchymy. For in Medicine, it is an excellent Remedy; in Alchymy it is profitable for many other things. But the Art conſiſts in the Preparation of Vitriol for Medicine and Alchymy. For Vitriol crude, is no ſuch thing. It is like Wood, of which all things may be made. It is profitable for Medicine of the Body; it profits alſo in Chirurgery, or External Diſeaſes, as the Pſora, Tetter, Hereditary Leproſie, and others; where all other Remedies are ineffectual, and as it were dead to the Diſeaſe. Vitriol aſſaults Diſeaſes of this kind powerfully, and cures them fundamentally. Therefore the true Preparation of Vitriol is in a ſpecial manner to be known by Phyſicians. For its Virtues when crude are other, than when diſſolved; and other when calcined, than when converted into a green, red, or white clear Oyl. This is the condition of it, that as often as it is reduced into another form, ſo often it is made a peculiar *Arcanum*.

This confounds all Apothecaries, and Writers, both *Italians* and *Germans*. For this part is ſuch, as it alone *per ſe* can fill a fourth part of all their Shops, and cure Diſeaſes proportionally. This being preſent, there is no need of ſo many Boxes, Pots, Glaſſes, *&c.* ſet all of a row, and diſpoſed in order in Shops. It concerns a Phyſician, not to take care for ſo many Boxes, and Beyond-Sea Medicines, but to be circumſpect, provident, and wiſe as a Virgin; ſince in ſuch numbers of Veſſels adulterate Remedies are for the moſt part contained. If he uſe the aforeſaid circumſpection, at his own doors he will find more choice Remedies, againſt all Diſeaſes, than *India*, *Egypt*, *Barbary*, or *Greece* can afford.

Let every Phyſician follow this Baſis, for it is now known even to plain Country-men, that meer Frauds are contained in thoſe Boxes: Which, as they are for the moſt part of Wood, ſo are they that uſe them Wooden Doctors and Apothecaries: But like with like do very well agree.

of

Of the Species of Vitriol.

THere are many Species of Vitriol, for they vary according to the Pits out of which they are taken. The common Probation of this is, as Coperas is proved upon Iron, but this is not true. The Genuine Probation is, that it be uſed crude againſt the Worms, in that manner as we will now explain; and accordingly as it expels Worms, ſo is it more or leſs excellent in Medicine. In Alchymy, another Probation by Cuproſity is more available; yet it may alſo be thus proved: If Vitriol change Iron into Copper, and that ſpeedily, and the ſame be perfectly well gradated and ſoft under the Hammer, then is that Vitriol beſt in Medicine and Alchymy. For there is a Conjunction of Iron and Vitriol, where of Iron it makes Copper good and excellent. Of the beſt Vitriol the beſt Copper is made. Let no man wonder, that Copper can be made of Iron by Vitriol; for there is alſo this virtue in Nature, *viz.* that the Water of Borax makes Quick-ſilver of Lead. Alſo experience teacheth, that *Cachymia's* tranſmute all Metals into other, no otherwiſe than as Vitriol changeth Iron into Copper. Nor is Vitriol, only the tranſmuter of one Metal into another, but there are alſo other things, which have like effect upon all Metals. The reaſon why we know not them all, is, becauſe Sophiſters pervert Arts for their private benefit, uſing them only to ſupply their Purſe and Kitchin.

In *Hungary* is a River proceeding from Vitriol, or *per ſe* conſiſting of Vitriol, not coagulated into Cryſtals. If Iron be put therein, and left for its due time, it turns to a Rubigo, or Ruſt. If that Ruſt be melted by a Wind-Furnace, it is preſently made pure and conſtant Copper, not convertible into its own Nature of Iron. There are infinite Mines of Vitriol found throughout *Germany*, all which cannot be deſcribed apart. Yet the aforeſaid Probations are to be uſed both in Medicine and Alchymy. There is beſides theſe another Probation (not profitable in Medicine, but in Alchymy only) and that is: If the Colcothar of Vitriol do from it ſelf by Fire, give or yield Copper. If it give Copper, then in Medicine it is weak, but in Alchymy ſtrong Vitriol. Likewiſe the Colours of Vitriol are to be obſerved: That which is all over blue, mixed with no other Colour, is not ſo good in Medicine, as that Vitriol, which is (as it were) parted, and all over filled with red and yellow Lines and Veins. What in the Air inclines to whiteneſs, is efficacious, and fit for the green and white Oyl of Vitriol: what turns to a redneſs and yellowneſs is more excellent for the red Oyl. There needs no more to be ſaid touching the Species of Vitriol, than what is ſuggeſted by Probation; which every Phyſician and Alchymiſt ſhould make, according to the uſe he intends it for. Laſtly, this Probation is never fallacious. If mixed with Galls, or Oak-Apples, it makes good Ink, then it may be uſed in all Caſes: But if it maketh an aqueous, or wateriſh Ink, that needeth many additions, it is not ſo good.

Of the Virtues of Vitriol *in Medicine: firſt, of it Crude, and its Colcothar.*

IN explaining the virtues of Vitriol, I will firſt ſpeak of the virtues of it Crude, and of its Colcothar. Therefore, know ye, Vitriol is a famous Purgation, in grievous and difficult Diſeaſes of the Stomach. For it ſometimes happens, that the Stomach is diſtempered by Meats and Drinks, and falls into a Diuturnal Diſeaſe, which continues unto death, and by depraved Meats and Drinks, it often comes to paſs, that the Sick are either contracted in their Members, or die.

Alſo among Souldiers, through Immoderation, it frequently happens, that burning Feavers, Dyſenteries, and other Diſeaſes ariſe. In all theſe Evils, the higheſt, and moſt excellent Remedy is a Purgation by Vitriol, which rightly and Allegorically is called *Gryllum*. Its Doſe is as much as you can take up at ſix times upon the point of a Knife. If that Operate not, repeat the ſame Doſe, and if not this Doſe neither, give it a third time, and it will be ſufficient. To the Weak, give it in Wine or Water; but to a ſtrong Man, that is not eaſily Laxative, in rich Wine. It ſo exhibited, will throughly purge upwards and downwards. Indeed Hellebore, both the Spurges, Coloquintida, *&c.* do famouſly purge alſo; yet not with virtues equal to Vitriol. The Reaſon of this is, becauſe in Vitriol is a certain ſowreneſs, which hath a conjoined Sharpneſs, Acrimony, and Deterſion; by which ſaline ſowreneſs the Operation obtains a full and perfect power, which neither Hellebore, nor Coloquintida, *&c.* hath. For the Nature, or way of Purgation is here two-fold: One purgeth *per ſe*, the other by Saltneſs. Therefore here the two virtues are better than the only one in Hellebore. In Saltneſs a Specifick Form is latent, and that of ſuch a Nature, as all Worms touched by it die. And that is a ſingular power, which deſtroys Worms, being what none of the aforeſaid doth. Therefore it is evident to every one, that a Purgation, which hath in it ſelf ſowreneſs and ſaltneſs, together with a Laxative virtue, doth in a double way and manner exquiſitely cleanſe, evacuate and purge. Wherefore, for Internal Diſeaſes, it is twice more noble, and more excellent than other Purgations. But becauſe I intend at large to declare to you the Nature of Vitriol, there is no need I ſhould alſo explain thoſe Internal Diſeaſes: Yet in general I ſay, that a Purgation of this kind in all Vices of the Stomach, in the Falling-Evil and Vermination, is moſt profitable and moſt ſafe, if it be uſed according to the condition of time, Diſeaſe, Perſon, *&c.*

Touching Colcothar you are to know, that it is not inwardly to be taken, but only to be applyed in Chirurgick Diſeaſes, *viz.* in putrid Ulcers, which admit not of Sanation: For in theſe it diſcovers the way to perfect healing. Yet there are many Chirurgick Diſeaſes, as Grievous, Malignant, Worſe and Worſt. Againſt the Worſe and Worſt, Colcothar is not conducent, yet is effectual againſt thoſe, which conſiſt in the firſt degree; and therefore to be applied to them. For the Worſe and Worſt of all, its Oyl is to be uſed according to the degree of the evil, and of the Oyl. All Ulcers of this kind, how many ſoever they be, are cured by Vitriol; but according to the degree, the uſe of it is, that it be reduced to good Colcothar, which

muſt

muſt be certain times extinguiſh'd in Vinegar; and being dry, be ſprinkled on, or permixed with ſome Plaſter, which by the Phyſician ſhall be judged apt and fit for that evil. So it makes an Eſcar, which taken off by Fatneſs, a good and eaſie Cure follows. But the Evil, which is not obedient to this Cure, of it you ſhall thus judge, *viz.* that there is yet more venom latent, which muſt thenceforth be ſearched out with Oyls applied; becauſe the Baſis of the Ulcer cannot ſufficiently be amended with Colcothar for an intire Sanation. If crude Vitriol be diſſolved in Vinegar, and the Solution thickened with Colcothar into a Powder, and ſo applied, it ſoon cleanſeth the bottom of the Ulcer much more potently, than of Colcothar is ſaid. But the beſt way of reducing it to Colcothar, is to extract the water thereof, and therewith to imbibe the *Caput mortuum*, until it be conſumed, afterwards to dry it leiſurely in the Air. If this be uſed, it induceth a better bottom in Ulcers. But whatever you do, mind the degree of Ulcers, Tetters, *&c.* Whatſoever of theſe is not cured, ſet about the Cure of, with its ſeparated Oyl and Water of which afterwards.

Although Colcothar anſwer not the deſired end, yet by reaſon of that the Cure muſt not be deſpaired of, but you muſt think of correcting it in diſtilling. For by Preparation the Medicine is brought to the higheſt degree, ſo as it even cures all Ulcerous Affects, as the Wolf, Cancer, and the like. Theſe are explained more at large where we ſpeak of the Preparation of them.

Of the Water of Vitriol *in Chirurgick, and Internal Diſeaſes.*

ALchymy diſcovers many excellent Arts to Phyſicians; by which, wonderful Sanations of many Diſeaſes are made. For this cauſe in the beginning of Medicine, Phyſicians always uſed Alchymy; becauſe this was the Mother and Genetreſs of many Commodities. Theſe two Faculties, [*viz.* Medicine and Alchymy] as *Sociates* ſo long kept together, as until Deceivers and Humoriſt Sophiſters aroſe, who mixed Venom with Medicine, and made her a Strumpet. Such Medicine as this, will always remain, as long as Humoriſts live. Theſe things I thought good to premoniſh you of, that henceforth you may give the more diligent heed to this head Chapter, by reaſon of its famous Medicinal Utility.

But this is always to be premiſed, *viz.* That as often as unskilful Men take in hand any Art, ſo often do they every way defile and corrupt it, and of a Pearl make a ſtinking Puddle. The very ſame is alſo committed in Vitriol. At firſt, the Spirit from Vitriol extracted, was wont to be gradated to the higheſt. By this exalted, the Ancients did perfectly cure the Falling-Evil, whether Recent or Inveterate, both in Men and Women, of what Condition ſoever they were. But here unskilful Laborators ruſhing in, attempted otherwiſe to reduce the Virtues of Vitriol, and thus failing of the firſt way and *Arcanum*, they ſuffered that to expire, and then ſought an Oyl in the Colcothar, which could not any way be made to that end, or have ſuch a Uſe. For what is to take away the Epilepſie muſt have a ſubtile, ſharp, and penetrable Spirit.

In that conſiſts a faculty of piercing through the whole Body, and of leaving no one thing untouched therein. And by that pervaſion, or penetration, the Diſeaſe is aſſaulted in its own place. For it cannot be known certainly and indubitately, whence comes the Seat, or Centre, or Period thereof. Hence we conclude, that a Phyſician hath only need of ſuch Remedies, as can penetrate the whole Body. This is the Reaſon, why ſordid Humoriſts heal none, but proſtitute all their Doctrine and Profeſſion. Therefore, I poſitively affirm, that in the Oyl, which thoſe Laborators ſeek, is no penetrating Spirit. A meer Terreſtreity (as I may call it) is by them uſed, which penetrates not at all, but where it falls there it lies. Wherefore it is greatly to be bewailed, that the true Proceſs is ſuppreſſed by that unskilfulneſs, and a falſe ſubſtituted in its ſtead. But I am perſwaded, the Devil contrived that, to the end the Sick ſhould not be cured, and the Sect of Humoriſts might thenceforth ſpread the more.

Let us return to the beginning; how the Spirit of Vitriol was found out. The Humid Spirit of Vitriol was at firſt diſtilled from its Colcothar; then it was gradated, by diſtilling and circulating *per ſe*, as the Proceſs teacheth. This way the Water began to be uſed for many Diſeaſes, both Internal and External; as for the Falling-ſickneſs, *&c.* and thus a marvellous Sanation was effected. But in the extraction they were wonderful diligent; for they took the Spirit of Vitriol corrected, as above, and diſtilled it from Colcothar eight or ten times, with a moſt ſtrong fire; ſo the dry Spirits were mixed with the Humid Spirits, and the Work ſo long continued, as until the dry Spirits came forth together with the Humid, by extracting. Afterward, both Spirits put into a Phial were gradated to the higheſt. This Medicine they found to be of much more powerful Operation againſt Diſeaſes, and by that Medicament effected ſo much, as they confounded all Humoriſts in General. Yet here is no Correction added to it (by Artiſts) by Spirit of Wine, to render it of greater Penetration. But it was of no greater degree, than as I ſhewed.

Now I will Communicate to you my Proceſs, which I commend to all Phyſicians, eſpecially for Cure of the Falling-Evil, the ſingular Cure of which, conſiſts in Vitriol. For which cauſe, Charity to our Neighbour binds us to inſtitute a more diligent Cure in this Diſeaſe. The Proceſs is thus.

I imbibe the Vitriol with Spirit of Wine, and afterward diſtil it from the dry and humid Spirits: This being done, I find the following Addition to be very profitable, *viz.* If Spirit of Tartar, corrected, be mixed to a third part of the Vitriol, and Spirit of Treacle-water Camphorate, be added in a fifth part, with reſpect of the Vitriolate Spirits. Thus I adminiſter it, before the aſſault of the Fit, or certain times in a day. This Medicine is famouſly efficacious againſt this Diſeaſe; yea, ſo excellent, as a better cannot be deſired from Nature.

Therefore, the firſt Proceſs invented by the Ancients, is to be retained with the ſaid Correction, *viz.* by imbibing with Spirit of Wine before diſtillation, and by adding the Spirits of Tartar and Treacle-water after diſtillation, as is ſaid. For ſo is attained the Heart of Nature, and every Virtue.

I hope I ſhall not be blamed, but commended rather by every good Man, that conſiders the horridneſs of this Diſeaſe, which would even move a ſtone to Commiſeration. Since ſo great is the vehemency and horridneſs of this Diſeaſe, as almoſt any Man may lawfully ſay, Curſed be all Phyſicians, who paſſing by ſuch Sick, yield them no relief, but like the *Prieſt* and *Levite* in *Jericho*, who forſaking the wounded man, left him to be cured by the *Samaritan*. I pray here give your judgment, what Condemnation were that *Prieſt* and *Levite* worthy of, who paſſing by the diſtreſſed, *ſtopped their Noſe*, as the Proverb is; ſurely they were worthy of Hell Fire, from which is no Redemption.

And who can judge any other of all Phyſicians, none excepted, that look upon this Diſeaſe, and yet paſs by with their Noſe ſtopt? Who can otherwiſe ſay, than that they muſt render an account of it at the laſt day? Notwithſtanding, all theſe men are generally ſo diſpoſed, as they will not wag their hand, or beſtow one penny, for acquiring a more certain Foundation for the cure of this Diſeaſe. Did they not, as it were, by compact imitate *Prieſts* and *Levites*, but would rather ſtudy to imitate the *Samaritan*, GOD certainly would recompenſe their fidelity with a manifeſtation of the Secrets of Nature, with which they might be helpful to the Sick. And if ſuch Virtues were not incited in Nature, the Almighty would undoubtedly create them anew. Therefore I teſtifie, together with you noble and ignoble men, that all Doctors generally have baſely erred and deviated from the Truth. Whatſoever thoſe Seducers, *Galen*, *Avicen*, *&c.* fooliſhly deviſed, to that they adhere, and relie upon thoſe Lyes, ſo far are they poſſeſſed with the Devil, that they cannot exerciſe Charity towards their Neighbours; and in this manner they make themſelves the Sons of Damnation; for their only ſtudy and drift is to heap up Wealth. The Kingdom of GOD is firſt of all to be ſought, yet not after the faſhion of the *Prieſt* and *Levite*, but according to the *Samaritan* nature. If we be merciful, and follow the example of the *Samaritan*, GOD is with us, who will preſently help us with a Remedy not yet created in Nature. In the mean while, ſince Phyſicians deal with the Sick *Levitically* and *Prieſt*-like, the moſt Wiſe GOD withholds Medicine, and reſerves it to himſelf. The Sick flie to the Kingdom of GOD, but Phyſicians to the Infernal Abyſs, prepared for *Levitical* Doctors of the ſame ſort. Therefore open your eyes and look, the way is two-fold, one leads to infernal ſhades, this the *Levites* follow; the other way leads to Heaven, unto which the *Samaritan* directs his Feet.

That Vitriolate *Arcanum*, and its extraction, is not only excellent in the *Falling Evil*, but is alſo conducent in other ſpecies like unto it, as in *Swoonings*, *Extaſies*, *&c.* Alſo it is after the ſame manner beneficial in all Oppilations and inward Impoſthumes, and is no leſs efficacious in precipitation and ſuffocation of the Matrix. Yet in it are many more Virtues acquirable than are here commemorated, if greater diligence in inquiring be beſtowed thereabout, and Phyſicians themſelves would be better men. But the Devil, whom they ſerve, poſſeſſeth them, and ſtirs them up to the hating of Him who loves Verity. Even thus things are acted about the Health of Good Men.

It is further to be known, that the aforeſaid Receipts of the preparation of the humid ſpirit of Vitriol cannot more clearly be deſcribed; for to underſtand that, a ſufficient Artiſt is required; thoſe ſordid Decocters cannot underſtand a thing of ſo great moment. Therefore you are only to expect all-ſufficient Information from true *Artiſts*, and *Alchymiſtick Laborators*; ſo alſo by them you muſt be fully inſtructed about the correction of ſpirit of Wine. For the Doctors of Academies are ſo very rude, as they can ſcarcely diſcern *Agarick* and *Manna*. Yet this kind of Aſſes are created Doctors. You have Treacle-Water contained in my practice, in the Chapter of the Cure of the *Falling-Evil*; what others there are of this kind, are not here to be recited. By this Chapter you may learn, That the Art and all Virtue of Vitriol, conſiſts in well-extracting the Spirit, and graduating it to the height, and by addition deducing it to Penetration, whereby it may ſearch out the center, root, and ſeed of the Diſeaſe. For 'tis impoſſible ſo exquiſitely to find the places, as thoſe Doctors babble of Humours. Certainly, the Foundation is not yet known, as what it is that makes a Diſeaſe, or where that lies, or what that is, which caſts a man into ſo grievous a Fit. Therefore every Operation is only to be committed to that *Arcanum*, which Nature hath directed to the Diſeaſe; that *Arcanum* ſearcheth out his Diſeaſe, as the Sun penetrates all the Angles of the World. Briefly, I ſay, whoſoever endeavours to be a true Phyſician, ought firſt of all to learn to be a *Samaritan*, not a *Prieſt* or *Levite*. If he be a *Samaritan*, all things he hath need of will be given him; nothing will be occult to, or hidden from him. But to him who will firſt be a *Prieſt* or *Levite*, nothing will be given, unleſs it be Infidelity, which he alſo had before. Thus are ſuch men paid in their own Coin.

Of the Red Oil of Vitriol.

YOU are alſo to underſtand, how of the *Colcothar* by a Retortive Deſtillation, in a Chymical manner, a blood-like and moſt ſowre Oil may be prepared. This Oil Laborators have judged more efficacious in the aforeſaid Diſeaſes than the Spirit, but that their judgment was erroneous. The vulgar Proceſs of preparing it I think not to mention here; for every thing of moment is cited in manual Operation and diligent Inſpection, alſo in convenient Inſtruments. As touching the Virtues you are firſt to underſtand, that it is a ſowre thing, ſo far exceeding all ſowreneſs, as nothing than it is more ſowre. It likewiſe contains a corroſive nature, for which cauſe it had need be uſed circumſpectly and warily, *viz.* not *per ſe*, but in a good Concordancy and ſuitable mixture, with reſpect to that againſt which it is exhibited. We will explain this by Example: The Viper is a Serpent moſt venomous, therefore of no uſe alone, but in Compoſition it is moſt excellently uſeful; for of it Treacle is made. The very ſame is alſo to be judged of this Oil, *viz.* That it is not to be uſed alone, but

but in a Compoſition ſuitable and fit, as of Treacle we have ſaid. By reaſon of its ſowrneſs, it profits a Stomach free from Choler and an Impoſthume; but if either an Impoſthume or Choler be preſent, it is manifeſt by Experience, that it hath no good effect. For the Impoſthume is inraged by it, and exaſperated by ſuch ſowrneſs, paſſeth into an unquiet matter. And if Choler be preſent, a mutual Ebullition and Strife is cauſed, no otherwiſe than as is ſeen between *Aqua-fortis* and *Tartar*, neither of which can remain or perſiſt with the other. Therefore diligently and circumſpectly conſider, leſt you erre to the damage of the Sick. In Compoſition this Oil is profitable for other Affects, as in all Fevers and want of Appetite, if given in the aforeſaid manner, *viz.* in a good concordancy. There are many other Virtues ſaid to be in this Oil, but Experience confirms few of them. I have ſeen and proved thoſe to be egregious Lyars, who have boaſted, that they could do Wonders with this Oil. It is true, it is uſeful in the *Stone* and *Gravel*, yet I have known no man cured by it. In all it doth ſomething, but not to purpoſe: Yet in my Practice, in the Chapter of the Cure of *Gravel*, you ſhall find a Compoſition thereof, for this and other diſeaſes. But as I ſaid of the Corroſion of this Oil, uſed by it ſelf, ſo I do alſo affirm, that the ſame Corroſion hath power of diminiſhing or breaking the *Stone*, and expelling *Gravel*; yet that is done with ſo great difficulty, as there is need of ſome other Invention, than hath hitherto been practiſed; for otherwiſe it may not ſafely be uſed. As much as any man hath gained by Experience, ſo much I allow of. This Medicine is new; wherefore it daily ought to be proved anew, and as oft as need is permixed with new Compoſitions.

But as to Chirurgery, of this Oil you are to note, It doth indeed excite great dolours, yet it inferrs preſent Health, even in the moſt difficult diſeaſes. For in the Hereditary Scab of the Head, called *Achores*, it is ſo effectual, as it takes the ſame off in one whole piece, as a Man pulls off an Helmet from his Head. With this Oil the whole Head is to be anointed with a Feather, where it is hairy, for 3 daies continually; then expect its Operation. If you ſee it not ſufficient, anoint it more often, according as the Scab ſhall be. The ſame Oil may alſo be co-tempered and mixed with Water of *Selandine*, and the Head often waſhed therewith. Yet he who would be healed, muſt not think that his Cure can be effected without dolour; for the condition of the Sick is the ſame as of a pregnant Woman, which brings not forth without exceeding great pain. So Meat, without pain, cannot be prepared for us; with dolour and ſweat alſo we are freed from diſeaſes. This way all *Tetters*, *Scabs*, and *Itch*, together with all other Vices of the skin, howſoever ariſing, are healed; and likewiſe the depraved *Tentigo*, by anointing herewith, is cured, and the *Wolf* and *Cancer* expelled and mortified; yet in this caſe you muſt diligently obſerve, if the Evil be very forcible (that the Venom ſo deeply penetrate, as the quick and ſound fleſh be in ſucceſs of time like to be eaten away and fall off) to apply a good *Oppodeloch* for a defenſive.

But in whatſoever eſtiomenous Ulcers, other Remedys be deficient, this Medicine yields relief, by reaſon of the degree it holds. It will not be improper to mix this Oil with ſome fat Unguent, and ſo apply it. This way it will cauſe leſs pain, but it is not ſo ſwift in operating: *Dolour* can by no means be avoided, no more than a Woman in Travel can be delivered without pains. The beſt, and moſt ſublime way of preparing this Oil, is to deſtil it into ſpirit; ſo a very ſmall weight will be ſufficient in all the aforeſaid diſeaſes, which are then removed with little trouble.

Theſe things I have found out by experience of the Red Oil of Vitriol, which in grievous diſeaſes is an excellent and famous Medicine; for fetid and contagious diſeaſes of this kind, as are the *Scab*, *Itch*, *Tetter*, *Achores*, and other like Affects, which are of affinity to the *Leproſie*, may be cured by this great Gift of Nature, which is here offered to the Phyſician, by which he may effectually cleanſe and heal diſeaſed men. There is not an abundance of Remedies of this kind, therefore I will carefully preſerve this Oil, *&c.* for all other Coctures are nothing worth, nor do they remove theſe loathſome diſeaſes, but with their fatneſs do cauſe them to be reincrudated and encreaſed.

Of the White and Green Oil of Vitriol.

IT is worthy of conſideration, that from crude Vitriol an Oil is deſtilled by deſcent, ſometimes white, and ſometimes green, according to the condition of the Vitriol. This Oil deſerves a ſingular commendation; for ſince it is prepared of crude Vitriol, therefore it alſo contains the ſpirit of the ſame, touching which I have above treated. This Oil, made by deſcent, demonſtrates by thoſe its Virtues that it is an excellent and admirable Remedy for the before-mentioned internal diſeaſes. The ſame Oil whether it be white or green, (but the green is better) if circulated and mixed with the above-commemorated ſpirit of Vitriol, is a certain and indubitate Remedy againſt the Falling-Evil, and all its ſpecies. But it is worthy your obſervation, that this diſeaſe is ſeldome ſo ſolitary, as not to have other Evils concurrent with it. Indeed, that ſuch a concurrency is, is evidently manifeſt by all diſeaſes. Hence it is now clear, that a Remedy againſt the principal Evil is not ſufficient, but Secrets againſt concurrent ſymptomsare alſo required. For this cauſe in my Practiſe I have deſigned a peculiar Chapter of the Falling-Evil, not for the principal Remedy ſake, which in this place is ſufficiently deſcribed, but only for the underſtanding of thoſe things, which concurr together with the firſt Affect. If other Accidents do not concurr together with the firſt Affect, there is no need of exhibiting other Medicaments than the principal, which is ſufficient. Therefore, touching the green Oil, thus do ye: Graduate it to the higheſt, that it may be ſeparated from its terreſtreity and fæces, in *Balneo* firſt, afterward in dry Fire. So in *Balneo* the phlegm is taken away, and the terreſtreity removed by dry Fire, and the ſpirit of the Oil only is collected, which in it ſelf is circulated. Afterward you may make addition with ſpirit of Wine, but there is no need of adding more, if it be only to be uſed as a Primary Remedy, without Medication of coherent diſeaſes.

It is to be given in Water of Pæony, alwaies before the coming of the Fit, whether it be frequent or seldome, *&c.* Therefore mind the Paroxisms. As soon as the spirit of the Oil finds out the center of the disease, then the Fit is pacified, and thenceforth waxeth more and more gentle. But when it exerciseth a power of Healing, it first of all excites a *Vertigo* sensible to the Sick, who notwithstanding do not fall nor foam, nor are shaken, or quake, nor deprived of reason, but are seized with a gentle sleep, and are much better presently. At length the *Vertigo* also ceaseth, and the sleep is ended; yet in the mean while the Medicine must continually be applied, several times reiterated, according to the condition of the Disease and Patient. This way the Cure is to be followed, and all things diligently administred. This belongs not to a drunken Physician, or *Doctor Levite.*

Of the Vitriolate Oyl *to be used in* Alchymy, *and also of the Crude.*

NOw to speak of the Alchymistick Virtues absconded in Vitriol: I will first propose to you the Virtues of Crude Vitriol: How every Crude Vitriol of Iron makes Copper. For the Alchymist doth not this, but Nature, or Vitriol, by the Operation of the Alchymist performs the same. And this is the sublime power of Nature. And in the light of Nature it is done, but not without admiration; to see any Metal, as it were put off it self, and become another; which is almost, as if of a Man, a Woman should be made. But in these things Nature hath her singular Privilege granted by GOD, for the sake of Man. I speak this of Transmutation, that you may understand, that the foolish Philosopher *Aristotle*, was not well grounded in his Philosophy, but was meerly fatuate. Now I will give you the Receipt, that you may know how, in all places of *Germany*, to make Copper of Iron; whence we may easily gather, what the power of Transmutation is, and that many other Transmutations may be made; although they as yet be unknown to Us.

To change Iron into Copper is not of so great moment, as to turn Iron into Gold. Therefore, what is least, GOD manifests, but the greater is yet hid, until the *Elias of Sciences* shall come: For Arts also, want not their *Elias.* The Receipt of this Transmutation is thus.

R. Of the Scales, or Filings of Iron (without all other Metals, as Copper, Tin, *&c.*) ℔ j. Quick-silver, ℔ *ss.* Put both into a large Iron Pan, or Pot, and pour on them one Measure of Vinegar, and of Vitriol ℥ *iiij.* Sall-Armoniack, ℥ *j. ss.* Boil them together, and continually stir them well with a Wooden Spatula. If the Vinegar vapour away, pour on more, and add new Vitriol.

By this Decoction, Iron is changed into Copper: If it be made Copper, it all passeth into the Quick-silver, the boiling being continued for ten or twelve hours. After the Cocture is ended, separate the Quick-silver from the Iron (as much of it as is left) and well wash it, that it may be clean. Put that Quick-silver into a Bag made of Leather or Cotton, and press it out; so you will see an Amalgama left. Suffer that Amalgama to expire by Vulcanick Heat, and you will find pure and good Copper. Of this Copper, *R.* ℥ *ss.* of Silver as much, make them flow, or melt them together, and the Silver will presently ascend to the sixteenth degree. This way you may prove, that such Copper is made of Iron: But that the degrees are fixed, is not true. Yet he, who in Regal Cement is able well to operate, may thence receive a sufficient Recompence for his pains. The whole business consists in the Operation, and in Judicious labouring: Yet in this most men erre. Nevertheless, by the aforesaid Process, you may always make Copper of Iron. I so often inculcate this, only to confirm the transmutation of one into another.

Also of Vitriol such is the Nature, as if the Colcothar thereof be calcined, it with easie liquefaction is turned into Copper. For in it is a wonderful Coppery Nature, and in Copper also a Nature of greatest Affinity to Vitriol. If Copper be dissolved in *Aquafortis*, and Crystallized, it makes every Copper Vitriol, and it is no more Copper: So also of Vitriol, Copper is made; and that is no more Vitriol. Therefore the Reason of such Affinity in Vitriol and Copper is very strange. What is Cuprous or of Copper, makes good Vitriol. So Verdigrease, which is good and highly gradated, gives a Saphyrick Vitriol.

Although it may seem ridiculous for us to discourse of these things; yet it cannot be deny'd, that in Vitriol a Tincture is latent, which is of greater efficacy than many can believe. Blessed is he that understands this. But touching the Oil of Vitriol, further note. If the Oil of Quick-silver, and this Oil be conjoined, and so coagulated in their Process, a Saphire of wonderful Nature and Condition is produced: Not indeed a Saphire stone, but like unto it, of an admirable Tincture; of this I will say no more. Hence it is evident, that stupendious, and to be admir'd *Arcanums* are treasured up in Nature, and in many other things created by GOD, and produced by Nature. Now, it would be more commendable for us to search out these things with an indefatigable labour and study, than to consume our days in Luxury, Drunkenness, Whoredom, *&c.* But at this time, Lascivious Whoremongers, are in greatest Honour, and so are like to be, until with these Vices one third part of Men be suffocated, and another third part destroyed by Pestilence; so as one part of the World, will scarcely remain untainted, or unconsumed. For with this abomination the World cannot long endure, nor good Arts flourish. Therefore, of necessity these evil Courses must be annihilated and cut off, otherwise no good can have place. But when this evil time is expired, the Golden age shall flourish; that is, Man at length shall use his own Understanding, and live as a Man, not as a Brute, nor act as a Swine, or lie in the Caves of Murtherers or Robbers.

Therefore, since I have communicated to you these things of Vitriol, out of my good affection to all; I do earnestly entreat all Physicians in general, when they shall see the unhappy and miserable sick so afflicted with that most grievous Disease the Falling-Evil, seriously to consider, what GOD the Creator, their own Consciences, and Charity to their Neighbour, command and require of them in such a deplorable State as this; and not contemn, or slightly esteem of the Virtues, which by GOD himself are insited in Vitriol. Let Charity move you night and day to be diligent in these things: Let none be found idle, but every

every one make it his busineſs to help his needy Neighbour: But be not you deterred herefrom, becauſe Lawyers do not this. Hear what Chriſt ſaid: *Woe to you Lawyers.* Surely this is not a light Saying. Nor take you any offence at *Theologians*, becauſe they rather ſeek Rewards and Salaries, than take care for the ſick: Theſe are they, which in *Jericho* paſſed by. Be ye *Samaritans*, and preſs after the *Samaritan* Virtue: So GOD will conferr on you ſuch profound and neceſſary Gifts, as in curing the ſick you ſhall be ſenſible of no Deficiency. All things you have need of ſhall be given you, do you only ſearch out this Treaſure.

Thus far *Paracelſus*.

An Admonition.

ALthough all things we have in the foregoing Diſcourſe propoſed, touching our *Sal Mirabile*, be conſentaneous to Verity; and the Virtues, which we have aſcribed to it in Medicine, Alchymy, and various Arts, do powerfully diſcover themſelves, yet we find very much diverſity in it, according to the diverſity of matter, of which it is made. For, that which is prepared of Vitriol, is of a far other Nature, and endowed with far other Properties, than that, which is made of *Salt-Nitre*. And what is made of common Salt, agrees with neither of theſe: For one poſſeſſeth a greater ſharpneſs than another; yea, this more than that, diſſolves Metals. The more potent, are fit for Tranſmutation and Solution of Metals; the more weak ſubſervient to Medicine; the weakeſt, and moſt ſweet, profitable for multiplication and propagation of Vegetables.

Theſe things, he who would reap the deſired Fruits of his Labours, ought neceſſarily to know, and conſider accurately of. For if any one, in hopes of future Multiplication, committed to the Earth the Seeds of Vegetables imbibed with the ſtronger Salt, he will indeed never obtain his deſired end, nor will the Earth give forth any Plants, becauſe ſuch ſharp Salts do rather deſtroy, than augment Vegetables. In like manner, Metals are delighted with a convenient Salt, *viz.* with the more ſharp, as Vegetables are with the more ſweet. Therefore, when we find our labour to be fruſtrated, we muſt not impute that to the *Sal Mirabile*, but to our own Unskilfulneſs.

Indeed theſe Salts are endowed with far more noble Virtues than we mentioned in the precedent Diſcourſe; but the high Ingratitude of Men of this Age, permit us not to diſcover the ſame. For if you communicate your Secrets to thoſe Men, from whom you cannot require a promiſe of Secrecy; be aſſured, the knowledge of thoſe Secrets will preſently come to others, who will proudly uſe the ſame to thy Diſparagement.

If you do the contrary, and keep to your ſelf, whatſoever you have purchaſed by your own Labour and Coſts; you will create Enmities to your ſelf: So as which way ſoever you take, you will ſuſtain loſs.

The Conſideration of theſe things, have cauſed me to reſolve to expoſe my Laboratory, with all my Arcanums, to the view of others. The end of this only was to exhibit to the ſight of all, the truth of thoſe things, which I have purchaſed with indefatigable Labour, and communicated to the World by writing; that this way, the Mouths of the Malevolent and Ignorant may be ſtopped.

I could, if it were needful, give various other Reaſons, by which I was moved to make my Laboratory common to thoſe that deſired it.

Now the year is paſt, in which I promiſed *in my fourth part of the Proſperity of* Germany, I would build a Laboratory, and exhibit the Wonders of GOD to my Friends. I then publickly and privately demonſtrated various moſt excellent Inventions, not without labour and very great Charges, all which I value not, ſince I know, that by this means I have diſcovered the Truth to many, which they alſo will publickly own to the honour of the moſt high GOD, and Correction of envious Detracters.

I did purpoſe alſo, in the following year, to continue my Labours for the ſake of faithful Friends, but (beſides other hinderances) my Age prevented that, Nevertheleſs, thoſe, to whom I have committed my Laboratory, will perform the ſame, and exhibit a Light to this blind World. This I was willing to ſignifie to all, that they may for the future ceaſe to trouble me with Letters.

But whilſt I exhibit the Virtues of my *Sal Mirable*, and to it (prepared in Glaſſes after the above recited manner) aſcribe the virtue of changing imperfect Metals into Silver and Gold, I would not have this matter ſo underſtood, asif we could by the help of it acquire to our ſelves Gold in a very great quantity, it is ſufficient to have demonſtrated the poſſibility (of Tranſmutation) and the ſame to be proved by a ſmall quantity.

It is moſt certain, that very many Medicaments may be prepared, by the help of it, againſt various effects of the Humane Body. Alſo it is moſt certain, that it is very conducent for a particular gradation of the Minor Metals into better. Believe me, that have experienced the ſame; if you rightly proceed, you will reap no mean Fruits.

But touching the true Univerſal, I do queſtion whether by the help of it, it may be procured. Aſſuredly, if common Gold, as to its degree, can be changed above what is Natural, Why ſhould it be judged impoſſible, to exalt it further, in length of

time? My decrepid Age forbids me to put my hand to this Work; yet to Posterity (better able than I to sustain the heat of fire) occasion is given, by Prayers and Labour to search further; perhaps, GOD will grant to them, what he hath denied to us.

This Operation, by which we peculiarly draw profit from the Minor Metals, cannot be performed in common Crucibles, as we before said; because they are obnoxious to breaking, and so the Liquors are easily lost; but in such as will not easily break, unless after a long time, and will not permit the humid Salt to run out. Here it will be needful to peruse those things (relating to this matter) which I mentioned in the Third and Fourth Parts of the *Prosperity of* Germany.

To prepare these Crucibles is a great Work, greater to make some Pounds of Salt, or rightly to use the same; but greatest of all, (and in which the summ of all consists) to know what Metals are to be joined, or in what quantity. Here many will have enough to do, and be at a loss, although they enjoy my Secret Furnace, and know how to make the Salt of Art in abundance.

Besides all these, we must needs crack the hard Nut, if we will eat the sweet Kernel. It is required of us to know an easie way of separating Gold or Silver from fixed Metals; for such a Metallick Mass, altogether untameable, cannot be separated by the help of Lead, *per se*, as Ductile Metals; but here is need of another Separation; which is the principal thing.

Nor should any Man perswade himself, that all things are here so clearly written by us, as he can by their literal sence most easily institute the Operation. For there is need of a long time, and a skilful Master. It would be a very inconsiderate thing to set about those things, of which we have no knowledge.

Although this is my Admonition, here often repeated, yet there will be some, who neglecting it, will set about the said Operation, and perhaps find out various profitable things: In like manner, there will be various found, who following my Prescripts, will reap much benefit from the Minor Metals.

Who can deny, but that *Mary Ranta*, a *Brittain*, hath Propheſied truly, *viz.* That true Alchymy should flourish in the Year of Christ, 1660? I my self have not seen this Prediction, but have it from the Relation of others, whereunto I refer the Reader. And add, that if such a Prediction were not, daily Experience doth abundantly witness, that egregious things are here and there performed in Metallicks, by help of my *Sal-Mirabile*. And there is no doubt, but that all Darkness will daily more and more be dissipated by the power of this Light.

I have unto some communicated the use of this Light for their proper benefit; but these, contrary to my Intention, have caused what I thought to have kept secret, to be spread abroad in publick and many have hit on the right way leading to Verity. If this be done without my knowledge, what would not have been done, if my Laboratory had been open for a year longer? Certainly the World would have shewed it self other than it is, and altogether new; which the new and great Star extending it self from the South to the West, seems to indicate.

Let the most high GOD grant what are necessary, and salutary for us, turn the Ungodly into the right way, and give to his own Children, Rest and Peace, that his most Holy Name and Truth always to be magnified, may not be totally suppressed by the Impious. *Amen.*

ANNOTA

ANNOTATIONS
UPON THE
CONTINUATION
OF
Miraculum Mundi.

Explaining and Defending the *SECRETS* therein contained; As also the True *Aurum Potabile* therein mentioned.

IT is truly said, that He who builds an House by the Highway exposeth his Building to the judgments of all sorts of men, and to their censure especially who have not skill enough in Architecture, to erect a Country Cottage. The same is wont to happen to those who write concerning things not common or unknown. For you shall presently hear People saying, *Who knows whether this be true or not?* thereby signifying that they cannot perceive those things which exceed their Capacity; but nevertheless they will not altogether reject them, because they are yet in doubt concerning the truth of them. This their doubting is not to be taken ill, because it proceedeth from ignorance, but not from envy. On the contrary, there is another sort of perverse men, who being puffed up with their own putatitious knowledge, despise unknown things, not out of simplicity or ignorance, but out of a meer diabolical envy to those who have a greater knowledge and experience of things than themselves.

This hath also happened, and doth daily happen to me, especially since the publishing of my *Miraculum Mundi*, in that I have there disclosed Secrets of great moment, of which the Vulgar, nor yet the bubbles of Envy, have plainly no knowledge; and therefore out of meer Envy, reproach them for Unprofitable and False.

But to stop the mouths of such persons, I intend shortly to build a spacious and well-furnished Laboratory, and in it to place a good Laborious Operator, who being occupied therein with continual Labours, shall shew the Divine Wonders to those who desire to see the same. Which being done, I shall have no farther need to defend my Writings against every Calumniator; seeing that I know there will be those (GOD willing) hereafter, who will defend the truth which they have seen with their eyes and handled with their hands.

In this Laboratory shall be seen not only those Artificial destilling Furnaces, and my Press for Wood, with the circulatory Instruments necessary for the easie making of Salt-Petre; but also those things shall be shewed, which I have treated of in my *Miraculum Mundi*, and its Continuation, yea, and much more than I have there declared.

Those things also which I have ascribed to my *Aurum Potabile* shall be demonstrated to be the very truth, *viz.* That crude Mercury, in an hour or two's time, may be by it converted into pure Gold. Nor shall this only be proved, but also that after my *Aurum Potabile* hath tinged and changed the ☿ into pure and constant Gold, that nevertheless it hath yet great Virtue, *viz.* that any Arsenick, whether white or yellow, being digested in it for some hours, is so changed, that its poisonous quality passeth into a good Medicine, resisting all Poison. Nor doth it only become a powerful Medicine against venomous and incurable diseases, which cannot be eradicated by purging, bleeding, sweating, and the like Remedies, whilst it Tincture the evil Humours in the Blood and other parts of the Body, and changeth them into good Humours. But this also being changed into Medicine, and its Venom converted, sheweth its power in Metals; if it be cast upon melted Copper, then the Copper poured out and proved on a Cupel with Saturn, leaveth behind it some good Silver and Gold. These two proofs are sufficient for the defence of my *Aurum Potabile*. But that any one may be yet rendered more certain, after those two Experiments, *viz.* the coagulation and transmutation of Mercury into pure Gold, and the conversion of poisonous Arsenick into a safe Medicament, he may yet try a third, and that indeed incredible, with the same *Aurum Potabile* that hath been twice used, as before, and this not upon mild or slight Poisons, but upon the most dangerous and indefensible both to Men, Beasts, and all living things, to wit, Mercury sublimate,

mate, which being digeſted for ſome hours in the ſaid *Aurum Potabile*, layeth aſide all its horrid and formidable Venom, and paſſeth into a ſafe Purging and Diaphoretick Medicine, and loſing its former white Colour and corroſive Venom, it becomes a ſweet red Powder, purging out the *Gout*, *Pox*, *Leproſie*, and other deteſtable diſeaſes, and impregnateth Saturn in ſome meaſure with a Golden Tincture. So alſo white Arſenick, after digeſtion, putteth off its white colour, loſeth its corroſive faculty, and is changed into a ſweet and yellow powder.

Theſe Experiments and Proofs ought not to be hidden to the Studious of good Medicines, but to be made manifeſt to the everlaſting and immortal teſtimony of the Truth, againſt all ignorant Sophiſters whatſoever.

I have, for my defence, the moſt ſharp Sword of Truth, whoſe edge, if any deſire to feel, let him come forth; the defence of the Truth will be grateful and eaſie to me, although the malice of the whole world ſhould oppoſe me. I here challenge all thoſe Calumniatorswho being moved by a diabolical envy, have endeavoured to oppoſe my moſt true Writings; let them come forth with their Lyes into the open light, and into the view of the whole World, and ſhew any Experiment like to thoſe which I here promiſe to ſhew, that we may ſee how filthily or baſely they will appear, like the darkneſs vaniſhing by the light and ſplendour of the Sun. If they cannot, as indeed it is not in their power, (*for he that hath any knowledge of things never contemneth a good one*) nor will be poſſible for them to do; foraſmuch as they know nothing, it is but reaſonable that for the time to come they ſhould reſtrain their virulent tongues, and ceaſe to calumniate thoſe things which they neither know nor underſtand.

I do not wonder that thoſe Slanderers, attempting the coagulation of Mercury into Gold, have erred, ſeeing that it hath ſometimes happened to my ſelf, that I have erred two or three times together, and could not effect that Tranſmutation, until the cauſe thereof was known to me: For if through too much haſte the humidity of the *Aurum Potabile* ſhall exhale or evaporate too faſt, the Mercury being dried up, cannot be ſufficiently penetrated, nor throughly tinged.

An errour alſo may be committed, if the glaſs containing the Mercury and the *Aurum Potabile* grow hot too faſt, ſo that the Mercury with the *Aurum Potabile* boil, and leaps, diſperſeth it ſelf by too much motion, and exhibiteth it ſelf in form of a powder, when it ought to remain in the bottom, concreted into a round maſs. So will he alſo greatly erre, who ſhall uſe Mercury that is not pure and clean, but adulterated, and defiled with many ſordes or impurities, which Impediments deny ingreſs to the Tincture, and render the trial uncertain and precarious. Therefore it is neceſſary that the Mercury be firſt well ground with Salt and Vinegar, in a *lignum vitæ*, or Stone or Glaſs Mortar, and by a diligent waſhing freed from all its blackneſs, whereby it more eaſily admitteth the Tincture. I have found that Mercury very fit for this Operation, which is ſublimed by the *Fulmen of Jove*, into which my *Aurum Potabile* hath a ſwift Ingreſs, and tingeth the whole of it.

Truly it ſhews the great ignorance and boldneſs of thoſe Calumniators, to dare to ſpread ſuch falſe clamours and rumours, ſaying, *That Mercury cannot be indeed tinged into Gold by my* Aurum Potabile, *but that the Gold which was before in my* Aurum Potabile *applieth it ſelf to the Mercury, and in ſome ſort coagulateth it, but doth not render it fixt and conſtant.* But this is indeed a very rude and ignorant Aſſertion, which every one but meanly verſed in the handling of Gold and Mercury, is able to detect of Folly.

For if common Gold, diſſolved in Water, would readily coagulate Mercury, what ſhould we further ſeek or deſire? But this is greatly wide of the matter, ſeeing that in all ſuch Solutions the Gold in digeſtion adheres to the injected Mercury by precipitation, and paſſeth with it into a white *Amalgama*, the Mercury conſtantly perſevering in its priſtine Nature, not admitting the leaſt tranſmutation into Gold, the which exceedeth not the knowledge and capacity of Ruſticks, but is difficult to be underſtood by thoſe putatitious Doctors, who believe ſuch things to exceed all Belief.

It is well known, that the pureſt Gold hath no more of perfection than what it needeth for its own defence; that hath not the leaſt power to amend any other metal, and to render it fixt and conſtant, much leſs that it can coagulate Mercury, (the derider of all Alchymiſts and Sophiſters) into Gold. Of both is made a white *Amalgama*, but not hard yellow Gold conſtant in the Fire. He that believeth not me, let him make trial himſelf, and he ſhall find it anſwerable to my words. Beſides, all corporeal Gold refuſeth ſolution by fixt Nitre, of which my *Aurum Potabile* is prepared, the which, if it were yet poſſible, the Gold would not be hid in it, but the ſolution would be yellow, and would colour the skin with a ſubrubid or blackiſh colour, which my *Aurum Potabile* doth not. Therefore its tinging Virtue conſiſteth not in corporeal Gold, but in a golden Tincture, from the firſt *Ens* of Gold, converted into an Aſtral Eſſence, by the benefit of Art. By a like reaſon the *Aſtrum* of *Luna* impreſſeth Mercury with the nature of Silver, the *Aſtrum* of *Venus* tranſmuteth it into Copper, the *Aſtrum* of *Mars* converteth the ſame into hard Iron, the *Aſtrum* of *Jupiter* of it maketh Tin, and the *Aſtrum* of Saturn inveſteth it with the nature of Lead. For Mercury is tranſmuted into that Metal, whoſe *Aſtrum* it ſhall receive. So the *Aſtrum* of Mercury changeth all the metals into a running *Argent-vive*, although this tranſmutation brings little or no profit. Nevertheleſs, I intend to prepare the *Aſtrums* of all the metals, and thereby to ſhew the power of Nature and Art to the ſtudious of the Truth, and ſo to manifeſt it to the World. The *Aſtrums* of metals being extracted from their firſt *Ens*, they are no longer metals, but their tinging Anima's, which at length with Mercury, become corporeal metals.

This is the true and genuine Foundation, upon which the whole ſtructure of my *Aurum Potabile* is built. Therefore, as pure Gold, cannot render Mercury partaker of its own golden nature; ſo neither Silver, nor Copper, nor any other metal, will communicate its nature to Mercury, but being precipitated, attracteth it to it ſelf, but in no wiſe changeth it. Hence the Philoſophers ſay, That the Tinctures of Metals are not to be ſought in the metals themſelves, but in their firſt *Ens*. As *Baſil Valentine*;

Quod prima Entia non efficiunt,
Hoc Aurum & Argentum non faciunt.

Which is to be well regarded by him who deſires to attain his wiſhes.

From

From all these things it appears, that my *Aurum Potabile* being made of the first *Ens* of Gold, by Art, into an Astral Tincture, ought to be an excellent Medicine; as also, that it is such, I have largely demonstrated: For if it were not better than a common Solution of Gold, it would not change Mercury into true Gold, neither also would it have the power of transmuting a most potent Poison into an excellent Medicine. Without doubt, such Medicaments, which by the help of my *Aurum Potabile*, from most violent Poisons, are changed into so salubrious a nature, as Antidotes, do powerfully resist other Poisons and pertinacious Diseases, and may be used in Physick with great admiration. What would it profit, if the Body should be purged by an hundred stools, and at the same time the Disease doth not consist in the matter of stools, but still keeps its place, and gives no way, except it be attacked in its own quarters? Neither will it avail any thing to let all the blood out of the body, if the seat of the Disease be not in the blood. Yea, if it were there fixed, and the whole mass of blood wholly corrupted, it would be in vain to undertake to amend the same by bleeding; for all the blood cannot be drawn out, without peril of Life. And if, for example sake, two or three pounds of twenty should be left in the body, to be amended by sanguifying Meats and Drinks, and good Blood to be encreased, yet the event would not be answerable, because the encreasing blood would be corrupted by the former. E. g. An Hogshead of sharp Vinegar, out of which, if you should draw all the Vinegar, leaving only the fæces or Lees, and should by degrees pour into it noble and generous Wine, the Wine would be plainly corrupted by those few fæces. Even so it is with those fixed Diseases, which have taken such deep root in the humane body, that they cannot be taken away neither by Purging, Bleeding, nor Sweating, nor by outward Anointings. Therefore they are to be tinged and amended in those places, to which they pertinaciously adhere, by the help of Tinctures or Astral Medicines, as above is done with Mercury, and Mercury sublimate, that remaining there, they may put on a better nature and quality, and no farther molest the humane body. And this is the true and genuine way of Curing radicated and incurable Diseases. Yet I would not be so understood, as if I condemned all Purgation; for Purging being used at a due time, brings no small profit. Blood-letting also being seasonably used, wants not its utility; but being often abused, is the cause of great mischiefs, and not seldom hastens on untimely death.

Moreover, the following Experiment, for the trying the Truth of my *Aurum Potabile*, is not to be contemned. Rub some *Argent-vive* upon a small Silver Plate, and what is superfluous, and doth not adhere, wipe off with a Linen cloth, after the manner of Goldsmiths, (or Gilders) who gild with the *Amalgama* of Gold and Quick-silver: Digest the Silver Plate in my *Aurum Potabile*, for half an hour, or an hour, then take it out, and you shall see with how fair a Golden Colour it will be gilt. For in this digestion the Mercury is not so heated, that it can vanish in smoak, and therefore adhereth to the Silver Plate, and is tinged by my *Aurum Potabile* into the best Gold. Now try the same operation with another Silver Plate, rubbed over with *Argent-vive*, and digest it in a solution containing corporeal Gold, to see if that Plate will be gilt like the other. For the Plate coming out white, you will see a very great difference.

I could here add more such Experiments, if I thought it needful. If Goldsmiths (or Gilders) could gild their Silver Vessels, by such a coction (or digestion) in a solution of corporeal Gold, without doubt they would soon leave the common way of gilding by the *Amalgama* of Mercury and Gold, because by its poisonous Mercurial fume, affecting the bodies of those who handle it, it is wont to cast them into dangerous and lasting Diseases. But because they can effect nothing by such golden solutions, they are forced to supersede their Use, and to acquiesce in the old usual way.

These few things of my *Aurum Potabile*, which is the Fourth and Last Article in my *Continuation of Miraculum Mundi*, I am constrained to publish for its defence, that every one may know I have not attributed too much to it, but that it can perform much more; the truth of which I am ready to exhibit. Therefore this is a Medicament most worthy to be presented to Great and Noble Men, as a precious Gift.

As for the Third Process in the same Work, which is offered to Physicians and Citizens, that they may by an easie labour obtain good Medicines for Mankind, and an honest livelihood; it is openly and clearly described, so that in it not the least thing is hidden or concealed, I cannot force any to believe or try the matter; I have enough to do with my own affairs; but if in my Youth I could have obtained such a Manuduction, as I have hitherto and still do administer to others, I should not have been forced to the searching out of Nature with so great charge and labours, heavy stinks, and great danger of my Life, as I have. I here again assert that which I have often asserted, *viz.* That by the fulminating of Salt-Petre with Tin and Mercury, much Gold and Silver is acquired; which thing I have often done, and as yet can do it, and do promise that in due time I will demonstrate it publickly in my Laboratory to Friends. The other point, in which I have taught how Rich men may augment or improve their Gold and Silver, much safer than they are wont to do by putting it to Usury, I have truly and candidly revealed, and have kept back nothing. NB. But that there are other waies of acquiring Riches, without great Cost and Labours at the Fire, the troublesome Exercise of Merchandise, or other things, disturbing or hurting the mind, I do in no wise deny. For the like things are every where obvious, in divers place of my Writings, especially in the 2, 3, and 4 parts of *The Prosperity of Germany*, where mention is made of an Excellent Work, by means of which an honest livelihood may be obtained in tranquility, without noise, meltings, and blowings of Bellows, and that by the help of a certain Water extracting Gold and Silver from Sand, Earth, Clay, Stones, and Minerals, without great labour and costs. And although there should not be at hand any such Earth, Sand, or Stones, which contain Gold and Silver, from which these cannot be elicited by common melting; (yet there is hardly any place in the World, where these matters do not occurr) nevertheless there is no want of Lead and Tin, from which two at all times, and in all places of the World, Gold and Silver, by the help of the said Water of Salt-petre may be extracted; which is an excellent and profitable Art, the which, lest it should die with me, I have already shewed it to some Friends.

I alſo here promiſe, that in my publick Laboratory I will ſhew and demonſtrate various Secrets. But let no man perſwade himſelf that I will do this to all men, without deſcrimination, or admit every unknown Perſon to this demonſtration, but only thoſe whoſe Piety and Candour I my ſelf have long known, or ſuch as ſhall be recommended by them, or other known Friends.

Moreover, beſides my publick Laboratory, I will alſo have a private one, in which ſhall be ſhewed to my Friends the more curious and excellent things which I have mentioned in my Writings.

There ſhall be ſhewed rare and hitherto unknown Wonders of Nature, as Vegetable and Mineral Plants. As for example.

Vegetables of a Metallick Nature; of which we have ſpoken in the Treatiſe of *The Nature of Salts*.

Herbs ſpringing up or growing out of hard Flints, yea, out of pieces of Iron.

Metals in a few hours growing up like Vegetables, by the help of a certain Water; concerning which, ſee my Deſcription of the Liquor of Flints, in *The Second Part of Furnaces*.

Metals in a few hours ſpace, like Herbs, without the addition of any foreign matter, growing up, ſo that they loſe nothing in the trial of the Cupel.

Alſo divers manual Operations, and Compendiums not common in the Deſtillation of excellent Spirits, profitable both in Alchymy and Phyſick, ſuch are Spirit of Nitre, Spirit of Salt, *Aqua-fortis*, *Aqua-regis*, and the like, by which they are ſo eaſily and ſwiftly deſtilled, that with two or three pound of Coals, by a Body and Head, in Sand, every hour may be deſtilled one pound of ſpirit, and that ſo pure, ſweet, and clear, that it needs no rectification.

But ſeeing that this is a thing unheard of, and therefore will be look'd upon by the common Chymiſts as a thing incredible, I cannot forbear here only to point at the way, by which it may appear poſſible to be done.

Suppoſe that I have need of ſome pounds of ſpirit of ſalt, and want the opportunity of preparing it in a long time, by the force of fire, I uſe the following preparation. Inſtead of a great and continual fire, I uſe a ſeparatory Art, ſevering the pure from the impure, diſſolving common Kitchin-ſalt, or ſalt-petre, in common Water, and adding to the ſolution put into a Cucurbit a ſeparatory ſulphur. The Cucurbit, with a Head or Retort, (by which alſo the Deſtillation may be made) being ſet in ſand, I kindle a fire, by which the water containing the ſalt may boil, and ſo by the ſulphur, in the boiling, the pure parts are ſeparated from the impure; the purer parts are rendered very fugacious and ſweet clear ſpirits; the groſſer, more earthy and fixed ſalt remaineth in the Cucurbit or Retort, of a very wonderful Nature and Property. And after this manner, from one pound of ſalt or ſalt-petre, may eaſily be deſtilled one pound of ſpirit of ſalt, or ſpirit of Nitre. From a pretty large Cucurbit, in ten hours, may be made ten pounds of ſpirit of ſalt, or ſpirit of Nitre, which two ſpirits being mixed together, make an *Aqua-regia*. The quantity of your ſpirit in each Deſtillation will be greater or leſſer, according as your Cucurbit is larger or ſmaller. He that deſireth to make *Aqua-regia* by the ſame deſtillation, muſt diſſolve equal parts of ſalt and ſalt-petre in Water, and deſtil by a Body or Retort.

This is indeed an excellent Compendium for all thoſe that need a great quantity of thoſe Spirits. Gold, Silver, as alſo all the other Metals, may be diſſolved without *Aqua-fortis*, or *Aqua-regis*, and the like ſpirits, by the help of certain ſalts diſſolved in water, which truly is alſo a famous Invention. So alſo it is with thoſe other rare Experiments above mentioned; as for example, If a metal ought to grow in height, ſomething contrary is to be added to it; for this, while it flieth from its contrary, ariſing out of the maſs, groweth up as well in the dry as the moiſt way.

If we would have an hard Metal or Flint bring forth an Herb; the Metal, whether it be gold, ſilver, copper, iron, tin, or lead, are firſt to be reduced into a tender Powder by ſalts, and that Powder being put into an Earthen Veſſel, is to be moiſtened with a certain peculiar Water, and the ſeeds of the Herbs to be ſowed or ſet therein, which after they are grown to perfection, are to be no longer moiſtened, but the powder is to be expoſed to the Rays of the Sun, which again becoming a metal or an hard ſtone, plainly like to another metal or ſtone, containeth the inhering Roots of the Herb, and cauſeth the Ignorant to admire how an Herb ſhould grow out of a piece of Gold, Silver, Iron, Copper, or an hard Flint. This is alſo certain, and not to be doubted, that the ſaid Herbs ſo growing out of the Metals, do obtain the nature and properties of thoſe out of which they ariſe.

Although theſe Experiments of Herbs thus growing afford no profit, yet they are noble Operations of Nature and Art, having more in them than they promiſe at the firſt ſight, therefore I have not here brought them in vain, inaſmuch as they are of no ſmall moment.

But that I may here (at leaſt) mention ſomewhat of this growing faculty of Vegetables and Metals, be it known to every one, that in my publick Laboratory ſhall be ſeen the ſeeds of all ſorts of Herbs, and eſpecially of Grain, as Wheat, Barly, Oats, and others, *viz.* by what means they may be ſo prepared, as to acquire a ſwift faculty of growing, and that one grain may produce ten, twenty, or thirty ſtrong ſtalks, with full ears, and fruit an hundred fold.

In like manner ſhall be ſhewed to ſome Friends, how Salt-Petre, as the only promoter and helper of the growing faculty, may be ſowed it ſelf, ſo that it ſhall recompence the labour an hundred fold; for ſalt-petre multiplieth it ſelf, and groweth up out of common ſalt, like other Vegetables; whence that old Proverb of ſowing of ſalt might perhaps take its Original.

It behoveth that I here make mention of yet another wonderful thing concerning the growing faculty, to be ſhewn (God willing) in my private Laboratory. And it is this, that Gold and Silver do grow, are encreaſed and multiplied out of groſs Saturn, even as the ſeeds of Vegetables, out of a dunged and ſalt Earth, ſo that in fifty ounces there is daily an augmentation of one ounce, if not of two. He that ſhall be here a good Husbandman, and skilful in ploughing of Saturn, and rendering him fertile, and of ſowing or planting in him a fit ſeed, he will have a plentiful Harveſt, anſwerable to the ſeed which he ſowed, and will eaſily gain three or four times as much.

There-

Therefore, becauſe the growing faculty of Vegetables, Animals, and Minerals, or Metals, taketh its riſe from the only and Univerſal Salt of the Earth, and this from the Salt of the Sea, and the Sea Salt, from the Sun, if the Divine Goodneſs ſhall grant me Life, I will ſhew to my Friends, how by ſmall labour and charge, the Univerſal Salt fatneſs, fit for the rendring all barren and ſandy ground fruitful, inſtead of Dung, may be copiouſly ſeparated from Sea Salt. Yea if need require, I can eaſily demonſtrate, that alſo the natural Seed of Gold, the true Univerſal Medicine may be prepared of the ſame, or that it may be acquired from the viſible Ocean which is known to every Man. But ſeeing that belongs not to this place, we referr the Reader, deſirous of ſuch ſubtile knowledge, to the Treatiſe of the Nature of Salts, where he will find thoſe things which will ſatisfie his deſire.

Theſe, and the like Experiments ſhall be ſhewn in my Laboratory, among all which, that is the moſt excellent, by which a Man, without the incommoding of another, and with great quietneſs and Tranquility, may honeſtly get his Food and Raiment. There ſhall be alſo demonſtrated thoſe four *Arcanums* treated of in *the Continuation of* Miraculum Mundi, and many other things treated of in my Writings, which many believe cannot be effected. That ſo I, by giving an occular Demonſtration, may vindicate my Writings from the Injuries and Reproaches of the ignorant, and alſo leave behind me ſomewhat for the good of Poſterity.

A TREATISE OF THE Nature of Salts:

OR, A

Clear Deſcription, declaring by a perfect Explanation, the Nature, Properties, and uſe of ſuch Salts as are commonly known, as alſo of a certain other very wonderful Salt, hitherto unknown to the World; by whoſe help all Vegitables Animals and Minerals, without diminution of their weight, or change of their form, may be tranſmuted into hard and incombuſtible Bodies:

WITH

A moſt firm Demonſtration that Salt (after God and the Sun) is the only Beginning, Original, Propagation and Augmentation of all things; from which the greateſt Treaſure of the whole World; and the greateſt Riches may be obtained.

THE PREFACE.

THe manifold and various ſorts of food, whether prepared of Fleſh or Fiſh, if brought to the Table not ſeaſoned with Salt, are not grateful to the Palat; in as much as they neither exhibit a pleaſant reliſh, nor conduce to the health of the Body. Every man will readily aſſent to the truth of this trite and vulgar Maxim, if he ſhall conſider with an accurate mind, that among all the Seaſonings and Sauces of food, Salt holdeth the chiefeſt place, and that there is no other equal to it, ſo that among ſo many, there is no one to be preferr'd to it.

There-

Therefore what great and excellent Treasures, admirable Virtues, and most worthy Endowments, in which, by diligent search, and inquisition the minds of men may be occupied, are contained therein, I have determined in this present Treatise to enquire into, and declare; inasmuch as for the space of fifteen or sixteen years, I have endeavoured nothing more, than that by all my Labours I might serve the Divine Glory, and the publick good. For by my first endeavours I published a Work, treating of Philosophical Furnaces *in five parts, and I discovered five Furnaces, adapted to the various modes of Distillation; I also shewed the way of preparing (by an artificial manner) excellent Medicines which drive away various and divers Diseases afflicting the Humane Body, which profitable and artificial Inventions, no man before me hath revealed.*

Next follows my Mineral Work, *shewing the Original, and emendation of Metals and Minerals: To which succeedeth my* Pharmacopœia Spagyrica, *in three parts, treating of Vegetables, and by what means efficacious Medicines may be prepared of them.*

Next after these, was my Work of the Admirable Nature and Properties of Salt-petre, *in which is solidly demonstrated, that that Miracle of all sorts, is the true Universal Solvent of Philosophers, which is subservient to the use of all men, high and low, rich and poor. That little Treatise I have called by the name of* Miraculum Mundi, *which I have augmented by an Explication and Continuation, and fenced it with a defence and Apology, against the wicked Insults of Envy and Scorn. In all these I have set before the Eyes of this blind World, the Divine Miracles and Misteries of Nature.*

After this, came out another Treatise, under the Title of the Prosperity of *Germany, in four Books, the two latter of which are not yet Printed, but shall be published in a short time, if God shall prolong my life, which contain very profitable Precepts of the Oeconomy and Administration of things familiar.*

Then another little piece, called, The Consolation of Sailers; *teaching how they may defend and preserve themselves in all long Voyages, as to the* East-Indies *and other parts, against Hunger, Thirst, and other incommodities of that kind, to which they are wont to be Obnoxious.*

Moreover, A Treatise of Tartar, Vinegar, and Spirit of Wine, *shewing their easie attainment and preparation.*

To these I have adjoined, a Treatise of *Aurum Potabile, and another of true* Aurum Potabile, *or the* Universal Medicine, *and other Apologetical Writings, in which I have not only set forth the perfidious unfaithfulness of men, but have also revealed many excellent Sciences, that by all these Writings I might illustrate the Divine Glory, and contribute to the benefit and profit of my Neighbour, by giving him as it were wholsom and excellent food, whereby both his Body and mind may be equally refreshed.*

And although the said Meats be wholsome, of a good Savour, and contain their own Salt; nevertheless, it seems to me necessary, to salt them as it were afresh, and to season them with a certain Sauce, that they may be tasted with so much the greater appetite and pleasure. And I have so much the more a mind to do this, as I more studiously endeavour to observe that precept of the ancient Doctors, that no Meat should be brought to the Table without Salt. For it was a received custom in former time in well ordered Familiss, to set the Salt first upon the Table before any other Dish, and not to take it away till all other Dishes were first removed: The which indicates, that Salt is a most profitable thing, and an highly necessary gift of God, therefore of right claimeth the precedency of other Meats in setting upon the Table, and of remaining there, till they are again removed. But that this most Noble and Divine Gift, may the better be understood by the ignorant, and may be made more known than hitherto it hath been, I cannot pass by, but I must indulge my self, as my time will allow, in a few words, and as it were by the bye, to shadow out, and depict its great and admirable efficacy, for the profit of Mankind. But here I shall speak but of few things, and that very compendiously, the studious of Divine Wonders may find the rest in the Writings of other pious and diligent Men, if he hath a desire to know more.

As for the Original of Salt, which is drawn out of the Ocean, as an Universal Storehouse, Writers are divided into divers parts and Opinions. Some think that those Salt Fountains, which in many, and various places of the Earth break forth from their Springs, and by the help of boiling, yield their Salt, do not take their beginning from the Ocean, but from a Salt peculiarly generated, and brought forth in many places of the Terrene Globe, like Metals. And they establish their Opinion by this Argument; That the Water of those Fountains much exceedeth, oftentimes, that of the Sea in saltness; and on the contrary, the Sea Water being brought by long and tedious Passages through the Earth, necessarily looseth its saltness, and therefore leaving its Salt, it ought to come forth plainly sweet, or insipid. This reason, at the first sight, seemeth so agreeable to truth, that one can hardly think the matter to be otherwise. But most Springs of sweet Water, in their first rise were Salt, which penetrating the passages of the Earth, have deposited their Salt in the same, to nourish the Earth, and that they might come forth sweet for the daily use of Man. Whence they have given rise to so many, and such various Rivers, which again return in that Universal Store-house the Sea, or Ocean, by which incessant and Reciprocal Flux, they are impregnated with Salt, and Communicate the same to the Earth, that it may never labour under a want of due nourishment, but may render Minerals, Stones, Trees, Grass, Beasts, and even Men also, partakers of the same perpetually, and so may serve as well for the Sustentation, Propagation, and Conservation of Irrational, as Rational Animals, the which no man of a sound mind can deny, except he will also deny the Circulation of the Blood in the Body of Man, or Microcosm, *which is plainly unknown to not a few, and will say, that the blood in the little Toe, or little Finger, or left Ear, or other places, doth not arise from the Liver, the Universal Fountain of Blood, but that it is particularly generated and produced by the Vital Spirit, in those very parts, which savoureth not a little of Absurdity.*

Seeing therefore, that the constant Circulation of the Blood in the Microcosm, *can be in no wise deny'd, why should not also such a Circulation in the* Macrocosm *be admitted as true? For as the Blood of the Human Body arising from the Liver, diffuseth it self through all the Passages and Veins of the Body, as well small as great, and Conserveth the life of the whole, nourisheth all the parts, and augmenteth the good juices, which are changed into Flesh, Bones, Skin, and Hairs in the Members themselves, and leaving the unprofitable Phlegm to be expelled by the Pores of the skin: So also is it with the Nutriment and Universal Aliment of the great World, while the Salt water without intermission, of the great Sea, or Ocean, encompassing the whole Globe of the Earth, by many small and great passages or Veins, passeth through all the parts of the Earth, and nourisheth and sustaineth them with its Salt, that Minerals, Metals, Stones, Sand,*

Sand, Clay, Shrubs, Trees, and Graſs may be nouriſhed and grow, and in growing take their encreaſe. The reſt of the Water being freed from all ſaltneſs, is exterminated as a ſuperfluity in the Superficies, and being diffuſed into various Springs, as well ſmall as great, is expelled, no otherwiſe than the ſuperfluous ſweat of the Blood in the Microcoſm, *by innumerable paſſages and pores. But that in many places of the Earth, the Water doth not leave its ſalt, but carrieth it along with it ſelf, that may very well come to paſs for divers reaſons. For firſt, the moſt excellent Governour, by His Divine Providence, hath moſt wiſely ordained and appointed, that a ſalt water of this kind, which men could in no wiſe be without, ſhould break forth out of the Earth, and it is thus effected: The Sea-water every where paſſing through the paſſages and clefts of the Earth, in ſome places is dried up by the Central fire, and coagulated into hard and great pieces, which being digged up by men, and diſſolved by the help of Water, and freed from its faces, is boiled up in fit Veſſels, and reduced into a pure* Salt.

But if it happeneth that other Water paſſing through thoſe paſſages, findeth pieces of Salt of this kind, it diſſolveth ſo much of the ſame as it can carry along with it, and afterwards is boiled into Salt after various manners, according to the greater or leſſer quantity of Salt it hath carried along with it.

But that one Salt Fountain is richer in Salt than another, the cauſe of the difference is in the Water, which paſſing by, doth more or leſs aſſociate it ſelf with the Salt, and ſo is made ſtronger or weaker.

Theſe few things are ſufficient for the refelling of their Opinion, who aſſert, that Saline Fountains do not draw their original from the Sea, but are generated and produced in a peculiar manner in the Earth, by the help of the Stars.

But if this ſhould ſeem credible, nevertheleſs it would ſeem more credible, that the Sun and Stars caſting their Rays and Influences into the Ocean or Seas, ſhould there generate Salt, which afterwards penetrating through the pervious paſſages of the Earth, ſhould convey due nouriſhment to the ſame.

This reaſon may alſo be aſſigned of the greater or leſſer quantity of Salt in Fountains or Salt-ſprings, that thoſe paſſages which receive ſalt water from the Sea, differ in ſcituation of place, and are alſo differently diſpoſed or allotted by the ſea-water it ſelf, which being various and manifold (in reſpect of ſaltneſs) differs much in one place from another.

For by how much the nearer the Sea-water is to the North, *it contains ſo much the leſs ſalt, ſo that oftentimes it ſcarcely holds the tenth or twelfth part of Salt. But the nearer it is to the* South *or the* Eaſt, *it is inriched with ſo much the more ſalt. For this reaſon, in many places of the* Eaſt *and* Weſt Indies, *the ſea aboundeth and ſwelleth with ſo great a force of ſalt, that when it is ſtirred up by the vehement impetuoſity of Tempeſts, it caſts out with its ſurges a copious ſpume or frothy ſcum upon the ſhore, which being afterwards dried by the Rays of the Sun, the Inhabitants are wont to uſe for the ſalting of Fleſh and Fiſh. Experience teacheth, that in places of this ſort, four pounds of Sea-water yield one pound of ſalt, and the fertility of thoſe Lands alſo indicates the great quantity of ſalt, which without any cultivation or human labour, both Winter and Summer inrich the Inhabitants with moſt excellent Fruits. But thoſe Regions ſcituated near the Arctick Pole, or North, do not enjoy ſo great a fertility, becauſe they want the greater and more penetrating Beams of the Sun, and do not exhibit ſo great a quantity of Salt, which is the cauſe of all fertility, and therefore thoſe Regions are denied ſo large and ſpontaneous a fruitfulneſs.*

But that Salt which the Unskilful have been accuſtomed to have in little or no regard, may be had in greater honour, I neither could or would any longer paſs by its due Name in ſilence, and therefore I have called it the greateſt Treaſure, and moſt ample Riches of the World.

Moreover, that I may prove and demonſtrate, that this common abject ſalt, known to every man, (in which the life, conſervation, growth, and propagation of all the Creatures conſiſteth, and which is the beginning and end of all things) doth deſerve this title, and that a greater Treaſure is not found in the Earth; it will be neceſſary to do this, that I make manifeſt the infallible Verity of the Myſteries of GOD and Nature.

But I deſire of the unprejudiced Reader, that he will not be offended at the vileneſs of abject and contemptible ſalt, nor think that I, in giving this Title to it, and calling it the greateſt Treaſure and chiefeſt Riches of the whole World, have exceeded or given it too great honour. For ſo great and honourable a Title doth of right belong to it, and ſhould as yet be inſignized with a greater, if a greater by me could be attributed. And I eaſily perſwade my ſelf, that if thoſe who are captivated by the hunger of Gold, ſhall ſee this Book, and read the Title, they will conceive no other thing in their minds, than the deſcription of the great Univerſal it ſelf, or the revelation of great Riches and maſſy Treaſures, which they will hope to find in this Treatiſe, never dreaming that poor abject and contemptible ſalt ſhould be ſet before them, and therefore will ſay, What is all this noiſe about a handful of Salt? Who could have thought that Glauber *would have dared to have given ſuch a Title to Salt? But I earneſtly require of thee, my Friend, that thou wouldſt patiently read thoſe things which in this Writing I have put before thine eyes, concerning Salt, and that thou wouldſt accurately examine them, that thou maiſt apprehend me to have written the pure and ſincere truth. If they exceed the capacity of thy mind, and thou haſt not hitherto learned or underſtood the ſame from the Books of others, I would have thee to underſtand that all men have not knowledge of all things, and that the Omnipotent GOD hath left many* Sciences *to Poſterity, which he hath hitherto concealed from the proud and haughty. Read over and over the true Writings of the ancient Philoſophers, that thou maiſt know, and throughly know, that thoſe men who have ſearched the moſt intimate Penetrals of Nature, had ſalt in great eſtimation, to have induſtriouſly concealed its Myſteries and* Arcanums *from the ingrateful World, which now in theſe laſt times are brought to light, for thee and all others, to be received as incomparable Gifts, with a grateful mind.*

Therefore Reader bend thine Ears, and open thine Eyes, overgrown with blindneſs and darkneſs, attend to thoſe good things which I ſhall diſcourſe to thee of ſalt; if thou wilt make trial, and will ſearch them throughly by an accurate examination, whether they agree with God, Nature and Truth, I doubt not, but thy mind will be enlightened with a great light, and thou wilt become as a man renovated; but if with a proud mind thou ſhalt refuſe to learn and underſtand thoſe things, or ſcoff or mock at them, thou ſhalt be reckoned amongſt the number of Fools, and perpetually abide in the ſame, although Ariſtotle *himſelf, and all the Profeſſors and Doctors ſhould ſit upon thy long Aſs-ears, and thou with the ſame ſhouldſt endeavour as an Aſs with a ſack to cover thy fooliſh Pride and proud folly. It is much better for a man to know many things, and meaſure or eſtimate himſelf in his own way or manner, than to know nothing, and bear himſelf out with the vain pride of his own ignorance. I have never ſeen any man endowed with true knowledge, who hath preferred himſelf to others; on the contrary, I have found very many, who being ſtirred*

up by envy, hatred, and inhumane malice, do nothing sooner or more readily, than insult and make a mockery at pious men, to whom the Divine Bounty hath granted his Gifts, and as it were, devour them with their Wolf-like Teeth, which diabolical wickedness the Divine Justice in its own time will not suffer to escape unpunished.

Thus much I was willing to say to the proud Caviller; now therefore attend to those things which I shall speak concerning Salt.

A TREATISE OF THE Nature of Salts, &c.

I. *Of the Nature of* SALT.

THat it may be demonstrated in a *Compendium*, how many good things, as first the Tranquility of our mind, the chiefest Temporal Good, the Conservation of our Bodily Health, the great Riches and Treasures, and other things which are necessary for humane use, are latent or hidden in the despicable Body of Salt; in the first place let us hear what our Saviour Christ himself saith, who is the Truth, the Light, and the Life, in the Gospel of St. *Luke*, Chap. 14. Ver. 34. and in *Mark*, Chap. 9. Ver. 50. *Salt* (saith he) *is a good thing*. And in *Luke*, Chap. 18. Ver. 19. *No man* (saith he) *is good, but God alone*. But he calleth his Disciples the Salt of the Earth, and addeth, *If the Earth wanteth salt, it is unprofitable, neither doth it bring forth Fruit*. And Dung it self, without Salt, is of no use. This is as if he should have said, Salt is the most noble thing of the whole World; and yet amongst Fools the most abject and contemptible. Be ye like to this, and do the Will of God, and as Mediators, lead Sinners to GOD, which otherwise cannot be done. *I am your Head, your Master, and go before you; tread ye in my footsteps, follow me, I am the Way*, &c.

But to return to Salt, we will hear the opinion of others concerning it: There is here no need to cite the Writings of Philosophers at length, seeing they are at hand, and from them it may be manifest to every man, that next after GOD, the Sun, and Fire, they have esteemed it the most Noble Creature, and have given to it Honours as it were Divine. The Heathens would not sacrifice to their gods without Fire and Salt. If you read the Old and New Testament, you shall find that God himself hath commanded to have regard to Salt. In the Gospel of St. *Mark* you shall find that all men are to be seasoned or preserved by Fire, and all sacrifices with salt, and that the Lamp or Light upon the Altar was never to be put out, but to be kept in continual Burning. In the Christian Church, this manner is still observed, that no Infant is baptized, without some Light or Candle be present, and the Priest sprinkles a little salt upon the mouth of the Baptized, with these words, *Receive the salt or seasoning of Wisdom*; as if he should say, *Learn to understand and know God, and be not like the Beast, which hath no understanding*. These Ceremonies are observed in some places at this day. The Greek Church baptizeth with fire and water, by that Rite indicating the Holy Ghost to be like to fire, because he warmeth the cold hearts of Men, enliveneth them, and turneth them to GOD. God Himself calleth himself a consuming Fire; and the Holy Ghost hath alwaies appeared in the form of Fire, and shewed Himself to the Disciples of Christ in fiery Tongues. The *Abyssini* professing the Christian Religion in *Africa*, under the most Potent King and Priest *Prester John*, baptize with Fire and Water, and make a sign or mark in the Foreheads of the men which are baptised, by Burning. In short, there is not any man among the Heathens, Jews, Turks, and Christians, who doth not highly value Fire and Salt, of which notwithstanding he knoweth no more than a mad-man, or than a Swine, or an Ox, or other irrational Beasts, which pass their life without understanding. But these two Creatures of God, to wit, Fire and Salt, are one and the same in the foundation of Nature; for Fire produceth Salt, and Salt is again converted into Fire, and Fire into Salt, so that by a mutual conversion they are alwaies changed one into the other. Therefore *Hermes* the Father of Philosophers saith, *That which is above, is as that which is below, and that which is below, as that which is above*; as you may read in his *Smaragdine* Table. The Sun or Fire is above, Salt is below, which is by an easie way rendered combustible, like the sun or fire; as I have taught in many places of my Writings, and all Philosophers, with an unanimous consent, do confess, that the greatest Secret lieth hidden in fire and salt.

Henee

Hence is the word Alchymy from fire and ſalt, which penetrate all things, and Fire is the Symbol of GOD, who hath alwaies exhibited himſelf to mortal eyes, in the form of Fire: But Salt is the Symbol of Eternity, inaſmuch as it defendeth and preſerveth all things from Corruption.

There are ſome who determine the Evangeliſt *John* to have underſtood Hermetick Philoſophy; and there is yet extant an Hymn, compoſed and ſung by the ancient Fathers, in honour of the ſame *John*, in which occurr theſe words: *Who maketh Gold of Rods or Twiggs, and Gemms of Stones.* Nevertheleſs I leave thoſe things to every man's judgment, and here I only ſay this, That both Heavenly and Earthly Myſteries were known to the Prophets and Apoſtles.

But although I have never taken in hand ſo great a Philoſophick Work, nevertheleſs it is ſo known to me from the Writings of the Prophets and Apoſtles, and from the Light of Nature, that by comparing things Divine and Humane, I could eaſily ſubject it to the Eye, but that power is not allowed me, and therefore I truſt that no man will make an evil Interpretation of what I have ſaid, ſeeing that thereby I aim at nothing but the glory of God, and the profit of my Neighbour.

There is no need for any man to ſeek many things from the Old and New Philoſophers, ſeeing that by reading and conſidering the Divine Writings of *Moſes*, the Prophets and Apoſtles, he may obtain his deſire, and may without doubt, in them, find the Stone of Philoſophers deſcribed, provided he ſhall have but a little knowledge of Nature. I will ſay no more, but that the infallible Truth occurrs in thoſe. All theſe things are to be taken ſo, that things Divine may be underſtood in a Divine ſence, and Natural things in an Elementary ſence, without changing or mixing, ſeeing that they have no Communion among themſelves.

But leſt it ſhould ſeem to any, to be abſurd, that St. *John* the Evangeliſt ſhould make Gold of Sticks or Twiggs, and Gemms of Stones, as the ſaid Hymn teacheth, by an Art indeed great, and to be admired, I have thought it neceſſary to open and ſhew to the Unskilful by what means that might be done.

In the firſt place, this was poſſible to St. *John*, as he was a man abundantly gifted with the Holy Spirit, and ſeaſoned with the Salt of Wiſdom, ſo that he might perform this action ſupernaturally, as well as naturally, ſeeing that he was endowed by the holy Spirit, without all doubt he had alſo the natural Light in his poſſeſſion.

But by which of thoſe powers he effected this, is not for us to know, nor doth it behove us to know. But becauſe few will believe that St. *John* wrought the ſame by natural means, and many not believing in Nature and Art, will only ſay, that it could never be that Wood ſhould be tranſmuted into Gold, and Stones into Gemms. And although the later ſhould be in ſome ſort credible, by reaſon of the alliance or likeneſs between Stones and Gemms, nevertheleſs the former, by reaſon of the great diſagreement between Woods and Metals, inaſmuch as they belong to divers Kingdoms, they object, exceeds all Belief, and other Objections of this ſort, may be found among the Unskilful, by reaſon of the external ſpecies of place But ſuch things are wont to move no admiration in Philoſophers, much leſs any doubt, ſeeing that they are not ignorant how great familiarity there is of the Vegetable Kingdom with the Mineral, both which have their Riſe from the ſame Subjects, *viz.* Salt and Fire, which their Anatomy doth clearly demonſtrate. And although this may exceed the Capacity of ſome, yet it doth not thence follow that it is not true. If all things were to be ſpoken truly and openly, I confeſs there would be found a very ſmall number of thoſe who rightly underſtand Nature, ſeeing that almoſt all men who have but frequented a School for ſome years, and obtained any thing of Latin, whether they underſtand Nature, or are ignorant of her, will be taken for Philoſophers, traduce thoſe Philoſophers who are illuminated by the light of Nature, with ſtrange Cavillings and wicked Lyes, every where ſetting forth themſelves by their own ignorance. Therefore it is no wonder that the Secrets of Nature ſhould lie hid, and by the ignorant and unskilful of this ſort be all taken for Fables and fooliſh Whimſies, which their Sheeps Brains cannot reach. But who is able to cure this Evil? Perverſe manners are to be left with a perverſe World. But that I may prove and demonſtrate that it is not altogether impoſſible for Art to tranſmute Wood into Gold, I will point out by what means it may be done.

Firſt, Then it is manifeſt before all things, that all Wood and every Herb hath its original from a certain ſulphureous ſalt, to which Metals alſo owe their Riſe and greatly agree in ſimilitude, and by an intimate agreement in the ſame name; ſo that how eaſily a Mineral ſuffereth it ſelf to be changed into a Vegetable, and that again into a Mineral, I have ſignified in other places of my Writings. Indeed if you ſhall look upon the external difference of any Wood or Herb, and a Metal, it will indeed appear great; but being reduced to their firſt matter, they will not differ in any diſcrimination; as is manifeſted in my *Continuation of Miraculum Mundi*.

Therefore if the firſt matter of Vegetables be adjoined to any metallick ſeed, this is nouriſhed by that; and again, if a metal be reduced to its firſt matter, and any Vegetable ſeed put to it, that will be changed into a Vegetable; which Experience hath often ſhewed me. But if thoſe two had not a great affinity with each other, they would not ſo eaſily admit of a mutual converſion one into the other; the ſeeds indeed differ between themſelves, but they agree in the firſt matter, which appeareth thus: If a ſulphureous ſalt, not corroſive, be mixed with ſand, and moiſtened with water, and the ſeeds of divers Herbs ſowed in it, for every ſeed doth thence attract its own nouriſhment, every one, according to its ſpecies, producing its like, endowed with various colours, ſmell, and proper taſte, powers, and virtues, all which proceed from one only ſalt, and are manifeſted by the heat of the Sun, and the operation of the internal Archeus. But to make the matter more clear, it is to be known that the principals of Vegetables are Water, Salt, and Sulphur, from which alſo Metals take their original, and not from running Mercury, as many think. For that *Argent-vive*, in its own peculiar nature, is alſo a metal ariſing from the ſame three principles, from which the other metals, and all Vegetables draw their original, *viz.* from Water, Salt, and Sulphur, which their Anatomy maketh manifeſt. Here the rout of Unskilful men will take Counſel to refel this my opinion, inaſmuch as it will ſeem worthy of credit to few. But the cauſe of this incredulity is the rudeneſs and unskilfulneſs of men of this ſort, who having no Experience in Natural things, nor in no wiſe enlighte-

ned

ned by the Light of Nature, are blinder than a Mole.

Thoſe things which hitherto I have ſo often, and with ſo many words inculcated, the ſame I here repeat and affirm, to wit, That a Metal may be converted into a Vegetable, and that again into a Metal, and that no Vegetable is found, from which a natural and yellow Sulphur, in all things like to the Mineral, may not be prepared; and this Sulphur prepared of any Vegetable, if it be adjoined to any fixed metallick Sulphur, it is maturated by the ſame, into a metal, yet not without a *medium*; as I have often indicated in my Writings, and that *medium* I have ſaid to be Salt. Therefore whoſoever knoweth how to adjoin any immature ſulphur, whether Vegetable or Mineral, to any ripe Metal, the fixed and conſtant ſulphur of Gold and Silver, will be nouriſhed and encreaſed by the Vegetable or Mineral ſulphur, not fixed, and will tranſmute that into the ſpecies and property of the other, as the Ferment ſhall be white or red, in like manner as the ſeed of any Vegetable doth. So gold and ſilver may be made of a ſulphureous ſalt, according to any ones will, which nevertheleſs requires a due time, ſeeing that a tranſmutation of thisſort is perfected gradually, and by a due heat, as alſo in the propagation of Vegetables & Mineralsit is wont to be done. From theſe things it appears, that this Tranſmutation is the meer Work of Nature, which many Experiments which I have made, and yet am able to make, do evidently demonſtrate; therefore there is no reaſon why ſuch things ſhould ſeem ſo wonderful or abſurd to any.

Whether St. *John* performed the Tranſmutation of which we have ſpoken, by the help of any natural Art, or whether he did the ſame by a Divine Power, we will not here diſpute; but let it ſuffice to have demonſtrated that ſuch things may be performed by a natural reaſon.

For when Wood, Bread, or piece of a Bone; or alſo any Herb ſhall be adjoined to its own ſalt, in due manner of Art, and reduced to its firſt matter, that ſalt tranſmuteth the Flower, Bread, Wood, or Herb into a ſulphureous ſalt, which encreaſeth the growing faculty of Vegetables and Minerals. A ſalt of this ſort being mixed with a ſmall quantity of white Flint reduced to powder, and melted in a ſtrong Fire, will give a red and pellucid ſtone or glaſs, which if it be kept long in the Fire, it turneth green, and at length black, like a Coal, and acquireth ſo great hardneſs, that it may be cut and poliſhed after the manner of other precious ſtones. Here the deſirous of Art may ſee, that by one and the ſame way, and in one and the ſame time, that Gold may be prepared of Wood, and fair and pellucid ſtones, of various colours, of white Flints. But that the Eyes of the ſtudious of Divine and Natural things, may be the better opened, I will more clearly expound what the firſt matter is.

Therefore, as to this firſt matter, of which we here ſpeak, that of it Metals no leſs than Vegetables may be brought forth, it is to be known how eaſily it may be prepared by the help of Fire, and of a certain Salt not corroſive, of Metals, Vegetables, and Animals, and indeed ſo ſwiftly, that in the ſpace of three hours a piece of Bread, Fleſh, or of any Metal, may be tranſmuted into a ſulphureous ſalt. The ſame thing alſo happeneth in the ſtomachs of Men and Beaſts, in which the Vegetables and Animals which are eaten, are conſumed in the ſpace of 24 hours, and tranſmuted into that ſulphureous ſalt from which they have drawn their Riſe. But Metals being too fixed and compact, thoſe ſtomachs have no Juriſdiction over them, inaſmuch as they are not able to reduce them to their firſt matter, except the ſame were ſo reduced before, and ſo ſhould come into the ſtomach, opened by a radical ſolution, and ſo are digeſted and conſumed like Animals and Vegetables. But what need is there of the help of humane ſtomachs to perform ſuch things, ſeeing that Operations of this ſort may be perfected by the help of Fire and Art. A moiſt putrefaction without the help of Fire, performeth the ſame thing in Vegetables and Animals, in a long Proceſs of time; but in Metals very difficultly, and not except in a very long time. Neither are humane Stomachs themſelves alike potent, in reducing every Vegetable to its firſt matter, inaſmuch as they exerciſe their power only upon thoſe Vegetables which by a due Preparation are firſt rendered fit to be digeſted and concocted by the ſtomach, and reduced to their firſt matter. For firſt they are boiled, roaſted, or prepared by ſome other way, becauſe thoſe things which are admitted into the Body, contrary to humane Nature, exerciſe nothing but venomous Operations. By a like reaſon Metals and Minerals refuſe to be brought to their firſt matter in a humane Stomach, ſeeing that the ſtomach cannot ſuffer them, as being averſe to humane Nature, but ejects them as a certain Venome, not without great peril of Life. Here I except Gold, which Metal only, being firſt rightly prepared, doth not refuſe reduction into its firſt matter in the ſtomach of Man; nevertheleſs Art doth it more eaſily and readily. He who knoweth not this Artificial Reduction, muſt be content with the Natural, which nevertheleſs is not deſirable, by reaſon of the toil, ſtink, and length of time which it requires. For which reaſon it is of leſs account than the artificial. Some of the ancient Philoſophers have indeed (not without reaſon) uſed the Dungs of Animals, by reaſon of the incredible Virtues which they poſſeſs. But becauſe we have better and fitter Medicaments at hand, not without reaſon we omit thoſe, and leave them to them who labour under the want of better; which happeneth to Country people, who being remote from Cities and Medicines, are wont to uſe Dungs in various Diſeaſes inſtead of Medicines. They purge the Bodies of Boys and Girls with Mouſe-dung, Horſe-dung, and Gooſe-dung, being diſſolved in Wine or Beer, and ſtrained through a Linen Cloth, they uſe in curing the Falling-ſickneſs by Sweat. In the Cure of an *Eryſipelas*, or *Burns*, or *Scalds*, they uſe Hoggs-dung; and in all kind of *Swellings* Sheeps-dung; in a *Quinſey* white Doggs-turd, or Humane dung, as alſo to other Diſeaſes of the Neck, which the rude and ignorant are wont to drink againſt various inward and outward defects of the humane Body.

I remember once to have ſeen an admirable Cure done in a moment by the help of humane dung, in a certain, long, and tedious Diſeaſe, which it plainly and ſwiftly removed, drawing thoſe into admiration who were ignorant of the reaſon of ſo ſwift a Cure. He that underſtandeth the nature and properties of Dung, will eaſily perſwade himſelf, that wonderful things may be effected by the ſame. The reaſon is ready, becauſe humane Dung is nothing elſe but Bread and Fleſh, reduced into their firſt matter, all their Bonds being looſened, and rendered fit for the exerciſing of their Virtues; and from humane Dung is elicited, without any great difficulty, a natural Burning, and like to Mineral Sulphur, of which being mixed with Coals and

Salt-petre,

Salt-petre, Gunpowder is wont to be made ; as alſo a certain Salt, not much unlike the *Sal Enixum* of *Paracelſus*. And both thoſe, to wit, that Sulphur, and that Salt, the Humane dung containeth in it ſelf ; the which may put forth their wonderful Virtues, by admirable Operations, I think may be doubted by no man. Put a piece of Gold for a time into Humane dung, and afterwards cleanſe it by waſhing, you ſhall find it equally yellow, as if it had lain in a Lixivium, in which common Mineral Sulphur had been diſſolved. And that yellowneſs adhering to the Gold [*or rather Silver, for the better diſtinction*] is but the Vegitable or Animal Sulphur ariſing from the Food which the Man hath eaten.

This I ſay is the cauſe that the Dungs of Men and Beaſts produce ſo great effects, which Bread and Fleſh otherwiſe cannot produce, before they are reduced into their firſt matter. Nevertheleſs, I do not therefore admit them of value in Medicine, but only ſhew whence they have their Virtues of reſiſting Diſeaſes, that by this means I may aſſert Vegitables, Animals, and Minerals do highly exerciſe their Virtues, when they return to their firſt matter, not that it is at all neceſſary to be done in the Stomachs of Animals, ſeeing that the Operation of the fire alone ſerveth for this reduction.

In what manner ſoever this firſt matter be made, whether by the Stomachs of Animals, or by the Operation of fire, there is no great difference, only that which is made by fire is purer, and not ſo ſtinking, as that which is done by the Stomachs of Animals, although in gilding of Silver, they are found to be equal, and obtain a ſulphurous nature. And hence it appears, that there lies hid in Bread, and in Fleſh, a fugacious and ſpiritual Gold. And for this reaſon I conclude, that in all things of the World born of Salt, and brought to Maturity by the heat of the Sun, there is neceſſarily reconded a fugacious Volatile, and ſpiritual Gold, yet in greater quantity in one ſubject than another, but not manifeſted till the body containing it, by the help of art, returneth to its firſt matter.

The which Art, ſeeing that it is out of the reach of Ruſticks, it is but reaſonable, that they ſhould make uſe of Dungs, without any ill interpretation. For in the greater, and more powerful Virtues to be produced, Dungs are found more potent than thoſe things from which they proceed. Bread, Wine, Fleſh, and the like things deſtinated for the nouriſhment of the Body, are not Medicines, but only Nutriments, from which, after an Animate Body hath ſeparated its Aliment, that which is left, obtaineth Medicinal Powers and Virtues ; and did I not fear that this dungy diſcourſe ſhould lead me too far from my purpoſe, I could declare things to be admired of Dungs. For Metals alſo being prepared but once by the help of Animals, may be wonderfully Converted, and reduced to their firſt matter, although it is in no wiſe neceſſary that we ſhould take that way of doing it, ſeeing that an eaſier and better way is at hand, than that by the help of Animals. But he that is ignorant of this artificial Converſion, muſt be content with the other, till the teachings of experience, ſhall bring him to better things.

That incredible Virtues are hidden in the Dungs of Animals, *Paracelſus* at ſome time declared, in the preſence of ſome Noble-Men, to ſome Unskilful Phyſicians, who being moved with anger, departed, thinking themſelves to be highly reproached by *Paracelſus*, becauſe they had asked of him ſome great Medicinal Secret, and he had ſet before them Humane Dung. But without doubt, he would have ſhewed them great Secrets hidden in ſuch a matter, which exceeded their dull Capacities, but not the incomparable Ingeny of *Paracelſus*, who without doubt had revealed to them thoſe Secrets which himſelf had found, had they not gone away from him with wrath and Indignation.

In another place of his Writings, he ſaith in expreſs words, that he that knoweth not his own Dung, knoweth nothing at all, and is a blind Aſs, to whom nothing of Heaven and Earth is manifeſt; which words do plainly prove *Paracelſus* to have been able to perform many things with Dung. But this I aſſert, that this my Tranſmutation, and Converſion of things into their firſt matter, doth far excel that which is done by Dungs, in as much as being endowed with a greater efficacy, it appeareth not in the ſpecies of Dung, but of a Sulphureous Salt, and may commodiouſly be uſed by all Men, and in all Diſeaſes. Its Virtues are not reſtrained to any particular Diſeaſe, but operate generally, not only in all Humane Diſeaſes, but alſo in all Infirmities and Defects of Vegetables and Minerals, as I have ſhewed in other places of my Writings. What I have here ſpoken of Dungs, I would not have any think that I have done it to the end that I would have them uſed in Medicine, but for this reaſon, that I might ſhew the great difference between an Herb as brought forth by the Earth, and that which being firſt digeſted, the Animal Stomach hath freed from its Bonds, and reduced it to the operation of its hidden Virtues : The which I have very clearly proved by the Dungs of Animals. Therefore the expert and learned Phyſician, ſetting aſide all Dungy Medicines, may by the Spagyrick Art, reduce his Herbs to their firſt matter, that is a Sulphurous Salt, and may perform by Salts of this ſort, more and greater things, than by the unprofitable, and deſtitute of all Virtue, Barks, Shells, and empty Husks, which a multitude of Phyſicians are accuſtomed to uſe at this day. I have thought fit to expoſe to the light theſe few things, concerning the firſt matter of things, and Dungs, which are not diſtinguiſhed, by any great difference: But let us return to the matter it ſelf, and ſee how fairly the light of Nature ſhineth from the Divine Light.

As God formed the firſt Man *Adam* of the Earth, and breathed into him a living Soul, and placed him in Paradiſe, and the Devil withdrew him from God, and Precipitated him into Eternal Damnation, uſing the Serpent as a Mediator : So alſo, Man who fell from his Creator, being deceived by Satan, by the Divine Serpent and Mediator, to wit, Jeſus Chriſt, was again to be reconciled to God, which could no otherwiſe be done, and God permitted it ſo to come to paſs, who otherwiſe might have bridled the Devil, ſo that he could not have ſeduc'd a Man, and alſo could have kept Satan himſelf in his Angelical Eſtate, that he ſhould have had no hatred againſt God or Man. Now this Philoſophick Elementary Secret may be compared, in all points, to the Heavenly Miſtery. For if the Elementary Sun, in the ſeparation made by God, in which he lifted himſelf on high from the rude and formleſs Chaos, had not ejected his earthly and corruptible Sulphur, and ſent it down to the Abyſs of the Earth, the Rays of the Sun, when they now penetrate the Earth, would not be hindered to Communicate with the Solar Progeny or Iſſue, ſo that the Bowels of

the Earth would produce nothing but Gold; and the other Metals, *viz.* Iron, Lead, Tin, Copper, *&c.* ſhould not be, which nevertheleſs are brought forth impure owing their received impurity to that impure, ſtinking, and earthly Sulphur, which is mixed with a Metallick Body in the Bowels of the Earth.

But to help Metals infected with a Sulphur of this ſort, that they may become like to Gold, as the Son of the true Sun, it is neceſſary that Sol ſhould humble his Son, to wit Gold, and ſuffer him to put on a Saline nature, whereby he may become the Medium of reducing radically the imperfect Metals to perfection. Salt is the only Medium of reconciling Gold to common Sulphur, and of making of it a Tincture, changing the imperfect Metals into perfect, of which all the Philoſophers, whom few underſtand, have written ſo clearly.

Concerning this matter I have written very clearly in a Treatiſe, which I lately publiſhed, deſcribing a Saline Water, or *Aurum Potabile*, which certainly containeth a great Miſtery, although very many can neither underſtand or believe it. For becauſe it wholly tingeth Mercury, it cannot be a ſolution of common Gold, becauſe no Water, nor no Liquor prepared of Corporal Gold it ſelf, can give to Mercury a conſtant Tincture. It may indeed be done that Gold diſſolved, may adhere to *argent vive*, or that to Gold, ſo that both may paſs together into a white Amalgama: But that ſuch an Amalgama ſhould become yellow and hard, or the Argent vive tranſmuted into Gold, will never happen, although it ſhould be digeſted or cocted an hundred years in ſuch a Golden ſolution. For the ſnowy whiteneſs of Mercury never ſuffereth it ſelf to be tinged or coloured by common Gold, but is obedient to any tinging and coagulating Sulphur, concerning which in the Appendix to the Continuation of *Miraculum Mundi*, more things are declared. Let theſe few words be well examined, in which will be found a great Miſtery; to wit the whole Philoſophick work it ſelf, provided the light of Nature ſhall a little ſhine. Nevertheleſs this is not ſo efficacious, as that it can reveal ſuch Miſteries to a Man who wants Venus to open his Eyes, with which he may behold the light of Nature. For without God, there is no light, and without light, no life, no Underſtanding nor Wiſdom; Obſcurity is Death, and Death Eternal Deſtruction.

Salt ſpeaketh thus of it ſelf; *I am fire and life, and no Combuſtible Sulphur can be made Gold, except I be the Mediator.* Salt is the only Medium between Combuſtible and Corrupt Sulphur, or the imperfect Metals, and Gold. The pernicious Sulphur or Satan, which lieth hid in lean Death, is firſt to be vanquiſhed and overcome in Hell, then ariſing a Glorified Body, it occupieth its Royal Throne, and Converteth the Diſeaſie Metals into Gold.

But to delay the Reader, burning with a deſire of Divine and Humane Myſteries, no longer, I will deſcribe the whole Operation in a Philoſophick manner, briefly, clearly, and truly, as I have oftentimes done it with my hands, but never yet, by reaſon of various Obſtacles have brought it to a due perfection.

To the common Salt of the Earth well cleanſed, adjoin a Terreſtrial Sulphur in a due weight, the injected Rays of the Sun being firſt received by the Salt; the Salt and Sulphur will fight in Hell ſo long, until the Salt overcometh the Devil and Death, and ariſeth a Glorified Body, by which its ſick Brethren are to be Cured, or Converted into Gold.

This is the whole Operation, in which nothing is omitted, but the weight, and the name of Satan or Death. But the name of the Salt I have already manifeſted, and nothing here remains, but that I ſhould expreſs the name of Satan and Death, which for the Glory of God and Profit of my Neighbour, I will not conceal.

The Death and Devil of all Metals, is that Combuſtible Sulphur, which having its ſeat in all things, is equally in Vegitables, Animals, and Minerals. Conjoin Salt and burning Sulphur, and cauſe them to fight until the life (that is Salt) ſhall overcome and ſwallow up the burning Sulphur, which is Death, and from both will proceed a Glorified Body, like a fair Ruby, or pellucid and red Carbuncle, by which the Diſeaſes of Men and Metals may be cured. In this manner of operating, delivered in few words, lieth hid a miſtery of great moment, which one of a thouſand will ſcarce underſtand, and by reaſon of the vileneſs of the matter, it will be to many offenſive, and contemptible. But we will have no regard to Fools, blinded with their own folly and madneſs, who ſeek good where it is not to be found, and neither do nor will know it when put before their eyes. If after a Sophiſtical manner I ſhould have propoſed ſome Chymical Operation with a long and tedious Circumſtance of words, I make no doubt, but the blind World would more readily have received it, than a ſhort and compendious way of operating of this ſort: Whence *Sendivogius*, and other true Philoſophers, have not ſaid without cauſe, that if the true manner of Operating ſhould be revealed to any man, nevertheleſs, by reaſon of the vileneſs of the matter, it would not be believed. For this reaſon, ſome will object; I pray what good is like to be in ſo vile and abject a thing as Salt? And when was Sulphur wont to be made Gold? Hence alſo, they neither will nor can believe the truth.

But that I may clearly prove, that there are Secrets hidden in Salt and Sulphur, it behoveth, that I manifeſt thoſe things more largely. Salt is the Symbole of Eternity, ſeeing that it is not diminiſhed nor altered, neither by Fire, Air, Water, or Earth, but preſerveth all things for a long time from Corruption. It is a thing well known, and converſant in the ſight of all the World, and is a help to all other things, yet wants not the help of any thing. Burning Sulphur is the Symbole of Death, and the true Infernal Devil, which no Element, nor any other thing (one Salt excepted) is able to vanquiſh and overcome. For although Sulphur not yet freed from its Bonds, being ſurely kept in its Priſon ſhould ſuffer it ſelf for many years to be tortured by the fire, yet would it not receive any ſenſible mutation, nor any loſs of weight, provided there be no open paſſage for its Exit. By the like reaſon, if it ſhould abide an hundred years, in the Air or Water, yet it would in no wiſe putrifie. Salt only overcometh it, and changeth it into a Carbuncle; I ſay into a Carbuncle, ſo called, becauſe ſhining with a pellucid redneſs, it ſheweth like a burning Coal, and for its excellency may be accounted among Precious Stones. It is found by few, but they who have it in poſſeſſion, hide it, nor do they expoſe it to Sale like Diamonds, or other Gemms. It is not digged out of rough Mountains, as others, but is ſought by Prayers to God, and acquired by the Labour of the Hands.

But why do I ſay ſo much? Seeing that I have already exceeded my due limits, yet I know, that what I have

I have ſaid will exceed the capacity and underſtanding of the Impious. But that no man ſhould doubt, that ſalt and ſulphur are moſt noble Creatures, although very lightly eſteemed, I will prove that ſalt is the *beginning and end of all things*. In the Creation of the World ſalt was firſt made, from which afterwards the four Elements proceeded, ſo that by the Philoſophers ſalt is called *The Center of the Elements concentrated*; and by the ſame reaſon, by which it was the firſt, it ſtill is, and remaineth the laſt. All things ariſe from ſalt, and after they are deſtroyed by death, do again return into the ſame. *Et ſal theſauros grandes & poſſidet ignis. In Salt and Fire are contained great Treaſures.* Salt is Fire, and Fire is Salt, and they contain in themſelves a third thing, to wit, an hidden Spirit. When the moſt Omnipotent Creator had pronounced the word *Fiat*, and had created ſalt, the *Chaos* was afterwards parted or divided into four portions, and divers ſeats or places aſſigned to each, and alſo each had its Name given to it; which being done, the Elements took their beginning, inſtituting in themſelves mutual actions, and ordaining their generations. The moſt pure and ſubtile part became the Firmament, and gave the Sun, Moon, and Stars the more groſs and heavy, joined together into a maſs of Earth, and like fæces or dreggs, occupied the loweſt place. The watery and airy Portions encompaſs the Terrene Globe.

Now when the ſuperiour or fiery part, with the Stars operate and immit their powers upon the lower part or Sea, the Water is rendered pregnant, or as it were with young, and generateth Salt without intermiſſion. But leſt this continual generation of Salt, effected by the operation of Fire, ſhould be produced in the Sea or Water only, and the reſt of the Elements ſhould be idle; God hath alſo given to each of theſe its proper Gift, *viz.* to the Air, that it ſhould receive the ſeed ſent from the Stars, and communicate it to the Water; to the Water, that it ſhould diſtribute the received ſeed through the paſſages and clefts of the Earth, that ſo by this reaſon Minerals and Metals of every kind might as well be produced within the earth, as all kinds of Herbs, Fruits, and Trees, without it in the ſuperficies, ſerving for the nutriment, encreaſe and multiplication of Animals. This thing is witneſſed by daily Experience; for if the Sea ſhould not diſperſe its ſalt through the earth, ſo many excellent Minerals could in no wiſe exiſt in its bowels, neither in its ſuperficies could not ſo many and ſo great Trees nor ſo various and manifold Herbs, and ſuch divers ſorts of Graſs, be brought forth. For as much Salt as Vegetables draw to the external ſuperficies, and Minerals to the inward bowels, ſo much the Sea or Salt-water reſtoreth to them, ſo that the Earth may never labour under a want of its ſalt, of which the Indigent are to be rendered partakers. For if the Sea ſhould not provide for the Globe of the Earth a continual nouriſhment, the Earth it ſelf being deſtitute of the ſame, would not be able to afford a due aliment and encreaſe to other things. For a Cheſt which is continually exhauſted by taking out, and nothing put in, at length being empty, retaineth nothing. But becauſe the wiſe Providence of God hath appointed that the Terene Globe, without intermition, ſhould be fertile in bringing forth good Fruit for the nouriſhment of Mankind, neceſſity requireth that a perpetual aliment ſhould be afforded to the Earth, from the Sea, for which end the Stars never ceaſe in animating the Air and Water with their influences, that the Elements, by mutual helps, might ſuccour one another, and no ſtop or hinderance ſhould be put to the courſe of Nature. For if one Element only reſt, and ceaſe to perform its office, the other would alſo ceaſe from working, and fall into ſuch a Reſt.

Except the Stars ſhould generate Salt, and the Water receiving it, ſhould diſperſe it through the Earth, by what means ſhould it come to paſs, that any thing ſhould be brought forth, grow, and encreaſe? The whole Orb of the Earth would at length grow dry, and periſh, which nevertheleſs by the perpetual acceſs of ſalt, never intermitteth, but is encreaſed and ſuſtained.

There is no Stone which can want Salt, which argueth Salt to be its beginning and nouriſhment, and that thoſe Mountains, in which is a great quantity of a ſaline nutriment, do grow and encreaſe thereby, as receiving it in a plentiful manner from the neareſt ſea. This is no where more eaſily to be found, than in thoſe places in which the Mountainous Coaſts are very fertile and fruitful in Metals, for the acquiring of which the Rocks are to be digged through with holes in height or depth, affording a commodious going in and out. But when in places of this ſort all the Metals are dug out, or the metallick Veins are broken off (& loſt) from the tranſverſe Walls, or ſides, or alſo from the ſliding or dropping Waters, they are rendered unprofitable; and for that reaſon ſuch a Mountain is to be deſerted; nevertheleſs it doth not ceaſe to grow, and indeed as well the Stones as the Metals, having their ſeat in it. Whence it is wont to happen, that thoſe holes or paſſages abovementioned, through which one might have walked upright, in a long proceſs of time, do ſo grow together, and become ſo little and ſtrait, that he who deſires to go into the moſt intimate Penetrals, muſt ſtoop even to the ground. This is to be underſtood of ſuch ſorts of Stones as abound with ſalt, for places not paſſable by ſalt, are found to be fit neither for the generation of Stones, or of other things, as alſo thoſe which refuſe to admit Water: For Water is the Vehicle which carrieth Salt through the whole Globe of the Earth, and by it diſperſeth its nouriſhment, as the Air is the Receptacle of the Aſtral ſeed, of which the Water is to be rendered a partaker.

Thoſe things which I here write, altho' they may ſeem to be vile, and of ſmall moment, nevertheleſs they are moſt true, and cannot be rendered more clearly and truly by any man. And altho' the ſame might be propoſed by a more prolix deſcription, yet there is no need of that prolixity, when all things may be delivered more compendiouſly.

Nevertheleſs, that I may as yet confirm by a clearer demonſtration, that the Life of the whole World is Salt, and that of it all things take their original, I will bring for witneſs the Univerſal Opinion of all the Philoſophers unanimouſly aſſerting, That all things being reduced into their firſt matter, return into ſalt; from which Saying it followeth, that they have taken their beginning from Salt; and this Argument can be refelled by no man.

Now ſome man may ſay, How ſhall I be ſure of this? or, By what reaſon may all things be reduced to their firſt matter? To obtain the knowledge of thoſe Labours and Operations, it behoveth thee by experience to go to clear Philoſophers and Chymiſts, becauſe I intend not at the preſent to treat of operations of this kind. Every Countryman taketh notice of the Work of Nature, who ſeeth daily, that every Herb, every Wood, every Man, and every Animal, after that

it hath attained its end by Death, passeth by putrefaction into a sulphureous salt, hidden indeed in a putrefied Dung, but unknown to him, although with the same he dungeth his poor and barren Land wanting salt, and rendereth it fat and fertile. As long as the Herb, Wood, and Animal enjoyeth its own vital Air, it doth not dismiss its salt by which it is preserved, but superfluous fæces. But as soon as death hath taken away the vital Air, and dissolved the *Vinculum* or Bond, the rest of the parts can no longer subsist, every one going out to that place whence it proceeded. Rain dissolveth the salt, and by all Rivers carrieth it back to its Mother the Ocean, from whence it had come forth; the spirit is attracted by the stars; the earthy matter remaineth in the Earth, to which it oweth its Rise. For the Fruits of the Earth do not obtain this universal nourishment from the Sea, by right of Inheritance, but they take it only as a profitable Aliment, given them to enjoy as long as they live; after death, the universal Mother, to wit, the Sea, taketh it back, and bestoweth it upon others which she hath accommodated to it. If thou hast a mind to make trial of this thing by another way, burn any Herb, Wood, Stone, or Animal in the Fire, for so whatsoever is spiritual flieth into the air, and the salt will remain in the ashes, to be extracted with water, and separated from the dead earth. Salt therefore in all things is *the beginning and the end*, and most worthy, which is accurately to be noted, inasmuch as it is that which containeth great mysteries and secrets.

He that is ignorant of these things, deserveth not to be called a Philosopher, but rather a proud Ass, knowing and maintaining nothing but slanders and calumnies, with which, to conceal his own ignorance, he cavilleth at the Truth, and bringeth it into contempt. The Ancients were not ignorant of the excellent Virtues hidden in salt, so that many of the Philosophers have thought that something Divine was hidden in salt, and therefore they have expresly written, that the knowledge of God can be drawn from nothing more clearly than from Fire and Salt. Therefore they at all times adjoined to their Sacrifices and Altars Fire and Salt, as Symbols of God and Immortality. They were afraid to touch any Fire or any Salt with unwashen hands, lest they should draw the Divine Wrath upon themselves, if they should defile those most noble Creatures with impure hands: They swore by Salt and Fire, not using any greater Oath; and in any matter to be searched out by a diligent examination, they proposed to the interrogated Salt and Bread, that so he should witness the truth; whence perhaps came that Proverb, *Salem & Mensam, non violabis.* Our Saviour Christ is called *The Salt of Wisdom.* In holy Baptism, the Priest putting a little Salt to the mouth of the Infant, is wont to add these words, *Receive the Salt of Wisdom*; which custom, with the burning of Wax-Candles, alwaies adjoined in Baptism, that Christ might be remembred to be the light of the world, is now in many places abrogated by Innovations; so that it is to be feared, if the world should continue long, the matter would come to that pass, that it would also be prohibited to name the very Name of Christ. For truly it is already come to that boldness, as to prohibit the Celebration of our Saviour's Nativity, under the injunction of a certain penalty. O the miserable condition of *Christendom* at this day!

Christ himself calleth his Disciples *the Light of the World*, and *the Salt of the Earth*, *Luk.* 19. 9. Salt and Water, by Faith and Baptism unite God and Man: so also fixed Gold and combustible sulphur are copulated by the help of salt and water, which thing, although it may seem impossible, nevertheless it is very well known to true Chymists; for when they are minded to separate melted Gold and Silver, they are wont to inject a little sulphur, which interceding between both, like a Partition wall, disjoineth the gold and silver, by reason of the enmity which it hath with the gold, disagreeing with the sulphur by so great an antipathy, that it can at no time suffer it. Nevertheless salt and water take away this Enmity, reducing both into favour with each other, no otherwise than Christ, the Salt of Wisdom, and the Divine Light, as a Mediator, reconcileth the filthy sinner to God.

Christ saith in certain places, *salt is good*, or *it is a good thing*: When the Earth wanteth salt, being dead, it bringeth forth no Fruit; the same is Dung, when destitute of salt.

Here I have the eternal Truth Himself my Witness, reproving my impious *Farnnerian* Enemies, who endeavour to refel my *Miraculum Mundi* with their false Calumnies and Cavils. In which Book I have demonstrated by most manifest Arguments, that the Earth is rendered fat and fertile, not by Dung, but the Salt which is in it. These Calumniators being convicted by the true testimony of this witness of their shameful Lyes, must without doubt bridle their venomous Tongues, and for time to come, cease to tear me with their savage Teeth. *The Truth may indeed be pressed, but never quite born down*; for GOD at length will bring it to light, although for some time it may be pressed and perplexed by Satan the Father of Lyes, and its capital enemy.

In another place Christ saith, *None is good but God.* Also in another place, *Salt is good.* This is truly a most efficacious testimony, and famous praise, by which Salt is extolled.

Salt is also taken for Understanding and Wisdom, and for that reason a rude and ignorant man is called dull and insipid, and in the same sence a speech is said to be unsavory or witless, as if having nothing of salt, it were unhandsome and stupid; whence the vulgar Proverbs are wont to say, How heavy and insipid is this man? How dully and unsavourily doth he speak? Also that usual saying, *That which relisheth, nourisheth*; and so on the contrary, where there is no savour, there is also no nourishment. There is nothing can be brought forth in the nature of things, without the *medium* of salt; yea, Man himself is not born without the Sun, Man, and Salt. Therefore a certain Philosopher saith very appositely, *The vigour of salt is fiery, and of a Celestial Original.* The sun and salt are the Parents of all things, which procreate all things, and without which nothing is procreated; Bread and Flesh, which are seasoned with salt, afford more Virtues than all other Foods which are not salted. Salt being added to Wine in its fermentation, rendereth it stronger and sweeter.

NB. That nevertheless the salt here spoken of ought not to be common and vulgar salt, which doth not give a good relish to Wine. Empty Hogsheads may indeed be purged by common salt dissolved in warm water, so that every ill taste or smell may be drawn out, and the wine preserved in its vigour. Moreover salt exceedeth wine in corroborating the heart of Man, and is therefore in many things to be preferred before it. And he that knoweth how to conjoin true salt with wine, and in the same to dissolve the Sun of the earth,

(which

(which is Gold) may from it extract a Royal Medicine, as is shewn in other places of my Writings.

For any man of understanding may easily see, that if the noble virtues of these three things Corroborating the heart, to wit, Gold, Wine, and Salt shall be joined together, what a noble Medicine will proceed from such a Conjunction. *Paracelsus* hath not without reason determined with the Philosophers, that no true *Aurum Potabile*, can be prepared without Salt. If there were no Salt in the Earth, neither Herbs, nor Grass would be brought forth for the food of Animals, nor the life of Man sustained. All Animals also do therefore desire the Salt of fruitfulness, concerning which, you shall find more, in the description of my Green Liquor. The Combination of Gold and true Salt, restoreth decaying seeds to their pristine fruitfulness, and also restoreth to half dead and barren Trees, their faded greenness, if that Medicine be applied to their Roots. On the contrary, common salt before preparation, is hurtful to Vegetables, and killeth them by its Corosion, but after preparation it exceedeth dung in fatening them: Nevertheless, there are some Vegetables, which are able to bear the Corosive power of salt, *viz.* those which grow spontaneously upon the Sea-shore, as the Herb *Kaly*, of which the Ancients prepared their *Sal Alkali*; for being burnt it leaveth a very sharp salt. Also all those Fruits which are of a sowre, or bitter Taste, or have sowre, or bitter Rinds, do equally bear the Corrosion of salt, as Olives, Limons, Oranges, Lentisk, and the Palm, which also rejoiceth in common salt; as on the contrary, the Vine, Grain, and Fruit-Trees are delighted with the sweeter Sun; concerning which, more hereafter.

I remember to have read, that in the Island *Sardinia*, near the City *Catar*, so great a quantity of salt hath been digged up, that it was given to the Inhabitants for their necessary uses, for nothing, and the rest was sold to Foreign Sailors and Merchants to be Exported. And the Countreymen so abounding with salt, gave it so largely to their Cattel, that they wonderfully abounded in Milk, whence they made most excellent Cheese, which was sold all *Europe* over, but whether it be that which we call *Parmasan*, I know not. But it appears, that so great a plenty of Milk and Cheese proceeded from salt only, which is also very agreeable to the Truth. The same Author (whose Name is *Bernhardus Comesius*) also taketh notice, that in the *West-Indies* there is a City standing in a sandy and barren place, abounding with a great multitude of Fishes, which are there taken. And the Inhabitants cast the Heads of the Fishes into a pit, or hole in the Earth, sprinkling them well with salt, and after a certain time taking them out, they plant or sow in every Head, a Corn of some Grain, and cast the same into the sandy Earth, and those Grains growing, do again bring forth an hundred fold. That this might be so done, is not dissonant to the truth, seeing that the Heads of the Fishes preserve the salt in the Earth, that it cannot be washed away with the Rain, nor the Grain be deprived of its Alimentary Juice. But such ways of sowing Grain, are tedious and laborious. I have a far other preparation of salt, which without much cost and labour, rendereth a great quantity of it fit to make sandy ground fruitful, and yet is not washed away by the Rain, salt is to be rendered sulphureous, that it may generally and universally nourish.

NB. Here some may say, if a sulphurous salt be the effecter of Fertility, how is it that the *Mare Mortuum*, or dead Sea of *Sodom*, abounding with sulphur and salt, doth neither bring forth Fish, nor contribute any thing to fruitfulness? I Answer, because the said Sea is full of bitter and Vitriolate Minerals, which by their Venom are hurtful to all Fish, and Vegetables, and also Fishes themselves cannot live in Waters which are too salt, which is to be observed. For every thing that is too much, is turned into a Vice. But what Fertility salt imparteth to natural things, may be learned by Fish, many thousands of small Fishes at once, proceeding from the Spawn of one Fish, which is not granted to Birds and Animals. It was not in vain that God would have King *Pharaoh* Dream first of seven fat Kine, and afterwards of other seven lean ones, descending from the Earth into the Sea, thereby signifying fruitfulness to draw its Original from the Sea. *Joseph* being illuminated by God, both by Divine and Natural light, understood this, and interpreted the Dream: To wit, that it was in the power of salt. Salt is insignized with the Title of the Fountain of Philosophers. *Hesiod*, *Homer*, *Plato*, *Pythagoras*, and other Philosophers, deliver that of all things, salt is most affine or near to God. I assert, that by the help of salt, many become the chosen Sons of God. If the Earth should want salt, there would not thence proceed any fruits affording necessary Aliment for Men, whence Mankind would perish, not being able to draw its Nourishment and Multiplication from the Air, but is constrained to take it from the Earth. Salt becometh Milk, Honey, Sugar, Wine, Bread, Flesh, and passeth into all those things which we want. Salt is all in all things, the beginning and the end of all things which God hath created.

But some man may here ask; whether therefore do all things arise from salt? Whether it be necessary that salt in the seeds of Herbs, should be changed into Herbs, in the seeds of Animals, into Animals, and in the seed of Metals, into Metals? Whether such degrees may not be sooner passed by the quicker progress of Art, correcting the more slow advance of nature? I answer; yea, it may be done, it is possible for Art to bring salt to its highest perfection, by a far more compendious way, than nature can. But by what way that may be done, is not proper to shew in this place. This I would have you to know, that wonderful Generations do arise from the Sun or Fire, united with salt, which otherwise would not appear. For Example, in the Months of *June*, *July*, and *August*, fill a wooden vessel with common water, and expose it to the Rays of the Sun, that it may night and day receive the Astral Influences, and be dried up, being dried up fill it again with more water, and so keep the Vessel always full, in which at length, from the salt contained in the water, there will be brought forth Vermin of all sorts without any seed; such as is accustomed to be brought forth in other putrid Waters, as Frogs, Toads, and Serpents.

NB. That the Vessel must be made of Wood, not of Metal, least the water should suck in a Vitriolate Juice which is adverse to the life of Animals: Also beware that nothing of Iron or Copper fall into the Vessel, and corrupt the Operation. Or fill the same Vessel with sand, and moisten it with water, then subject it to the Sun beams, and when it is dry, moisten it again, repeating the Humectations, and by this Operation you shall see various and unknown Herbs to come forth and be produced, without any seed,

as is manifeſt from other places of my Writings.

Gold the moſt conſtant of all Metallick Bodies, and as it were invincible, feareth not the violent aſſaults of any other Element, and ſubſiſteth in the fire it ſelf with ſo great conſtancy, as not to loſe any thing of its weight, although for many years it ſhould be kept in a continual torture of Fire. Nevertheleſs, ſalt draweth from it its Anima, and taketh away that fair red colour, and that conſtancy, whereby it was wont to reſiſt the fire, ſo that it obtaineth the colour of Lead, and the brittleneſs and fugacity of Antimony. A thing exceeding the credit and belief of the unskilful, although experience it ſelf witneſſeth it to be true. Hence it appeareth, that there is a greater power in Salt than in all the Elements and Elementary things, and therefore we deem it to be juſtly called the Center of the Elements concentrated. Gold eludeth the moſt potent and ſubtil powers of the fire, which nothing can reſiſt, and yet is overcome by Salt, which by a ſtupendious Miracle of Art, attracteth its moſt Noble Part, *viz.* its Anima being ſeparated from its more groſs and earthy parts. How noble a thing the Anima of Gold is, any Man may eaſily imagine, and without doubt may ſee, that it hath the chief place in Medicine. This is like to what *Sendivogius* hath written concerning his *Chalybs* ſpoiling Gold of its Anima, but although ſuch an extraction hath divers times ſucceeded to me according to my wiſh, that the Anima being extracted, the body of the Gold hath been left brittle, fugacious, and black; yet I confeſs, that the ſame Operation hath not always anſwered my deſire; as if God would not permit ſuch a ſecret to be commonly known. Therefore I am well content with leſſer things, and have ſhewed theſe things only to the end that I might manifeſt the Powers of Salt, and teach them to others: Nevertheleſs, I would not have any Man perſwade himſelf, that this Royal Medicine may be extorted from Gold, by the help of common Culinary ſalt; for to this matter another Salt is required, to be prepared by Fire and Art. But of this Artificial Concentration of Gold, the fourth part of *the Proſperity of* Germany, which God willing, ſhall ſhortly be publiſhed, will ſhew more at large. More indeed might be ſaid concerning Salt, which we leave for another time and place, ſeeing that thoſe things which have hitherto been ſpoken, ſeem to me to be ſufficient.

Therefore I conclude, and affirm Salt to be a help to all things, and on the contrary, to want the help of nothing.

Here ſome Man may ask me and ſay, Of what Salt doſt thou ſpeak, for there are many ſorts of Salt? I ſpeak of the Univerſal Salt, known to all Men, which is boiled up from Sea water, or Salt Springs, or digged out of Pits in Mountains or other places, and put to common and familiar uſes. This known Salt, I here call (and not injuriouſly) the Univerſal Treaſure, and general Riches: For it adminiſtreth Nouriſhment to the whole World, that not only the Beaſts of the Earth, Fiſhes in the Waters, and Birds in the Air, but alſo all Metals in the Bowels of the Earth may ſubſiſt for the uſe of Man, to ſay nothing of the great and Univerſal Medicine, which may be obtained by its benefit. Of right therefore it meriteth the Title of the Univerſal Treaſure of the World, ſeeing that nothing can be found, which doth not owe its Original to Salt. But that one ſalt is purer, better, and more precious than another, I do not deny, that the Original and beginning of all ſalts, is one and the ſame, and that their difference happeneth only from Accidents. For ſo long as ſalt is pure, and mixed with nothing, as it is made by the Sun in the water, it is one and the ſame, and poſſeſſeth one and the ſame Taſte, and the ſame Virtues: But as ſoon as it is mixed with other things, or changed by the fire, its firſt nature being laid aſide, it becometh either better or worſe. This is taught by Wood and Stones, reduced by the fire into Coals or Aſhes, in which part of the ſalt flieth away with the ſmoak, the reſt remaineth in the Aſhes, ſhewing a far other nature from that which it had before it was deſtroyed by the violence of fire. Indeed, by the Operation of the fire, all ſalts obtain a fiery and ſulphureous nature, and therefore neceſſarily aſſume another Property, which being well known needs no diſpute. The moſt known, moſt ſimple and void of all mixture is that ſalt which is elicited from Sea-water, or ſalt Fountains, or Mountainous Caverns. Vitriol and Alum, are indeed alſo ſalts, but infected with an Earthy and Mineral Property, and therefore unworthy of the name of ſimple ſalts.

Salt-peter is alſo numbred among ſalt, but it cannot be ſaid to be a ſimple ſalt, ſuch as the Sun operateth. For it is either digged out of the Earth, being generated of the Urine of Men and Beaſts, and elicited by water, and by decoction ſhooteth into Chriſtals, and ſeparateth from other Salts; or it is taken from the Mortar of old walls made with Lime, or it is taken out of Mountains and Limy or Chalky Hills, by the help of water; or it is made by Art of common Salt, Wood, or Lime-ſtones. But which way ſoever it cometh, it is of one and the ſame nature, and burneth with a flame, as my Treatiſe of *the Proſperity of* Germany, deſcribeth more at large. Salts extracted from the Aſhes of burnt wood, do again poſſeſs another nature and other Properties, and are called by the Name of Alkalies. Alſo there is another Salt prepared from Urine, common ſalt, Soot, and Bulls blood, known by the Name of Sal Armoniack, and is uſed inſtead of another Sal Armoniack, which was digged up in certain Mountains, and brought to us, which now ceaſeth to come.

Theſe are the moſt noted ſalts, and ſerve for very many uſes, as Sea ſalt, Fountain ſalt, Mountain ſalt, which is alſo called Sal-Gem, which are uſed in the Kitchin for ſeaſoning of food, for the ſalting of Fleſh and Fiſh to preſerve them ſome time from Corruption. The uſe of Vitriol is chiefly in Dye-houſes, for dying Silks and Cloth black, as alſo in Apothecaries ſhops, where it ſerveth for the preparing of Medicines: Concerning theſe things, ſee more in the firſt part of my Furnaces.

Alum is profitable for Dyers, Phyſicians, and other Artificers. Of Salt-petre is made that deviliſh thing call'd Gun-powder. Beſides this it is profitable for the making of many excellent Medicines, and for the Chymical Emendation of Metals, and the inventing and utility of many Mechanical Arts, as appears by the ſecond part of my Chymical Furnaces, and the ſecond part of my *Pharmacopœia Spagyrica*, alſo *Miraculum Mundi*, its Defence, and Continuation, as alſo the four parts of *the Proſperity of* Germany.

Of fixed ſalts, thoſe which Wood Aſhes afford, have their uſe in Medicine and Alchymy, but they are more frequently uſed in Dying of Cloth, and making Soap. Sal Armoniack is uſed in Medicine, Alchymy, and other Arts, but all thoſe ſalts are ſo well known, that

that we ſhall ſuperſede any farther Declaration of them. Thoſe therefore which we have here mentioned, are Salts, which hitherto, by a long Progreſs of time, and continual experience, have made manifeſt their own Virtues and Powers. Among thoſe, the Culinary or Kitchin-ſalt is moſt eminent in nobleneſs, excellency and neceſſity, inaſmuch as it is that from which all the reſt do ariſe, as alſo by the help of Art may be made, as my Writings every where teach; and is the *Baſis* of all other Salts, whether known or unknown; which thing is moſt true, and will alwaies remain to be true: For by a very eaſie buſineſs, by fire and the addition of any metallick ſulphur, it is turned into Alum or Vitriol; by the help of Sulphur, Fire and Air into a burning Salt-petre; and by the help of a certain peculiar ſtrong fire, it paſſeth into an alkaliſate ſalt, and being deprived of its ſharpneſs, becometh very profitable for the dunging and fattening of Fields, and ſandy and barren Land.

Moreover, the common Kitchin-ſalt ſuffereth it ſelf to be purged and cleanſed by its own ſpirit, and by that purgation and cleanſing acquireth a clearer and whiter colour, pleaſanter taſte, and more excellent powers and virtues for the ſeaſoning of Food, and ſalting of Fleſh and Fiſh, for it becomes ſweet, clear, and pellucid like Cryſtal, and ſhooteth into ſquare Cryſtals like Dice, reduced into Figures ſo perfect, that they cannot be more perfectly formed by any Inſtrument.

Hence no man will deny, but that ſuch a cleanſed ſalt is more conducible to health than that which is groſs and impure.

I admire at our ſupine negligence, who are ſo little ſollicitous about our own health. We daily ſee with our eyes, that no man can want the uſe of ſalt, that it is ſubſervient to the health of man, and alſo neceſſary for Cattel. And if when groſs, as it comes from the pans, and as yet loaded with many fæces, it doth much good; without doubt it would do much more, if it were cleanſed and prepared by an artificial preparation. It is the intereſt of great men (if not of others) who have the government of many Subjects, to preſerve a firm health of Body, and to cauſe ſuch ſalt to be prepared for the uſe of their Tables. The Coſt required for the doing this is ſmall, by which the ſalt is made ſo ſweet, that by its pleaſantneſs it will invite every one to covet it. It doth not provoke thirſt after the manner of common ſalt; inaſmuch as it wanteth thoſe earthy fæces which yet adhere to common ſalt, but quencheth it, allayeth hunger, corroborateth the heart, as alſo the ſtomach, brain, and all the members of the body, admitteth no putrefaction in the body, preſerveth it againſt all Diſeaſes, and excelleth with wonderful Virtues, to which that groſs ſalt is in no wiſe to be compared. Truly it is a great Treaſure and high Gift of God, by which Mankind is ſuſtained, nouriſhed, corroborated, and encreaſed, for which great thanks are to be given to God.

Beſides the commemorated Purgation of ſalt, inverſion and commutation of common Salt into Alum, Vitriol, Salt-petre, Alkalies, and the like ſalts mentioned in my Writings, there is yet a more ſecret purgation and emendation of the ſame common ſalt, exalting it into a more noble and far more excellent ſtate, concerning which I do not remember that I have read any thing in any Author, except in *Paracelſus*, who maketh mention of it in few words, in the Chapter of the Virtues of common ſalt, ſaying, The Virtues of Salt conſiſt in its preparation; crude ſalt only doth this, that it preſerveth the goodneſs of Fleſh and Fiſh. But if it ſhall become a *Sal Enixum*, it keepeth all things in their ſtate, ſafe and ſound, for an incredible ſpace of time, it turneth Wood into Stone, as alſo duſt and ſand; the Leaves of Trees remain green in it; whatſoever is beſprinkled with this ſalt, refuſeth all mutation. It preſerveth like a Balſam, and effecteth more, becauſe in proceſs of time it coagulateth all things.

Theſe are the words of that incomparable Phyſician and Philoſopher, concerning his *Sal Enixum*, but what this name ſignifies I know not, but I call it *Sal Mirabile*. He attributeth this to it, that it is able to preſerve all things ſafe and ſound for an incredible ſpace of time: Nor doth he erre from the Truth, for he that can prepare ſuch a ſalt, may not only perform that, but alſo much more.

The manner of preparing it is well known to me, becauſe I have often made it, and found in it things incredible: Whether my preparation agrees with the preparation of *Paracelſus* or not, nevertheleſs all things which *Paracelſus* aſcribeth to his *Sal Enixum*, and far more, I do in no wiſe doubt to attribute to my *Sal Mirabile*; neither is it any matter to me or others, whether I uſe or not uſe the ſame preparation that *Paracelſus* did, provided my ſalt performeth the ſame things which I affirm it can perform. Alſo I would not give the ſame name to my ſalt, which *Paracelſus* did to his, leſt Calumniators and Cavillers ſhould, out of envy and hatred, take occaſion thence of calumniating me, and ſaying, That my ſalt is not the *Sal Enixum* of *Paracelſus*, which hath already happened to me, when I gave the name *Alkaheſt* to my Univerſal *Menſtruum*: For the proud Sophiſters and ignorant haters of me, in their debauched Cups, have taken occaſion to cry out againſt me with loud vociferations, ſaying, *The Alkaheſt of* Glauber *is not the Liquor Alkaheſt of* Paracelſus *and* Helmont; when nevertheleſs mine exceedeth the Liquor of *Paracelſus* and *Helmont* by many degrees. For mine is at hand, and to be ſeen, by help of which I prepare my *Aurum Potabile*, tinging Mercury into pure Gold. That *Liquor* of *Paracelſus* and *Helmont* is plainly inviſible, and can be prepared or procured by none: *A ſmall Bird in the hand is better than many thouſands of great birds that flie in the Air, & can neither be ſeen nor taken.* And this is the reaſon why I would not call my Salt by the ſame name, becauſe I would not afford my haters, the wonderful Brethren of Ignorance, new matter of flouting, ſcoffing, and defaming me; although I well know, that my *Sal Mirabile* doth not in the leaſt come behind the *Sal Enixum* of *Paracelſus* in Virtue, and perhaps alſo much to exceed it; which in the following Narration I have determined to make manifeſt.

As *Paracelſus* delivereth, that his *Sal Enixum* defendeth all things which are put into it from Corruption, for an incredible ſpace of time, and at length, by an admirable Metamorphoſis, tranſmuteth them into ſtone; my *Sal Mirabile* doth not only perform that, but effecteth ten times more.

But before I enter upon the deſcription of the Virtues lying hid in my *Sal Mirabile*, I thing it neceſſary to indicate, That Salts of this ſort do every where occur in the Earth, and being diſſolved by Water, are carried to the ſuperficies, and ſuch Fountains are enumerated by *Gerogius Agricola*, ſhewing in what places they may be found, and that all things put into them are in a ſhort time converted into a ſtony matter; which other Writers alſo teſtifie, and eſpecially *Celſus* in his Book *De rebus metallicis*. Nor is there any reaſon why any man ſhould doubt it, ſeeing that Fountains

tains of this ſort offer themſelves in our *Germany*, although few judge them to be of any moment. There is ſuch a one in a certain place of *Helvetia*, which in a certain ſpace of time converteth all Wood caſt into it wholly into Stone. And the Inhabitants of that place do very often make trial of the thing by Experiments, by cutting ſome Wood, and reducing it to the figure of a Whetſtone, and putting it into the water of the ſaid Fountain, in which, being converted into a ſtone, they afterwards uſe for the whetting of Sythes, and other the like Inſtruments. I my ſelf have ſeen whetſtones of this ſort, and had them in my hands, from the figure of which it ſufficiently appeareth, that they were firſt wood, and have been converted into ſtone by ſo wonderful a Metamorphoſis. The matter is out of all doubt, and there are many Fountains obvious in other places, of the ſame Nature. I have not ſeen that in *Helvetia*, but I have ſeen the Infant of *Baſil* with Dr. *Exius*, who is yet living. To this Infant, in a very large Glaſs, ſtanding upon a low ſettle, the Signior *Exius* had poured a certain peculiar Liquor, which had preſerved it plainly uncorrupted and unhurt, to that time that it was ſhewed to me. And they told me, that the Infant was by the Liquor changed into ſtone; but I, ſeeing I did not touch or handle it, cannot affirm that for certain; but I ſaw it ſitting with a full body, as if it had been but new born, ſince which time it is now above Twenty years, and then it had been Ten or Fifteen years in that Water, in which alſo it yet remains, as I have lately heard. But no man knoweth what water that was which the Signior *Exius* had put to that Infant, whether he took it from a Fountain turning wood into ſtone, or whether he made it by Art. There is a Fountain of the like nature and property in *Auſtria* at *Neapolis Viennenſis*, a fenced City about eight miles diſtant from *Vienna*; I being a young man, long time ſince travelling towards *Vienna*, fell into a burning Feaver, known by the name of *The Hungarian Diſeaſe*, which ſeldom any ſtranger eſcapes, and having ſomewhat recovered my former health, came to the ſaid *Neapolis*, and ſuffering a Relapſe, was conſtrained to ſtay there. And the Diſeaſe had ſo debilitated the Appetite of my ſtomach, that it neither deſir'd nor digeſted any Food. The Inhabitants adviſed me to go to a Well of almoſt an hours Journey from the City, ſituated near a certain Vineyard, and to drink of the Water to recover my loſt Appetite. Following their Counſel, I took a great piece of Bread with me to the Well, nevertheleſs I gave but little credit to their words, who told me, that I would eat all that piece. Coming to the Well, I eat the crumb of the Bread ſopped in the water, and it reliſhed to me very pleaſantly, who before at home loathed the greateſt Dainties. I took up the ſame water with my hollow cruſt of Bread, and drank it, which ſo excited my Appetite to eat, that at length I alſo eat up my Cup, which I had made of my Bread; returning home much better and ſtronger, I declared to the Inhabitants the event, ſucceeding according to my wiſh, who affirmed to me, that if I would continue the uſe of that water, the faculties of my ſtomach would be throughly confirmed. I asked them what kind of water that was? They anſwered. that it was water of Salt-petre, which I believed, being then unskilful in ſuch things, but afterwards I found the contrary: For it could not be the water of Salt-petre, ſeeing that in no wiſe conduceth to the ſtomach, but rather occaſioneth nauſeouſneſs and loathing. It might be, that the water of the ſaid Fountain being evaporated to a Cuticle, might ſhoot into Cryſtals like to Salt-petre, but notwithſtanding was not true Salt-petre, as wanting all burning, and not taking flame, which they might eaſily have found, if putting a little of that ſalt upon a burning Coal, they had tried it after the accuſtomed manner of trying Salt-petre: For now it is certainly evident to me, that that Fountain contained that Salt which *Paracelſus* called *Sal Enixum*, and I *Sal Mirabile*; and alſo that it is the nature of that to ſhoot into long Cryſtals, and yet not to conceive flame. That *Well* is encloſed with wood, in which many water-Mice have their Habitation, which preſently will ſeize and ſwallow any crumbs of Bread caſt into the water. I asked why a *Well* of ſo great moment was encloſed and fenced with wood, and not with ſtone? They anſwered, That could not be done without damage, for the wood being taken away, which had now paſſed into a ſtony nature, it would come to paſs, that the ſand falling into the well, would choak it up. The wood which did not touch the water was now rotten, as I then very accurately obſerved, being a young man of 21 years of age.

Staying in the ſame City the following winter, I found, that the Moors or Marſhes about the ſame, which rendered it ſo ſtrong, were never frozen into Ice by the cold of the winter; which is an Argument that a certain peculiar ſalt is latent in that water; which is the reaſon that the Planks or Piles fixed into the Marſhy ground, upon which many, yea, the greateſt part of the Houſes of that City, do ſtand, or are ſet, in a long progreſs of time, are changed into meer ſtones, and afford a firm Foundation to the Houſes built upon them.

From all thoſe indications I have hitherto conjectured, that all the Springs about that City abound with that ſort of ſalt which *Paracelſus* calleth *Enixum*, ſeeing that in the ſaid Marſhes I have ſeen the Graſs green all winter, which is a certain indication of this kind of ſalt there exiſting. The watery Animals which are in the Fountain and Marſhes near to the City, confirm the conjecture, among which the number of the water-Mice is not ſmall, which cannot live in all waters; and the ſhell-Fiſh, or Tortoiſes, which are every where in an incredible quantity, in the water flowing about the City, and watering the Marſhes and Gardens, although wont to be eſteemed by great men among Delicacies, are here of no account at all; and for that reaſon both the Citizens and Countrymen put two or three of thoſe ſhell-fiſhes into the veſſel in which they ſave the waſhings of their Diſhes, to give to their ſwine, ſaying, that this ſort of Animals abiding in their waſh, conduceth much to the fattening them. And from theſe things it appeareth, that water-Mice and Shell-Fiſh of this ſort, do delight in ſweet waters, tempered with a certain ſalt. Any man that hath a mind to take the ſaid Shell-Fiſh, or Tortoiſe, goeth into the Meadows or Paſtures in a morning, which are watered with this kind of water, where they wander about in the wet Graſs, ſeeking their Food; and alſo in the evening after ſun ſet, when they return again to to feed. If they perceive any body in their way, they preſently betake themſelves to the water, and in their entrance into the water, they retract their four feet, which with their head and tail (like to the heads and tails of Serpents) they hide and ſecure in their ſhell, which is ſo hard, that it can ſcarcely be broken with a ſtrong and heavy Hammer. The Inhabitants, when they will boil them, prick them with ſome ſharp Inſtrument, at the feeling of which, they again put their head and tail out of the ſhell, which they preſently

ſently cut off with a knife. The body being boiled in water, the ſhell openeth of its own accord, out of which the Fiſh being taken, is purged, and prepared with Butter, Wine, and Spice, and is not much differing from Veal, nor of an ingrateful taſte, and therefore reckoned amongſt delicate Foods, by thoſe who are given to feed daintily. Truly, I am perſwaded, that Animals of this ſort are not to be uſed as Food, but are rather profitable to the health of Mankind, becauſe they abide in pure waters.

Theſe few things my Experience hath adminiſtred to me concerning theſe Waters, by which Wood is changed into Stone, yea, not Wood only, but alſo the skin and bones of Animals. I have alſo ſeen half a Loaf of Bread turned into a Stone; whence any man may conjecture, how great a fixing power is latent in the ſaid ſalt, concerning which there is yet more to be ſaid.

This Tranſmutation of Wood into Stone will put all the Brethren of Ignorance to the bluſh, who with their ridiculous Mockeries laugh at and deny the wonders of Nature of this kind, that by the operation of Art emulating Nature, a Body ſhould be ſpoiled of its fugacity, and be tranſmuted into a conſtant and incombuſtible body. All Wood being burnt by the fire, is conſumed, leaving nothing behind it except a few ſalt aſhes, which nevertheleſs being tranſmuted into a ſtone by a fixing water of this kind, retaineth its priſtine body, and cannot be conſumed by any fire. This is an infallible Argument, moſt clearly refelling thoſe Aſs-like Deriders of Art. Can theſe Belweathers be more clearly refuted by any other Argument or Teſtimony? I ſpeak theſe things, to the end that they may be brought to a more eaſie belief, and not to be amazed with ſo great admiration, when they ſhall in the following Treatiſe hear me affirm, That any ſubtile Spirit of Wine, by the help of this kind of Water, may be changed into a fixed Salt, conſtant in the Fire.

Seeing therefore it may come to paſs, that by ſuch a Tranſmutation any fugacious Spirit of Wine may paſs into a fixed and conſtant Salt, Who will deny, but that the ſame conſtancy may be afforded to fugacious Metals, by a water of this kind? But by what means ſuch an operation, which ſeems impoſſible to every man, may be effected, may be worth the while to indicate in few words, ſeeing that it happened to me caſually, not ſeeking it, and which I my ſelf at that time ſhould not have believed, although any one had ſeriouſly affirmed it to me.

The *Sal Enixum* of *Paracelſus*, or my fixed Salt, which diſſolveth all things, is endowed with that virtue and efficacy, that it diſſolveth all things by Fire; at a certain time I had diſſolved Gold with it by the dry way, and would make trial whether Spirit of Wine would take a Tincture from it or not: The diſſolution being made, I would have poured upon it a burning Spirit of Wine, but by chance I poured upon it in the Glaſs Spirit of Juniper; afterwards perceiving my errour, I ſet the Glaſs aſide, and half a year after, I found the Spirit tinged with a bloody colour, which I filtred through a brown Paper, and put the clear Tincture into a Glaſs, to ſeparate the Spirit from it by the Fire. But ſeeing that I obtained not a Spirit, but an inſipid Phlegm by evaporation, I found that that Red Salt, in a long proceſs of time, had rendered the Spirit fixed, and by a wonderful change had coagulated it into a fixed Salt. The ſame Salt afforded me another Experiment, and indeed yet worthy of greater admiration: A certain Friend gave me a glaſs of Oil of Citrons, prepared from mouldy or decaying Oranges and Citrons, by deſtillation, which Oil ſmelt muſtily, to take away which ill ſmell, I would have poured upon it Spirit of Salt, but by chance put to it my *Sal Enixum* diſſolved, and deſtilled it by fire, which indeed rendered me a clear Oil, but in ſmall quantity, and ſcarce the one half; Therefore continuing a ſtronger fire, when nothing more would deſtil, I let the fire out, the Glaſs being cold, and taken out of the ſand, I found all the reſidue of the matter turned into a black Coal, and when I had taken it out of the Glaſs, I put it upon a burning Coal, to ſee whether or no any Oil yet remained; but the matter being conſumed by the Fire, left many Aſhes, and diſcovered the fixing nature of my Salt. And ſearching more accurately into the operation, I found many wonderful things, which afterwards gave me occaſion to call that Salt by the Name of *Sal Mirabile*. Let others ſearch into the matter, by more exact Meditations, that they may be able to penetrate into it with a deeper ſight. He that cannot ſee the virtues of this Salt, is deſtitute of Eagles eyes, beholding the Rays of the Sun with an unmoved aſpect, and hath the eyes of an Owl, which can ſee ſomewhat in the dark, but is blind at Noon-day. Truly, it is a thing to be admired, that an Oil ſo combuſtible, in the ſpace of a few hours, ſhould be reduced to that ſtate, that it ſhould glow and burn in the fire like a Coal. Therefore let it not ſeem ſtrange to any man, that any Wood abounding with much combuſtible Oil, ſhould in a long progreſs of time, by the help of this Salt, be tranſmuted into a Stone. The knowledge of theſe things happened to me by chance; But who doubteth, but that the ſtudious of Art may, by a ſedulous and accurate ſearch, find out many more? Theſe are enough to the wiſe.

Now followeth the Praxis, demonſtrating the Theory, by what means this Salt is to be prepared, and to what uſes it is to be adhibited, and what wonderful and incredible things may be performed by *its* help, as well in Alchymy as in Medicine.

I. *Of the Preparation of* Sal Mirabilis.

THis my *Sal Mirabile* is prepared and ſeparated from all vulgar Salts, by the help of Art, nevertheleſs more eaſily from one than from another: For it may be elicited not only from the Salt of the Kitchin, but alſo from other ſalts, as Salt-petre, Vitriol, and Alum: Alum and Vitriol abound with many ſulphureous and mineral qualities, and therefore occaſion much difficulty and labour in their ſeparation; and Salt-petre poſſeſſeth a fugacious and burning nature. Therefore ſetting thoſe Salts aſide, we prepare our *Sal Mirabile* of that common ſalt which is uſed in Kitchins, ſeparating from it, by the help of Fire and Water, whatſoever is earthy and terrene; and the ſame being prepared, as much as in us lies, we uſe it to the Honour of God, and the profit of our Neighbor.

Of the external Figure, Colour, Taſte, and Smell of Sal Mirabilis.

THis *Sal Mirabilis* being rightly prepared, looketh like Water congealed or frozen into Ice; it appeareth like the Cryſtals of Salt-petre, which ſhoot into a long Figure; alſo it is clear and tranſparent, and being put to the Tongue, melts like Ice. It taſteth neither ſharp, nor very ſalt, but leaveth a little aſtrin-

gency upon the Tongue. Being put upon burning Coals, it doth not leap and crackle after the manner of common ſalt, neither conceiveth flame like Saltpetre, nor being red hot, ſends forth any ſmell; which gifts or endowments no other ſalt poſſeſſeth.

II. *Of the External and Internal Uſe of my* Sal Mirabilis.

IN the firſt place it is to be known, that my *Sal Mirabilis* containeth many great and hidden Virtues, inaſmuch as it is not ſo ſharp and acute as other ſalts, and therefore its internal as well as external uſe, is eaſily admitted in Medicine. Externally adhibited, it cleanſeth all freſh wounds, and open Ulcers, and healeth them; neither doth it corrode or excite pain, as other ſalts are wont to do. Within the body it exerciſeth admirable Virtues, eſpecially being aſſociated with ſuch things whoſe Virtues it encreaſeth, and which it conducteth to thoſe places to which it is neceſſary they ſhould arrive: For Salt is the Conducter and Rector both of good and evil Powers or Virtues, and carrieth them along with it ſelf, according as they ſhall be joined with it. As the nouriſhment of Vegetables and Minerals conſiſteth only in Salt, ſo alſo the nouriſhment of Animals dependeth upon the ſame. For if the Herbs, Bread, Fleſh, and all other things which we eat, ſhould be deſtitute of ſalt, they could in no wiſe ſuſtain, nouriſh, and encreaſe the Bodies of Animals, for by ſuch it would forthwith come to paſs, that they ſhould conſume and die: Therefore Food alſo nouriſheth, as it is well and in due manner ſeaſoned with ſalt; for a thing that hath no reliſh, is unfit for nouriſhment, according to the common Proverb, *Quod ſapit, nutrit*; *And that which hath no taſte, doth alſo not nouriſh.* Therefore the Omnipotent GOD hath given ſalt to all His Creatures, by which they are nouriſhed and ſuſtained; ſo that there would have been no need of ſalting of Foods with ſalt, appointed for the uſe of Man, had not Sin and the Curſe debilitated and corrupted all things, ſeeing that they were endowed with their own ſalt by Nature: Therefore for the ſuccouring of Nature, thoſe things which contain little ſalt, are to be ſalted with common and vulgar Salt, which is appointed by God for this end, that it might afford nouriſhment to the humane Body, corroborate and ſtrengthen it, as we ſee that Bread, Fleſh, and all Herbs or Sallets, may be indeed eaten without ſalt, but not to afford ſo much nouriſhment: For it is commonly known, that Fleſh, Fiſh, and Sallets being ſalted, do far better ſatisfie and nouriſh, than if thoſe Foods ſhould be received into the ſtomach wholly deſtitute of ſalt. For this reaſon men that undergo hard labours eat Fleſh, Fiſh, Herbs, and other Foods, plentifully ſeaſoned with ſalt, whereby their Bodies are preſerved in their due ſtrength; but thoſe who are not exerciſed with ſuch labours, feed upon Foods not ſo ſalt, but of a more eaſie digeſtion. Salt therefore is the only nutriment not only of Vegetables and Animals, but alſo of Minerals; yea, it univerſally nouriſheth and encreaſeth whatſoever exiſteth in the World.

Seeing therefore that without ſalt nothing can exiſt or live, and that the life of all things conſiſteth in ſalt alone, as is witneſſed by daily experience; Wherefore do Fools think Salt to be a thing of ſo ſmall moment? I anſwer, That this happens becauſe very few know what Salt is, what Powers and Virtues it exerteth, and what is reconded in its inward Penetrals: As is ſaid a little before, I compare ſalt to a Carrier, becauſe he carrieth or conveyeth all thoſe things which are put to him, whether good or evil, thither to where they are to be conveyed, without any labour or trouble, but committing the care to him, who taketh all the burden.

In like manner, Salt being mixed with good things, which adminiſter a good nouriſhment, aſſiſteth the nutritive faculty, and is the conveyer, helper, and ſtrengthener of the adjoined nutriment: Being mixed with venomous and hurtful things, it encreaſeth and confirmeth the Venom with great detriment to the Body, inſinuating it into the Paſſages and Members, into which, without ſalt, the Venom could not have penetrated; therefore with the good it is good, and with the evil it is evil, and being addicted to neither part, is ſubſervient to both, according to the will of the Artiſt, making good the vulgar Proverb, *Salt and Wine quicken the wit*: That is, when mixed with good things, they be moderately uſed. So alſo the contrary is true, if it be ſaid, that *Salt and Wine deprave the Wit*; which I could demonſtrate by many Examples, which for brevity ſake are here omitted. Nevertheleſs, that I may be the better underſtood, I will inſtance in two things: As I ſaid but now, if Salt be mixed with good ſubjects, containing a good nouriſhment, ſuch are Bread, Fleſh, and Herbs, the ſame are rendered fitter for nouriſhment, if daily experience may be credited, which no man will deny. Why therefore ſhould not the contrary be likely, that it ſhould render an evil thing yet worſe, and corrupt it more, if it be aſſociated with it. As for example. Common *Argent-vive* is eſteemed Poiſon, and indeed truly, and is rendered obnoxious to a greater or leſſer poiſonous quality, according as it ſhall undergo this or that Preparation. If one ſwallow half an ounce of it, it operateth nothing in the Body, and paſſeth away without hurt; but being ſublimed with ſalts, and exalted in its venomous quality, being exhibited in the weight but of two, three, or four grains, is ſufficient to kill a man.

In the ſame manner Orpiment, as digged out of the Mountains, performeth nothing of good in an humane Body, exciting frequent and intolerable vomitings and ſtools, if given in too great quantity; nevertheleſs one, two, three, or four grains of the ſame may be taken without any danger, cauſing eaſie vomits and ſtools; but being exalted by ſublimation with common ſalt, becometh ſo hurtful a Poiſon, that being drank, it forthwith killeth Men and Beaſts. So alſo it is with white Arſenick, which being ſublimed with Salt, obtaineth ſuch a poiſonous nature, as is commonly known, although the cauſe of that evil be known to few, as the ſaid Examples do ſufficiently declare. I will yet add one thing over and above, for the ſake of the Ignorant: They who have been verſed in the Labours of the Fire, know thoſe things, and want not my teaching, although their number be very ſmall, but of the Ignorant and Unskilful it is large enough. Arſenick and Cobolt are indeed moſt vehement Poiſons, but nevertheleſs are not hurtful to the Body, if they be taken in their corporal form; but being exaſperated by ſublimation with Salts, and reduced into a more fugacious nature, arrive to that vehemence, that they are able to kill a man only by their odour. Thoſe who have mixed Arſenick with Vitriol and Salt-petre, for the preparing of graduating Waters, as they call them, have experienced the Truth of this. Such Waters are ſo vehemently poiſonous,

ſonous, that they ſmite the Heart with a trembling of any one that taketh in their odour by the Noſe, and alſo extreamly debilitate the Brain. That vulgar Proverb, which ſaith, That *Salt corroborateth the Heart and quickeneth the Wit*, is true, when wholeſom and healthful things are aſſociated with it; but if things unwholeſom and poiſonous be adjoined with it, it doth the quite contrary, ſuffocating the Heart, and weakening the Brain, both which I my ſelf have found.

Long ago, when I was young, being occupied with Arſenical Waters of this kind, it often happened to me, that thoſe ſtrong ſaline Spirits had almoſt put out my Candle. Again, on the contrary, I have found, when I have mixed corroborating ſubjects with Salt, that it hath encreaſed their ſtrengthening Virtues, and exalted them in a wonderful manner. Therefore it is not without reaſon that *Paracelſus* teacheth, That Gold exerciſeth no power or virtue in the humane Body, but by the Spirit of Salts, which inſinuate the virtues of Gold into the Members, and augmenteth them. Here ſome may ſay, Seeing that other Metals exert their powers in humane Bodies without Salt, Why ſhould not Gold alſo do the ſame, if it hath any virtues? I anſwer, That this is the reaſon of the difference, becauſe the other Metals being reduced into ſmall Particles, by filing, do act in the humane Body, by reaſon of their own Vitriolate Salt, which they retain in melting, more eaſily admitting ſolution in the Stomach, and performing their Operations, by reaſon of that natural acidity, which Operations would be exaſperated by the addition of Salt. But that the imperfect Metals effect nothing of good in the body of Man, is witneſſed by Tin and Copper, in a Veſſel of which, Wine ſtanding all night, and then drank, cauſeth Vomitings and Cholical pains, as alſo Palpitations of the Heart; in exciting of which, Copper exceedeth Tin, which doth not ſo frequently excite Accidents of this kind, eſpecially that which is not adulterated with Biſmuth or Tinglaſs, but is pure and unmixt. Lead being ſwallowed, drieth, and cooleth too vehemently: But the filings of Iron are uſed medicinally, not without great profit, becauſe they kill and expel the Worms in Children; and its *Crocus* is alſo wont to be mixed with aſtringent Medicines with Fruit. Silver being filed and taken, is of no uſe in the humane Body, becauſe it hath in it ſelf no ſalt, with which Iron and Copper are endowed. Nevertheleſs, being prepared with Salt, it obtains an entrance into the Members of the Body, and expelleth all hurtful Humours, and ſtrengtheneth the Brain. But being bitterer than Gall, it is ſo ingrateful to the Palate, that it is more difficult to be taken than Vitriol it ſelf. Gold, the moſt eminent among all the Metals, in purity and nobility in its own nature, poſſeſſeth no Salt, and therefore hath no Operation at all in the Body, whether it be taken in filings, or reduced to a ſubtile powder; for the *acidum* of the Stomach is not of ſo great power, that it can enter and diſſolve Gold, as it diſſolveth Copper and Iron, but diſchargeth it with the Excrements in the ſame form in which it was taken. Hence the Unskilful have been ſo bold, as to exclude Gold from a medicinal uſe, as a thing deſtitute of all Virtue, and altogether of no uſe; an errour truly not Philoſophick, but fooliſh, proceeding from meer unskilfulneſs and ignorance, ſeeing that Experience doth altogether teſtifie the contrary. He that believeth no Virtues to be in Gold, may by an eaſie experiment find the contrary, if he ſhall diſſolve it in Spirit of Salt well cleanſed and rectified, and ſhall drink a little of this Solution mixed with Wine or Beer, or any warm Broth or Gruel, for he ſhall perceive a very ſwift and healthful Operation, caſting out all ſuperfluous fæces, according as they ſhall offend, either by Vomit, Stool, or Sweat, or Urine, without any weakening of the Body, but evidently confirming its ſtrength, as I have ſhewed in my Book entituled, *The Conſolation of Navigators*, in few words, by reaſon of the ſhortneſs of time, which did not allow me to treat of this matter more at large. Nevertheleſs I here aſſert, that a ſolution of Gold of this ſort by Spirit of Salt, is able to perform very much in Medicine, although by reaſon of its ingrateful reliſh, it is not much to be eſteemed: For ſeeing the ſpirit of Salt, with which the Gold is to be diſſolved, ought to be very ſtrong from this corroſive Liquor, without which the Gold cannot be diſſolved; firſt, this incommodity ariſeth, that its uſe is unpleaſant, it blacketh the Lips and edgeth the Teeth; to which may be added, that a great quantity of Liquor is required for this ſolution, and the acidity by degrees bringeth loathing to the ſick, and ſometimes the ſick cannot bear the ſharpneſs. Moreover, if this ſolution be taken in Broth, it hindereth its operation, and wanteth the deſired ſucceſs, of which it is not deſtitute when drank in Wine or Beer. For this reaſon this Medicament, which in it ſelf is very noble, and of great moment, is difficultly admitted into uſe. But becauſe we have ſaid that Gold without Salts is able to operate nothing at all, its whole ſolution conſiſts in ſuch a *menſtruum* which is neither corroſive, nor of an unpleaſant reliſh, nevertheleſs openeth the Gold, and rendereth it apt to become a very wholſom Medicine; which endowments I have found in no other thing but my *Sal Mirabile*, which being void of all corroſion and unpleaſantneſs, is it ſelf an excellent Medicament, and conciliateth a pleaſant ſweetneſs to all things which it diſſolveth: For when it diſſolveth Gold, it doth not ſtain the lips and hands with any colour, like other ſolutions, which are made by *Aqua Regia*, or ſpirit of ſalt; neither alſo doth it aſtringe like other ſolutions, but is of pleaſant uſe, and exerteth its gift by a noble Operation. I have tried many admirable things with this Salt, and at length obtained a ſolution, or rather an extraction of Gold, green as Graſs, and is a very wholeſom and moſt noble Medicament: For he who hath brought Gold to a greeneſs, hath performed much, in praiſe of which, many ancient Philoſophers call it *The Bleſſed Viridity*. But what this greeneſs may effect in Medicine, belongs not to this place, ſeeing that I intend here to treat of nothing but Salt, and to prove it to be the Beginning and End of all things, and that it encreaſeth and exalteth the powers and virtues of all things.

And ſeeing that this is agreeable to Truth it ſelf, and cannot be diſproved by any man, it muſt neceſſarily be granted, that a Salt brought to the higheſt degree of Purity, (as mine is) muſt be far better, and more noble than any groſs and impure Salt. Alſo becauſe it amplifieth and exalteth the virtues of all Vegetables, Animals, and Minerals, and that Gold exceedeth in nobleneſs all other Creatures which are found under the Sun, it is eaſie to conjecture, that if the pureſt and moſt noble part of Salt ſhall be aſſociated with Gold, that alſo a moſt noble Medicine muſt thence ariſe: For Salt and Gold, being the Off-ſpring of the Sun, are (as it were) immortal and incorruptible, and therefore afford help to all mortal and corruptible things, and defend them from putrefaction and corruption.

Never-

Nevertheleſs, I would not have any man perſwade himſelf, that in theſe words I go about to aſſert any Immortality, my purpoſe tendeth not thither, ſeeing that I am not ignorant that there is no Medicine againſt Death. I would only ſignifie this, that from the aſſociation of Salt and Gold, there muſt neceſſarily proceed an excellent Medicament. If Salt carrieth and promoteth the Virtues of other things, wherefore alſo ſhould it not promote and convey the Virtues of Gold? Truly there is found no Herb ſo abject, no Stone ſo vile, nor no Bone ſo contemptible, that doth not poſſeſs its own Virtues: Who then can deny that Gold, as the moſt Noble Creature of God (after the Sun and Salt, of which it is generated) ſhould poſſeſs Gifts and Endowments, to be preferred to thoſe of the more vile Creatures? That nothing of evil can proceed from two excellent ſubjects, to wit, Gold and Salt, every unskilful Ruſtick can underſtand; Wherefore then cannot thoſe proud and idle Scoffers perceive it? I think it to be, becauſe they would not be numbred among rude and ignorant Aſſes, if ſubſcribing to my words, they ſhould confeſs ſuch a Medicine to be *in rerum natura*, and notwithſtanding to be ignorant of its Preparation. But it were better for them not to envy thoſe who have received ſuch Gifts, nor to aſſault the Innocent with ſo many filthy Calumnies and Slanders, but to leave thoſe things to them which exceed their own Capacities.

I now make mention of my Green-Lyon, whoſe wonderful Virtues are to be declared and manifeſted to the whole World; although I well know, that this Green-Lyon will not find fewer enemies than my white or red *Aurum Potabile* hath done: For the Devil can in no wiſe ſuffer, that any thing which is profitable to Mankind ſhould be made manifeſt, therefore he uſeth all his power and arts to hinder the knowledge of the Truth, by caſting ſtumbling-blocks in its way. What various Arts have been excogitated, to bring my *Aurum Potabile* into Contempt, and indeed by ſuch a ſort of men, who might eaſily think that I ſhould not grant one drop of it to ſuch haters of the Truth, although they ſhould petition me for it.

And ſeeing thoſe Pot-Companions could not ask it of me, they have endeavoured to extort it from me, under pretence of the ſick, not that they would ſerve the ſick, but only get an occaſion of contemning it, and of bringing it into an Odium with the Sick, leſt by it they ſhould recover their former Health. Have they not taken counſel together in their Meetings, one offering this, another another thing, ſo that by every way poſſible they might oppugn my *Aurum Potabile?* But this Hatred and Envy, carried on againſt me with great ſtudy, I leave to the Divine Vengeance; and although many watery and obſcure Clouds may endeavour to hide the Sun, and to overſpread his warm and vivifick Beams with darkneſs, nevertheleſs they ſhall effect nothing; for at length being diſperſed into vapours, and vaniſhing in Clouds, they will give place to the Solar Rays. There is nothing able to extinguiſh the Truth, which may indeed be preſt, but never overcome, and is therefore like the Light, never wholly extinguiſhed. The Air is never filled with ſo many dark Clouds, but at length they being diſſipated, the Sun again appears to ſight. By a like reaſon alſo the Truth at length freeth it ſelf from the ſnares of lyes, and cometh forth into the Light: Therefore I may without fear propoſe the Truth, although there be many that can but ill bear my liberty of ſpeech; for GOD is to be obeyed rather than Men and the benefits due to Good men are not to be omitted for the ſake of thoſe which are Evil.

Therefore (in the Name of God) I will go on in declaring the Virtues of my *Sal Mirabile*; becauſe I have ſaid in the precedent diſcourſe, that Salt is the Rector or Diſpoſer of all things, carrying their virtues conjoined with it ſelf, to their due place; therefore it is not fit that evil and venomous things ſhould be adjoined to it, but ſuch as are good only, if any thing of good be expected from it.

But there is no Creature under the Sun more noble, excellent, and pure than Gold, nor which more reſiſteth the deſtruction of all the Elements, which without a true ſolution, as we have ſaid, cannot render the Body of Man partaker of its Virtues, and all corroding ſolutions are found to be unfit to diſſolve it; therefore ſuch a ſolution is required, as may be performed by the help of a *Salt* which is not corroſive; therefore taking ſuch a one in hand, we will ſee what good is to be expected from it.

Of the Uſe of my Sal Mirabilis, *as well in the Solution of Metals, as in the Preparation of Medicines.*

FIrſt, it is to be noted, That not only Metals, but alſo all Stones, and Bones themſelves, refuſing the ſolution of all corroſive Salts, may be radically diſſolved by my *Sal Mirabile*, and moſt things ſo diſſolved, whether they be Metallick, Vegetable, or Mineral, put on a green colour, of ſome of which the greeneſs remaineth, but of others, in proceſs of time, is changed into a yellow or red colour.

Concerning this wonderful mutation and ſolution, I could write a great Volume, if I had not deſigned this Labour for another place, intending here only to deſcribe the ſolution of Gold, becauſe another better cannot be found. I have found the ſolution of the reſt of the Metals which are adhibited, to be unfit either for the preſervation or recovery of Health, as I have admoniſhed a little before; but I have found Salt and Gold to be moſt noble ſubjects, of which an excellent Medicine muſt neceſſarily be prepared: For Salt exalteth the Powers and Virtues of all things to a high degree of perfection, and inſinuateth them into the humane body: This ſeems to me not unlike the volatile and fugacious Spirit of Vegetables, as of Wine and Beer, *&c.* which coming into the Body of Man, addeth ſtrength to the Animal Spirit, that it moveth it ſelf more readily, and with greater alacrity. Indeed every other Meat and Drink, whether it be Bread or Water, communicateth ſome ſtrength to the Body, but not ſo powerfully and efficaciouſly as any generous Wine, whoſe Spirit is very pure, efficacious, and ſubtile; ſo that its too plentiful uſe awakeneth all things that lie hid in a Man, and brings them to light. In the ſame manner Salt encreaſeth and confirmeth all things, & being united with them, maketh manifeſt all their hiden Virtues, which without Salt would remain in darkneſs. Who could have manifeſted to us that great Poiſon which lies hid in Arſenick, if Salts had not revealed it? If any melancholly Perſon (who otherwiſe in his own nature is prone to ſtilneſs, like one dead) ſhall drink any ſpirituous Wine, or ſtrong Drink, his Spirits, that were before dull, and as it were buried in a Dream, will preſently be awakened, and his Tongue ſet at liberty. The ſame doth Salt perform, which addeth an encreaſe to the powers of all things, eſpecially of the Metals, which it rendereth manifeſt and known.

known. And indeed without Salt Poiſons could not have been known, as I have ſaid a little above, concerning Arſenick and *Argent-vive*: If Salt worketh thoſe things in evil ſubjects, by dilating and encreaſing their malignity, Why ſhould it not effect the ſame in good ſubjects, by augmenting their goodneſs? Therefore, becauſe among Animal, Vegetable, and Mineral ſubjects, there are none more noble and eminent than Gold and Salt, which have their original from the Sun, it would be ill done to paſs them by, and to ſeek viler ſubjects, for the making of an excellent Medicine, ſeeing that if we take Wine, Salt, and Gold, there are no other things which afford us ſo excellent Virtues. Therefore acquieſcing in theſe, we will endeavour of them to make a moſt noble Medicament.

The PROCESS.

TAke three or four parts of *Sal Mirabile*, and one part of Gold (rightly fitted or prepared for this Operation) mix them, and put the mixture into a ſtrong Glaſs Retort, well luted, which place in an open fire, encreaſing the fire by degrees, until the Glaſs be red hot, urge the fire, and continue it ſtronger, for an hour, then ceaſe, and let all cool, take out the Retort, and free it from the Lute, that it may not be mixed with the matter contained in the Glaſs, but that may remain pure, which is to be accurately ſeparated from the Glaſs, and together with what is ſublimed into the neck of the Retort, to be put into a clean glaſs; which matter will look of a greeniſh colour: To this matter pour ſome Rain-water, that it may be diſſolved in an eaſie heat, and the Salt, with part of the Gold, may be mixed with the Water. Filter this graſs-green Solution through Paper, and draw off ſome part of the water by deſtillation, that the green Liquor may remain, not corroding nor taſting ſharp, nor yet too urinous, but fit to be drank in all Vehicles. The Gold which the *Sal Enixum* hath not diſſolved, you will find after the ſolution, which you may again uſe for the like Work; but the green Liquor you may preſently uſe, as well in Medicine as in Alchymy, which will afford you many profitable things. He that will draw off all the Phlegm to a green Salt, and then extract that ſalt with an alkalized Spirit of Wine, will obtain a Medicine yet more efficacious: For the Spirit of Wine will not be tinged with a green, but a red colour, and will be very ſweet, rendering the Golden Virtues of the Salt more efficacious, and more commodiouſly and readily inſinuateth them into the Members of the Humane Body.

NB. This is to be noted, That the *Sal Enixum* doth not imbibe the whole maſs of Gold in diſſolving, but only its purer part. Now, if you repeat this Operation upon the ſame pure maſs, as yet once more, you will extract the greateſt purity, and without all doubt obtain a moſt noble Medicament, which no man can refute, although he be a capital Enemy to the Truth. This is the Operation, no leſs compendious than true, of preparing a great Medicine of Gold, Salt, and Wine, meriting the name of an *Aurum Potabile*, whoſe great Powers and Virtues are now to be manifeſted to the neceſſitous Sick.

Of the Powers and Virtues of my Green-Lyon, Vitriol of Sol, *or Wonderful* Golden Salt.

THis green golden Liquor may be ſafely and pleaſantly uſed by all, whether young or old, ſick or in health, without any difference of Perſons, becauſe it containeth nothing which is evil or prejudicial: For a cleanſed Salt and Gold, never inferr any ill, but are alwaies profitable, exerciſing their wholeſom Operations, as well in Vegetables, as Animals and Minerals, as in the following Treatiſe ſhall be clearly demonſtrated.

Firſt, This green liquor, only by its external aſpect, cheereth the Heart, Brain, and all the vital Spirits; ſeeing that of all colours there is none ſuperiour to the Green in pleaſantneſs, of which all men are witneſs, who have overcome the intenſe cold of a ſharp Winter, behold the renewing greenneſs of the Trees half dead, and Herbs extinct, in the Spring time, with great delight and pleaſure, and feel all the Blood in their Body to be renewed and revived.

Secondly, This Golden Liquor being drank, ſtrengtheneth and confirmeth the whole *humidum radicale*, Stomach, Brain, and all the inward parts of the body, beyond all other Medicines which I have hitherto known. Alſo it expelleth Melancholly, and all anxieties of Mind, taketh away Palpitations of the Heart, openeth Obſtructions of the internal Veſſels; it healeth the hurts of the inward parts, as Liver, Lungs, *&c.* and cureth all inward Exulcerations; it cureth Gravel and Stone, whether in the Reins or Bladder; it keepeth the Body ſoluble; expelleth Wind, with the pains of the Cholick; preſerveth the Blood from Corruption; cureth the Leproſie, Scabs, and Fevers of all ſorts; in proceſs of time it taketh away the Gout; to the inſulting Apoplexy and Epilepſie it affordeth preſent Cure; it cleanſeth the Blood infected by the Scurvy, Plague, and other contagious Diſeaſes; it preſerveth and freeth from all internal Ulcers; defendeth the Lungs, Liver, and other parts, and removeth Exulcerations already ariſen, and takes them away radically. It ſo tingeth all the inward parts of a Man with its Balſamick Virtue, that not being eaſily obnoxious to Diſeaſes, they enjoy a ſound and long Life. Outwardly uſed, it healeth all freſh wounds, no leſs than old and open Ulcers, without any Ointments or Plaſters; for in curing Ulcers of this ſort, there is nothing in Animals, Vegetables, or Minerals, which anſwereth to this in Virtue; as alſo inwardly it cureth Ruptures.

This is the nature and property of Gold, that it moſt potently taketh away all filths, and alſo aſtringeth; which two things are neceſſarily required in the Cure of all Ulcers. This Salt, by its own help, commodiouſly doth the ſame, and alſo wonderfully promotes the Virtues of the Gold: The ſaid Liquor very quickly taketh away the Ulcers of the Mouth and Throat, with all their ſcorbutick Infection, which are wont to give way but very ſlowly to other Medicines: And this it doth, although the Tongue, Uvula, and all the Palate ſhould be full of Puſtules. In ſhort, for the taking away all internal and external Ulcers, I think no Medicine preferrable to this Liquor; but all other defects of the Body which it cureth, for brevity's ſake, I will paſs over.

Moreover, this green and golden Liquor hath this nature and property, that beyond all other Medicaments, it conciliateth a wonderful fertility to all things, as its ſignature, the wit, the green colour, and my diverſe infallible Experiments, do truly teſtifie.

Hence the seeds of all Vegetables being macerated in the same Liquor and set in meer naked Sand, they put forth golden Sprouts and Plants, having a smell much stronger and pleasanter, a fairer colour, and greater length than those which grow out of a fat Earth. Therefore this green Liquor holdeth the chief place in rendering Vegetables green and fruitful, and augmenting their growing faculty; so also among all the Medicines, I know it hath no equal in conciliating and preserving fertility in the humane body: For in all the Diseases of Mankind it bringeth great help and comfort, and effecteth more in assisting the fruitfulness both of Male and Female, than can be believed, and is so great an exciter of Venus, that it bringeth great solace not only to Old men, who being baulked by their younger Wives, are forced to lie still, but also to such Women who are barren in their flourishing age, and therefore destitute of Heirs.

I write not dreaming, but am taught by Experience, having seen some men so strengthened by this Medicine, that they have seemed to themselves never to have been weak, the which also some Women have experienced. Nevertheless such Medicaments are not to be administred too frequently to this Sex, seeing that without this sort of help they are wont to be sometimes exagitated by a more salacious Itch than is convenient: Its use is more safe to Old men, inasmuch as it cannot do them the least damage. Nor ought those things which I here deliver, to seem a wonder to any, for they have their certain and undoubted causes of Operation.

Let those two subjects, of which the Green-Lyon is composed, to wit, salt & gold be inspected; they are the best of things, & necessarily required to the generation of all things; for, what herb can be brought forth without seed and salt? not indeed the least: for if the earth or sand wanteth salt, the seed of the Herb can neither have nutriment nor production: Yea, if the seed it self be also sowed in a fat Earth, and yet be destitute of the Rays of the Sun, it can in no wise grow out of the Earth, but will be suffocated and perish; the which thing is not hid to Rusticks, who after they have sowed their seed, do ardently expect the warm Sunshine. Therefore, for a desirable coming up of Vegetables out of the Earth, and their encrease, there is required a fat and salt Earth, as also the warm and fruitful heat of the Sun, with necessary Rain; which also is to be understood of the generation and multiplication of Animals.

NB. In *Aurum Potabile* salt supplies the room of fatness, Gold is the Sun, and the Spirit of Wine performeth the Office of the warm and fruitful Rain; so also no Minerals are procreated, but by the help of the sun, and labour of salt. They exercising their operations upon the Water, generate Minerals, as the Writings of the ancient Philosophers teach.

Some ignorant man may here object and ask, How it can be, that the Sun, by operating in the depth of the Earth, should generate Minerals and Metals of salt? Let him know, that the Sun, by his hot Rays, doth excite the central fire in the profundity of the Earth; which central fire is not unknown to those who are occupied in digging Metals out of the Earth, who sometimes feel so strong a heat, that laying aside their Clothes, they are constrained to labour very leisurely, yea, sometimes wholly to intermit it; as I have taught in *The First Part of my Mineral Work*. Therefore no man of a sound mind will dare to oppose these things, seeing that it is wholly agreeable to Truth, that generation and encrease in all Animals, Vegetables, and Minerals, do arise from the sun and salt, to which water is wont to be an help.

Seeing therefore that my golden Liquor is prepared of such subjects, it can operate no other thing than fertility, and thereby signed by Nature with that beautiful greenness, by which it signifieth its endowment to render all things fruitful: God adorneth nothing with His marks and signs in vain; from which, as from His signatures, the powers and virtues may be more clearly known, than from Books. For the signature with which things are signed by GOD and Nature never erreth; but the Books and Writings compiled by Men very often erre. Wherefore did the ancient Philosophers and Poets worship *Venus*, the Goddess of Love and of Generation, and attribute to her a beautiful green, generated of the spume or foam of the sea? What is the foam or froth which the sea casteth out upon the shore, but salt, which being dried up by the heat of the sun, is reduced to salt? And the Poets, especially *Virgil* and *Ovid*, who were men of great literature, would not have handled such things with so prolix an ambage of words, but that they were willing by their Fabulous writings to reveal that great Philosophick Mystery to the world: Therefore I constantly assert, That this green Liquor is the chief Medicine of all things to grow or be encreased, as its pleasant Viridity and infallible Experience do testifie. The Ocean, the Mother of all fertility, sheweth also its greenness, especially in those places where it is rich in salt, and strongly irradiated by the Beams of the Sun. This is well known among Seamen, who from the change of the water into a greener colour, presently collect, that they are near to hotter Regions, in which the Sun-beams are more strongly projected; for in such places the Sea is so salt, that it shineth like fire: The Urine of those pissing out of a ship, falling into the Sea, sheweth like sparks of fire; there four parts of water are found to contain one part of salt. The Mediterranean Sea is not so full of Salt, as that which is between *Spain* and *France*; and again, in this it self is found not a little difference, seeing that the *Spanish* side exceedeth the *French* in saltness; and the Ocean it self, by how much the nearer it is to the North, by so much it is less salt; for which reason also the salt is weaker, and of less Virtue, being more remote from the beams of the Sun. Therefore the *Danes*, *Sweeds*, and other Nations, inhabiting the Northern parts, although they have plenty of Sea-water, nevertheless they do not make salt of it, but fetch it from *France* or *Spain*; which is a Testimony evident enough, that salt is elaborated in the water by the most ardent Beams of the Sun, and produced for the sake of an universal fertility.

This is indicated by the *German* name of the Sea, *Meer*, which is all one as if we should say *Vermeer*, that is, *Encrease*, *Enlarge*. An Appellation very well agreeing with the thing, because without the Sea nothing would encrease in the Earth, but on the contrary, all things live, and are encreased by it.

Hence the green colour is a manifest Index and Signature of Fruitfulness, which might be demonstrated by infinite examples, which, for the avoiding of prolixity, is not here necessary, seeing that the thing it self is so manifest.

Some profligate Deriders, who love to oppose the Truth, may say, That this green colour doth not proceed from Gold, but from Copper, that so they may draw honest men away from the Truth, because no Gold seemeth to them to be of use in Medicine; with which Cavil they have before now accosted my

Aurum

Aurum Potabile. That I may ſtop their impure mouths and obviate the frivolous Objections of this ſort, I ſay, that I indeed confeſs, Copper among the Metals doth obtain a green colour, if it be diſſolved in *Aqua fortis*, and other corroſive Liquors of that kind: But Gold being diſſolved in the ſame, appeareth in a yellow colour, and not a green, which is known to every body. But who would think me to be ſo ſtupid and rude, to impoſe upon any ſo open a Cheat? Who alſo in any wiſe could hide ſuch a Cheat? For Copper being diſſolved in ſalt waters, would preſently diſcover the Fraud, by its evil nauſeating and Vitriolick taſte, of which but one drop being ſwallowed down, would excite violent Vomitings, and would not be a Medicine, but rather a Poiſon. Moreover, if you put a Knife into ſuch a ſolution, it will be preſently covered over with the Copper, and appear to be Coppery. The contrary plainly happeneth, if any pure Iron be dipped in my Green-Lyon; for it will preſently appear to be gilt with the colour of Gold, and that more fair and eminent than any Ducat, or other piece of golden Mony exhibiteth. If any Iron-Wire be put into it, and there left for a certain time, it will at length be changed into a pure Gold, which is an infallible teſtimony, that that Liquor doth not draw its original from Copper, but from Gold. Again, it may be objected, that a vulgar ſolution of Gold by *Aqua Regia*, alſo tingeth Iron with a golden colour, and adhereth to the ſame; therefore this is no ſtrange thing, foraſmuch as it is common and known to every man. I anſwer, That ſuch a ſolution, not green, but yellow, doth indeed by precipitation adhere to the Iron, and diſſolveth the Iron it ſelf, and reduceth it into a Mud, but doth not penetrate it, and preſerve it in its form, as my green Liquor doth, which therefore is not to be numbred among thoſe corroſive ſolutions; but that which is done by the *Sal Enixum*, is rather to be called an Extraction than a Solution: For my *Sal Mirabile* is of that nature, that it doth not throughly diſſolve any fine Powder, or Calx of Gold, but only extracteth from it whatſoever is moſt pure, and leaveth the reſt like a black Powder. Moreover, that Solution is not corroſive; for if it were, it would corrode and diſſolve the Iron, and not tinge it with the colour, and advance it to the degree of Gold, the Iron remaining whole. By a like reaſon the green Solution of Copper, made with the vulgar corroſive waters, aſſociateth it ſelf with the Iron, in a green colour, corrodeth it, and forſaketh the Copper. But if Copper be diſſolved with my *Sal Mirabile*, that ſolution doth not penetrate Iron, but tranſmuteth the whole in its own form into Copper, yet not preſently, but in a long progreſs of time.

From all theſe things may be ſeen the great difference between the vulgar corroſive ſolutions of Gold, Copper, and other Metals, and mine, void of all corroſion, which is performed by my *Sal Mirabile*, diſſolving the Bodies of the Metals, after a far other manner than thoſe corroſive ſolutions are made. Therefore it is not to be reckoned among vulgar ſolutions, ſeeing that it poſſeſſeth far other Virtues. The vulgar ſolution of Gold, made by *Aqua Regia*, hurteth all things, as a corroſive Poiſon; a little of it being put to any Vegetable ſeed, depriveth it of all its growing faculty, and throughly killeth it. Some drops of it being drank by a Man, would corrode his throat and ſtomach, like Poiſon. A Liquor of this ſort, by its corroſive and gnawing faculty, converteth the Metal put into it into ſlime or mudd. That ſolution which is made by the rectified Spirit of Salt, may ſafely be taken by any, when a ſufficient quantity of Water is mixed with it; but it is not ſweet, it conſtringeth the Tongue, and ſtaineth the Hands; this doth not my green Liquor, for it neither coloureth the Hands, nor aſtringeth the Tongue, nor yet corrodeth the ſeeds of Vegetables, but rather exciteth them to fertility.

Whence it appears, that my ſaid *Sal Mirabile* is not corroſive, but by it ſelf is a good Medicine for all Vegetables, Animals, and Minerals, which Experience it ſelf moſt evidently argueth: Therefore it can work nothing but good, becauſe prepared without any Corroſive, and repreſented to the eye by a wonderful ſignature, to wit, the fair Green colour.

This ſignature is an undoubted token of its extraordinary Virtues, in rendering all living things vegete and fruitful, which lie abſconded in its inward Penetrals. And this I think ſufficient to be ſaid to thoſe fooliſh and idle Cavils of ignorant Scoffers, with which they may inſult over me.

Whatſoever I have here aſcribed to my Green Lyon, my red *Aurum Potabile*, extracted with Spirit of Wine, alſo performeth the ſame, and that as well in Vegetables and Animals, as in Minerals; for the Spirit of Wine can hurt none of them, but rather inſinuateth the virtues of Gold into Vegetables and Animals, and rendereth them more efficacious. But concerning the ſolution of Gold by my *Sal Mirabile*, and its efficacy and operation, this may ſuffice for the preſent.

As for the ſolution of the other Metals, there is no need to make many words, or to write a large Volume about it, ſeeing that from what hath been already ſaid, any man may eaſily conjecture, that ſolutions of this ſort, made by the help of *Sal Mirabile*, are far better than thoſe made by Corroſives. The Vitriol of *Venus* made by its help, doth not hurt Vegetables, as common Vitriol, which killeth the ſame by its corroſion; but the Vitriol made by *Sal Mirabile* wonderfully promoteth the growing faculty in Vegetables, ſo that Lunar, Venereal, Martial, Jovial, and Mercurial Herbs may be produced, which will have wonderful effects, eſpecially if the Vegetative faculties of Lunar Herbs be encreaſed and promoted by the Salt of Luna; of Venereal, by the Salt of Venus, and ſo of the reſt.

Enough hath been ſpoken to the Wiſe, but he that hitherto cannot apprehend what I have ſaid, is an Aſs, and unworthy of ſuch *Arcanums*. From this Foundation a diligent Phyſician may erect a far other method of Curing, and may prepare for himſelf ſuch Medicines, by which he may obtain Honour and Wealth. I have for many years obſerved, that Herbs are wont to acquire Martial faculties and properties, if they grow out of a reddiſh Martial Earth, although they were not before of a Martial nature, but of a Solar, Lunar, Venereal, Jovial, Saturnine, or Mercurial Property.

But how much more would the innate properties and virtues of Herbs be ſtrengthened and encreaſed, if they were not nouriſhed by the Dung of Animals, but ſet in pure ſand and watered with *Sal Mirabile* impregnated with the virtues of Metals, and thence acquire the promotion of their growing faculty. Truly other Herbs of far greater Virtues, and other odours and taſts, would be brought forth, than the common, which are wont to be produced by the Dung of Animals, and the ſimple Salt of the Earth. By this means ſo ſtrong an attractive Power may be conciliated to the Seeds of all Herbs, that by a Magnetick power they may attract to themſelves the Aſtral powers and influences, and ſo encreaſe their

Virtues

Virtues, that without any Preparation they might be able to cure all Diſeaſes to admiration. NB. That it is neceſſary, that he that would exactly underſtand the nature of Herbs, ſhould know how to promote the vegetative faculties of Solar Herbs, with Solar Salt; of Lunar with Lunar, and ſo of the reſt, and not that he ſhould intermix the one with the other, without any conſideration; which without doubt would be a hindrance to the deſired ſucceſs.

Conſider theſe things with an accurate Meditation, as great Secrets and *Arcanums*, which will not be revealed to the perverſe World. A word to the Wiſe is enough; therefore I will add no more; but I make no doubt, but that this Revelation of my *Sal Mirabile*, in proceſs of time, will be accepted by diligent Phyſicians, and bring ſo much benefit, that they will by the ſame effect much good in comforting and curing the Sick. All things have their time, ſo alſo this Arcanum, which in its time will be in vigour; but I would not have any man perſwade himſelf, that he may fiſh out of me the Preparation of my *Sal Mirabile*, I will not *caſt Pearls before ingrateful Swine*, but will reſerve them for Friends. But leſt an occaſion ſhould be given to ignorant Deriders, and thoſe that hate me, of calumniating and ſlandering me, as if I my ſelf were ignorant of preparing of a Salt of this ſort, I have determined to deliver ſome ſmall portions to divers prudent men, not of this Salt only, but alſo of thoſe Salts which are endued with the Virtues of Gold, Silver, and other Metals, that at any time they may be able to exhibit a clear Teſtimony of the Truth: And I will produce thoſe Herbs themſelves, that I may have them in readineſs to ſhew to others.

Therefore let no man trouble me with his Letters, to ask of me this ſalt, or other Medicines, for I will communicate them to none, but ſuch as I know, and with whom I am familiar.

Great Thanks are to be given to Almighty GOD, who hath made this preſent unworthy World partaker of ſuch *Magnalia*. I have ſought, and have opened the way to others; let another alſo ſeek, and enter by the way I have ſhewed, that inſiſting in my footſteps, he may by the eaſier labour, obtain a greater light of Nature.

But that I may omit nothing which pertaineth to the good Inſtitution and Doctrine, and concerneth the glory and honour of Salt, I will yet over and above add one infallible Teſtimony, by which any rude and ignorant man may evidently ſee, that all fertility conſiſteth in Salt only, and that it is the moſt precious Treaſure of the whole World, for the health of the Body, and that in it lie hid moſt ample Riches.

Fertility is indeed already demonſtrated in many foregoing Teſtimonies; but becauſe the Hiſtory of the Prophet *Eliſha* agreeth more than a little with theſe my ſayings, and may be a clear Teſtimony to them, I have thought fit here to adjoin it. We read in 2 *Kings*, 2. 19. that the men of the City ſaid to *Eliſha*, *Behold, it is good to dwell in this City, as my Lord ſeeth; but the water is naught, and the ground about it is barren: Bring hither to me* (ſaith he) *a new Veſſel full of Salt*. Which being brought, he went to the Spring into which he caſt the Salt, ſaying, *Thus ſaith the Lord, I have healed this Water, from henceforth there ſhall no dearth and barrenneſs ariſe thence*. So the Water was healed even to this day, according to the word of *Eliſha* which was ſpoken.

That this great Myſtery may the better be underſtood, it will be neceſſary firſt a little to conſider the Hiſtory it ſelf, from which it may be known by what means the Salt of *Eliſha* became ſo ſtrong, that it expelled Death, and rendered the Water good, and the barren Earth fruitful.

When *Elias* was to be carried up into Heaven, he ſaid to *Eliſha*, Ask of me what I ſhall do for thee, before I am taken from thee. *Eliſha* asked of *Elias*, that he would grant to him a double portion of his Spirit: *Elias* anſwered, *It is a hard thing which thou haſt asked; if thou ſhalt ſee me when I am taken from thee, it ſhall be as thou deſireſt, but if not, thou ſhalt obtain nothing*. And when they went on together talking, behold, there cometh a fiery Chariot with Horſes of Fire, and parted them aſunder; ſo *Elias* was carried to Heaven in a fiery Chariot; and *Eliſha* ſeeing this, cried out, *My Father, my Father, &c.* Liſten therefore, Wherefore did *Elias* ſay to *Eliſha*, *If thou ſhalt ſee me when I ſhall be taken from thee, thou ſhalt have thy deſire, otherwiſe not?* And why with this condition? Could not *Elias* at his own will have rendered *Eliſha* the poſſeſſor of his wiſh? Perhaps very eaſily, but *Elias* would not without ſome *medium*, becauſe *Eliſha* was to be doubly ſeaſoned with the Celeſtial Fire, by which he was ſeparated from *Elias*, for Fire bringeth forth Salt; the Celeſtial Fire bringeth forth a Celeſtial Salt, and the Elementary Fire an Elementary.

In this Hiſtory is ſet before our Eyes the eternal Divine Light, and alſo the natural, although few diſcern either of them, inaſmuch as their hearts are hardened and obſcured by a horrid blindneſs. And both the Old and New Teſtament are full of ſuch Myſteries; ſo that I dare boldly affirm, That all the Treaſures both of Soul and Body may be found in the Holy Scriptures, if we will; and that we have no need to read the Writings of the Heathen Philoſophers. I add this one thing, That it is of God alone to open the Eyes of thoſe who deſire to underſtand Divine and Natural Myſteries; for without divine illumination, all things are dead and buried in darkneſs. This Truth putteth to flight the diabolical Cavils and Slanders of all ſcoffing Mountebanks and Jack-puddings. But which of them will oppoſe this, and ſeek fertility from any other thing than Salt? Truly, I believe no man, except that moſt profligate *Farnner*, with his wretched Followers, who determine, That Salt doth not fatten, but Dung; when nevertheleſs this is to be aſcribed to the former, and not to the later. But thoſe Aſs-like Brethren of Ignorance, being convinced of their filthy Lyes by the moſt evident Truth, will I hope have their impure and ſhameleſs mouths more than ſufficiently ſtopped. I therefore acquieſce in this demonſtration, in which I think I have evidently proved, That the Sun and Salt are the moſt noble Creatures of God, and that Salt is by me rightly and deſervedly called the greateſt Treaſure, and the greateſt Riches of the World; becauſe after an earthly manner of ſpeaking, nothing can be more deſirable for fruitfulneſs. Salt is the Original of all fertility, the Sun is the original of Salt, and God the Creator of all things, of the Sun, to whoſe Name be Honour and Glory for ever, *Amen*.

But although this demonſtration, which doth evidently ſhew, that ſalt is the greateſt Treaſure in the world, be moſt clear, and beyond all doubt; nevertheleſs, I doubt not, but it will not ſatisfie the Covetous, who will ſay, Where is the *Stone of Philoſophers* which we expected from thee, as the greateſt Treaſure of the whole world, that it being known and acquired, we might lead a brave life? But ſtay, my friend, until ſome man ſhall come and render ſordid men partakers of ſo great a Gift: For thinkeſt thou that if I were

its poſſeſſor, that I would deſcribe ſo great a Myſtery, in ſuch clear words as I have deſcribed the fertility of the Earth: Not at all; nor have I the power of doing that, ſeeing that a man cannot give to any thoſe things which are not his own, but God's. Nevertheleſs, that the pious ſearcher after Truth may have ſome manuduction to a Work of ſo great moment, I cannot but hold forth to him that ſmall Light granted me by Divine Grace, provided he hath not Owls eyes, ſhunning the light of Nature, becauſe they cannot bear its ſplendour; which if he hath not, it cannot be, but he will give credit to a manifeſt Truth. And concerning ſo great a work, this is my opinion, That it is altogether poſſible, that the moſt noble univerſal Pearl, to wit, the Medicine and Stone of Philoſophers, reſtoring the diſeaſie Bodies of Men and Metals to their priſtine health and ſtate, may be prepared of common ſalt: But of the Preparation, which is unknown to me, I can affirm nothing certain; but that it may be done, manifold and infallible Experience hath cauſed me to believe; which Experience I keep to my ſelf, and will not part with it to any, although I could very freely, if I might or durſt make pious men partakers of it: But becauſe Faith is effected in us by God alone, it is to be ſought from Him by Prayer, and not to be expected from Men.

Therefore that (according to my promiſe) I may demonſtrate, That the Stone of Philoſophers, lying hid in ſalt, may be got out of it by the benefit of Art, I deſire only this thing of the ſtudious of divine Myſteries, that he would ſearch after thoſe things, in my Writings lately printed, which I have ſpoken concerning the little Fiſh *Echineis*, *viz.* by what means he may be taken with a Net out of the ſalt Sea, for there he will find a ſufficient manuduction, of which it is not neceſſary that I ſhould here ſay any more. Thoſe are the things which I was willing to add in honour of that noble creature ſalt: He that will not believe the moſt noble Pearl, of a univerſal and particular Medicine, to be included in the inward Penetrals of Salt, I cannot help him; it is free for every man to ſeek and walk in another way.

Would it not be too tedious, I could alſo plainly prove, that from marine Bodies, (as Coral, Mother of Pearl, Oyſter-ſhells, and the like things, being diſſolved into water, and precipitated) may be extracted corporal Gold, which I have done with my own hands, and therefore can boldly witneſs it.

But I will ſhut up the Tables, what I have hitherto ſpoken being ſufficient for this time; from which I hope and believe that others will receive benefit: Which I heartily wiſh, together with the divine benediction to all pious men. *Amen.*

A

TREATISE

Of the Signature of

Salts, Metals, and Planets.

OR,

A Fundamental Inſtitution evidently ſhewing by what means not only the Virtues, Signification, Nature, and Properties of *Salts*, *Metals*, and *Planets*, may be eaſily known, but alſo the reaſons of their Names and Appellations, and this not from Books or Writings, but from their naked Signature, to be obtained and known by the help of the Circle and Quadrant.

Written for their ſakes who delight in the Profitable and highly Neceſſary Contemplation of Divine Miracles.

To the well minded READER.

IT is a common ſaying, *Beware of thoſe whom Nature hath marked*; the which is indeed true, if it be underſtood concerning men who are inſignized with ſome preternatural marks, or of the abortions of Nature, but concerning other things it is falſe. For the Almighty God hath ſigned all His Creatures, as well ſmall as great, equally with their own certain ſignatures, and hath as it were ſubjected their depicted Lineaments to the Eyes of men, by which they might know what the nature and property of every thing is, and what Commodity and Profit it may bring to mankind. Hence not only all Vegetables, as

Herbs, Shrubs, and Trees, but alſo Animals, as Beaſts of every kind, yea, and Man himſelf, which abide upon the Earth, the Fiſhes inhabiting the Waters, and the Birds of the Air; but alſo all things moveable and immoveable, he hath ſigned with their peculiar forms and figures, to ſignifie to us by thoſe their ſigns, of what uſe every Herb, every Animal, every Bird, and every Fiſh is, and for what purpoſe it ſerveth. And this is the Divine Inſcription which the Divine Finger hath written upon all things, and by which the nature of all things ſhould have been learned by us.

But after that Men began more and more to decline from the humane, to a brutiſh nature, and ceaſed to have the Reaſon of ſo noble a Signature, preferring their brutal Conceptions to the Divine Works, and poſtponing the Signatures incited in all things by Nature; it came to paſs, that in a long proceſs of time that true Signature, or Divine Inſcription, being obſcured, periſhed by degrees, and wholly vaniſhed; ſo that but a very few are found in this Age, who are endowed with any knowledge of ſo great a Science; for the greateſt part of men are wont to follow the duct of Books and Writings, and ſtudy to learn the Virtues and Proprieties of things out of them. Neither could this ſtudy be diſapproved of, if the true, incorrupted, and entire Writings of the ancient and ſingularly-experienced noble Authors remained with us. But becauſe in a long Series of time their frequent deſcriptions, emendations, and interpretations have ſo corrupted them, that ſcarce any thing of truth is to be found in them; it were far better that ſuch mangled and corrupted Writings were not ſo much followed, but that rather that old foundation laid by God himſelf, upon which all thoſe Writings, all Characters, and all Signatures do reſt, and from whence they have received their beginning, ſhould be again brought out of Darkneſs into Light, and the nature and properties of things learned from thence. This would be the true way of coming to the knowledge of Nature, in a ſhort ſpace of time, without ſo many errours, to which, by thoſe falſe Writings, a man cannot come in many years.

Some perhaps may ask, where that ancient Foundation laid by God ought to be ſought, or where it may be found? I anſwer, Every where, inaſmuch as it is before the eyes of every man, but eſpecially ſhewing it ſelf in the Heavens, where the Sun, Moon, and all the Stars are conſtituted by God in a round Figure, ſignifying to us that all Forms and Figures take their beginning from a round Circle, and that a Circle or Rotundity it ſelf, as a moſt perfect thing, pertaineth to the Heavens, and to GOD Himſelf. The Ancients certainly put it in that manner, that by a round Circle they might denote thoſe things which they could neither comprehend by number, pronounce by words, nor conceive by their ingeny; and on the contrary, thoſe things which did not exceed their capacity, ingeny, nor number, they ſigned with a ſquare Figure: So that things celeſtial, and exceeding humane capacity, they have denoted by a Circle, but things viſible, earthly, and ſubject to humane capacity, by a Square, proceeding from a Circle.

And although the ſame ancient Philoſophers, attributing a Circle to God only, were of the opinion, that God could not be more aptly expreſt by any thing than a Circle, having (like Himſelf) neither beginning nor end: Nevertheleſs all thoſe things which after God they eſteemed great, they alſo noted with a Circle, to wit, the Sun in the Firmament, and Gold in the Earth; the firſt of which, ſome of thoſe Philoſophers thought to be God himſelf. Others of thoſe Heathen Philoſophers have feigned for God the Effigies of a Serpent, winding himſelf into a round Circle; and all earthy things of a celeſtial original, they have repreſented by a Square, and ſo they have ſhadowed out the Celeſtial and the Terreſtrial, by the Circle and Quadrant.

Therefore as they obſerved how much of the Celeſtial or Terreſtrial Nature were in the things to be ſigned, ſo much of the Circle or Square they added or ſubſtracted, and according to that they varied their Figures: And not only in the Celeſtial Lights, to wit, the Sun, Moon, and other Planets, but alſo in all earthly Creatures, produced in the Earth by the operations of the Sun, Moon, and the reſt of the Planets and Stars, *viz.* Gold, Silver, Copper, Tin, Iron, Lead, and Argent-vive; they have uſed this manner in ſigning them all with Characters of this ſort, and have noted them with the ſame Characters which they have given to the Celeſtial Lights, producing and effecting the Cauſes of thoſe inferiour Creatures. So the Sun and Gold, as the moſt perfect Creatures of God, are ſigned with a Circle having a point or center in the middle; the Moon and Silver appear in the figure of an half Circle, or of two ſemicircles, at a ſmall diſtance from one another; which ſhew their Bodies not to be abſolutely perfect, but as yet to labour under ſome defect. The Characters of the other Planets, as ♄, ♃, ♂, ♀, and ☿, are alſo the Characters of the reſt of the Metals, *viz.* Lead, Tin, Iron, Copper, and Argent-vive, becauſe they are much more vile and imperfect than Gold and Silver, and are noted with more imperfect Characters; ſuch are an half Circle and half Square, ſignifying that they ſcarce anſwer to the perfection of Silver in the half part, and hardly to the fourth part of that of Gold.

But that I may propoſe the thing more clearly, I think it neceſſary to incloſe the Characters of the Celeſtial Lights, as ☉, ☽, ☿, ♀, ♂, ♃, and ♄, and of the Terreſtrials, as Gold, Silver, Argent-vive, Copper, Iron, Tin, and Lead, which the ancient Aſtronomers and Philoſophers have impoſed upon them, in Squares, conſiſting of the ſame magnitude, that by thoſe it may appear in what degree they differ from each other in perfection.

Here thoſe Characteriſtick Figures of the Signatures are encloſed as it were in little Houſes, which are the Squares: Now, if into one of thoſe I put the Character of the Sun or Gold, *viz.* a round Circle noted with the letter B, it toucheth four parts of the Square, marked 1, 2, 3, 4, and filleth it up, ſignifying that

that among Celeſtial and Terreſtrial Creatures, the Sun and Gold do excell all other things, in their perfection.

The Character of the Moon or Silver, under the letter C, toucheth three ſides of the Square, to wit, the ſuperiour with the top of her Horn, marked 1, the lower ſide marked 3, and the bending of her back toucheth the third ſide, marked 2; but by reaſon of the incurvating concavity of her Superficies, ſhe cannot touch the fourth ſide, marked 4.

The Character of *Mercury*, under the letter D, with both his horns toucheth the upper ſide of the Square, marked with number 1, and with the bottom of the Croſs the lower ſide number 3: the other two ſides, 2 and 4, he leaveth untouched, ſo that the half part of the Square remaineth untouched by *Mercury*. *Luna* toucheth three ſides or the ſame, and *Sol* or Gold is contiguous to all the four ſides.

Venus or Copper, under the letter E, alſo adhereth only to two ſides of the Square, to wit, to the ſuperiour number 1, and to the inferiour, marked with the number 3, but the ſides, 2 and 4, remain untouched.

In like manner alſo *Mars*, or Iron, toucheth only the upper and lower ſides, as you ſee under the letter F. So alſo *Saturn*, or Lead, under G; And *Jupiter* or Tin under H, you ſee touch but two ſides of their Squares. Therefore from this figure may be ſeen in what degree of perfection the Metals exceed one another, ſo that he who hath reſpect to this figure, cannot erre in diſcerning the ſaid degrees.

The Ancients have not impoſed theſe Characters, neither by chance nor in vain, but they have directed the whole reaſon of characteriſing to this end, that the Character might exactly agree with the Nature and Property of the thing ſigned; as the great agreement between the Celeſtial Luminaries or Planets, and the Metals, doth clearly manifeſt. Nevertheleſs theſe things are not to be diſcerned by all men, but by thoſe only who are able throughly to inſpect the nature of Metals, and from that knowledge of the Metals, to know the ſaid degrees of perfection; for ſo much of rotundity as exhibits it ſelf in the Character to the ſight, ſo much alſo of purity and perfection is in the ſigned body; and ſo much as it ſhews of the ſquare, ſo much alſo it hath of imperfection: And this is a Chymical Axiom or Precept altogether infallible, and ſo certain, that he who in the emendation of Metals ſhall follow it, will not eaſily erre.

Gold, the moſt perfect of the Metals, by touching the four ſides of the ſquare, argueth its great perfection: Silver is not far from the perfection of Gold. And among the reſt of the Metals, Argent-vive, Iron, and Copper have the half, but Lead and Tin only the fourth degree of perfection.

Theſe few things we think ſufficient for thoſe who are deſirous of ſo great knowledge. He that deſires to know more of theſe Harmonical Signatures, of the Celeſtial Lights, and Terreſtrial Bodies, let him accurately examin this Foundation, and he will find thoſe things which neither *Ariſtotle* long ago, nor our Schools at this day, have had any knowledge of. This I dare aſſert for truth, That the Ancients, in the *Egyptian* Schools, have hidden great Myſteries under the Characters of their Signatures, and not only in thoſe ſigns impoſed upon the Sun, Moon, Stars, and Metallick Bodies, but that they have manifeſted great Secrets by the very Names which they have given to all things, which was not by chance that they have given to this thing ſuch a Name, and to that another: But when after times changed many Names, thence it happened, that thoſe Signatures fell into great uncertainty, and are now perplexed with many doubts. The Names which from *Adam*, *Noah*, and their Poſterity, were in uſe with the *Egyptians*, *Chaldeans*, and *Hebrews*, the *Greeks* alſo had in uſe, and from the ſame Foundation called things by due and true appellations. The *Latins* have taken no care about thoſe derived to them, although the only and true Foundation of every Inveſtigation of thoſe Secrets is placed in thoſe. Indeed I being ignorant of the *Egyptian*, *Chaldean*, and *Hebrew* Tongues, know not how to interpret thoſe Names with their ſignature. But one that is skilful in thoſe Languages, and endowed with ſome knowledge of natural light, by applying himſelf to ſuch ſearches, by a prudent inquiſition, will find the Truth of thoſe things which I have here written, to wit, That the Nature and Property of all things are poſited in their Names and Characters: I will expedite the matter by a clearer Explication, and in a few words expound the Circle and Quadrate. In my Treatiſe of the *Nature of Salts*, I have clearly taught and demonſtrated, that all things in the World have their original from the Sun and Salt. The Ancients have deſigned the Sun by a Circle, and Salt by a Square: But as a Circle is firſt drawn before that a Square can be put to it; and as a Circle by right is preferred before a Square, inaſmuch as that is the Original of this; ſo alſo the ſun is to be preferred to ſalt, to which it hath given Riſe, and which it hath preceded in its exiſtency, and which being compared with the ſun its Original, is leſs to be eſteemed: Hence, without the ſun, ſalt generateth and produceth nothing; nor yet the ſun without ſalt, becauſe in every generation and production there is neceſſarily required the conjunction of Male and Female, the ſun performing the office of the male, and the Moon of the female.

So *Eve* the Female, as a Square, aroſe from *Adam*, as from a Circle, and from both, to wit, from the circle and the ſquare conjoined, the fertility and propagation of mankind hath drawn its original. The Poets have attributed this propagation to *Venus*, and noted it with a ſign compoſed of a Circle and a ſquare, ſaying, that the Goddeſs *Venus* was born of the froth or foam of the Sea and Salt, and dried up by the Rays of the ſun.

The Character of *Venus* being weighed with an accurate conſideration of mind, very perſpicuouſly ſheweth how wiſely and prudently the Ancients have ſhadowed out the Myſteries of Nature by their Characters.

Venus is ſigned with a round Circle, with a Croſs pendant from the Circle; the Circle denoteth the Sun; the Croſs, Salt: For when four lines are conjoined in their extremities, they make a Croſs, all the ends meeting in one point. But if all thoſe Lines be diſpoſed four ſquare, they form a Quadrate. Therefore in things ſigned, the Croſs and the Square differ only in their external Figure, and ſignifie one and the ſame thing.

That this Myſtery may be the better apprehended, I will interpret the true ſignature of thoſe principal Creatures of God, (to wit, the Sun and Salt, from which all things proceed) attributed to them by the Ancients, according to their Latin ſignifications *Sol* and *Sal*, that their degrees and difference in nobility and goodneſs may evidently appear: For the more Circles there are conſpicuous in thoſe words, the more of purity and goodneſs they argue to be in the things which they denote; and the more ſquares there are in a Word, the more of earthineſs, imperfection, and im-

impurity is ſhewn to be in the thing thereby ſignified. But this Rule holds only in thoſe words which were impoſed upon things by the Ancients, in others not.

Seeing therefore that it is beyond all doubt, that thoſe two words, *Sol* and *Sal*, were by the Ancients impoſed upon the things they ſignifie, according to a true ſignature; we will therefore further explain them.

And here it is firſt to be noted, that all the forms and figures of Vegetables, *viz.* of Trees, Herbs, and other things growing out of the Earth, and alſo of Animals, whether Men or Beaſts, alſo of Minerals, do take their original only from the circle and ſquare, ſo that by thoſe it may be known what bodies or members are round or long; for the Body of a Man, as alſo the Trunk of a Tree, have not only a round, but alſo an oblong figure, and the joints of every finger, and the leaves and branches of Herbs and Trees ſhew forth the ſame figure, ſo that in thoſe the Circle and the Quadrate are every where found.

And not only all the Creatures of God are noted with the ſame ſignature, but alſo all Writings and Letters, proceeding from *Adam*, *Noah*, and their Poſterity, have taken their beginning from the Circle and Square. As for example: All the Latin Letters, even from the beginning to the end, you ſhall find to be compoſed of a circle and a ſquare. *A* containeth two lines and a half of a ſquare; *B* conſiſteth of two ſemicircles, and one line of a ſquare; *C* is a ſemicircle; *D* is formed of a ſemicircle, and one line of a ſquare; *E* hath three lines and a half of a ſquare; *F* two and a half of the ſame; *G* conſiſteth of a ſemicircle, and half a line of a ſquare; and ſo on to the laſt Letter of the Alphabet: So that all the Letters being compoſed of a circle and a ſquare, were left by the Ancients to ſhadow out and ſignifie thoſe Myſteries to Poſterity.

Therefore ſeeing that in my Treatiſe of *the nature of Salts* I have evidently demonſtrated the Sun and Salt to be the beginning of all things, I think it neceſſary to interpret thoſe two words, *Sol* and *Sal*, according to their nature, and to prove that they are the true beginning, and true end of all things.

Between the words *Sal* and *Sol* there is no other difference, but the middle letter, which in *Sal* is *Alpha*, but in *Sol Omega*; by which two Chriſt manifeſted himſelf to St. *John*: But the initial and final letters of both words are the ſame, they are diſtinguiſhed only by the middle letters, *Alpha* and *Omega*, and that not without great reaſon; for as *Sol* generateth *Sal* from the beginning, and all things which are take their original from him, ſo alſo the end of all things ſhall happen at the laſt day, when all things born and ariſen from the Sun and Salt, ſhall again be conſumed by fire, as *Peter* writeth, to wit, that the Sun, Moon, and all the Stars, ſhall fall from Heaven, and that the whole Earth ſhall be reduced to Aſhes. Therefore in *Sol* and *Sal*, the beginning and end of all things are perfectly diſcerned. Neither do theſe two words only ſet before our eyes the beginning and end of all things, with the deſtruction of this earthy and fading World, but they alſo make manifeſt the whole Myſtery of the Holy Trinity, which I could very eaſily demonſtrate.

But becauſe the *Egyptian* Learning, built upon the foundation of Nature, is loſt, and in the room thereof Sophiſtical Schools have grown up, which by their vain loquacity have altogether oppreſſed and baniſhed the truth; it might eaſily happen, that I might bring a Neſt of Hornets about my Ears, if I ſhould write ſuch things publickly, as fly the knowledge of the learned multitude. Therefore it is better to be ſilent, than to incumber my ſelf with unneceſſary contentions.

But that we may ſee there have alſo been others, who were not ignorant of the Myſteries hidden in ſalt, it ſeems fit to me, in the end of this Diſcourſe, to ſubjoin the opinion of a certain learned man, explaining the Greek word ἅλς, *Chap.* 13. *Book* 4. and as it were, bringing into view the great Myſtery of God hidden in the ſame, that ſo we may be invited to read the learned Book of the ſaid Author, concerning ſalt, which containeth many things highly worthy to be read, and of the reading of which no man will repent; the name of the Author is *Bernardus Gomeſius*, printed at *Frankford*, in the year 1605, a Book truly worthy of any man's reading, and as ſuch I ſtudiouſly recommend it to thoſe who are deſirous of learning any thing of good.

But to return to my purpoſe, I ſeriouſly affirm, that the nature and property of Metals may be learned and openly known, not only from the ſignature aſſigned them by the Ancients, but alſo from that which the fire introduceth into them, and this ſignature proceeding from the fire, is far to be preferred to that of the Philoſophers; not therefore becauſe the Element of Fire poſſeſſeth a greater authority or might than all Philoſophers ever had or can have: But becauſe the Fire alwaies performeth immutable actions, and committeth no errours, nor can it commit any, provided the Operator who handleth the fire doth not deviate from the manner of operating, for at all times in one and the ſame manner it ſheweth the ſignatures of the metals.

The nature of the fire is ſuch, that whenſoever we will, it exhibiteth to us, by a ſingular ſignature, the occult nature and hidden properties of the metals; for even as any burning ſpirit of Vegetables, or volatile ſalt of Wine, being drank by men, ſtirreth up their nature and properties, and expoſeth thoſe things to view, which before lay dorment, and which would not have been known, if the warm ſpirit of the wine had not manifeſted them: So alſo is it with Salt, which, as we have taught in the precedent Treatiſe of the nature of ſalts, hath a power and faculty of exciting the nature of metals, and of manifeſting their medicinal Virtues. But the Fire, of which we here treat, hath the faculty of ſubjecting their perfection to our eyes.

For as by the pure ſpirit of Wine the vital ſpirit of a Man is preſently cheered, and being awakened, the hidden ſignature forthwith goeth out of the inward Penetrals of the heart; ſo that the Sanguine ſing, dance, play, and are occupied in Amours; the Cholerick break forth into quarrels and fighting; the Phlegmatick grow drowſie and ſleepy, and the Melancholy are taken up with ſpeculations, meditations, and ſearches. Theſe ſignatures the ſpirit of Wine can draw forth from the moſt inward receſſes of men. By the ſame reaſon the ſignature of Metals is awakened, excited, and educed by the operation of the fire, *viz.* when they are melted in a Crucible; for the ſmoak or fume going out from them, preſently indicateth the nature and property of every of them. Pure Gold, and free from all addition, emitteth no fume alone, but being melted with ſalt, giveth a purple exhalation. Silver alwaies exhaleth ſomewhat of a blue, bitter, and unpleaſant fume: The fume of Copper is green, and ſtinketh: Of Iron not ſo much as Copper, being alſo red, ſtriketh the Noſtrils with a ſtink: Lead and Tin ſend forth a white fume, ſtinking and poiſonous: Argent-vive, in its whole ſubſtance,

ſtance, vaniſheth in a venomous fume, and theſe are the ſigns of the fumes, by which melted Metals, when they are not mixed, are wont to be diſtinguiſhed and known from one another. But if Copper, or any other imperfect Metal, ſhall be mixed with Gold or Silver, it changeth the fume, and rendereth the proof or examen doubtful and uncertain: Nevertheleſs of the judging of the perfection of Metals by the Fire, this Experiment is of all the moſt perfect and certain, *viz.* when they are ſo melted by a very ſtrong fire, that they move themſelves, and are as it were turned or whirled about in the Crucible, and by how much the rounder this motion ſhall be, and the higher it elevateth it ſelf, by ſo much it ſheweth the Metals to be more perfect; the more depreſſed and equal, and the plainer the ſuperficies ſhall be, the leſſer of perfection is in that melted Metal. The trial of this thing is eaſily made, by which it is found, that among all the Metals Gold is chiefly moved on the Teſt, or in a Crucible, by a round or ſpherical motion; next Silver; next to that Copper; next to Copper Iron; after Iron Lead; and laſtly, after that Tin.

The ſame difference of perfection and imperfection is ſhewed by the pouring of a melted Metal upon a Porphyry ſtone, or any the like well levigated, and put into a Kettle of Water, ſo that the water may not touch its ſuperficies, which is to receive the melted Metal: This therefore being poured out upon the ſaid Stone, leapeth and divideth it ſelf into many grains, greater or leſſer, more round, or leſs round, according as the Metal ſhall be more or leſs pure. But of all the Metals, there is none more imperfect than Tin, which by effuſion upon ſuch a Stone, very rarely diſperſeth it ſelf into grains, but if the effuſion be dextrouſly made, it dilateth it ſelf in breadth in a very thin form, like to writing Paper, ſo that it may be writ upon (by a ſtile or ſtift) like Paper, and folded and ſealed, and ſent to others, after the manner of other letters: Such letters made of Tin, are hurt by no Water, ſo that they may be of great uſe, where neceſſity requireth ſecreſie in ſending letters.

But that Tin ſpreadeth it ſelf into ſuch broad leaves, and doth not ſeparate into grains, after the manner of Gold and Silver, the reaſon is its imperfection, which its before-mentioned ſignature evidently argueth, containing but little of roundneſs, and taking the greateſt part from the ſquare.

The knowledge of a metallick perfection is alſo acquired from the rotundity of the metallick motion in the Examen of Saturn, or the ſeparation which is made by Lead in a Cupel, where Gold, before all the reſt boileth with a ſpherical roundneſs, and all the lead being ſent away in fume, by the violence of the fire, remaineth on the Cupel or Teſt, in a pure, round, or ſpherical body, eſpecially when there ſhall not be too great a quantity of Gold.

Silver doth not anſwer to Gold in its round body, in which it remaineth, yet it exceedeth Copper in roundneſs, which ſometimes alſo remaineth pure and round, if it be in a ſmall quantity.

Iron and Tin do not admit the Examen of Lead by the Cupel, for indurating the Lead, they deprive it of all flux, ſo that by combuſtion it is reduced into a powder.

Argent-vive is by the Fire wholly driven away into the Air, in which nevertheleſs keeping a perpetual flux, its ſignature of perfection may be judged of in the Cold, which perfection exceedeth that of the other imperfect Metals, and cometh near to gold and ſilver; for being diffuſed into ſmall grains, it exhibiteth in running a round or ſpherical body, imitating melted Gold: So that it is not without reaſon, that the Ancients in its ſignature have uſed the ſigns of ☉, ☽, and a ſquare; being within wholly Gold and Silver, if it be coagulated; the truth of which many Experiments have demonſtrated to me, made by the Waters of gradation, as they are called; Experiments, I ſay, which I have performed in ſmall Inſtruments, for hitherto I could not make them in great ones, and in a large quantity. If any youngman ſhall have a deſire to try the ſame, let him in the firſt place beware that he uſe not corroſive and eating waters, and by this means render the Argent-vive more fugacious.

It behoveth that he ſeek and know true ſulphur, which if it ſhall be red, he ſhall alſo bind it with a red bond; but if white, he ſhall preſerve its colour conſtant, and bind it with a white bond, otherwiſe it is wont to vaniſh in fume.

Theſe few things I could not paſs by, but ſignifie to the ſtudious of the Divine Signature of Metals and Planets. Let every one occupy the powers of his Ingeny in the exerciſe of this Science, that he may become expert in the wonders of things, eſpecially of thoſe which lie hid in the words or names impoſed upon things ſigned by the Ancients, who have found out great Secrets, as well Celeſtial as Terreſtrial, and have comprehended them in thoſe. Some ſuch words of the Ancients I would have interpreted here, but that in ſo doing I ſhould have divulged thoſe things which are not vulgarly known, for which cauſe it is better to paſs them by in ſilence. He that will bend his endeavours to ſo great a Science, may obtain many wonderful things; but of theſe enough; it ſufficeth at the preſent to have laid the Foundation, the reſt I leave to him, who being prompt to the ſtudy of ſeeking, ſhall bring his mind to the acquiring of this knowledge; if he ſhall once get into the right path, he will find out more than he ſeeketh or deſireth. Alſo Mountains, Woods, and Countries, by their ſignatures do not only indicate the Treaſures and Riches, given them by God, but are alſo wont to foretell their own Fates, as their Riſe, Encreaſe, and Deſtruction. It remains, that we briefly examin, and take a ſhort view of the ſignatures of ſalts, with what notes or marks they are ſigned by God, and alſo by what they ſignifie their natures and properties; for without doubt, they have their ſignatures, and eſpecially the common and vulgar Salt, the which, wherefore ſhould it not have its ſignature, ſeeing that it is the original of all other things? There is not found any Herb or Weed ſo vile, any Worm ſo abject, which wanteth its marks given it by God, by which it manifeſteth to us its nature and virtues. I have above indicated the Sun by a Circle, and Salt to be deſigned by a ſquare added to it: and in the Sun and Salt all earthly things as Vegetables, Animals, and Minerals, to have the beginning and end of their generation, propagation, and encreaſe; alſo all things being riſen from the ſun and ſalt, to be ſigned by the Almighty God, with certain ſignatures, from which their nature, powers, virtues, and properties may be known; neither have I only aſſerted, but alſo affirmed, that all the Myſteries of Languages and Words may be ſearched out and known by thoſe ſigns, to wit, the Circle and Quadrate.

Theſe things are ſo certain and true, that they are beyond all confutation, which I will make plain to every one, by one only Argument, not exceeding the Capacity of a ſimple Boy, if the envious Brethren of Ignorance, being lifted up by their great pride, ſhall

refuſe to undertake it. That the Sun is conveniently and appoſitely ſigned with a Circle, no man will deny, becauſe it never ſheweth it ſelf to the ſight in any other figure than a round fiery Sphere, which ſign being attributed to the Sun, by the Ancients, ſo remaineth even to this day.

The Ancients have alſo ſigned Salt with a ſquare, which by the length of time, and the negligence of men, hath vaniſhed, ſo that every one hath ſigned the ſpecies of ſalts according to his pleaſure, one in this, another in another manner; and by this occaſion peculiar Characters are invented by almoſt every Chymiſt, whence one uſeth not that which another doth. But at this day among them, for the moſt part, Salts are ſigned in the following manner. The common Kitchin Salt hath the Character of a Circle, cut by a line tranſverſe: Salt-petre hath a Circle repreſenting the form of an Egg, and cut by a line drawn from the top to the bottom; But who was the Author of thoſe Characters to theſe Salts, I know not, neither is it much matter, whether a man know, or not know it; but without doubt they were men who had never ſeen Salts brought to their higheſt Purity: For vulgar ſalts, as they are every where found, have not their proper figure and form which they ought to have, and which they obtain after their cleanſing: So the vulgar and ſimple ſalt, as it is made from the Sea, or ſalt Fountains, or dug out of the Earth, hath not its true and proper ſignature, neither can it have, by reaſon of its many earthy feculencies; but after all its fæces are removed, and it hath obtained a great purity and cleanneſs, its own true ſignature, to wit, a ſquare then appeareth, and indicateth the ſign which is due to it. I have already demonſtrated this to be true in my Treatiſe of the Nature of Salts, where I have taught by what means every common Kitchin Salt is to be ſo purged, that it ſhall be no longer rough, foul, obſcure, and aſtringent, but clear and tranſparent like Cryſtal, both in ſmall grains, and greater pieces, of a ſweet ſavour, and a ſquare or cubical figure, and which way ſoever it is thrown, alwaies exhibiteth four Angles, like to a ſquare, as if it were formed by Art: Going forth in this moſt pure form, it ſeemeth thus to ſpeak to Mortals: *Here ye ſee my true and natural form, given to me by the Sun my father, in the body of the Water my mother, which the Earth indeed hath covered with a rough and vile Garment, but Art hath again taken it off (praiſed be God) reſtoring to me my priſtine form, to the future advantage of many ſick; therefore as I was created from the beginning, ſo now I appear, without any impediment, to perform thoſe things for which I was appointed by Divine Creation.*

If the Sun in the Firmament could by any accident be ſo defiled and corrupted, that he ſhould loſe his Light, it could in no wiſe be that any thing in the whole World could remain alive for one day. Which thing Experience it ſelf ſheweth us, when the Moon interpoſing between the Sun and our Eyes but for one hour, depriving us of his Rays; in which Caſe the Sun in no wiſe ſuffereth, nor is in any manner corrupted, but only hindred for that little time, from tranſmitting to us his vivifying Rays. Therefore if ſo ſmall an Impediment in the Orb of the Earth can cauſe ſo many Diſeaſes, and other Incommodities to men, why ſhould not alſo the fæces obſcuring Salt, eclipſing its natural form, and rendering it more ignoble, be a detriment and impediment to its Powers and Virtues? Let every man judge, if a groſs and impure Salt can be as commodious to all Men and Beaſts, as that which hath been reſtored to the higheſt purity of its Body.

Seeing therefore that it is the great intereſt of Mankind to enjoy ſuch a pure Salt, I have determined to prepare a quantity of it, according to that manner of purging it, preſcribed in my Treatiſe of the *Nature of Salts*, that I may be able to accommodate many therewith. I have hope, that at length the Eyes of Mortals will be opened, that they may ſee how for a long time they have been ſeduced by blind Leaders, and finding this, will have a greater regard to their own health. Truly there is but a very ſmall Labour and Coſt required for the cleanſing of common Salt, to free it from its earthy fæces, and render it clear, tranſparent, and in the Water of a Cubical Figure, and that without the addition of any foreign thing, only by ſolution, filtration, and coagulation of its own proper ſpirit.

If by theſe Operations you ſhall bring ſalt to its higheſt purity, you may boldly aſſert, that you have acquired ſuch a ſalt as the pure Sun operated in the pure Water at the beginning; when the Sun, ſeated in the height of the Firmament, would very freely perform his Office, yet being hindered by groſs and turbid Clouds, interpoſing between him and the Earth, whereby he cannot render us partakers of his all-warming Rays, we ought not to impute the fault to the ſun, inaſmuch as he is not in fault, but rather to thoſe thick and dark Clouds, which hinder us of his ſplendour and efficacy.

So alſo is it with Salt, which would freely exerciſe the Gift beſtowed upon it by the Almighty Creator, were it not hindred by its terreſtrial fæces; therefore this impediment is not to be attributed to ſalt, but to the intervening fæces, which hinder its ſalutary virtues. If it were in our power to remove thoſe thick Clouds from the ſun at our pleaſure, as it is to ſeparate the earthy fæces from Salt, we might every year make our ſelves a very commodious Summer, which nevertheleſs cannot be done, ſeeing that God the great *Pater familias*, hath reſerved this alone to His own Power.

As for the ſignature of Salt-petre, that certainly is very unequal, by reaſon of the great diverſity of this Salt, ariſing hence, that it is well or ill purged, is defiled with more or fewer fæces, or other ſtrange ſalts. The Common, which is required for the making of Gun-powder, is never perfectly pure, but alwaies mixed with other Salts, which cannot be ſeparated from it by the accuſtomed and uſual manner of ſolution and coagulation: Hence alſo you ſhall find no ſalt-petre, which can have that true and genuine ſignature, which God and Nature hath given it.

For by whatſoever vulgar labour and pains the Salt-petre which is got out of Stables, is purged by Solution and Coagulation, it is yet impoſſible that it ſhould obtain its due cleanneſs and ſignature. But to acquire that, it behoveth to uſe the following Operation.

Firſt, ſome pounds of Salt-petre are to be taken, which are to be purged by Solution and Coagulation, and that to be ſo often repeated, untill it acquire that purity which it is wont to admit by this vulgar Operation. Being ſo cleanſed, it is to be divided into two equal parts, and one of them to be mixed with white Potters-earth (or Tabaco-pipe-clay) of which little Balls are to be formed, to be dried in the Sun, and put into a Glaſs Retort well coated, or an Earthen one which will hold the ſpirits, that the pure ſpirit of Nitre may be Elicited by Diſtilation, and received in a large Glaſs adjoyned to the Retort, containing ſome Water, into which the ſpirit entreth freely. The other part of the cleanſed Salt-petre, being put into a

Cru-

Crucible, is to be reduced into a fiery fixed Salt, by the casting in of Charcoal, Tartar, or the Stellate Regulus of Antimony, then to be dissolved in rain Water, and filtred through brown Paper: So much only of this Liquor of fixed Nitre, is to be poured drop by drop to the distilled spirit of Nitre as will suffice for the fixing it. This Operation stirreth up a great noise, hissing and bubling, which ceasing, admonisheth to leave off pouring in any more, and indicateth that those two contrary Natures, to wit, the acid spirit, and fixed liquor of Nitre have mutually satiated one another, and the corrosive spirit hath lost its corrosive nature, and the fixed fiery liquor its fiery quality, both returning to the pristine nature of Salt-petre. From this liquor, the Glass being imposed in sand, the unprofitable Phlegm is to be distilled off so long untill a Cuticula or thin skin appear at the top of the matter, the sand being cold, the glass is to be taken out, and set in a cold place, and let stand for one night to shoot into long and sharp Chrystals, to be freed from the rest of the liquor, by pouring it off. This liquor is again to be freed from its unprofitable Phlegm by distillation, and again to be exposed to the cold to Chrystallise. Whatsoever shall remain after every Operation, is again to be Evaporated in sand, till the Cuticle appear, and to be reduced to Chrystals in the cold, which Chrystals may be used as common Salt-petre. The Chrystals of the two first Operations, are once more to be dissolved in Rain Water, Filtred, Evaporated and again Chrystallised, which are now white as snow, and extend themselves into length, thin, sexangular, and so equal, as if they were smoothed with a Plain: For not the least roughness or unevenness is to be seen in their superficies, but they Exhibit the true and natural Signature of Salt-petre. If any one shall be desirous of bringing this Salt yet to a higher purity, he may again divide this purified Salt into two parts, and from one draw the Corrosive spirit by distillation, and fix the other with Coals, and destroy both by Commixion, repeating the Operations as we have already taught, he will prepare a Salt-petre far more Excellent as well in Chymical as Medicinal Operations, as is manifest in many places of my writings.

If you Operate rightly all the Chrystals, none excepted, will be straight, sexangular, and equal in length, without any roughness, or unevenness, which is the true and genuine signature of well purged Salt-petre.

NB. The fixed liquor of Nitre, being left in the Air for a long time, and afterwards Evaporated to a Cuticle, shooteth into small Chrystals, representing the Effigies of Stars, whose figure appeareth in a rotundity so neatly and pleasantly Constituted, that those six Rays proceeding from the little body in the center or middle, seem to be most exactly dispосed and distributed to an equal distance and length, as in a circle. Truly it is an admirable and stupendious work of Nature, and a signature very unlike to the former, in as much as the six Angles of this, are comprehended after a Circular manner, but in the other they extend themselves only in length and sharpness. Those things which we have here delivered concerning the true signature of common Salt, and Salt-petre, the same are also to be understood of the signature of other Salts, which must be free from all their sordes and fæces, before they can shew forth their true signature.

Vitriol and Alum, which always shoot in a knotty and uneven Figure, after they have laid aside their defilements, exhibit clear and pellucid Chrystals, which yet will be much clearer if purged by several Operations. Yea, being reduced to their highest purity, they put on a Cubical figure like common Salt, nevertheless in Elegancy, Beauty and Pleasantness, giving place to that. Hence it is manifest, that nature is always ready for the gracing and adorning of her own fruit, if a helping Hand be afforded her by Art.

Before I put an end to this Treatise of the signature of Salts, I think it fit to point out in what degrees of Dignity, those two Words *Sol* and *Sal* differ, and are distinguished.

The word *Sol*, containeth two Circles and the half part of a square, O. is a whole Circle; S. hath two semicircles, which being conjoined, make an entire Circle; this being cut in the middle, and the half of the section turned upwards, towards the right hand, and the other half downwards, towards the left; giveth two semicircles forming the Letter S. L. is the half part of a square.

The word *Sal* hath only one Circle, to wit, the Letter S. consisting of two semicircles: Also one square, constituting the Letters A and L, which argueth that the good which is in Salt is partly tempered with the other Elements, and partly combined with Earth. The Sun far exceedeth Salt in purity, nevertheless it is not absolutely perfect because the Letter L containeth the half of a square, which sheweth that it cannot be endowed with an absolute and perfect purity, neither is it as Telescopes at this day demonstrate, by whose help those solar spots have been observed in those times. Neither also ought it to have an absolute perfection, the which belongs only to God, and not to any creature, in the number of which is the Sun: Nevertheless that he is the purest of all creatures, there is no Man dare deny. Hence it came to pass, that the ignorant Heathens, attributed to the Sun Divine Honour, thinking that besides the created, there was as yet another uncreated Sun; That is, the Omnipotent God himself, the Creator of the Elementary and shining Sun, which according to the Words of Christ shall also perish at the end of the World. By a like reason there is a twofold Salt, *viz.* one Eternal, Divine and Celestial; the other Terrestrial and fading. And as the Holy Spirit proceedeth from the Eternal Light, and Divine and Celestial Salt, for the warming and enlightening the Hearts of Men involved in darkness, and for the defending our souls against the crafts and deceits of Satan; so also from the Elementary Sun or Fire, and the Terrestrial Salt, proceedeth that most noble saline spirit for the strengthening of humane Bodies, defending them against various Diseases, and preserving them in good Health. Therefore there is an Eternal and Divine *Sol*, a Celestial *Sal* and Holy Spirit; and also an Elementary, frail Sun, Salt and Spirit. But it is our Duty to Love, Praise, Honor, and Adore the Eternal Sun, and to him to commend the health of our souls. And to use and enjoy temporal and fading things for our necessities, with thanksgiving.

The Explication of the Word ἅλς or Sal, *by* Bernhardus Gomesius.

BUT before we undertake to expound such excellent places, it behoveth us to invoke the divine Being; that, that which cannot be fore-known by any Augury and Divination, we not erring, but being led by the Divine inspiration and instinct, may at length expound;

pound; seeing that in the treating of things so Divine and unspeakable (that being wanting) if we should erre, it might be unpardonable, but if we shall piously and happily prosecute the matter, universal thanks and praise may be given to God alone, and to Christ the great giver of Salt. First, therefore we are to shew what the Celestial Salt is, and by what means it may be distinguished from the Terrestrial Salt, of which Christ speaketh in the Gospel. And because the Evangelical Words of Christ will be of great force to us in the speaking of it: And seeing that Christ when he would grace the Apostles with a high Title, called them the Salt of the earth: we think it not improper to call him the pure and undefiled salt of Heaven. For there is scarce any thing of so many preparations of an inferiour nature which excels the (as it were) Divine strength and efficacy of Salt in this part: For Christ and his blessed Humanity is the only Salt that is placed upon the Table of the Blessed. In whom Salt is the fullness of his infinite, inexhausted, and never-ending divinity; which abundantly filleth both Heaven and Earth and all things therein; and then again making himself palatable to us, he exhibits himself to be tasted most sweetly by all Men. For from that all things that are, and ever were and that shall be hereafter, have both received their being, and are made perfect, and without it could not be, for his Divine seasoning, or become palatable to the seasoner.

So this salt endeavours to express his, in whose name are both in Greek and Latin three Letters in one syllable; or rather to adumbrate this one and the same Divinity common to the three Persons. For tho' the Divine mystery and sacred things are shut up in Letters chiefly with the *Chaldees* and *Hebrews*, because GOD spake by them: Yet they don't always want the Elements of the tongues, especially the *Greek*, which was both derived from them, and words construed from these things are not imposed from their power but from their propriety, as *Plato* the greatest of the *Greeks* supposes; For that the divine infinity and Immensity is exprest and explicated in Greek letters, is shewn in the *Apocalyps*, Cap. 1. where *John* saw and heard our Lord Christ preaching of himself, I am α and ω, the Beginning and the End.

For as the sun, when it lightly touches with its perspicuous light, by that its image and splendour it is forthwith given: So the Heavenly and Infinite Divinity, with all Goodness, as it were His Brightness, does not only leave His impress Image in the things themselves, but also in Letters, with which those things are enlightened and made perspicuous. The like we have found in Salt, design'd in Greek notes; for that which in Latin is called *Sal*, in Greek is called ἅλς, express'd by the same Letters, though chang'd in order, and extended in three Letters, but one Syllable; but the Greek word expresseth both more plainly.

For the first Letter of it is α, which by its infinite roundness, as with two Horns, seems to be brought into the following Letters; which note plac'd with the Holy and Divine Trinity, signifies the first Person of it, to wit the Immense Father: Who as ἄλφα, is an infinite beginning in himself; so the same pours out and infinitely communicates his Nature to other two Divine Persons proceeding from himself: in one of which by Generation the Son; but in the other by inspiration he produces the Holy Ghost. And further, as α shews it self, its certain divine Operation follows that Eternal, Infinite and never ending Power of the same Mighty Father,, which also he sometime pour'd out from his Almighty Infinity, to procreate the Universe. As also in two horns, I mean Benedictions one is found to be in Creatures by the Creation of things; and the other in their Preservation; both by the Wisdom of the Omnipotent Son, and by the Goodness of the Holy Spirit.

But the middle Letter λ, is a Note full of sweetness: which is expressed with a Face, round, and composed for Mirth; and its Figure is not unlike a Circle. For from the superior Angle two sides stretching backwards, seem to make a Triangle, yet without a base and without end, as the Letter it self expresses. Which note again relates to the same Trinity, and represents the second Person of it, to wit the Son, or Word proceeding out of the most sweet Mouth of the Father: In which, two eternal Relations, as they call 'em, as to Infinite sides, are found: the one whereby he relates to the Father, from whom he proceeds by his eternal Generation; the other whereby he is Related to the Holy Ghost, whom he breaths together with the Father by an eternal and infinite habitude, and without any intermission.

But this note λ, I mean Christ the Son of GOD, and Mediator between GOD and Man, is never when time presents, wanting in his most beneficent Actions: that he who had taken the Human nature to the Divine, and was made the Corner stone, might (as he has done) connect the two Walls, to wit the *Israelites* and *Gentiles* as two sides, when he built in himself a strong and safe Sanctuary for them both, that flying to Him, they might escape the fearful sentence of everlasting damnation.

Lastly, the Letter ς, concludes this Monosyllable. This note is design'd with a certain sinuous and Circumflext line drawn from hence and thence, which going from the two extreams in the middle, designs as it were two distinct semi-circles; out of which is shewn that they are made and constituted. Which lineament compar'd with the Trinity it self, adumbrates the third Divine Person, to wit the Holy Ghost. For that spirit proceeding out of the Bosom of both the Father and of the Son, by one and the same Inspiration, so knits those two distinct Persons, to whom he is co-equal and co-eternal, by an Infinite tie of Love, that he remaining a distinct Person, might agree with them in their most simple, individual, and immense nature.

But as to the other Persons, so also his Communication is attributed to the Holy Ghost in time; which is wonderfully expressed by the shape of this Letter ς: Yet if we consider its lower extream, which seems as it were to arise of the former Letters of the Monosyllable, that is how it comes to be stretch'd chiefly towards the right hand: then from right to left, is wrested a little by ascending by a sinuous derivation: and thence at last, with the like following obliquity it ends again on the right hand. For the same Holy spirit proceeding from those two eternal and infinite Persons, as from an immense Fountain of Infinity, whilest from time to time he communicates his Gifts to the World, first those on his right hand, that is into the hearts of Men, he pours out to them that are illustrated and endued with the Divine Light of Nature: Then the same Light remaining, as it were bending from the right, ascending a little to the left, he brought forth the Mosaick Law written with the Finger of God, that is Dictated by him to the *Israelites*. Lastly, leaving the Mosaical Law on the left, he return'd to the right hand, and season'd the Evangelical Law deliver'd by Christ our Saviour, with his most Wise and Loving salt of Grace.

From

From all which, that which pertains to the buſineſs, appears from thoſe three Letters of *Sal*, making one Syllable; and again, this unfolding it ſelf in thoſe three Letters, ſhews us, that there is in *Sal* a certain impreſs or image of the Sacred and Individual Trinity, which we worſhip, Three in One, and One in Three. Which Trinity we ſhould have had, as an infinite, eternal, and inexpreſſible thing, commonly unknown, and incomprehenſible, and as a moſt remote Salt, never heretofore put into an humane or Angelick Saltſeller, we ſhould have left untouch'd; unleſs at length the Divine Perſon of this Trinity, the Word, in taking the Humanity to himſelf, as it were Salt into a Saltſeller, had preſented to our taſte ſo much Divinity; for this very Saltſeller, both in figure, is covered with the eternal ſplendour of the Father, as alſo pointed and illuſtrated with the embroidered Notes of His Paſſion, and likewiſe adorned with the Unction of the Holy Spirit is alwaies placed upon the Heavenly Table of the Bleſſed, to ſeaſon their Food and ſolemn Banquets, after an eternal and ineffable manner; for in him all divine, and moſt ſweet reliſhes and excellent taſtes of His eternal Wiſdom are ſeaſon'd anew; for Chriſt Himſelf is not only the Heavenly and moſt Wiſe ſeaſoner of the moſt opulent Feaſt, but alſo the very ſeaſoning, and thing ſeaſoned, and the Food which is ſo placed; for by Him his Heavenly Father, the King of kings, and magnificent Lord of lords, who out of His Goodneſs, and as He loves His good things, gives moſt liberally to all People a very large meaſure of Salt, that is, the help of His Grace to ſeek Him, and ask of Him Heavenly things.

True, that they who are called to the Heavenly Banquet may prepare themſelves to come in this meaſure, and moſt happily ſit down in it; but if (like fools) they refuſe to come, the Meaſure being taken from them, they will be plung'd into eternal puniſhment. In which reſpect they may be likened to Fleſh and Bones put into a Pot together, and water and ſalt put to them, hung over the fire to boil, and afterwards brought to the Table: Of which the Bones, which will be neither ſeaſoned by ſalt, nor ſoftened by water, are thrown under the Table, to be broken by Doggs; but the Fleſh, becauſe it is made tender by heat and water, and takes the ſeaſoning, is again ſprinkled with a purer ſalt on the Table, and eaten with the greateſt pleaſure: For as Bones are to Fleſh, ſo are Evil men mingled with Good: Of which theſe, when they will neither reliſh the Salt of Divine Grace, nor be waſhed nor ſoftened by pure Water, nor warmed by the heat of the Heavenly Word to be willing to divine things, will by the ſevere Judgment of the great Taſter Chriſt, at his magnificent Table, be reſerved to the moſt exquiſite puniſhments: Which obſtinate and unſeaſon'd Fools, He, for their hardneſs, finding unworthy his heavenly Table, plucks out from among the Righteous, and throws 'em down into Hell, there to be torn in pieces and devoured by thoſe infernal Dogs, to all Eternity.

But the Good, who have been ſeaſoned not only with the former, but alſo the later Salt, I mean with antecedent (as we ſay) and conſequent Grace, and are not only adorned with Virtue, but have ſuffer'd all croſſes and afflictions of this Life for Chriſt: Theſe, as Fleſh worthy His Table, the divine Taſter offering to God the Father, He ſeaſons with the new Salt of Glory; and though Aliens and Strangers, places them among the Angels and Citizens of Heaven, and with theſe Commands an equal Manſion of Bleſſedneſs to be given to them, though nevertheleſs they both come to the ſame felicity, by a different way of meriting it. For from what thoſe above Angelical Citizens, from the very beginning of things, and ſince firſt a full deſire ſeiz'd them, they have preferred the Heavenly Suppers of Chriſt to the mid-day Dinners of the moſt inſolent *Lucifer*; they have deſerved to follow thoſe Oppipary, and (as they call 'em) Princely Banquets ſeaſoned with the moſt ſweet Salt of Grace, and made reſplendant with the ſhining light of glory.

But the Inhabitants of the Earth, and Men, ſtrangers of Heaven, oppreſt by the great weight of a Body, and involved in the thick darkneſs, have made ſo long a Journey to the Country, by a far more tedious way of travelling; for the Univerſal occaſion of deſert is not to be ſnatch'd by thoſe in the Journey of Life it ſelf, and thoſe under the terminative moment following the Creation; but they ought rather ſtudiouſly and laboriouſly to take this by a continual and daily period of life, even to their death: Beſides that, the Journey to the Country is ſo hard and wearisome, and expoſed to ſo many dangers, brings ſo many anxieties upon ſtrangers every where, leads them into ſo much anguiſh of mind and troubleſome ſolicitudes, that it is plain, that not humane ability, but divine grace muſt cauſe, that ſtrangers are not deficient in the way, or that they do not wander from the true ſcope or end of their Journey: Which would be the fortune of every one in the World, unleſs Chriſt, by divine Counſel conſtituted the *Parochian* of the whole World, who giveth to his ſtrangers every where Salt and Wood, doth recreate and refreſh them, and alſo lead them into the way that directs to the ſame Heavenly Country.

This may ſuffice to be ſpoken of the ſignature of *Salts*, *Metals*, and *Planets*, at this time. He that diligently weighs it, will ſearch Nature deeply enough: If God grant me life, I ſhall publiſh a Tract of the *Signatures of Vegetables, Animals, and Minerals*; alſo in which I ſhall deliver many things good and profitable for all ſorts of Men.

O Eternal, Almighty, Bountiful, and Merciful GOD and Father, the Heat, Light, and Sun of Juſtice, enlighten and warm the hearts of all men, overwhelmed with a ſleepy numbneſs, ſhadowed with thick darkneſs, and made rigid by an horrid coldneſs, that they may ſee, know, love, and fear thee, and give thee due Thanks and Praiſes for all thy Benefits, and at laſt awakened, they may receive that ſight they had before loſt.

O Eternal Word of God, moſt ſweet, wholſom, and palatable Salt, Jeſus Chriſt, recreate and refreſh our ſick and miſerable ſouls, by thy Divine Virtue and Efficacy, that we being corroborated, neither Death nor the Devil may hurt us.

O Holy Ghoſt, the only Leader to Truth, who proceedeſt from the Eternal Fire and Heavenly Salt, comfort all the ſudden and deſarted Sheep, wandering this poiſon'd Marſh and Valley of Miſeries, among devouring Wolves, and corroborate them, that they may patiently endure their Croſs; and hereafter ſeparate them from the ſtinking Goats, and bring all the Elect into the green and heavenly Paſtures, that there they may continually behold the eternal Light, taſte the heavenly Salt, and enjoy the fulneſs of Joy, *Peace, Grace, and Mercy for ever.* Amen.

THE CONSOLATION OF NAVIGATORS.

In which is Taught

How they who Travel by Sea may preserve themselves from Hunger and Thirst, as also from Diseases, which are wont to happen to them in long Voyages.

Written for the Help, Comfort, and Solace of all those who make long Voyages for the Good of their Country.

THE PREFACE.

Reader,

OUR SAVIOUR CHRIST hath prescribed to us this Doctrine, that we should behave our selves towards our Neighbour, as we would that he should do to us; *yea,* that we should love him as our selves: *This He hath earnestly commended unto us, as the indispensible Will of God, contained in the Law and the Prophets. But although there be few who consider this, and all men seek only their own, yet one or other is still found, who calleth this duty to mind, and as far as he can, taketh every opportunity or occasion of serving his Neighbour. Although also there may be some who bear a love to others, and desire to assist them with their counsel and help, and yet are destitute of a power of giving them any thing; for no man can distribute more than he hath. Moreover, Covetousness and Envy so far governeth some, who have plenty enough to bestow upon others, that they will do good to none but themselves; of which sort there are many now to be found in the World, and hence Charity towards our Neighbour is wholly vanished.*

Seeing therefore that the Almighty, of His singular Grace, hath bestowed on me a small Talent, in searching out the Secrets of Nature, it is, without doubt, to the end that I should thereby do good to others; which Talent I would not bury, but have put to use in writing particularly from year to year, for the publick Good, and being affected towards my Neighbour, have made them publick. I have also determined, if time shall permit, to publish yet more and better things of this nature. But after that some described Voyages to the East *and* West-Indies, *and other far distant places, had happened into my hands, I perceived, not without great admiration what immense dangers occurr on the Seas, not only from Robbers and Pyrates, but also the adversitys of violent Winds, (to pass by many other Calamities in silence) by which the Ship, together with all in it that draw breath, are overwhelmed, and perish: And when I further contemplate those things with an intent mind, nothing seems to me more grievous and intolerable than Hunger and Thirst, or the want of Meat and Drink, which sometimes happeneth to Ships by adverse Fortune: For when they are overcome by the hand of an Enemy, they are wont indeed to suffer the loss of their Goods, but the Lives of the men are for the most part saved; which loss of Goods they may again easily repair by Merchandizing; and although they should be adjudged to death, yet their pain would quickly have an end. But if through an ill fate of necessity one be destitute of Bread and Water, and be forced to tear another in pieces to eat, that is of all the highest misfortune, and death it self were more desirable, than to sustain extremities and miseries of this sort. And although the want of Food doth not so frequently happen, yet the want of Water often falls out, whence Seamen are grievously tormented with Thirst, to whom, as in a most urgent Calamity, Mercy and Christian Compassion ought to be administred; but, Who can carry them succour afar off, and in a tempestuous Sea? And seeing that the Prosperity of* Maritime *Countries (where for the most part there is no Wine, no Fruits, no Mines, as in the upper* Germany, *and other places) consisteth only in Navigation, it were very well worth the while that this should be promoted to the utmost. I have therefore diligently considered the matter with my self, and have found that a Remedy may be applied to this Evil,* viz. *the want of Meat and Drink, by providing in time an* Apparatus, *or certain matter to be carried in Ships, which is of far greater efficacy in mitigating* Hunger *and* Thirst, *than common Bread and Water; yea, is able to prevent and expel that Disease which is so familiar to Seamen, to wit, the* Scurvy, *which is often a great hindrance to Sailing: So that this matter may be carried together with the usual Provisions, as a Preservative, and in case of necessity,*

ty, as if the Ship be overmuch haraſs'd with Storms, or be hindred by other infelicities, or detained longer in the Voyage than expected, it may be taken and uſed. It were indeed to be wiſhed, that theſe materials might never be wanted in any Ships, but as the old Proverb hath it, A ſuperfluous Caution never doth hurt; *therefore it is alwaies better to have a thing in readineſs, which we do not uſe, than to want it when its uſe is neceſſary. But what thoſe materials are, of which I ſpeak, and how they are to be uſed when need is, I ſhall communicate to my Neighbour, for the publick Good, not at all doubting, but that this invention will prove highly profitable to many who uſe the Seas.*

The Reader now underſtands what hath moved me to write this Treatiſe, viz. *the love of my Neighbour, and that I have not compoſed it only for the ſake of ſome few, but that I have emitted it to the publick, to the end, that thoſe highly profitable Inventions might afford help and comfort to all Mankind, and eſpecially to all that uſe the Seas, and ſuch who are infirm in their health: Nor do I doubt but that this my ſincerity of mind will be a great preſervative, comfort, and relief to thoſe who paſs the Seas, when they are in danger, by the benefit of which, they may eſcape various Chances and many Misfortunes, or beware of them for the future: For by this means which I ſhall here produce againſt Hunger and Thirſt, or other Diſeaſes which are wont to afflict Sailors, it will be found, that what I aſcribe to them may be fully deduced to the deſired effect. And therefore many Thouſands of men may thence receive Fruit and Profit, as long as the World ſhall endure; ſo that all who travel the Ocean, and are afflicted with any Diſeaſe, ought to rejoice, and give Thanks to God.*

Now, if any one ſhould yet doubt of the ſucceſs of this matter, (which nevertheleſs is ſhewed from ſo clear and irrefragable Fundamentals) I leave him to his freedom, whether he will put the matter into examination, and certifie himſelf of the Truth, before he give credit to it: Which alſo may be proved in a ſmall quantity, and not only on the Seas in Voyages, but on the Land alſo in the Houſe, among both the Sound and the Sick. Therefore let no man viliſie what he doth not underſtand, but let him commit the thing to trial, and ſee its reaſon and quality, before he contemneth it, or paſs an immature Judgment, leſt his curioſity or imaginary Wiſdom from a vain inſtinct, deceive him, or confound him with ſhame, when the proof ſhall ſhew it to be better than he could perſwade himſelf.

But that in ſome places I have uſed obſcure words, and have not propoſed all things ſo clearly, as that every man will be able to underſtand them, let no man wonder at this for I have certain reaſons for ſo doing; for no man will have any prejudice or injury thereby, ſeeing that nevertheleſs there are ſuch points of this ſort elucidated, which will remain after me ſafe and ſound: Therefore whatſoever the Reader ſhall here find written, let him eſteem it worthy to be received and embraced, as the Gift of God; the which, if I find to be gratefully accepted, more (God willing) ſhall follow. Alſo to all thoſe who ſhall have need, I offer the Medicaments aforeſaid, profitable againſt Hunger and Thirſt, and all Sea-faring Diſeaſes, a good quantity of which I will cauſe to be prepared, that every man may uſe them that will, and thence ſatisfie his deſire.

Wherefore it is the intereſt of any to whom I have committed the Preparation of this Medicine, to betake himſelf to it, and when need ſhall be, he will not be unwilling to uſe it. I have not ſought my ſelf in theſe things, being content to ſerve my Neighbour out of Chriſtian Charity. And although this my good Will ſhall not be accepted by fooliſh and ungrateful men, nevertheleſs God ſhall have the praiſe, who hath committed to us a mutual participation of love and good will, which alſo in his own time will grant the benefit of this to be derived and redound to my Children after me, by ſome pious Souls, of which I make no doubt, and therefore readily acquieſce in my preſent condition.

THE
Conſolation of Navigators, &c.

NOw to come to the Work it ſelf, we will point out the Remedies, whoſe uſe is ſo neceſſarily required in Navigation, and which is able to preſerve us not only from the preſſures of Hunger and Thirſt, but alſo from the injury of Diſeaſes; and they are no other than Corn and Water concentrated, or reduced into a more compact and narrow compaſs, the one for the extinguiſhing of Hunger, the other of Thirſt; and how they are both to be concentrated, and adminiſtred in caſe of neceſſity, I will exactly deſcribe and teach. And,

I. *Of the Concentration of Corn or Grain.*

AS for this, it is ſufficiently explained in the *Firſt Part of the Proſperity of* Germany; ſo that it might be here paſſed over; nevertheleſs I will make this ſhort repetition.

Make a Malt of Wheat, Barley, Oats, or any other Grain, as is uſual for the brewing of Beer, [*See the full Deſcription, Proſp.* Germ. *p.* 1. *cap.* 2.] and extract all the ſtrength with Water, as if Beer were to be made thereof: Afterwards boil this Liquor away gently in broad and ſhallow Veſſels or Coppers, to the conſiſtency of Honey: The Dreggs or Grains ſerve for Food for Cattel, but the inſpiſſated liquor or juice may be commodiouſly carried by Sea, and at pleaſure may be made into Beer with a mixture of Hops and Water. And becauſe for the moſt part eight Tuns of Grain afford one Tun of the inſpiſſated Juice, every Tun of Grain maketh a Tun and an half, yea, two Tuns of Beer, for every Tun of Liquor maketh at the leaſt eight, ten, twelve, or more Tuns of Beer, according as you will have it ſtronger or ſmaller. Therefore it is eaſier and cheaper to carry in a ſhip one Tun of this Juice, than ten or twelve Hogſheads of Beer, which eaſily corrupts and grows ſowre; but on the contrary, this Liquor being kept from the Air, retaineth its goodneſs; and this is of ſingular advantage, ſeeing that good freſh Beer may be made of this juice. To this alſo belongs another great Commodity, *viz.* that

that if this Juice be mixed inſtead of Water, with Wheat flower, and baked, it makes an efficacious Bread, which affordeth far more nouriſhment to ſailers than their common Bread, and containeth in it ſelf ſo great power, that it can refreſh and cheer the Sick: For which reaſon our Anceſtors did not in vain uſe to temper fine Flower with clarified Honey inſtead of Water, and make Bread thereof, which they called Cakes of Life, becauſe they were a great ſupport to the Humane Body, and as it were excited the Life it ſelf: But in our daies all things being ſubſervient to *Avarice*, you may ſee thoſe ſweet Cakes, made up with common, impure, and unclarified Honey, which cannot generate much good blood, or juices; but this our Bread will approve it ſelf to be of a greater ſweetneſs, nobility, and efficacy, inaſmuch as the elicited juice of Grain, affordeth a far better nouriſhment than Honey. But if any deſire to proceed farther with it, this concentrated Liquor of Corn will yet afford a greater utility, *viz.* if being inſpiſſated or brought to a thick conſiſtency, it be mingled with fine Flower of the beſt Mault, and Bread made thereof, which after it is baked, is to be cut into pieces, and again put into the Oven, till it be dry and hard, and then put up into Cheſts or Hogſheads, to preſerve it from the Air, and ſo carried to Sea; for then this Bread, when neceſſity requires, may be infuſed in warm Water with a few Hops, and excited to the ſeparation of its fæces, and it will acquire the ſubſtance of Beer: But that which doth not paſs into the Liquor, nor become Beer, may be heat in a Kettle, and ſome Butter put to it, which will very much comfort the languiſhing ſtomachs of Seamen, as well, or better than the eating of Bread ſoftened in Beer. But in regard that bitter Potions are not agreeable to all Palates, it may alſo be made into Beer without Hops, by mixing the bread with good water only, and afterwards boiling it for the evaporating the more phlegmatick part, which will have a pleaſant taſte. But this Bisket alſo, or twice baked Bread, may be ground ſmall in a Mill, and put up cloſe in Casks, and preſerved on ſhipboard. Afterwards, when need ſhall require, you may temper it with warm water, and in an open Hogſhead (which yet muſt have a bottom) ſuffer it to ſettle, and clear it ſelf; ſo the flower aſcendeth upwards, and the water attracteth the ſweet liquor, and hence becometh excellent and wholſom Beer, which if it be drawn out at the bottom of the Hogſhead runneth as clear, as if it had been made ſome Months; for there is now a ſeparation made of the pure part of the Bread, from the impure or groſs, and when that which is fine is drawn off, the groſs part may alſo be drawn out of the Veſſel, which being boiled with butter, affords a ſingular pleaſantneſs to the taſte; yea, alſo is of a greater ſalubrity, and better digeſtion in the ſtomach, than Peaſe, Beans, or French Barley boiled: So that here is nothing loſt, Bread or Meal of this ſort affording good Beer, and alſo a wholſom Food to eat. And thus on ſhipboard one may at any time of the year not only have good freſh Beer, but alſo thence may be made good Vinegar. And this may ſuffice to have briefly taught the manner of mitigating Hunger and Thirſt by concentrated Corn.

I ſhall now treat of the Cure of Diſeaſes, to which Seamen are liable, and which often bring death.

Now, if you regard the Nature of Man, you ſhall generally find, that he uſeth no meaſure or mediocrity in eating and drinking, but rather puts down ſo much till his belly will hold no more. Which Vice one man obtrudeth upon another, under the ſhew of kindneſs and good-will, from an old cuſtom and enormous abuſe, although in this one offends more than another. Therefore while the Appetite is more liberally indulged, than admitteth of a good digeſtion, the Liver aſſumeth a Chyle which is ſcarce half concocted: Whence alſo a groſs blood is generated; and ſo in proceſs of time the Viſcera are filled and obſtructed with craſs and viſcous humours; hence they cannot perform their office as they ought, but rather many and divers Diſeaſes do ariſe, according as the heap of crudities encompaſs the Fleſh covering the Joints, obſtruct the Veins and Nerves, and deprave all the *mediums* of nouriſhment; therefore when the Evil cometh to that paſs, and grows prevalent, the whole body is ſenſible of it, but chiefly in that place where it fixeth its ſeat: And hence neceſſarily one part ſuffereth by the hurt of another, till at length all the powers go to decay, and the whole body languiſheth, and cannot help it ſelf, and unleſs ſuccoured by Art, dyeth.

For theſe cauſes Phyſick was invented, that thoſe Diſeaſes ariſing from intemperate eating and drinking, might be met in the way, the perverſe Enemy or primogenial Vice of the body be removed, the viſcous and phlegmatick *Saburra* of the depraved humours diſſolved and opened, and the oppreſſed Members expurged, that ſo the body may again recover its former healthful eſtate; the which is wont to be done by divers means, and in various manners, according as the Phyſician underſtandeth the Diſeaſe to be, ſo he alſo affords his help, *viz.* taking it away by Evacuations upwards or downwards, by Sweat or Urine, or by other means, as the nature of the Diſeaſe requireth. But by which way ſoever the recrements of the malignity be diſſipated and expelled, and the inward parts be freed from them, it is well, and the Phyſician hath performed his Office, alſo meriteth Thanks and a due Reward. Therefore whoſoever well underſtandeth the nature, riſe, and birth of diſeaſes, and alſo poſſeſſeth a good Medicine, or can obtain one, is fitly qualified for a Phyſician; but he who knoweth not the diſeaſe, nor is alſo furniſhed with fit and efficacious Medicines, nor knoweth how to obtain them, grievouſly erreth by trying Experiments ſo long, till the Evil more and more encreaſing, the Sick at length expires; the which is ſo well known that it needeth no proof; ſo that many who have contracted diſeaſes from immoderate eating and drinking, are afraid to commit themſelves to an unskilful Phyſician, but chuſe rather to cure themſelves by abſtinence and faſting, which way is indeed ſafe, although it be tedious and full of delay.

Others again uſe vulgar and trifling Medicines, and yet recover their health, tho' late, thinking that this happened by the uſe of their Medicine, when nevertheleſs the length of time, and the ſparingneſs of their meat and drink, during their illneſs, whence the ſuperfluous pravity of humours hath gradually waſted, hath effected this; which alſo ſometimes happens to thoſe who take no Phyſick; but by how much the greater the pravity of the humours is, by ſo much the longer it will be before Nature will be able without help to overcome and expel them. The which, if it take 4, 5, or 6 weeks to accompliſh, a Phyſician (by the benefit of good Medicines) might effect it in 2 or 3 days. So great is the difference between a Cure which Nature performeth in a long time, and that which is quickly done by Art.

But here it may be objected, that all diſeaſes take not their beginning ſo much from an evil and ſuperfluous humidity, as from manifold other cauſes, one being

being derived from this, another from another cauſe. To this I anſwer, that all thoſe affects of the Body which exiſt in the skin, and do not proceed from external accidents, as wounds, bruiſes, falls, *&c.* whence the bruiſing of the body, and alſo Death, at length happens, do draw their original from the intemperance of eating and drinking, which adminiſter occaſion, and furniſh matter to noxious humours, which hence occupy and infect divers Members; for one part affecteth another, till the whole body abounds, and is imbued with a multitude of viſcous humours. When the Stomach is over-gorged, and its tone is ſpoiled, it contracteth cold crudities, and falls into a dangerous eſtate, How then ſhould it rightly digeſt the Food? and, What good can it tranſmit to the Liver? And ſeeing the Liver receiveth nothing but what is evil and depraved, What can that procreate of good, and diffuſe throughout the whole body? Therefore as I have ſaid, one Member muſt ſuffer by another, till the errour become common. Whilſt a Tree or an Herb in the ground remains temperate, that it be neither too wet nor too dry, its root draweth from the earth virtue, and imparteth it to the trunk, and the trunk to the branches, leaves, flowers, and fruit, and is able to produce fruit conducible to health, for many years. But if the root be ill placed, the Salt being ill diſpoſed, whatſoever the ſtock there finds, it aſſociates to it ſelf, and alſo communicateth the ſame, and no better to the branches: And if it ſtand too wet, it brings forth an inſalubrious Fruit, which by reaſon of too much moiſture, falleth off before it is ripe, in whoſe ſtead fungous protuberances ariſing from putrefaction, ſpring up, and ſuch Plants do not endure long.

Again, if the Root ſtand too dry, it cannot thence have juice ſufficient to nouriſh the Tree, and bring forth Fruit, but will by degrees wither away and die. So alſo it is with Men, and their Diſeaſes; for according as their Bodies are treated, they are healthful and fruitful, or elſe diſeaſie. Now ſeeing that I have proved Diſeaſes from redundancy or humidity, or from drineſs, it will be eaſie to provide preventive Remedies againſt them; or if any errour or delay ſhould happen in this, it may be amended in the curative part, by which the Evil may be aboliſhed. Theſe are required to be of that nature and property, that they attract the ſuperfluous and pernicious humours from all the Viſcera and principal Internal Members of the whole Body, into the Ventricle, conciliate a new concoction or digeſtion, ſeparate the pure from the impure, adjoin the one to the Liver, and eject the other by Seige: And ſo the body is not only freed from depraved burthenſom humours, but alſo recovereth its ſtrength, and is cured of all Infirmities. Which manner of Curing, at this day, the more the pity, is known but to few; ſeeing that it is not to be effected with common Herbs, but ſomewhat better is required, than what the Philoſophy of old Women preſcribeth: Nevertheleſs there is a great efficacy in certain Simples; as may be ſeen in *Hellebore* or *Helleboraſter*, by whoſe benefit the Ancients prolonged their lives, by the daily uſe of a certain doſe of it. Moreover, Tabaco where it cometh to maturity, effecteth things to be admired, being rightly prepared and adminiſtred; yea, even that which (being crude) is taken in Pipes, cooleth and refreſheth the body, and alſo in ſome meaſure relieves againſt Hunger and Thirſt; which common experience daily witneſſeth. But whence this Virtue happens, Tabaco-takers neither know nor care, but acquieſce, in that they either receive pleaſure or profit by it: Therefore, if Tabaco, or any other vulgar Plant can perform ſo many and ſo great things, being yet crude, without any preparation, What would not an Extract or concentrated Eſſence of all the Vegetables do, being rightly made? which nevertheleſs ought to be of that nature, that it may not only diſpel every heap of malignant humours, but alſo ſtrengthen the inward parts, and preſerve from all things which may happen in the generating of a Diſeaſe.

Such a Medicine is that which I here preſent to all thoſe who continually uſe the Seas, and beſides the Scurvy, undergo many other Diſeaſes; by which they may not only efficaciouſly protect themſelves againſt the aſſaults of Diſtempers, and hinder their progreſs when already began, but alſo under the preſent want of Meat and Drink, may make ſound an infirm body: But how, and from what Ingredients this Euporiſt may be made and prepared, needs not to be manifeſted to every one. This is a great Gift of God, which ought to be honoured, and not proſtituted to the Unworthy. Let it ſuffice at this time, that ſuch a Medicament may be obtained at a ſmall price; I will not ſuffer it to be buried with me, but will leave it to others, who may keep it, and ſell it to thoſe who deſire it at a reaſonable rate.

This is given in form of an Electuary, and may be taken for a Preſervative, daily, or every ſecond, third, or fourth day, as occaſion requireth, in the quantity of half or a whole Peaſe, upon an empty ſtomach, faſting two hours after it, if need be, but if not, Food may be taken preſently after it, although it is better to abſtain ſome hours: But when a Diſeaſe hath already invaded a man, whether it be *Fever*, *Scurvy*, *Headach*, *Catarrh*, or any other Diſeaſe infeſting Seamen, let the Patient forthwith ſwallow down of this Electuary the magnitude of an ordinary Peaſe (for it hath no unpleaſant taſte) and ſweat if he can; if not, let him keep however a very moderate Dyet all the day, and in Summer time, as much as he can, avoid the intenſe heat, and in Winter, the extremity of Cold; the next day let him take the quantity of a Peaſe or two, and ſo let him encreaſe or diminiſh the doſe, according to the ſtate of the Diſeaſe. Theſe things being well obſerved, all Sickneſſes will give place.

If a man carry with him but half an ounce of this Medicine to Sea, in a long Voyage, he will poſſeſs a *Panacea*, both for the preventing and curing all Diſeaſes incident to his body.

This is of very great uſe and profit eſpecially for Maſters of Ships, to whom I alſo highly recommend it as ſuch, and not to them only, but alſo to all the Inhabitants of the Earth, to whom it promiſeth no leſs ſucceſs. If a Medicine can be invented, (beſides that univerſal one of the Philoſophers) accommodated to all diſeaſes, truly this is one, and will perform all, or even more than I have attributed to my *Catholicon* in the *Second Part of my Pharmac. Spagyr.* that is a Powder, but this, of which I now diſcourſe, an Electuary prepared of certain good Ingredients and Sugar. I affirm again, That there is no diſeaſe, whether internal or external, for the curing of which this Medicine doth not ſuffice; for it doth not only reſiſt the *Fever*, *Scurvy*, and *Pox*, but even the *Gout* and *Leproſy* it ſelf, provided they be not too much fixed and radicated; yea, although they be very inveterate, and cannot be throughly rooted out by this Medicine, nevertheleſs it gives relief in them, and renders them more tolerable, and hinders the acceſſion of the daily fits, and keeps it under. Certainly where this Medi-

cine can yield no help, Nature muſt be wholly ruined and tired out. What I have here written, is the Truth, which I am able to prove by experience; however it is free for every one to believe or not believe me, as he pleaſeth: Chriſtian Charity to my Neighbour hath compelled me, if it be well taken, it is well, if not, I have done my part, and diſcharged my Conſcience. Nor will I inſiſt any farther on the praiſe of this *Panacea*, I have ſaid enough to thoſe who believe, or can underſtand me.

And thus I have ſet before the whole World, that Medicament which can preſerve from, and cure the moſt grievous Diſeaſes accompanying Ships and Voyages, and alſo relieve in the extremity of Hunger.

This being done, there yet remains another Remedy whereby the Body may be relieved, and refreſhed in extremity of Thirſt, when drink is wanting; and this is done by Water concentrated, which is of ſo great virtue, that it giveth ſuch a refrigeration to a thirſty Palate, that in the whole World there is not the like. Seeing therefore that in long Voyages Water is often wanting, and putrefieth and ſtinketh, it will be very neceſſary here to declare and ſhew, how Thirſt may be reſtrained and rendered tolerable in time of neceſſity. Then alſo how common Water may be preſerved from corruption; moreover, that one Tun may effect as much for the quenching of Thirſt, as otherwiſe 2 or 3 Tuns of common Water can. Which is not only my ſaying, but the Truth it ſelf; as I will here prove by manifeſt teſtimonies: And this is to be done as I have ſaid, by Water concentrated and coagulated. But what that is, I will firſt ſhew, and then by what means it is to be prepared and uſed.

To explain the genuine Property of concentrated Water to many, may ſeem unneceſſary, in regard that Seamen are not skilled in ſuch diſcourſes, nor careful about them; and that they rather belong to Philoſophers, and the Contemplators of Nature, that they may render the knowledge of them familiar to themſelves: But this Treatiſe without doubt will come into the hands of wiſe and experienced men, as well as into thoſe who uſe the Seas, and therefore perhaps I ſhall not loſe my labour, if I ſomewhat more exactly deſcribe the nature of that water.

It is ſufficiently evident to all thoſe who have ſaluted but the Threſholds of Nature, that the Omnipotent God, in the firſt Creation of the World, hath ſeparated the Elements from the rude *Chaos*, as alſo the Elements from one another, placing the Earth in the bottom or foundation of the Center, and over that the Water, over the Water the Air, and over the Air the Fire; ſo that every of them holdeth its own receptacle and ſeat, from whence, without the will of God, it cannot recede. Nevertheleſs, we find that one alwaies participates of the other, and none is found without another, although one be predominant and viſible; but the reſt exiſt in it inviſibly, and by the skill of an Artiſt, may viſibly be deduced from it. So from the Earth we elicite Air, Water, and Fire; from the viſible Water, natural Earth, Air, and Fire; again, from the Air, Earth, Water, and Fire; and from the Fire, Air, Water, and Earth. Hence the Elements are continually circulated from one ſpecies into another, which indeed we do not obſerve or perceive, and no Element can want an Element, but draweth its life and nutriment from another. The Fire cannot burn without Air; the Fire operateth upon the Water, and of it maketh Air; the Water reſteth in the Earth, and moiſteneth the ſame; the Fire impregnateth the Air; the Air inſinuateth the Seed into the Earth; the Earth nouriſheth and cheriſheth the Seed unto perfection, and afterwards bringeth to light what it hath conceived, and carried in its belly.

Theſe things are only hinted at by the way, and not without cauſe.

But to return to our concentrated water, that we may explain its nature, know, that water is the *principium* or beginning of all the Elements; which thing is ſufficiently manifeſt, and may be ſeen daily, eſpecially in the *ſubterranean* Mines of Metals, whoſe inward bowels are ſo penetrated, that there is not only water, but we alſo ſee it to be quickly tranſmuted into various forms of Mineral Bodies, the which without is familiar; and the more limpid or clear the water is, the brighter Stones and purer Minerals it generateth: Of which you may read more in that Treatiſe, [*The Second Part of the Mineral Work*] where I have deſcribed the generation of Minerals; alſo that Flints and Sand, in the Earth, Rivers, and Seas, receive their encreaſe from water, is ſufficiently manifeſt; for all ſand was primitively water only, and hath paſſed out of water into hard ſand or ſtones, and into which it may again be changed. But this is not to be uſed as a Remedy againſt Thirſt, becauſe it is now too hard, and difficultly returneth to its firſt matter, *viz.* Water, except by the benefit of another ſubject, which is a *medium* between Sand, Flints, Cryſtal, and common water, *viz.* Salt, which hath an agreement with the nature both of common water and that of ſtones, and may be eaſily changed into either of them; as you ſhall hereafter hear. But this concentrated water, which I here propoſe for the vanquiſhing of Thirſt, and refreſhing of the body, is ſalt prepared and concentrated, either of the waters of Mountains, or of the Sea, which are of the ſame goodneſs: Of which afterwards is prepared by Art a water ſo excellent, that for repreſſing of Thirſt and refreſhing a languid body, there is no Remedy in the world may be compared to it.

Here ſome one ignorant of natural things may object, and ſay, How can it be that Salt ſhould repel Thirſt, ſeeing that when it is eaten, it exciteth and encreaſeth the ſame? To this I anſwer, That common ſalt, as it is firſt extracted or boiled, can in no wiſe reſtrain the Appetite of drinking, but rather provoke it, except its pravity be firſt corrected and deputated; for every ſalt ſeems to have laid aſide its nature and property, ſo long as it contains earthy and groſs fæces, which nevertheleſs may be removed from it by ſolution, filtration, and coagulation; whence alſo it is bitter, aſtringent, and hard; but this harſhneſs and terreſtreity being removed, the ſalt remaineth no longer hard, but is reduced into a ſoft and fluid Liquor, not ſweet, but pleaſantly acid, taſting like an Apple or the ſtones of Grapes. And this purification muſt be made by the force of Fire, *viz.* when the ſalt in deſtilling is ſublimed in earthen Veſſels, by ſtrong Flames; and then the pureſt and moſt noble part only aſcendeth, and the more groſs and earthy remaineth in the bottom, and is of no uſe; but the purer part is of great power and virtues, not only againſt Thirſt, but is alſo very neceſſary for many other things, as ſhall hereafter be demonſtrated. That otherwiſe in impure common ſalt a great Virtue is latent, let no man doubt, ſeeing that it may be daily obſerved: Wherefore that excellent Philoſopher *Plato* writeth, *That in ſalt there is ſomewhat divine*; and according to the opinion of other great and wiſe men, GOD hath openly manifeſted Himſelf in Fire and Salt, and the ancient Philoſophers were hence taught to prepare their

their *Univerſal Medicine*; which Art of preparing they have called *Alchymy*, or *The melting of Salt*; but I ſpeak not this by experience, in regard that I never yet durſt attempt ſo great a Secret, being contented with ſmaller things; but this I know, and have divers times done, *viz.* that by a certain Artifice, I have precipitated from common Salt ſome corporeal Gold, although without profit, and only to ſee the poſſibility, which without thoſe precipitations remaineth ſpiritual, and at length by them obtaineth a corporeal ſubſtance.

Indeed the greateſt Myſtery of the whole World conſiſteth in Fire and Salt, and with thoſe two (after God) nothing may be compared; for the Flame raiſeth Light out of Darkneſs, which otherwiſe none but God can do. It is alſo fit to reſtore life to the dead, no otherwiſe than the warm Sun or Oven reviveth Worms, Frogs, Serpents, Flies, and other Inſects, which have been killed by the Cold; of which I have made mention in the ſecond part of my *Pharmacop. Spagyr.* as alſo in *Miraculum Mundi*, and its *Explication*. Many men uſe Fire, yet know not what they have or uſe: So alſo it happeneth with ſalt, all men uſe it out of cuſtom, but obſerve not what they taſte. Salt is a thing of great moment; by it we give ſtrength to reſiſt Corruption, both to the living and the dead.

And ſo it is, that if men had not ſalt, or at the leaſt thoſe Plants and Fruits, in which it dwells, they would putrefie while yet living. Which would alſo happen to Cattel, if they did not eat Graſs, which contains in it ſelf its own ſalt, and ſufficeth them in feeding; nevertheleſs if ſomething better were given them with it, it would be very profitable for them; for if to horned Beaſts, as alſo Hogs, ſome ſaltneſs were given with their meat and drink, they would thereby acquire much ſtrength and fatneſs.

Seeing therefore that Salt, whilſt it is yet groſs and rude, and defiled with many impurities, performeth ſuch things in living Creatures, and preſerveth Fleſh and Fiſh, as alſo all Herbs and Graſs, long from Corruption; What could not ſuch a ſalt do, which by the help of Art hath received a greater purity than Nature hath beſtowed upon it? For the Fire containeth a power of correcting and purifying ſalt, and converting it into a finer and better ſubſtance. The common ſalts which we daily uſe, do indeed give a reliſh to all Edibles, and preſerve them from putrefaction; yet nevertheleſs they dry, aſtringe, and bind the belly; alſo excite Thirſt; but ſalt being rectified and depurated, communicateth a ſweet and grateful taſte, alſo more powerfully reſiſteth Corruption than the other, neither doth it bind the belly, but keepeth it ſoluble, expelleth Urine; nor doth it cauſe Thirſt, but rather taketh it away both from the ſick and ſound: So great a difference is there between the common and corrected and depurated ſalt, which Ruſticks little underſtand. The nature and property of common ſalt is known to every one, as far as concerns the Kitchin, but the rectified is known to few: And the Spirit of Salt, which is in uſe in Apothecaries ſhops, and which they alſo ſell, being for the moſt part not rightly prepared, effecteth little, and therefore not frequently uſed: But if it were made and rectified as it ſhould be, it would not only have a pleaſanter taſte, but alſo a better operation. So many things bear Names which are not agreeable to the thing, and therefore cannot perform what is expected from them.

The Ancients have aſcribed great Virtues to Spirit of Salt in Medicine, which it indeed hath, if after its deſtillation it be well rectified and dephlegmed; but if it be adminiſtred ſo crude as it aſcends the firſt time, it may perhaps do more harm than good, inaſmuch as a great deal of terreſtreity comes over with it, which in the rectifying remaineth in the bottom of the Glaſs, as an inſipid, bitter, or aſtringent ſalt. And although this be well enough known to ſome, nevertheleſs they abhor to rectifie their ſpirit, becauſe the ſpirit in rectification loſeth a great part of its weight, by ſeparating its ſuperfluities.

I taught, many years ſince, how to prepare the ſpirit of ſalt in quantity, whoſe deſcription is alſo exactly ſet down in the *firſt and ſecond part of my Furnaces*. It alſo demonſtrateth its utility in Metallicks; as manifeſtly appears in the *firſt part of my Mineral Work*, where the manner of extracting Gold from Stones, by its help, is taught. Altho' the ſpirit for that work ſhould be prepared after another manner, than that which is to be uſed at Sea, or on ſhore, for the curing Diſeaſes or repreſſing of Thirſt; wherefore I'll firſt teach the way of making this, and then alſo ſhew its Uſe.

As for the manner of anatomiſing Salt by Fire and Art, and tranſmuting it into a pure and ſweet ſpirit, it is various, for one uſeth this, another another way, as I alſo have taught divers waies, in the *firſt and ſecond part of my Furnaces*; but here I will appoint another, which is the beſt and moſt commodious for the uſes treated of in this Book, and is thus to be performed.

Get ſome ſtrong Retorts made of good Earth (but Glaſs is better) fill them with the following mixture of Salt and Earth, then according to Art, deſtil thence a ſpirit gratefully acid, which duly rectifie, and it will be prepared for Uſe. The ſalt is to be thus prepared for deſtillation: Fill a great Crucible with Sea-ſalt, which cover with an earthen Cover, and by degrees put Fire about it of flaming Coals, encreaſing it, until the ſalt be all over red-hot; this being done, preſently remove it from the fire, and let it cool; by this means, if any greaſie ſordes, or other combuſtible impurities, adhere to the ſalt, they will be conſumed and vaniſh. Diſſolve the ſalt in common water, filter or ſtrain it through a fine cloſe Linen Cloth, that the fæces may be ſeparated; the clear Liquor evaporate in an earthen glazed Veſſel, till the Cuticula appear, then make little balls of clay and ſand, about the bigneſs of Walnuts or Pigeons Eggs; dry them, and heat them red-hot in an earthen Veſſel, and ſo the fat ſpirit of the Earth will be burnt away; then imbibe thoſe balls with your ſtrong ſalt water, by letting them remain in it for ſome hours, that they may drink in as much of it as they can, then take them out, and dry them: With theſe fill your Retorts, and adminiſter Fire by degrees, and at length urge with the ſtrongeſt flames, ſo long, till they emit no more fume, for then all the ſpirit is come forth: The Receiver muſt be of Glaſs, and very large, in whoſe bottom muſt alſo be a little water, to attract and condenſe the ſpirit. The Deſtillation being finiſhed, the ſpirit is to be rectified by it ſelf in a low Cucurbit in ſand, and firſt the water or phlegm will come over, (which you may keep for another deſtillation) then the pure and ſweet ſpirit will riſe limpid and clear, and an unpleaſant ſalt will remain in the bottom, which is to be caſt away, and the ſpirit to be kept for the uſes to be ſhewed hereafter.

But if you deſire to have the ſpirit yet more pure, and efficacious, you may rectifie it again upon calcined or powdered Flints, which will retain in the bottom whatſoever is yet groſs or impure, and the ſpirit will be rendered very pure and ſubtile; for the Flint at the

firſt

firſt was Water and Salt, and hence both contain in themſelves ſo ſtreight a communion. This may be ſeen among the Glaſs-makers, who reduce Sand or Flints into clearneſs by melting, that thence they may make pure Glaſs; for Salt in the Fire diſſolveth Sand, Flint, Cryſtal, and together with them receiveth the Eſſence of Glaſs; yea, and theſe very ſpecies and matters, by the help of an *Alkaly* Salt, are reſolved into a diaphanous Glaſs, which being put into common Water, melt like Salt; of which I have diſcourſed in the *Third Part of my Furnaces*. When we deſtil the aforeſaid rectified Spirit of Salt again from powdered Flints, from the innate love which it hath to the Flints, it carrieth ſome part of them upwards with it ſelf, and is made better for uſe in all Diſeaſes, eſpecially in the *Dropſie*, *Stone*, and *Gout* it is an excellent Medicine. The Flints remaining in the bottom, yield a water which diſſolveth the hardeſt Cryſtals, and is acid like the ſpirit of Salt, and nothing elſe but part of it coagulated with them, and may be adminiſtred in all caſes as the Spirit of Salt.

Let no man wonder that I aſcribe more to this Spirit rectified with Flints, than to any other common ſpirit of ſalt; for few know what Virtues are latent in flints or ſand. All Birds and four-footed Animals uſe ſand. Many men adminiſter the powder of Flints and Cryſtal, for the corroborating of weak ſtomachs. Hens devour Sand and ſmall Pebbles, that they may thence have matter for their Eggſhels, and being debarred of it, lay Eggs without ſhells. Wherefore I affirm, That this ſpirit of Salt, abſtracted from flints, to be better in many Diſeaſes than the common ſpirit, and eſpecially the Cryſtals, or ſpirit of ſalt coagulated, of which we have above made mention.

Let this ſuffice concerning the Preparation of ſpirit of ſalt. Now we will alſo teach, how it is to be adminiſtred either at Sea or on Shore, for the repelling of Thirſt, and the Cure of Diſeaſes: To what other purpoſes the ſpirit of ſalt ſerves, beſides Medicine, I have ſhewed elſewhere; here my intention is only to ſignifie of what great uſe and profit it may be in Voyages to Sea, which was the only occaſion of writing this Treatiſe.

Of the Uſe of Spirit of Salt *in Ships, againſt Thirſt, and alſo the Scurvy.*

IN the firſt place, this ſpirit is profitable to the body, when a ſmall quantity of it is put into the Hogſheads of Water, whereof Seamen and Souldiers drink, to which it gives a grateful acidity, like that of Wine, and is far more effectual in quenching of Thirſt, and in leſs quantity than other Water, and beſides preſerves the Water from corruption and ſtinking, which otherwiſe in long Voyages it is wont to ſuffer, contracting a muddineſs, blackneſs, and breeding Worms, which generate the *Scurvy*; for the Water containing the ſpirit of ſalt, cannot corrupt; which ſpirit alſo preſerveth other things, both living and dead, from putrefaction. And becauſe the water with the acid ſpirit of ſalt extinguiſheth Thirſt more than any other, it neceſſarily follows, that ſo great a quantity of water need not be carried for a Voyage, as otherwiſe is uſual. Moreover, ſeeing that the ſpirit of ſalt reſiſteth all putrefaction, it ſuffereth not the *Scurvy* to take root, for it refreſheth and exhilarateth a man with great vigour, corroborateth the ſtomach, and all the members of the body, it conſumeth pituitous matter in the Reins and Bladder, expelleth Urine and Stone, keepeth the Belly ſoluble, promoteth digeſtion; it ſuffereth no Diſeaſe to grow from corruption of the Blood, to which otherwiſe Sea-faring men are ſubject: Moreover, it exerteth its ſalutiferous Virtues, if a little of it be mingled with Wine and Beer, in Ships, which will long preſerve it in its goodneſs and ſincerity, cauſing it the better to repreſs Thirſt, and therefore to go the farther in uſe. Alſo Beef, Mutton, and Veal may by it be preſerved a long time, *viz.* if they be put into ſtone pots, and powdered or condited with ſome ſalt, diſſolved in the ſpirit of ſalt. Nevertheleſs it behoveth that the Fleſh be without many Bones, and that all the legs, ſhins, or ſhanks be cut off. Moreover, a very ſmall quantity of the ſpirit being added to the water in which Fiſh is to be boiled, maketh the Fiſh eat firm and cloſe, and of a much ſolider reliſh than when ſprinkled with Vinegar. So alſo Raiſins being put into water impregnated with ſpirit of ſalt, will grow ſoft, and ſwell, and will recover their ſtrength and ſweetneſs, as if they were freſh plucked from the Vine, which will afford a great refreſhment to thoſe who frequent the Seas.

In a word, this ſpirit may commodiouſly be uſed, not only in Water, Wine, or Beer, but alſo in all ſorts of Food in Ships; for it giveth a very pleaſant taſte to all meat and drink, and correcteth them ſo, that they become more wholſom. It hath alſo another very profitable uſe, *viz.* If in hot weather but one drop, or ſo ſmall a part of the coagulated ſpirit, as the magnitude of an Hempſeed, be mixed with ſugar and held upon the Tongue; for it ſo cooleth the mouth, and allayeth Thirſt, that there will be no need of bad Water or Beer, by which the body is more violated than corroborated, through drinking often and much of them. Nor is this the leaſt of its virtues, that when in a long Voyage there is a want of water, a little more of the ſpirit of ſalt may be put into it than will ſerve for a grateful acidity; for ſo it will quench Thirſt for a longer time, and in a leſs quantity than otherwiſe a greater quantity of water can do. Yea, although the Ship ſhould be caſt away, and the men forced to betake themſelves to their Boat, or broken pieces of the Ship, as it often happens, if they have but an ounce of the ſpirit of ſalt in a Glaſs, or half ſo much of it coagulated, in defect of Drink, they may ſuſtain their lives and health therewith ſo long, till it pleaſe God to afford them a means of *getting* to ſhore; nor will they be forced to drink their own Urine, or Sea-water, which is pernicious.

Theſe and the like Virtues the ſpirit of ſalt ſheweth in Ships, which for brevity ſake, are not all declared.

I have alſo meditated how the *Sea-water* may be made ſweet and drinkable by precipitation, which would be very deſirable in want of water: And ſo far I have *attained*, that I can precipitate a good quantity of the ſalt from the water, which alſo becomes much ſweeter, but yet not ſo fully, but ſome ſaltneſs remains in it. Although in caſe of neceſſity this water may be uſed in Ships for the boiling of Peaſe and Beans, as alſo for the fermenting of *concentrated Corn*. What I now know concerning this precipitation, I will make manifeſt for the good of my Neighbour, and ſhew a good beginning how Sea-water may be made fit to drink.

There is a certain kind of Mineral called *Mary's Ice*; it is not the *Muſcovian* Glaſs, as perhaps ſome may think, but another thing; when it is heat red-hot in

in the fire, and ſo caſt into Sea-water, it is preſently reduced to a tender and white powder; which being done, the Water will be agitated and moved hither and thither; then the Powder attracteth to it ſelf part of the Salt from the Water, and ſettleth to the bottom of the Veſſel, and the Water groweth clear, which may be poured out, and if this labour be once or twice repeated, the Water, by this precipitation, will indeed be made ſweeter, but not altogether potable. Alſo the ſalt or ſolution of *Saturn* diſmiſſeth much of the ſalt from Sea-water, yet by that it is not rendered drinkable. The beſt way which I now know, is this which follows, but it is ſomewhat coſtly: Nevertheleſs when neceſſity urgeth, ſweet and good water profiteth a man more than a Bond of an hundred pieces of Gold. Hence this Art deſerveth to be honoured, although it be coſtly; for a man ready to die with Thirſt would give all he hath for a draught of Water to ſave his Life: Wherefore ſomewhat of this precipitation may be committed to Ships, for their preſervation, which may be uſed in great neceſſity, but if no ſuch be, it may be brought home again, and kept for another Voyage, ſeeing that it will in no wiſe decay, but be as good after an hundred years, as the firſt day of its preparation.

But what this is, there is no need openly to divulge, but he who deſireth it, may come to me and have it: But for the information of thoſe who are skilful in *Chymiſtry*, I will intimate this; That the precipitation of Salt from Water, is neceſſarily to be performed by a ſingular ſand, which doth not only drive ſalt downwards, but alſo all Phlegm, Sordes, and Impurities; ſo that although the water ſhould be like to a Fen or Dunghill in filth and ſtink, by the benefit of this precipitation, in a few hours, it ſhould become like clear Fountain water, becauſe the evil odour and taſte would alſo be precipitated.

The ſame may be done in all Waters, how naſty and muddy ſoever, and not only in Waters, but alſo in all potable Liquors, as Wine and Beer, although the Wine were red, ſeeing that the precipitation caſteth to the bottom all muddineſs, colour, and ſtink. And hence not only thoſe Liquors, which are changed red by corruption, or other accident, but alſo Cryſtals, which are red by nature, may be reduced to a perſpicuous clarity; which is a thing very profitable for Vintners; for otherwiſe the Sea-waters become ſweet when they are carried far through common ſand, which imbibeth their ſalt; for thoſe two have a mutual communion and communication, ſeeing that both are generated of Water; hence alſo, by the fire, they are reſolved into a dry Water, or pellucid Glaſs. Whence any man knowing in the nature of things, may apprehend, that this precipitation of Sea-water is built upon a foundation agreeable to Nature.

My *Alexipharmac*, or Mineral-Electuary, before mentioned, as alſo the Spirit and Cryſtals of Salt, may be adminiſtred, as well at Land as on Sea, againſt the *Scurvy*, *Fevers*, and other Diſeaſes.

And although in the *Second Part of my* Pharmacop. I have already deſcribed a certain Mineral Remedy, under the Title of a *Panacea*, and commended it againſt all Diſeaſes, by which admirable Cures are e'ry where done, yet I prefer my Mineral Electuary before that, becauſe it is more accommodated to uſe, ſeeing that when need requires, it may be taken out of a Box with a Knife only; neither is there need of any Vehicle, as Wine, Beer, or others, which are neceſſary to be uſed with the *Panacea*; neither is there need of weighing it, but may be proportioned by the Eye, according to the age and ſtrength of the ſick. Thoſe who are of full age and ſtrength, may take as much of the Electuary upon a faſting ſtomach as will equal the magnitude of a Peaſe, and faſt ſome hours after it, if time and opportunity permit; alſo let the Patient avoid the cold Air, and the heat of the Sun in hot ſeaſons. It is to be taken twice, four times, or oftner, in a week, according to the neceſſity of the ſick, to which it muſt alſo be proportioned by encreaſing or diminiſhing the Doſe; for if one grain ſhould not work, the Patient may take two, aſcending to 3 or 4, if need be. When a ſmall Doſe is adminiſtred, it works inſenſibly; if a little more, then it worketh by ſtool, and ſometimes by vomit, when it findeth diſeaſie matter in the ſtomach; if it findeth depraved ſalt humours, it caſteth them out by ſweat, ſpitting, or urine, and throughly purgeth the body from every evil. In brief, I ſay, it greatly purifieth the Blood, openeth all obſtructions of the internal principal members, as the *Liver*, *Spleen*, and *Lungs*, beyond all *Phlegmagogues*: It hindereth the growth of all *Apoſtemations* both within and without the body; it conſumeth *Fluxes* and *Catarrhs*, which fall upon the Eyes, Ears, and Teeth; it exterminateth the venereal *Pox* in a ſhort time; it alſo cureth the *Dropſie*, *Leproſie*, *Gout*, and *Falling-ſickneſs*, both in old and young; expelleth the *Stone* both of the *Kidneys* and *Bladder*; cureth all ſorts of *Fevers*; and laſtly, it healeth all inward and outward *Wounds* and *Ulcers*, being taken inwardly, and a due Diet obſerved.

This is a ſafe and approved Medicine in the cure of all curable diſeaſes, nor doth it fail to help in inveterate affects, *viz.* when a diſeaſe hath been long growing, and is now firmly rooted and fixed, that it cannot be totally expelled, as the *Gout* and *Stone*, yet then this Medicine mitigateth the pain, and maketh the Fits ſlower and more tolerable, and ſuffereth not the *Diſeaſe* to encreaſe, but to be more and more abated and diminiſhed. It cures all *Scabs* and *Ringworms*, or *Tetters*, proceeding from an impure Blood and Liver, only by taking it inwardly, without any outward unctions. What ſhall I ſay more? This Medicine cannot be ſufficiently praiſed, ſeeing that it operateth univerſally againſt all the diſeaſes both of Men and Beaſts: But I muſt forbear, for if I ſhould ſhew all its Virtues, this Treatiſe would ſwell to too great a bulk.

In *Maritime* Towns, and other places where the *Scurvy* is regnant, a better Medicine than this cannot be found, for it removeth all pravity of Humours, from which ſuch diſeaſes proceed; it preſerveth from the *Plague*, and other Contagions, and happily cureth their Infections; it ſtrengtheneth the Memory, Heart, and Brain; preſerveth from the *Palſie* and its Concomitants: In time it reſtoreth thoſe who have their Members contracted, and their Nerves repreſſed and immovable, after the being anointed with Mercury, for the cure of the *Pox*. He that will take it every week or once in 3 or 4 weeks as a preſervative, ſhall not have the *Tooth-ach*, nor ſhall his Ears be troubled with ringing or other noiſes, nor ſhall his Eyes be troubled with ſharp Rheums; but by the benefit of this, thoſe continual inveterate Corroders of the Body, *Catarrh*, *Fiſtula*, *Cancer*, and other almoſt incurable ſymptoms, are throughly cured.

Hence both Rich and Poor, and thoſe eſpecially who go long Voyages to Sea, and want Phyſicians, ought to eſteem this *Alexipharmac*, and provide themſelves with it againſt a time of neceſſity. If any man carries with him half an ounce of it, it will be ſufficient for preſervation and curation for more than a year, in many diſeaſes. If a Ship going to the *Eaſt* or *Weſt In-*

dies, carry with them half a pound of it, they may ſave the Lives of many men; one of which is of ten times more value than the price of the Medicine, by help of which the lives and health of many Hundreds of Men may be preſerved, and being ſick, may be reduced to their former health.

Now it is farther neceſſary to deſcribe the Virtues which the Spirit of Salt ſheweth on Shore; for that which is profitable to the ſick on ſhipboard, is not hurtful for thoſe who dwell at Land: For this ſpirit may be uſed in all Houſes in their uſual drink, as Beer or Wine, eſpecially in theſe moiſt Regions, where the Scurvy commonly reigneth; ſo that there is ſcarcely an Houſe to be found, in which there is not one at the leaſt infected with this Diſeaſe; for the drink is hereby made clear, ſo that it well dilateth the Urinary paſſages, moreover hindereth the growing of the ſtone in the Kidnys and Bladder; it alſo gives a pleaſant taſte to the Wine, removeth its ſuperfluous Tartar and precipitateth it to the bottom, ſo that *Spaniſh* and *French* Wine acquire a clearneſs like to *Rheniſh* wine. In Summer time, after Liquors have once wrought, it ſuffereth them not to fret, grow mucous, or work again, but keepeth them from many Accidents. *French* Wines, as ſold in many places, have neither odour nor taſte, but good Wine is endowed both with a Vinous reliſh, and a grateful odour; and when theſe are wanting, the name agrees not with the thing. But the Spirit of Salt, with the Eſſence of Wine, conciliates to *French* wine the ſmell, taſte, and colour of *Rheniſh* wine. Hence alſo being ſo meliorated, it will, like *Rheniſh*, keep many years, which otherwiſe will hardly hold good two years. Moreover, by the ſpirit of ſalt that quality may be taken away from Honey, which renders its taſte ſomewhat ungrateful, and its hidden Impurities may be precipitated, ſo that an excellent wholſom drink may be made of it. Which is a famous Art to be uſed in thoſe places where there is no wine; for when Honey is well depurated, and the unpleaſant taſte taken from it, it becomes as a comforting Balſam to Man; as that old Souldier had experienced, whom *Alexander* asked what he had uſed to prolong his Life to ſo great an Age, he anſwered, That inwardly he had uſed Honey, and outwardly Oil. And it is evident to many, that there is a great virtue in Honey, but by reaſon of the unpleaſant taſte, it is loathed; which yet is removed by the ſpirit of ſalt, ſo that a drink prepared of ſuch pure Honey, is as wholſom as the beſt wine: which hath alſo this benefit, that every Houſekeeper may have this drink at his Table, at any time of the year. This honied Nectar alſo holdeth good many years, after the manner of the beſt *Rheniſh* wine, and is made for a ſmall charge, and will be a great comfort to thoſe who are not able to go to the price of wine. Moreover, every one may make his own drink as ſtrong and as ſweet as he pleaſeth; which is the principal head of the Art, to take away the ungrateful taſte from the Honey, which being removed by the ſpirit of ſalt, the drink will become clear, to which you may add a little *French* or *Rheniſh* wine for taſte ſake. You may thence alſo make good Beer, which will hold its goodneſs 10 or 20 years, or more, *viz.* if inſtead of common water you take the water of Hops, to diſſolve the purified Honey, to which (if you pleaſe) you may give divers taſts, by putting into it divers Herbs, as is wont to be done in wine and beer. But this you are eſpecially to regard, That for this buſineſs you do not uſe unrectified ſpirit of ſalt, for ſuch would ſpoil the taſte, and corrupt the drink, but alwaies take that which is well rectify'd, which I have ſufficiently taught the manner of doing of, both in this Treatiſe, and divers other places of my Writings.

NB. There is no need to put the ſpirit into a Veſſel of Wine or Beer, but it ſufficeth to keep it in a ſmall glaſs, and as often as you have occaſion to put ſome drops of it into a Bottle of Wine or Beer, and ſo to drink of it. Every one therefore may make his drink as he will, by putting in more or leſs of the ſpirit, according to his Palate; which doth not only ſerve to make the wine and beer clear and diuretick, but may alſo be uſed in Fountain-water, in hot weather, for the allaying of wine: For if ſome drops of it be put into a bottle of water, it giveth it a grateful acidity, not much unlike to the natural Mineral acid waters, and in hot weather allayeth the over-great heat of the Blood, and quencheth Thirſt, ſo that there is no need of burdening the ſtomach with much wine or beer. Alſo all thoſe drinks, as wine, beer, and water, which are mingled with the well-rectified ſpirit of ſalt, are far wholſomer than other ordinary drinks. If a little pure Steel be diſſolved in ſpirit of Salt, and then put to fair water, it will have almoſt the ſame taſte with the *Spaw*-water, and if ſome quantity of it be drank, it looſeth the belly, and evacuateth black Excrements, whence a man grows lively and vigorous, as if he had drank of the *Spaw*-waters.

And this benefit may accrue by it to all Travellers, who carrying with them a little ſpirit of ſalt in a glaſs, may at all times, and in all places, correct and amend their beer or wine in their Tuns, and give it a better reliſh: But becauſe this ſpirit is more liable to be loſt in a liquid form by any accident befalling the glaſs, therefore being coagulated into a dry form, it may be more commodiouſly carried about in a Paper or Box, of which the magnitude of a ſmall Peaſe drank in one cup of water, quencheth Thirſt better than a great quantity of water alone. This ſpirit or ſalt will be ſerviceable to men of all ſorts, but to none more than to Seamen or Souldiers, in war-like expeditions, of which ſometimes more die through want of water, than by the ſword, who alſo for the moſt part contract their Diſeaſes from the filths in Ships, which might eaſily be prevented. What will it profit a Captain of a Man of War, or the Commander of a Merchant-ſhip, to have many men for his defence and ſervice, if they are diſabled by a Diſeaſe? Were it not then better to uſe all diligence to preſerve their health, and to reſtore it when loſt? Which may be done with ſmall Labour and Coſt. A General brings an Army ſome time into the Field, of 10, 20, or 30 Thouſand Men, and ſeeing that thoſe obſerve no due order in eating and drinking, and being deſtitute of Medicines, if the *Plague*, *Fever*, or *Bloody-Flux* comes among them, they drop off one after another like Flies in Winter; when notwithſtanding they might be ſuccoured and helped in thoſe Diſeaſes by my Electuary, [*This Electuary I think to be the* Panacea Antimonij *made up with Sugar.*] Salt of Salt, or Spirit of Salt, inſpiſſated or thickened with Sugar. The ſpirit of ſalt hath alwaies been highly eſteemed, both by ancient & modern Phyſicians, for its great virtues which it ſheweth both inwardly & outwardly; beſides which, it is of great uſe in other Arts, as I have ſhewed in the *firſt and ſecond Part of my Furnaces*. And that the Reader may ſee that I am not ſingular in what I have aſcribed to the ſpirit of ſalt, I will here ſet down the Experience of that no leſs learned than famous Phyſician *Conradus Kunrath*, of the ſpirit of ſalt, as he hath expreſſed it in his *Medulla Deſtillatoria*, printed at *Hamburgh*, *Anno* 1638. in theſe words, *Part* 1. *pag.* 59.

The

The Great and Effectual Operations which are attributed to the Spirit or Oil of *SALT.*

THE Spirit or Oil of Salt is not of so acrimonious a taste, as Salt commonly is: Nor hath it so great an acidity as the Spirit of Vitriol, but it tasteth almost like the juice of wild Apples, with somewhat of sweetness intermixt. It discusseth, dissolveth, consumeth, and dryeth, yet it doth not heat too much, but hath a temperate nature, mitigating and comforting the natural heat, which it also encreaseth, and dispelleth all things contrary to Nature, preserveth the state of sound humours unhurt, especially profitable for those who are phlegmatick, whose viscous Saburra *of humidities it consumeth, taketh away* Catarrhs *which fall from the Head, and preserveth from all Diseases which arise from a noxious Pituity, Mucor, and Fluxes. Yea, those who use labour and study, shall perceive their Strength to be restored by it, and as it were renewed.*

Experience, the Mistris of things, witnesseth, That it is a present Remedy against the Falling-sickness, *being administred in good* Aqua-vitæ: *Against the* Apoplexy, Palsie, *or* loss of Speech; *as also the trembling and beating of the Heart, and all dejections of Mind; as also in the time of the* Plague, *or in any infectious Air, it may be administred with profit, by mixing half an ounce of the Spirit or Oil of Salt with two ounces of the Juice of Violets, and as much of the Electuary of Juniper-berries, in a Stone or Glass Mortar, and the Patient taking the quantity of a Filberd in the morning upon an empty stomach.*

This Compound-Medicine being given to Women with Child, facilitateth the Birth, and is highly profitable against various Symptoms of Women in Child-bed, without any danger. If any desire to preserve their native heat, let them often use this Alexipharmack.

Whoever is burdened with superfluous moisture, let him take this Spirit or Oil of Salt daily, in Wine or some other Vehicle.

In Coldness, and continual Fluxes, which stop up the Breast, it conduceth much, and taketh away inveterate Coughs and grievous Asthma's, *which are stirred up by those Fluxes. It dissolveth, consumeth, and dissipateth depraved humours, collected and indurated in the stomach; and although of it self it communicateth little nourishment, yet it excites the Stomach to a good Appetite, and disposeth the Meat to a good digestion and passage through the body.*

It helpeth in the Tartarous and indurated Obstructions of the Liver and Spleen, *which it openeth and relieveth, and hence removeth and taketh away the* Jaundice, Dropsie, Hypocondriack Melancholy, *and pains and affects of the* Ribs *and* Viscera, *and also whatsoever ariseth from Wind and Flatulency, and other symptomes proceeding from the said causes, it especially absumeth the* Anasarca, *or Water under the skin, and throughly removeth watery Tumours in the Genital Members or Legs, which for the most part happen to those who are Hydropical, Phthisical, or labour under a Distemper of the Liver. It also taketh away the great Thirst in those, which otherwise in this kind of diseases doth not lightly afflict, so that the Patient shall have no desire of drinking, but may remain some daies without. The same is also a Remedy against all putrid* Fevers.

In tormenting Pains of the Belly, and Cholick, *which are excited by the viscosity of humours, or intemperature of flatulency, or force of cold, and a dense and tough Phlegm driven into the Intestines; this Spirit resolveth and consumeth, and so openeth the stopt passages of the Bowels, and looseneth the Belly, that it easeth the Iliack pains, whether it be taken at the mouth, or administred Clysterwise. In the* Lientery, Dysentery, *or* Hæmorrhage, *it is to be given in Clysters; in like manner in* Nephritick *Diseases, and the dolorous* Stone in the Bladder, *which it dispelleth and exterminateth.*

In Ruptures, *as the* Hernia *and* Enterocele, *let some drops be given daily in good Wine; let the Tumour of the* Scrotum *be also often anointed with this Spirit or Oil, and cherished by a fit Truss, or some other bandage, and in a few daies the sick will recover his former health.*

It killeth all Worms *in the Body, casteth them out, and prohibits their breeding again.*

It is a most effectual preservative against the contagion of the Plague; *and also is very conducible to those who are already infected. It also wonderfully profiteth such as have eaten Poisonous Mushrooms or Opium, as also those who are hurt by Serpents, Vipers, Spiders, and the like venomous Insects, it is accommodated both to inward and outward use, because it consumeth virulent humidities. For the stinging of Wasps and Hornets, it is to be applied topically.*

For fat Women, and those who are troubled with impurities of the Matrix, from a superfluous phlegmatick humour, it is very profitable; for by the benefit of it, every redundancy and incommodity of Phlegm is purified, consumed, and dried up, so that the seed may more easily rest in the Womb, and fertility be greatly promoted.

In protuberant Excrescencies of the Eyes, Films, Cataracts, Blisters, Pustles, *or* Spots, Dimness *or* Darkness of sight, *it is to be used in a good Collyry, or other commodious Vehicle. In* Blows, Bruises, *or* Falls, *when the Blood is congealed, (which we call black and blue) in the Eyes or Face, let a bit of a Sponge or Lint be wetted with the Spirit or Oil of Salt, and applied to the place affected; or else dissolve in the same a little red Myrrh, and with the Dissolution mix a little Honey, and anoint with it. It driveth away noise and pain of the Ears, also when the Ears send forth an ulcerous and purulent matter, the same Medicine may be administred with an happy success. And in these Symptoms it is to be mixed with Wine-Vinegar, and dropped into the Ears, and rubbed upon the diseased parts.*

In the Thrush, *and other sore mouths of sucking Children, also in the glandular or kernelly Swellings of the Neck, foulness of the Tongue, swelled and rotten Gums,* Scurvy *in the Mouth,* Tooth-ach, *superfluous humours and filths adhering to the Teeth and Gums, this Spirit or Oil of Salt is an excellent Remedy; as also in preserving from those Evils, it is to be conjoined with clarified Honey, and the Mouth, or parts affected in it, to be anointed therewith. Against the evil Affects and Ulcers of Womens Breasts, some linen rags are to be humected with the Spirit or Oil of Salt, and they will be quickly healed. The moist* Itch, Tetters, Ringworms, *and other contagious Affects of the Skin, are happily cured by both the inward and outward use of this Spirit.* Ulcers *and fungous* Tumours *in the Venereal Disease, or others, if we would bring them to a suppuration, the Oil of Salt will effect it, being applied either alone, or mixed with other convenient Remedies. For the healing of venomous Ulcers, which pierce the Bone it self, as also all virulent Apostems, the Spirit or Oil of Salt is to be mixed with White-wine, and Barley-Flour, into the consistency of a Plaster, which is to be applied to the Sore.*

Also in cancerous, eating, and spreading Ulcers, it is very profitable, being mixed with the juice of Rhue, and aptly applied.

That I may summarily express its use both inwardly and outwardly, it resisteth all fluid and corroding Vices, and layeth the foundation of their Cure. In luxated, shortened, or contracted members and joints, it affordeth

present

preſent help, being uſed alone, or joined with fit fomentations or Epithems.

In the taking away of Warts, *this Spirit is to be mixed with the juice of Marigolds, and applied to them: It alſo taketh away Corns, if after they are ſoftened with warm water, they be well cut and anointed with this Oil. In the* Eryſipelas, *St.* Anthony's *Fire, this being mixed with Elder-Vinegar, and applied, is of great virtue.*

The Hands or Feet being corrupted or chapt by Cold, are recovered by the benefit of this Medicine. This Spirit or Oil greatly conduceth to help the wearineſs and weakneſs of the Feet and other Members, reſtoring to them their ſtrength and vigour, if they be well bathed therewith before the fire.

Moreover, in the dolorous Gout *it is a famous Remedy, and a profitable* Anodine *for allaying the pain, if beſides its internal uſe it be alſo applied topically: For to this our Medicine are to be joined Oil of Turpentine, Oil of Wax, Oil of Camomile, or alſo Oil of Cowſlips, with which the parts affected are to be well anointed. But where the members are contracted by* Fluxions *and* Catarrhs, *fit Fomentations are alſo to be uſed, and beſides our Oil or Spirit, the dulcified Oil of Vitriol, and pure Oil of Turpentine, are to be mixed together, and the parts to be therewith anointed before the fire. And hence the Nerves and Joints are ſo comforted, that they will not ſo eaſily admit ſuch Fluxions again. Alſo if there be* Tophes *or* Nodes *in the Joints, they will be diſcuſſed beyond belief; being duly anointed with this Oil, mixed with the dulcified Oil of Vitriol.*

It is alſo uſed with great profit both inwardly and outwardly, againſt the Cramp *and* Convulſion *of the Nerves by Cold.*

In external Wounds and Symptoms there often happens a Putretude, and alſo proud Fleſh ſometimes ſtarteth up, and cauſeth great pain. Theſe Protuberances being anointed with this Oil or Spirit, are preſently diſſolved and conſumed, and alſo preſerved from future corruptions.

In brief, this is a moſt excellent Medicine, overcoming many Diſeaſes. Moreover, the Reader is to know, that this Spirit or Oil of Salt, (beſides thoſe Virtues which I have declared) if it be diligently prepared, and rightly preſcribed, may be uſed for the preparing of many excellent and precious things in the Chymical Art; for it diſſolveth Gold, Gemms, and other Stones, Pearls, Corals, &c. ſo that they are reduced into excellent Medicines, in a liquid or potable form, highly uſeful for Mankind: But how thoſe Proceſſes are to be inſtituted, I ſhall here pretermit, But he that hath drawn a good foundation of working from that information which my Medulla Deſtillatoria *hath faithfully propounded, let him weigh the matter with an accurate mind, and put his hand to the Work, there is nothing in it ſo tedious, but he will eaſily conceive; moreover, let him aſſociate himſelf with honeſt, ſincere, and skilful Artiſts, and take their counſel, then he will find out many Secrets of Nature, and ſingular Arcana's, and will ſee that his care and diligence hath not been in vain: Then let him uſe that Experience to the Glory of God, and the help of his needy Neighbour.*

The Virtues or moſt efficacious Operations of the *Spirit* or *Oil of Salt*, in which Gold is rightly diſſolved, according to Art; or, when it ſhall be made an *Aurum Potabile*.

PHiloſophers and Phyſicians, endowed with the great Exerciſe and Knowledge of Things, have attributed to the Spirit or Oil of Salt, in which Gold is rightly diſſolved, or the Aurum Potabile *made with it, very great operations in the body of Man, inaſmuch as in all Diſeaſes and Infirmities, of what name ſoever, it giveth preſent help, and in all dejections of the vital ſpirit, although they tend to the fatal period, it giveth ſuch relief, that life and vigour may be yet ſomewhat farther protracted, if two, three, or four drops be adminiſtred as occaſion ſhall ſerve in a good* Aqua vitæ *or Cordial Water. In like manner, if three drops be adminiſtred once a week in generous Wine, or* Aqua vitæ, *or other fit Vehicle, it renovateth a man, makes him youthful, changeth gray Hairs, produceth new Nails, and Skin, preſerveth from various and diverſe ſymptoms of Diſeaſes, and preſerveth the body in ſuch a ſtate, even to the prefixed hour of the Divine appointment.*

Theſe are the very words of that famous Philoſopher and Chymical Phyſician *Conradus Kunrath*, in his *Medulla Deſtillatoria*; as the Reader may there ſee.

Now any may eaſily conjecture, that although this learned man had found out many things, yet that he knew not all, but what was known to him, that he divulged. But that as yet more might be done by that Spirit or Oil of Salt, than what he had ſet down, eaſily appeareth from that which he ſheweth at the end, concerning the Oil or Liquor of Gold, prepared by the Spirit of Salt, which words are Truth it ſelf, and much more may be done by the benefit of that ſolution. He hath written what Experience hath taught him, the reſt he hath left to the ſtudy and ſearches of others.

Seeing therefore that I alſo (not to ſpeak boaſtingly) have often handled Furnaces and Coals, and among others, have found this Liquor of Gold or *Aurum Potabile*, made with Oil of Salt, to be of great virtue, and knowing its great uſe, power, and virtue by experience, I will deſcribe it in an open ſtile, leſt ſo noble a Medicine ſhould be buried. Such a Liquor of Gold as is here mentioned, is compounded of the pureſt Sol, and the moſt highly rectified and again concentrated Spirit of Salt: The Sol is to be firſt melted, and throughly purged with Antimony, then to be diſſolved in *Aqua Regia*, and precipitated with ☿, to be edulcorated and brought into a ſubtile Calx, which muſt be heat red-hot (to free it from the ☿) and then diſſolved in ſtrong and well-prepared Oil of Salt; being diſſolved, abſtract part of the ſpirit of ſalt from it, and a very yellow Liquor of Gold will remain at the bottom, which yet is not, fit for uſe alone, ſeeing that the Oil of Salt containeth too much Acrimony; therefore a drop of it is to be mixed with a ſpoonful of Beer, Wine, or warm Broth, before it be adminiſtred to weaken the ſpirit of ſalt; but if any deſire to have it ſweeter, inſtead of Wine, Beer, or Broth, it may be mixed with melted Sugar, or ſyrup of Roſes. The Doſe for a man of ripe age, is two or three drops, which if he ſhall perceive not to operate ſufficiently, he may encreaſe to three or four drops, ſo long, till he ſhall find an evident operation, which appearing, let him encreaſe the Doſe no longer, but rather diminiſh it a drop; and when the Oil of Gold rightly performeth its operations, theſe ſigns will appear: In the firſt uſe, a certain loathing or nauſeouſneſs of the ſtomach, will be perceived, when the Oil of Gold findeth there a vitious pituity, and endeavouring to expel it, driveth it downwards, and ejecteth it by ſtool. 2. The Excrements are as black as a Coal, and during the uſe of the Medicine, the ſick maketh a diſcharge by ſtools at leaſt twice, ſometimes three or four times, without any impediment or ſence of neceſſity, as is wont to be in the working of Purges. The Urine will alſo be thick and turbid, becauſe the Medicine diſſolveth the Tartar and Phlegm in the Reins and Bladder, and by de-

degrees expelleth it. NB. That by the black Excrements, it is manifeſt, that Gold may be radically diſſolved in the ſtomach of a Man, which ſome think to be impoſſible. The humane ſtomach hath a greater power in the deſtruction of things than the ſtrongeſt fire, as may be here ſeen by the Gold: Yea, all things which are eaten or drank, in the ſpace of 24 hours, it throughly diſſolveth and tranſmuteth into a new form of Excrements.

If the ſtomach of a man can effect ſuch things, why not Art alſo? Yea, hence it is expreſly proved, that the colours of Gold, at length, when it is radically diſſolved and deſtroyed, do appear, and may be known, ſeeing that in Colours Blackneſs hath as it were the firſt and chief place, and containeth all others hidden and concentrated under it.

NB. That theſe black Excrements ſhould not be caſt away, but the radically-diſſolved Gold ought to be ſeparated from them, with which perhaps ſome great thing may be effected.

I ſome time ſince adminiſtred this Oil of Gold, for eight or ten daies ſucceſſively, to a certain Infant, for the freeing his body from Mercury, which had been imprudently given him for the Worms; I ordered the Excrements to be ſaved, for ſome Experiment, which nevertheleſs, becauſe they ſtood long and bred Worms, I could not uſe, but commanded them to be put to the Roots of a young Vine, which had not yet born Grapes, being but of two years growth, which produced a ſmall Grape with large ſtones, which had golden ſpots like Stars, admirable to behold. This Example is worthy of a profound conſideration. It alſo ſeems to me, that the Urine of thoſe who continually uſe the aforeſaid golden Liquor ſhould be auriferous, although it appear not in the colour. The thing is out of doubt, ſeeing that men, in the uſe of the ſaid Medicine, attract only a certain hidden virtue from the Gold, and again ſend the reſt forth of the body, that that Gold is better than other common Gold: The Benignity of the Divine Being hath diſpoſed and ordained every thing in the World for the beſt.

Seeing that in the Stomach of Man or Beaſt the Food is deſtroyed and putrefied, Nature taking a little from it only for nouriſhment ſake, caſteth out the reſt by ſiege, which yet is not of ſo abject a condition, as to want its virtues? for if theſe Excrements be mixed with any Earth, moiſtened with Rain-water, and expoſed to the open Air, there will thence ſpring forth divers Herbs, without the addition of any ſeed; but if the ſeed of any Herb be adjoined, then is alſo brought forth fruit of the ſame ſubſtance and quality; ſo that theſe Excrements may degenerate, and be converted into whatſoever Fruits we will: From which Fountain the multiplication of Herbs and Metals may perhaps take its original. Therefore it is neceſſary, that Putrefaction ſhould go before Multiplication; which our Saviour himſelf told his Diſciples, ſaying, *Except a grain of Wheat ſhall fall into the Earth, and die, it remaineth alone; but if it die, it bringeth forth much fruit.* The Axiom of Philoſophers is, *Where Nature endeth, and leaveth the Work imperfect, there Art ought to begin.* But the manner of proceeding farther they have involved in ſilence. Nature from the beginning hath ſublimed a Mineral *Ens*, or firſt matter of Metals, as much as it could, and brought it to the royal ſeat, or higheſt perfection: Art hath deſtroyed the moſt perfect body of Gold by corroſives, and being deſtroyed, hath again diſſolved it in the body of Man: But if any know the manner of proceeding farther with it, he may eaſily reduce that Eſſence of the diſſolved Gold into a better, and multiply it: But I would not have this taken for an Oracle, ſeeing theſe are only my Cogitations.

The Uſe of this Medicine is to be continued till the body is freed from all ill ſymptoms; nor are any other Remedies to be intermixed with it, that its operation may not be hindered: But before this Medicine be adminiſtred, a Doſe or two of my *Panacea* ought to be given, (of which the *Second part* of my *Pharmacop.* treateth) for then its effects are to be admired.

This Oil of Gold, or *Aurum Potabile*, is of much greater force in all thoſe Diſeaſes, in which the ſimple ſpirit of ſalt is conducible, becauſe the Oil of ſalt hath double the ſtrength of the ſpirit, and alſo diffuſeth its virtues much better, by reaſon of the Gold which is anatomized in it; the which, becauſe it is of a hot and dry property, agreeth very well with the Oil of ſalt, whoſe nature is hot and moiſt: and hence it effectually reſiſteth all Corruption which may ariſe in the humane body.

Beſides, the Virtues which the ſpirit of ſalt, and eſpecially the Oil of Gold prepared with it, manifeſt both within and without the body; it is an egregious preſervative againſt Drunkenneſs, which is the root of many Diſeaſes, and the gate by which many evils enter: For ſtrong Wine or ſtale Beer being drank, ſuffer nothing in the ſtomach, becauſe it cannot reſtrain their ſubtile ſpirit, which preſently flieth up into the Head, and diſordereth and confoundeth all the ſenſes. But if in the drinking, a little ſpirit of ſalt be mixed with the Wine, it openeth the Orifice of the ſtomach, and ſuffers not the ſpirits to fly upward, but reſtraineth and bindeth them, alſo mitigateth and repreſſeth that unnatural Thirſt, which otherwiſe the Wine cauſeth in exceſſive drinkings: Nor doth the Wine, which is mixed with ſpirit of ſalt, ſo eaſily hurt the Liver; for as the ſpirit of wine heats and inflames the Liver, ſo the ſpirit of ſalt corrects and cools it. Add that the ſpirit of ſalt permits not the liquor to lie lurking in the ſtomach, but preſently caſteth it out by Urine: and the ſooner the ſuperfluous Wine is caſt out of the body, the leſs hurt it can do. But this is to be underſtood of the ſpirit of ſalt well rectified, and ſubtilly prepared.

Spirit of Salt, a Remedy againſt Drunkenneſs.

In ſhort, I might ſooner want Paper to write, than matter to expreſs what good the ſpirit of ſalt coagulated can do, being taken in drink; I have ſaid enough for the preſent; in my *Vegetable Work* I will more fully diſcourſe of this matter, in which I now acquieſce. Whatſoever I have here written of a Medicine againſt all Sea-faring Diſeaſes, and of the concentration of Corn and Water, againſt Hunger and Thirſt; as alſo of the moſt efficacious uſe of Spirit of Salt, againſt Drunkenneſs, and of the melioration of Wine, Beer, Water, and other Drinks, is built upon the pure foundation of Truth, which Experience it ſelf will ſufficiently teſtifie; with which I put an End to this Diſcourſe.

A True and Perfect

DESCRIPTION

OF

Extracting good TARTAR

FROM THE

Lees of Wine,

And that after a Plentiful Manner.

To the most Reverend PRINCE JOHN PHILIP, *Lord Arch-Bishop of* Moguntina, *High Chancellor of the Empire, and Elector, Bishop of* Herbipolensis, *Duke of* Franconia, *&c. my most Honoured Lord.*

I Presume, you remember (most Reverend and Noble Lord Arch-Bishop and Elector) that about Two Years since, I crav'd Your Lordship's Licence, to Extract *Tartar* from the Lees of Wine; which your Highness was pleased to grant me. From which Work, seeing I have been hitherto hindered by the multiplicity of other business, and the great Waste and Loss which is daily sustain'd in the Electorate of *Moguntina*, and Bishoprick of *Herbipolensis*, proceeding from the Ignorance of the Lees, daily troubles me; I have determined to dedicate this gainful *Extraction of Tartar from the Lees of Wine*, to your Electoral Reverence, under whose Patronage I may be safe, and for this Reason especially, Because none of the Princes of *Germany* enjoy a greater Vintage than your Reverend Highness; to whom not only a good part of the Tract of the *Rhine*, but almost the whole Jurisdiction of *Mæne*, together with *Franconia*, by Divine Providence, belongs; being very fruitful in Wines; where also much Lees are cast away, thro' Ignorance *of the way* of extracting their *Tartar*, for the Good of the Country, from which a good Spirit of Wine might first be drawn by Destillation; the *Tartar* contained in the thick Lees, and remaining in the bottom of the Still, is by all Men cast away, as unprofitable, a few excepted, who with great Labour dry them, and of them make clavellated Ashes: Which Waste or Loss of the Lees, seeing that it makes every year an incredible Loss of *Tartar*, I have thought fit to expose the Knowledge of this Mystery to the Eyes of all Men, for the Good of my Country, by which some being instructed, may set about the *Extraction of Tartar* with great Gain, not doubting, but many, when they shall see this Labour to be profitable to others, undertaking the same, will bring great Profit to their impoverish'd Country.

Therefore I trust, this Little Work will be acceptable to your Reverend Highness. And I pray the Giver of all Good Things, to furnish both your Soul and Body with His Gracious Benefits, who study to be

Your Highness's most

Humble Servant,

J. Rud. Glauber.

A True and Perfect Deſcription of Extracting good TARTAR *from the* LEES *of* WINE, &c.

FIrſt of all, we muſt know what Dregs are, or what is their Eſſence and Nature, how they are reſolv'd into Parts, and the Good ſeparated from the Unuſeful, becauſe without the knowledge of the thing we can't give a right judgment of it, but muſt erre: Therefore it is neceſſary that we know what we have in our hands, that we may the ſafer handle it. For this cauſe I ſhall ſhew the Ignorant what are properly Dregs, and which way the better part may be extracted, that hereafter ſo great a Good may not by ignorant ſluggiſhneſs be laid aſide, but converted to the profit of all.

All thick matter, whether it be of Wine, Beer, Vinegar, or the like, when it has ſtood a little, ſends the earthy, heavy, and more thick part of it, to the bottom, which we call Dregs or Lees, upon which the clearer part flows, to be ſeparated from the impurity, as in the making of common drinks may be ſeen.

There was no uſe of theſe Dregs heretofore, except the making Brandy with e'm, and the reſt to be thrown out of doors, in which was much Virtue, which Men did not think of: But that all things are not unprofitable which the Vulgar pronounce ſo, and that there may be great Virtue in ordinary Matter, I ſhall demonſtrate by this Excrement of Wine.

When the Juice out of the Winepreſs is put into Hogſheads, that there working, the dregs falling to the bottom, the clean Wine may come out, the ſuperfluous Salt of new Wine, while it is ſqueez'd out of the Grapes, with the ſame labour is ſeparated, part ſticking to the ſides of the Veſſel, which we call *Tartar*; but the greater part of this Salt or Tartar, imply'd in the turbid dregs like Sand, ſinks to the bottom. Beſides, this is the property of Salts, that by a hot humour they make a thin water, the humour growing cold, not being able to keep all the diſſolv'd Salt that is compell'd to ſeparate, which excluded the Vehicle, ſeeks a new place. If you put into the Solutions Sticks or Strings, that Cryſtalline Salt, in a cubical or angular figure agreeable to its nature, will ſtick to them; or otherwiſe it cleaves to the ſides of the Veſſel.

'Tis beyond all Controverſie, that the Grape above all Vegetables has much Salt, not ſenſible, unleſs it is fermented with a minute heat, which working by Nature, endeavours a ſeparation, while the purer and more liquid part retains ſo much Salt as the Wine has need of, the thicker Salt being exturbated, part of which incruſtates the ſides of the Veſſel, part of much thickneſs ſticks, and ſubſiding with them, gets the appellation of dregs, from which the vulgar are wont to deſtil a Spirit or Brandy Wine: But theſe dregs are not a uſeleſs matter, as they have been hitherto thought, for much *Tartar* may be extracted out of 'em with little coſt.

But he that ſhall ſearch more narrowly into the thing, will find a way whereby poor and decaying Wine may be made good.

In ſome places, as ſuppoſe in *Franconia*, *Alſatia*, *Auſtria*, and the *Rheniſh Tract*, moſt fruitful for ſtore of wine, theſe lees of wine are made nothing of, but are given to Swine and other Cattel to drink, by which means the Tartar in it ſo purges 'em, that they are ſoon fat; they ſeldom try to draw the ſpirit thence. Otherwhere, where wine is not made, eſpecially where they fetch their wine a great way, they are much eſteemed of, not only becauſe wine may be drawn from 'em, but alſo put in ſmall Hempen ſacks, are preſſed in adapted Preſſes, a good mixt wine flowing thence ſaleable to others; yet this being but a ſmall wine, many have deſtinated it for Vinegar, to which it beſt agrees; but he that knows how to reſtore to it what it loſt in preſſing, may make a palatable ſtrong wine, not inferiour to what it was at firſt: But this Secret belongs to another place, I ſhall here only treat of Vinegar and Spirit of Wine.

In *Holland*, *France*, *Italy*, this preſſing of the dregs and preparation of Vinegar is of frequent uſe, and very profitable to many, who get nothing but what they ſqueeze out of the dregs they have of the Vintners, and convert the Wine into Vinegar; the reſidue of the dregs they put into Barrels, and ſell it to Hatters, which being boil'd in water, they thicken rough Hats with it; for Wool is brought into a little compaſs by hot water, and by how much the hotter that is, the Hats are made the thicker by it: For ſince it is the nature of Tartar to make the water wherein 'tis diluted hotter than fire, and ſince there is much Tartar in the dregs, by virtue of which, water acquires a more intenſe degree of heat, which the ignorant Hatters aſcribe to the limoſity of dregs, rather to be attributed to the inherent Tartar, hence they put ſo much dregs in every pot as they know to be needful to the conſtipation of the wool.

And this is the uſe to which preſt Lees are put, but if they have a greater quantity than the Hatters uſe, ſometimes they are corrupted, part turns to Worms, and afterward to a moſt ſtinking dirt fit for nothing. When they ſell them to the Hatters, then the Vinegar made of the wine preſt out of them, which coſt them little, brings 'em great profit, otherwiſe they would not gain much by their own Art, if they were not eas'd by the Hatters taking the reſidue.

But after what manner Vinegar may be made, I ſhall briefly ſhew: Vinegar-makers diſpoſe many Hogſheads upon Stands a foot high from the ground, under which a pot to receive the Vinegar is ſet, erected in a hot place, the upper head being taken out, about the middle of the Hogſhead they place two pieces of Wood acroſs, ſuſtaining another foraminous bottom, upon which they put the Vinous dregs, filling the Veſſel even to the top, then they cover it with the head or ſome good ſquare Cover, that little Air may enter; when in two or three daies, by putting in your hand, ſufficient heat is perceiv'd, the wine which before was preſt out of the dregs, is to be pour'd to it, ſo that the wine may be above the dregs, ſo the Hogſhead cloſe covered is left, till on the oppoſite row another Hogſhead can be filled with the like dregs and grow hot; then the Wine being drawn out of the firſt hogſhead, is poured into this, till the dregs in the firſt hogſhead begin again to be hot, which are again to be macerated in the firſt Wine. This mutual affuſion and depletion of

of the Wine is to be repeated till a juſt acidity follows, which may be done in the ſpace of two or three weeks, according to the heat of the Air; which will be good and permanent Vinegar, to be kept for ſale in another Hogſhead. Preſently the firſt dregs being hot, freſh wine is to be pour'd to them, doing all things as before, till this wine alſo ſhall become good Vinegar. If you have many Hogſheads, you may make Vinegar all Summer only, but if you will alſo work in Winter, the place may be made hot by the help of a Furnace.

After this manner in *France* and *Holland* many Families are maintain'd and enriched, by the dregs of Wine preſt and converted to Vinegar.

And now I ſhall produce my Invention, a good Gift of God, as I take it, to good men; 'Tis certain, that in Viniferous Countries, where much dregs are bought for a ſmall price, they may obtain a profit to themſelves not to be deſpis'd; for which (next to God) they are beholden to me, who by unwearied toil have found this Science, and let 'em ſhew their gratitude towards Needy Perſons, leſt they incurr the diſpleaſure of God, and ſo turn this Bleſſing into a Curſe.

Firſt of all, let there be a good Preſs, with a long Beam, from which hang weights, let there be put in ſmall bags at leaſt 5 or 6 Firkins of Lees, and them ſoundly preſt.

The wine that comes out by preſſion, you may turn to Vinegar, either by the help of other Lees, or ſome other method; pour as much of the thick in the ſacks with a due proportion of water into a Still, let it not boil in ſtilling, the Head being on, apply the refrigeratory, manage the deſtillation as otherwiſe Spirit of Wine is wont to be drawn, keep the Spirit proceeding thence till there is a good quantity of it, which you ought to rectifie or clarifie by ſeveral deſtillations: (tho this Spirit is not abundant in the dry dregs, yet there is ſufficient to pay for the making of the Vinegar and Tartar) when there comes an inſipid water, take out the fire, open the Pipe or Cock coming from the Still, let the water with the dregs run through the Channel into a great ſack put to the Preſs, when 'tis cloſe ty'd, preſs it, that the moiſt may be ſeparated from the dry: the Liquor cooling in a peculiar Veſſel, and congealed into Tartar, will ſtick to the ſides, the reſt falls down like ſand: Take out the dregs remaining in the ſack, dry them in the heat of the Sun, burn them under a Still as wood, and you will have very ſharp aſhes, commonly called clavellated aſhes, uſeful for *Dyers*, the price of which (at leaſt) exceeds the preſſion and preparation of Tartar. When you have finiſhed one deſtillation with the Preſs, fill the empty Deſtillatory with freſh water and dregs, as before, and while you draw ſpirit thence, preſs the firſt dregs, and continually put the deſtillation to the ſame Preſs, which coming out hot, don't put it to the former, but give proper Veſſels to each deſtillation. The day after, put the firſt water from which the Tartar went to the bottom, to the third deſtillation, inſtead of freſh water, that is, by diſſolving and deſtilling new dregs in it, as I have taught: Let the fæces of the fourth deſtillation be pour'd in the ſecond water, which hath let fall its Tartar, and ſo afterwards, by which Compendium you will make no waſte of Tartar, but what remains in the water, may take encreaſe from the new dregs to which it is pour'd, and it will give its Gain: But if you will, you may animate that acid water from which the Tartar is ſeparated, and with a ſmall charge, by Grain and Fruits of Trees, give it life and ſoul again, that it may again be made Wine, not unlike the firſt preſt from the Lees, after the ſame method it is turn'd into Vinegar, (becauſe 'tis already ſharp, the life or ſoul only that preſerve from Corruption being wanting) the way of proceeding will bring great Gain to him that underſtands it.

If you know not the adminiſtration, do as I have order'd, and inſtead of common water, diſſolve the hard dregs in this acid, and you will have good Tartar; but that languid water may alſo be adhibited to other uſes, which I ſhall ſet down in the end of this Book: This do, that the fæces be not burnt by too great a fire, nor the ſpirit ſtink, and the ſtill be ſpoil'd, which you may prevent if you anoint the bottom with Lard before you put in the heavy water, and draw off the ſpirit. Here I might ſhew a Compendium whereby the dregs, tho' dry, ſhould not be in danger of burning, but it would be long and tedious to the Reader. But if you mind diligently what I have written, you will get enough.

When you have gotten a good quantity of Tartar from the Lees, not neat to outward appearance, but very like dirt or ſand, purge it yet more, that either it may be reduc'd to a very fair Cryſtal, or till it cleaves in great Fragments to the ſides of the Veſſel, which you may effect by the following Way. Fill a *Veſica* with limpid water, almoſt to the top, put a little granulated Tartar into that water, ſoundly boiling to diſſolve, putting a ſtick to the bottom, you may ſee when it is diſſolv'd, add more by degrees, till no more will melt in the water, which you may thus find out: Fill a Pewter Saucer with this Liquor, if it contracts a little skin or cream, it ſhews that it has enough Tartar to produce Cryſtals, but if not, add more Tartar, till you ſee this ſign in the pot; while it boils, add the ſcum taken off with a perforated Braſs Ladle, to the dry Lees, which by reaſon of the Tartar adhering, when burnt, conduces to the clavellated aſhes; when the boiling has drawn Tartar enough, let it be let out thro' the Pipe of the Still into a clean Receiver, where while the water cools, the Cryſtals will incruſtate on the ſides; apply the reſt of the water to the ſame uſes, you will do better; if you ſhall change it into Wine or Vinegar, let the Cryſtalline roughneſs remain in the Veſſel, for if you add a new boiling, greater and fairer ſorts of Cryſtals will be made, becauſe by how much the thicker this Tartar is, ſo much the dearer 'tis held; and thus you may conciliate thickneſs to your Cryſtals. When it ſhall ſeem enough, pour the reſt of the Solutions into another Veſſel, in which the firſt Tartar has concreted, let it dry of it ſelf, afterwards ſtrike the ſides of it with a great blow, and great Fragments of Tartar will fall down, which you may ſell for profit, put the veſſel to the ſame labour again.

This is the exact deſcription of producing good Vinegar and Tartar neceſſary for many Arts, from the baſeſt dregs, and of juſtly getting much profit with little pains.

Now I proceed to make the Wine which ſome call Aduſt, or Spirit of Wine, of the Lees of Wine, without any Coſts.

After the defecated Wine is pour'd out, put the fæces into the Still, add as much water as the diſſolution of the inherent Tartar requires, kindle a fire, ſtir it at the bottom with a wooden Ladle, that it may not burn to; when you can no longer bear the heat of the water with your hand, and the ſpirits break forth, take out the Ladle, put on the Head, and deſtil till you perceive no ſpirit, but meer Phlegm; the remaining Liquor draw out into a ſack cloſe ty'd, work it in the Preſs, and you will have ſpirit of wine by deſtillation, and alſo Tartar by expreſſion, concretion, cryſtaliſation,

tion, with double encreaſe; as I ſhall ſhew more clearly by and by, that before you begin to work, you may be ſure, how much you hope to gain thereby, leſt you labour in vain, maturely conſult that you may diſcern by a premis'd computation what is to be done.

For inſtance, If five Firkins of Lees coſt half a Doller each, five Firkins will yield two R. Dollers and an half; from theſe I preſs out two Firkins of Wine, two Firkins remain in the ſacks, one Firkin is ſuppoſed to waſte in the transfuſion, when yet a Veſſel ſeldom ſoaks up four quarts: I turn the two Firkins of Wine into Vinegar; the two Firkins of thick Lees being diluted with Water, I draw Spirit of Wine, and preſs out the Tartar; this Wine drawn by the Fire, together with the dregs left of the Tartar, being reduced by burning into clavellated aſhes, do equal the Charge of making the Vinegar & Tartar, but two firkins of dregs afford from 40 to 100 pounds of Tartar, as the Wine is ſweeter or more acid, (tho' the harſh affords more Tartar than the ſweet) but if they yield but 40 pounds, this Tartar refunds the price of the Lees; the ſpirituous Liquor and clavellated Aſhes, recompence the Wood, and the two Firkins of preſſed wine you have over-plus to be turn'd into Vinegar.

Or if you buy two Firkins of Lees for one R. Doller; firſt you may draw off the ſpirit; after that, you may preſs out about ten pounds of Tartar, both together ſaleable at one Doller, as much as the Lees coſt; all the Liquor of the Spirit will be clear gain, by an egregious ſhort labour to grow Rich. Suppoſe a Firkin to coſt a Doller, and to yield not above 9 pound of Tartar, each of which is worth two Bazeins; tho' ſome Lees are better than others, yet ſeldom any are found ſo poor, that do not afford their value in Tartar; even the *Rheniſh*, *Franconian*, and *Auſtrian*, one Firkin yielding one Doller, oftentimes affords fifty pound of Tartar, or more. Beſides, we muſt note, if the Lees are dear, Tartar and burning ſpirit of wine can't be cheap, becauſe the dearneſs of them depends on the ſcarcity of wine: But if the Lees are dear, the the Vinegar, Spirit, and Tartar cheap, (which yet was never known) ſo that the quantity of Tartar will not yield the price of the Lees; neither alſo can you have the Vinegar and ſpirituous wine *gratis*; yet you ſhall have this profit above others, living on Vinegar and burning wines only, that the Tartar and clavellated Aſhes collected from the refuſe of the eliquated wine, by others rejected, you may get an help, that you may ſell the ſpirit of wine, that coſt you little, for more than otherwiſe. If therefore he gains by only preſſing wine, or deſtillation of the ſpirit, how much rather you that acquire both Vinegar and ſpirit of wine from thoſe dregs for a gratuity?

One thing more I add for confirmation: If 8 Firkins of Lees, that coſt 4 Dollers, make 4 or 6 Firkins of vinegar, or one of burning wine or brandy, that vinegar or brandy yields 10 or 12 R. Dollers: The preſt or deſtilled dregs, if they give fifty or ſixty pound of Tartar, they equallize the firſt price of the dregs; but if there be a leſs quantity of Tartar, the vinegar or ſpirit will ſtand you in but little, which being made better, or ſold cheaper than ordinary, you (the ſeller) will allure buyers before others.

Some man may ſay, the Art indeed has been unheard of, and is gainful, but does not agree with every age and condition; for all don't underſtand Merchandiſing, but rather ſome abhor it, ſeeing the Scriptures compleatly teſtifie, that the fraud between the buyer and ſeller ſticks as faſt as a Pin between the ſtones of a wall; to whom I anſwer, that to every Chriſtian an honeſt Occupation is permitted by Divine Providence for the ſuſtentation of him and his, but he need not burden his Neighbour in any caſe. For that it is lawful to endeavour a livelihood this way, or that, is atteſted to by a laudable example, in both the Old and New Teſtament.

This is the true way of preſſing wine from Lees, and reducing it to Vinegar, and drawing out Brandy and Tartar, and incinerating the refuſe.

It remains that I ſet down the uſes to which the reſt of the water from the Tartar may be adhibited with profit; but we muſt know by the way, that the ſourneſs in that water is nothing but Tartar diſſolved, which does not take a Cryſtalline form at the ſides of the Veſſel: therefore this acid water performs whatſoever is effected by Tartar diluted in common water.

Since there is no man but knows how to diſſolve Copper in tartariſed water, without the help of ſalt, as in the dealbation of ordinary Coins and Silver Veſſels among the ſilver-workers may be ſeen, who take away the Copper ſticking in the ſuperficies of money or ſilver-veſſels by boiling, the ſilver appearing as if it had nothing of copper mix'd with it: to this work the aforeſaid water may be very profitably applied; and ſeeing that a great quantity of it remains in the working of the Lees, it can ſcarcely be better imploy'd than by the following method. If the viler Marcaſites of Copper, every where obvious, and which cannot otherwiſe be melted with profit, as alſo the *Scoria* or droſs of Copper, which is thrown away, be boil'd in this water, it will attract the Copper to it ſelf; caſt in Filings of Iron, and they will be exalted into Copper, and the extracted Copper will be precipitated from the water by the addition of the Iron. This gradation of Iron into Copper being done, which in outward appearance will be like a dirty Mudd, it is to be edulcorated with clear water, and then throughly melted by the force of fire, which will yield a very fair Copper, no way coming ſhort of other Copper in goodneſs. Which Labour is very profitable, becauſe a great quantity of tartariz'd water proceeds from this Work; but that it may the more eaſily act upon the Copper, in extracting it from the ſtone or Marcaſite, a little ſalt is to be added in the boiling.

But if the Marcaſite or Copprious-ſtone abound with too much ſulphur, which yet ſeldom happens in the more ignoble Marcaſites, they muſt firſt be torrefied, that the ſulphur may be burnt, then to be ground, and boil'd with the tartaris'd water, and precipitated with Iron; which way more Copper is acquir'd than was in the Copprious-ſtone it ſelf, becauſe while it is precipitated, part of the Iron is exalted to Copper, part turns to Vitriol unlike to the natural in hardneſs; for a green ſolution remains, whereby Cloth and Yarn are made as black as with common Vitriol; alſo it affords the beſt Black for Shoemakers to colour their Leather, and is naturally adapted with Oak to conciliate a black colour to Wood.

If this vitriolated Water be boil'd in an Iron Pot till it be dry, and the reſidue melted in a ſtrong fire, you will obtain a moſt tenacious or tough Iron of wonderful virtue, if not to be preferr'd to good Copper, at leaſt to be compar'd with it. And ſo the common Copprice-ſtone of Iron is better than the filings or ſcales of Iron, if with the Lees of wine it be reduc'd by the ſpirit of the world into ſmall Balls, when you melt them, a very ductile and pure Iron will come out, fit for more uſes than common Iron; which labours if any will enter upon, they will reap fruits not to be deſpis'd.

It would not be beſide the matter to annex the manner how you might uſe both your Tartar and Aſhes at home, neither that you might be forc'd to ſell them abroad, but it would be too long, and rather hurtful than profitable to the preſent buſineſs. This I think to treat of farther another time, by the Grace of God.

THE

FIRST PART

OF THE

Prosperity of Germany:

Wherein is Treated of

The Concentration of Wine, Corn, and Wood, and the more profitable use of them, than hath hitherto been.

TO

All those Patrons that Love GOD, and favour their Country,

HEALTH.

Ye Pious, Prudent, and your Country-loving Patrons.

THE Most Excellent Glorious God, and our most Merciful and Bountiful Father, hath (out of his great Love unto, and Fatherly Care of us, from Eternity) set Nature before our Eyes, that he might signifie to us his Will; which said Nature, is no other thing but the proper, eternal, and only Will of God. To this Nature, God hath (as to his obedient and faithful Instrument) absolutely delivered, and committed his Will and Command to be by her faithfully and diligently performed; she accomplisheth the Task imposed on her, without intermission, nor resteth she one moment of time from doing the Divine Will with her utmost study and endeavour.

Therefore, deservedly ought we to learn to know, worship, and love the Creator above all things else whatsoever, seeing the Creator is known by the Creatures.

If his Creatures be great, and unperceivable to our sight, and so wonderful; certainly it of necessity follows, that the Creator is far greater, and far beyond all Human Understanding; and this, every one may easily understand: 'Tis therefore clearly and evidently manifest, that God Created all things for the service of man, that he might thereby acknowledge the Divine Bounty, and Honour, and fear the Creator, and bestower of all good things, and yield him due Thanks for his Gifts.

But seeing that it may so be, that the most just God will sometime or other, at last (being provoked by the perfidious malice of men, avenge himself on the most Impious living of this perverse World, by bringing scarcity of Food, (War, and the Plague); and seeing that it may so be, as that the small Company of the Pious, lying hid amongst the Impious Crew of the wicked, may partake of the same punishment: Therefore I thought it very expedient, with a cheerful mind to publish (to the Honour of God, and my Country, and for the comfort and solacing of its Pious Inhabitants) the Talent that God hath vouchsafed unto me, by the help of which, very many such Calamities as may come, *viz.* Famine, War, and the Plague, may be prevented.

But the way I have pitched on to serve my Country in, doth chiefly consist in the manifestation and Revelation of those most great Treasures that lie hidden in *Germany*, being such as by the regardlesness of Men have been hitherto unknown, unsought, and not gotten forth. I have therefore endeavoured, faithfully to manifest in this present Treatise, by what means those Treasures are to be sought for, and rightly ordered for the profit of my Country; and withal, to open the Treasures of the Noble State of *Germany*, wherewith it is most abundantly enriched, beyond all the other Countries of *Europe*, and hath hitherto enjoyed, and used (but not so well as it should have done) *viz.* Wine, Corn, Wood, Minerals, and Metals. For Ungrateful Men have extreamly wasted unprofitably, the most wealthy, and rich Benediction of God, who hath bestowed Wine and Corn on them, in abundance, and the Relicks (which they spent not) have they suffered to corrupt and perish with lying.

Nor

Nor is there any body that doth in the leaſt entertain any thoughts, by what means ſuch an abundance of ſo great Gifts, might be kept and preſerved for future years, which may be accompany'd with extream ſcarcity and Dearth. Every one ſhifts for himſelf and his, with that plenty of Goods he enjoys; and leaves another to take care for himſelf, and to ſee for time to come, that he provide himſelf for things neceſſary whereon to live. And it is come to ſuch a paſs, that the overplus which remains of the abundance of the Bleſſing of God, is meerly caſt away through a careleſs diſregard, and ſo nothing is preſerved for after times. And yet our Lord Jeſus Chriſt himſelf when he fed many thouſands of Men with Bread, commanded his Diſciples carefully to preſerve the remaining Crumbs, that nothing might be loſt; the which without all doubt he did for no other end, but that we might have the Gifts of God in high eſteem. But where ſhall we find ſuch as will imitate, and do the ſame; certainly no where, which is inexcuſable with God and good Men. Certainly ſuch a largeſs of Divine Gifts, is not beſtowed on us, that they ſhould miſerably periſh, or be caſt away; but we ſhould rather labour and take care of diligent laying up and preſerving (like ſo many Laborious Ants) all that overabundantneſs which we cannot make uſe of. Let it be but conſidered, I pray, in what great heaps Corn lies heaped hoarded up, and is ſpoiled. And is it not the ſame with Wine, which being gathered in ſuch over-great quantities, is become vile and abject, or caſt away?

What, cannot there be ſtore laid up out of this very plenty (which now is grutched at, as 'twere) as ſo many great Treaſures for future Calamitous Years?

Well however, though as yet this hath been left undone, yet I am confident, that ſome good Houſholders will be found, that will not deſpiſe this Inſtruction and Admonition of mine, but will condenſe the ſo much ſuperfluity of Wine, and Corn, and preſerve it againſt future Years ſcarcity. Nor do I at all doubt, but that others, after they have by this Book well learned the manner, will turn the ſuperfluous, and caſt away Wood (which lies and rots, and is reduced to nothing) into Salt-petre in great quantities; that by its help the Enemies may be reſiſted, and the Inhabitants defended. But in the three following Parts, which treat of the Concentration of Metals, and Minerals, wherein all kinds of Medicaments reſiſting natural Diſeaſes, ſhall be taught, I know that every one will find refreſhment, and help, againſt the future Plague, and Contagious Diſeaſes. So then, when we have Food and Drink neceſſary for a Livelyhood, and Salt-Nitre to defend us againſt our Enemies, and Medicines ſerving for the preſervation of us in Health, there remains nothing elſe we can deſire, ſave a little Gold and Silver, by which we may exerciſe Trade, or Merchandiſe, and furniſh our ſelves with Outlandiſh Wares. The which, that we alſo may get out of thoſe Mountains, we every where meet withal, and out of thoſe abject, and given-over Mine-pits, I queſtion not, but (God permitting) to effect it, and clearly to ſhew it in the three following Books of the Concentration of Minerals and Metals. Upon this account I would no longer keep by me this ſmall Book of the Concentration of things, but publiſh it to the Honour of God and my Country, (it being a Talent vouchſafed me by God.)

I do therefore Dedicate it to all Pious, Faithful, and Good Houſholders, hoping that my ſincere Admonition, and Inſtruction, will find ſome place, and not be rejected.

The three Parts I promiſed, ſhall ſhortly follow: Furthermore, I offer my moſt faithful help to every one in the opening and revealing the ſaid Concentration of Wine, Corn, Wood, Minerals, and Metals; for all things being in a readineſs, I can eaſily ſhew the manner of Concentration. And ſeeing I am ignorant, how long a time the moſt Merciful God will vouchſafe unto me, the uſe of life and light; I would not willingly bury with me a Science ſo eminent, ſo Noble, and ſo profitable to my Country. But if now it ſhould ſo fall out, that few or none ſhould at all mind it, yet have I done my part, and ſatisfied my Conſcience: Though indeed I do not in the leaſt doubt, but that there will be ſome good and faithful Houſholders, by whom theſe Profitable Inventions of mine, will be regarded, and be made uſe of for God's Honour, and for the Conſervation of the Country, and its Inhabitants.

This I certainly know, that if this Counſel, or Direction of mine, concerning the Concentration of Wine, Corn, Wood, and Minerals (which proceeds from the ſimplicity and ſincerity of my mind) ſhall find any place of entertainment, that our moſt praiſeworthy Country of *Germany*, will in a few Years ſpace become moſt exceeding happy, and be ſo enriched, that both high and low will be much joyed, and praiſe God, and give him thanks.

But I eaſily conjecture with what various and different Judgments this Off-ſpring of my Brain, will be expounded. One will haply give credit to the things I have ſaid; but another will condemn and diſdain them, as mere Impoſſibilities, and Dreams. But however, the truth will at length break forth, and the work it ſelf will purchaſe to its Maſter due Praiſe, and herein I content my ſelf. The moſt Bleſſed, moſt Merciful God, and our Father, that great Houſholder, beſtow on us his Divine Benediction, that ſo we may inſtitute in moſt places of this our moſt dear Country this Concentration of Wine, Corn, Wood, and Minerals; and may by the help thereof obtain ſuch Treaſures, as may ſerve for the ſuſtaining of our life, in time to come, atd for the reſiſting of our enemies, and for the Glory of God, and the help and ſuccour of very many needy ones in Diſtreſs.

THE

The PREFACE.

IF the *Proverbs of the Ancients are to be embraced as wholsom Doctrines, then certainly this (being none of the least) is not to be rejected; and is thus,* That he that will not hear, 'tis fit he should afterwards feel. *The meaning of it is this; If so be any one be regardless of a warning, and so come to damage, every one is wont thus to say of him, He is but justly rewarded, why did he not yield to a faithful warning? who will help him now?*

But however, I have endeavoured (for the Honour of God, of the Magistrate, and of my Country, and the benefit of my Neighbour) to shew, by good Admonition, and by a profitable Testimony, by what means, that great plenty we have in these as yet prosperous times, wherein we have abundance of Corn, Wine, and other things in great plenty throughout all Germany, *may not unprofitably be lost; but be preserved for support in those years of scarcity that are next to come, according as* Joseph *that most excellent Steward mentioned in Holy Writ is said to have done.*

And now that there may be as much prevention as is possible, that the Wine, and Corn perish not with lying, but be preserved against a future scarcity, I have published this little Book for every ones view, concerning the Concentration of Vegetables, Animals, Minerals, and Metals, in which, the prosperity and felicity of all Germany, *and indeed the Universal Treasure and Wealthiness of the whole World, is seated.*

And because such an abundant plenty of all these things begets a nauseating and loathing, as it were, of those Minerals, Metals, Wine, and Corn, wherewith Germany *exceeds all the other Countries of* Europe; *I judged it well worth while to constringe, or concentrate this plenty into a little room, and preserve it from the loss and destruction of the same, arising from Negligence and Contempt. For when such vile, or cheap things are driven into a small compass, the baser and unprofitable part goes off, and the nobler and better part is driven together, and preserved, and doth not so easily become corrupt as afore, when both good and bad are commixed together.*

And this is to be understood of the Minerals, and Metals, and of Wine, Corn, and Wood. For where the Water is separated from the Wine and Beer, and the more Noble Parts are concentred, as it were into a Centre, you may even preserve them as long as you list. And when you need either Wine, or Beer, the concentrated parts may be relaxed by the apposition of Water, and be enlarged, insomuch, that one Vessel will hold six Vessels of Wine; and this, taking up but one place, and yet contains six times the quantity, there will not need so much costs, nor will so much Wine be spoiled by vapouring away, as would be by six Wine Vessels, which must always be kept full. Besides, this farther benefit ariseth hencefrom, viz. *That out of such concentred Juices (if they be at hand) there may be made every* Autumn *new Wines sooner than ordinary, 4, 5, or 8 weeks time or more, and be sold at a bigger rate, than in the very* Autumn *Season, when the Grapes are ripe, and every Body furnished with Wine.*

NB. *For such a work there is requisite a certain peculiar Instrument, and artificial knack, by the help of which the Must may be holpen to a speedy fermentation; there are also other Conveniences which arise from these thus concentred Musts, which for Brevities sake we here omit. So likewise Beer being after the same manner concentred, doth bring a many more Utilities than ordinary Beer. For that Corn which eight Barrels were scarce sufficient to contain afore, need no more but one here, the which being put in the Beer Vessel, will not turn into Vermin; nor will it flie out of the Barn, but may be used after* 10 *or* 20 *years. Such Artificial Factitious Ales, seeing they are (in their condensation) boiled a longer while, are far better than the common sorts which are made of dried Corn, or Malt. Whosoever therefore shall in a great plenty of Grain, buy up Corn, and condense it by such Artificial Concentrations, and so lay it by, till a scarcity comes, will gain abundantly, and will not only get to himself an honest, and to others no ways injurious profit; but will withal (being thus studious of Charity and Mercy) deserve exceeding well of his Neighbour, if he helps him in his great necessity, and he will readily pay him for his Corn, whereby he may get Money to sustain his Family and be a profitable gainer.*

So then, no body is injured by this condensation, and concentration of Ale, or Wine, but both the Buyer and Seller are Gainers, and this should of right, be in every Man's heart, what condition soever he be of. It would be well done of Noble Men, Princes, Kings, Emperors, and other Magistrates and Common Wealths, if they would provide in their Store-houses for Warfare, such kind of condensed Liquors, and Juices, that so the poor may in a time of scarcity be made partakers of that plenty, and they will have no loss thereby, but rather benefit.

But the Condensation of Wood, and turning it into Salt-petre or Nitre, is far more profitable than that of Wine or Ale; for wood may be had even as it were gratis, *and be with a very small Cost transmuted into Nitre; the which may be kept without hurt in the Storehouses for a long time, seeing it is not wont to corrupt or perish, and be there conserved until it be made up into Gun-powder with Coals and Sulphur, both which are also not subject to corruption; so that it is not so very necessary (nay, rather it is hurtful) to have such vast quantities of Gun-powder in their Castles and fenced places. There are examples enough of Towers in which Gun-powder hath been stirred up, which either through negligence, or else by lightning, being fired, have in less than a moments time o'return'd whole Cities, and slain abundance of men. Now this mighty inconveniency may easily be prevented by this only Remedy,* viz. *If the Powder be not made up, but the matter thereof* (viz. *Nitre, Sulphur, and Coals*) *be only kept in readiness, wherewith the said Powder may be made, as necessity requires: Besides, herein also doth the concentration of Wood exceed (as to profit) the condensation of Wine and Ale, not only because there lie vast heaps of Minerals in* Germany, *(which not containing a fixt and corporeal Gold, are therefore disesteemed) that admit of a separation of their better part, and fixation of it by Nitre; but withal, the meaner Metals (their superfluous Sulphur being burnt up) may be transmuted into better; and the perfect Metals,* viz. *Gold and Silver, may (by the help thereof) be destroyed, and be enforced or concentred into a better part; the which thing the following* Second, Third, *and* Fourth Parts *treat of.*

So then, this Transmutation of Wood into Salt-petre or Tartar, of both which not only great quantities may be sold, but

but may be also applied to sundry uses, will bring to our noble Country of Germany (*in which there is an incredible quantity of Wood to be had almost every where* gratis) *a most notable encrease of Power and Strength, not only against its future, but its present Enemies.*

Whosoever therefore shall have abundance of Wood, shall likewise be enriched with store of Wealth, provided he will but set his hand to the work, and not fear that ever Salt-petre *will be such a Drug, as to be of no value, and not vendible: And yet if it should so be, yet in the Explication of my* Miraculum Mundi, *already published, I have manifested so much, and will, in the three following parts of this Book, manifest such things as concern the use of this* Salt, *that there will never want such, as penetrating into the knowledge of these Secrets, will not full well know its Use.*

He that hath Eyes, let him look about, and use them, for the time comes, yea, and by little and little approacheth, in which Knowledge will be a profitable thing; and it will be well for those who are seasoned with the knowledge of things profitable. Verily, Knowledge is better than store of Goods, for no body can carry them with him, nor (in some cases) help either himself or his Friends with them. Happy is he that can say with the Philosopher, All that is mine do I carry with me: *How injuriously do they speak of the most bountiful Lord God, who accuse Him for that He hath forborn the bestowing of Wine, plenty of Corn, Pome-Citrons, and Gold on some Countries, and yet fully as great Treasures are to be found there, if the Eyes of the Inhabitants were not darkened? If there were nothing else, yet certainly there is Wood to be found, which without any labour, costs, or trouble of Rich or Poor, doth grow night and day, and offers it self unto us, and as it were, saith unto us in these words;* What! am I of no use? Do not I come forth to thy view, that thou maist by contemplating on me acknowledg the Divine Bounty, and make use of me with thankfulness? *There is not therefore any reason why one Country should exalt it self before another, because it is better; or contrarily complain, that the Divine Benediction less regarded it than other Countries; no, each Country hath enough, if it would but be content with what it possesseth. As for those Countries which are even destitute of Wood, they do nevertheless abundantly enjoy the Divine Benediction; witness* Island, *and other cold Northern Countries, which have their Corn, and other Necessaries for Life, brought them out of other Countries. But now on the other hand, these Countries afford Cod or Stock-fish dried; and so, though they want Trees, Fruit, Corn, and Wine, yet they do not want, and are equally as well nourished by the Divine Bounty as the rest be. Though they want Wood, yet have they Pit-Coals; for the Earth there is very sulphurous, and at the Mountain* Hekla *it burns perpetually, and casts out fire, smoak, and ashes, and yields to the Inhabitants a great quantity of Brimstone, which they dig out and sell to our Country Mariners and Traffiquers, thereby sustaining themselves.*

Some one or other may object to me and say, Seeing that Salt-petre *is to be accompted of as an* Universal Subject, *and to be found in all things, it must necessarily be, that seeing* Island *has no Wood at all, the* Salt-petre *is to be found in the dry Stock-fish, for otherwise this Salt can't be said to be* Universal, *as being not to be found in such or such a Country.*

Well then, to clear this doubt, I do affirm; (as I said before) that Nitre is in Fishes also, though not in such plenty as in other subjects, viz. *in Wine, Wood, and Corn: But it is found far more plentifully and potently in Stones, with which those Countries are well stored; and any one may easily guess what Riches they would produce, were they but versed in the knowledge how to extract it; for in Stones which by burning are turned into Lime, (the which may be done without Wood, even by dried Turf or Pit-coal, and that easily) Nitre is as abundantly hidden, as in Wood, and in other Vegetables: Nor is there ought else requisite, save the knowledge of the way of its extraction.*

If therefore that harsh and wild kind of Country, wherein nothing grows, be put in the Philosophical balance, with the most rich Country, it would (seeing it contains hidden in its Earth and Stones such great Treasures) easily exceed it, and obtain the chiefest place. There is therefore no reason why any one should complain before God: A small man doth usually exceed, as to swiftness and agility, one that is big and tall: A weak man may oppose the acuteness of his wit against the strength of the lusty: A poor man enjoys Quietude, and patiently undergoes his more hard fortunes; but contrariwise, the rich is invironed with cares. And this may be also understood of other living Creatures. These things being well considered, every one may understand and perceive, that God hath satisfied every one, and that there is no Creature that can justly complain.

It is reported of the Peruvian *part of* America, *That it is enriched with the most abounding Silvery Mountain* Potosi, *seated in a part of that Region, and is about some* 50 German *miles in compass, and that it doth by its exceeding cold Air hinder the growing of any Vegetables, and yet notwithstanding, there is such a notable power and excellency obtained by the Riches of that place, that the City there founded doth abound with the best Wine, Corn, Sugar, and other such-like necessary things, and is scarce inferiour in bigness and fair Buildings to any City of* Germany, *and from this very Mountain only receiveth it this felicity. It is hence evident, that all such things are not unprofitable, which (by reason of the meanness of the outward shape) are not so well known to every body; for sometimes a Countryman throws a Stone at a Cow, which is far more worth than the price of the Cow is, and yet it is contemned, because unknown.*

The external and superficial Figure therefore of a thing is not alwaies to be regarded, but its inward parts are to be search'd into and viewed; and that we may attain hereunto, Alchymy *points out to us the way, (She being the Instrument of the true praise-worthy Philosophy) and opens the Gate, whereby we may search into the inmost bowels of every thing.*

He who well knows the fire, and the use thereof, will not be distressed with want. And he that has no knowledge of the same, neither will he throughly search into Natures Treasures: From these things it is evident what Treasures we Germans *do unknowingly possess, and yet convert them not to our use; And were not foreign parts as ignorant too of these things as we our selves are, they would readily have upbraided us* Germans, *that we spend more time in eating and drinking, than on good* Arts *and* Sciences.

Now as concerning my writings about the concentration of Wine, Corn, *and* Wood, *and the condensation of 'em, I shall never be better able to prove and confirm the Truth of the same, than by producing it to manifest light, that so the Eyes seeing it, all admiration may cease, and all incredulity vanish. There is credit therefore to be given to all the things mentioned in this Book, as to an experienced Truth, and which are not made publick for any other ends, save only that those natural Sciences may tend to the utility and benefit of my Neighbour. Whoever therefore shall believe them, will purchase Honour and Profit; and contrariwise, he that will not believe, will get only disgrace and detriment.*

I will therefore predict or foretell, that this one only Artifice of making Salt petre *in such great plenty, and the way of using it to metalline works, will bring incredible Trea-*

ſures to our Country of Germany, *if we be not too negligent, or let it ſlip by a ſluggiſh ſlothful drowſineſs. I do verily believe, that if God doth yet vouchſafe me one years life, that this ſaid Artifice of* Salt-petre *will be profitable to very many; but if ſo be that it ſhall not pleaſe the Divine Majeſty to prolong my life ſo ſhort a time, it may however be accounted of, that God hath indeed ſhewed us* Germans, *as heretofore he did to* Moſes, *the* Land of Promiſe, *but hath, by reaſon of our ſins and incredulity, ſhut up the paſſage againſt us.*

But that I may abſolutely ſerve my Neighbour, and that he may have no cauſe to complain, as if I had ſerved him but by halves, in that I have not deſcribed the Preſs for Wood, together with the appertaining Inſtruments, I do now therefore certifie every one, that all the things neceſſary and requiſite for the concentrating of Wine, Corn, and Wood, are to be ſeen in my cuſtody in perfection.

If now any one be deſirous of receiving benefit from his Wine, Corn, or Wood, and that he find it highly to concern him to get this knowledge he will well know, by the inſpection of the Work preſented afore him, wherein lay the defect as to the getting this thing, and what means the ſaid defect is to be holpen by; but the Inſtruments that I have mentioned, ſhall be no longer to be ſeen, than from the Calends of March *to the Calends of* September, *this preſent year* 1656. viz. *ſix months time; for I have purpoſed to my ſelf, not to render my life burdenſome alwaies unto my ſelf, by carrying ſuch troubleſome burthens about to and fro, but at laſt to get a quiet ſeat and abode. So then it will, by this here ſpoken, be evidently manifeſt to every one, what he is to do as touching this matter.*

The three other Parts concerning the concentration of Minerals and Metals, ſhall (if God permit) ſhortly alſo follow.

But becauſe Nitre is the alone Inſtrument of that work, and that no body can get any eminent profit, unleſs he can have Nitre at a very cheap rate, it is wholly neceſſary that ſome labour be beſtowed about the procuring it, which if you can get good ſtore of cheap, then will the hoped-for profit be perceived, both out of Minerals and Metals: If not, vain will it be for you to make your ſearch into that Mineral kingdom.

Well, I do affirm, That by the benefit of Nitre, things wonderful may be effected in Metallick Labours; yea, ten times more than what I have deſcribed in my ſmall Treatiſe, called Miraculum Mundi, *or dare to deſcribe for the future; for all things requiſite to true* Alchymy, *may be perfectly accompliſhed in it, by it, and with it.*

Herewith I conclude this Preface. Whatſoever is here wanting in this Treatiſe, for brevities ſake, the demonſtration viſibly expoſed to view, will afterwards compleatly recompence, inſomuch that any one will eaſily wind himſelf out of all doubts. And here we reſt for this time.

THE FIRST PART
OF
The Proſperity of Germany, &c.

IN the Name of the moſt Holy Trinity do I begin to deſcribe the moſt great Wonders of God, that I may manifeſt to every one (without concealing ought) His Grace and Mercy, which He embraceth Mankind withal; and I pray God, the Father of us all, the merciful Creator of Heaven and Earth, to guide and direct this Work, that it may ſerve to His Divine Honour, and tend to all our welfares. *Amen.*

We will enter into *Franconia*, and ſee what a wealthy and large Benediction of God is to be found therein: And I will firſt begin with Wine, none of the leaſt of the moſt noble Creatures of God, and will demonſtrate how ungrateful we ſhew our ſelves to the beſtower of all good things, and how baſely we abuſe His Goodneſs.

Every one knows what a noble Creature wine is, how ſtrained from the Grape and made, and therefore this thing needs no further deſcription, foraſmuch as others have hertofore ſufficiently enough done this task and daily Experience is an abundant teſtifier of the uſe of the ſame. It is behoveful here, that we only ſignifie how it ought to be handled better than it has hitherto been, and may ſo likewiſe bring a greater profit and utility to the tillers thereof than hitherto. Every one knows, that wine is the nobleſt amongſt all drinks, and moſt conducive to health, and may and ought to be called the Pureſt drink: It cheriſheth old men, and heats the cold, but ſuch as are of a tender age, ſhould deſervedly ſhun wine, becauſe being drunk too ſoon, it eaſily inflames the Liver, and dries it up, and ſtirs up various Diſeaſes, and at laſt cauſeth Death it ſelf. So then, there is nothing ſo good, but may alſo do hurt, nor is any thing ſo evil, but doth ſometimes bring ſome benefit, according as the difference of the uſe is which it is applied unto; as is here evident in Wine; the which being drunk moderately, and at due ſeaſons, doth not only excellently well digeſt and concoct the Meat in the Stomach, but likewiſe evidently ſtrengthens the Heart, Brain, and Vital Spirits, and generates pure and ſound Blood and Fleſh. Contrariwiſe, being immoderately taken, it overflows as 'twere the Stomach, Lungs, and Liver, fills thoſe Veſſels with many evil humours, and obſtructs them, ſo that they cannot well perform that office whereto they are deſtinated by *GOD* and *Nature*, but are overwhelmed with whole Troops of Diſeaſes; for the Heart and Brain is ſet upon by their ſpiritual efficacy and hot nature and property, and is weakened, and the vital ſpirit is overcome and ſuffocated, as we ſee in the fire, the which when greater doth alwaies ſuppreſs and overcome the leſſer.

Hence it comes to paſs, that men that load themſelves with daily drinkings, do little differ from new-born Calves and Geeſe, and are wont to be neither profitable to God, nor to Men, nor to themſelves.

In

In the Name of God, therefore we will proceed on in the matter we have proposed, and see by what means more profit may be reaped from Wine than hath hitherto been.

In the first place, he that aims at the bettering of any thing, must know what the thing is which he studies the amending of, and of what parts it consisteth.

Therefore, as concerning Wine, it consisteth as well as the other Vegetables of three principles, *viz.* of *Salt*, *Sulphur*, and *Mercury* (that I may use the Philosophers terms). The *Mercury* is its insipid moisture, and the *Sulphur* is that burning Spirit which is extracted or drawn out thereof. You shall thus know the thing, by this following Experiment. Put a Cucurbit full of Wine in a B. and with a gentle heat draw off what will come, but yet so, that the parts which in the destillation alter or change themselves, be each of them received apart in its peculiar Receiver. For example; If there were 12 parts of wine, or 12 measures, there ascends first only one part of spirit, which is the soul and life of the wine; after it, come ten parts or measures of insipid water; the remainder in the bottom of the Glass is a thick and austere or harsh matter, which being the Tartar or Salt of the wine, is also almost one part or measure of the wine. Of these three parts all wine is compounded, but yet partakes of one or the other of the Principles, more or less, according to its being more or less mature, or its growing in such or such a place. As for example;

The Austere Wine hath alwaies more Tartar and less Spirit than the Ripe Wines; and contrarily, the ripe wine doth abound with more Spirit than Tartar, as the *Spanish* and other extraneous wines witness, which do alwaies abide sweet, and plainly have no Tartar in them; the reason is this, Because in those warm Countries they are brought by the Sun to meer sweetness, and so are ripe; so that the austere Tartar or Salt is throughly changed, and concocted into a sweet Sugar. Hence it comes, that the said wines do not in the afore-proposed Examen leave any austereness, as our wines in *Germany* do, but rather yield twice as much spirit, and scarce the half part of insipid water: Whenas austere Wine yields about a twentieth part of spirit, the ripe *German* wine yields almost a twelfth part, and the *Spanish* a sixth part of spirit, four parts of water, and one part of fæces without Tartar. So that from good *German* wine there comes (as I said afore) one part of spirit, ten of water, and one part of austere or sowrish matter.

He that knows these things, will easily contrive and prepare for himself by the help thereof, at all times, be it hot or cold, good and constant, or durable wine. Neither is there any room left a man here of complaining, as if God shewed greater bounty to men one year than another. The fault of this defect is not to be imputed to God, but to our own selves, who know nothing, nor are willing to know, nor study how to help Nature; for Art can bring an assistance and help to Nature when she is impeded in her work, and is unable to bring her Fruits unto a maturity, provided the Artist removes away that which the wine naturally abounds withal, and addeth thereunto what it is destitute of.

For example, Let us examin a thin wine, which being not sufficiently concocted and ripened by the Sun, is endowed with too much sharpishness and water, and contrarily has but little of spirit; if now to such a wine, when it begins to boil or ferment, some spirit shall be added, so that it may work together with it, it will be even as well ripened in the wine-vessel, by the benefit of this fiery spirit, as if it had been ripened by the Sun, as it hung upon the Vine; insomuch, that by this means there mought be made excellent wines every year, if any had but the knowledge of thus helping them.

NB. But now such a spirit must not be such an one as that common Adust or Brandy-wine is, but a grateful and pure Essence of wine; the manner of making it I have described in my *Vegetable Work*. Now by how much the more this Spirit shall ferment or work with such a wine, so much the stronger and more efficacious doth the wine become: Forasmuch as all the Virtues of all the whole wine consist in the Spirit only, and the Tartar or Salt doth by its muchness make it austere and sharp. But *Musts* being by such an Artifice made stronger and more efficacious, do keep a longer time afterwards without corrupting, and may be carried or transported whithersoever one please; whence it comes to pass, that they are never spoiled, as they are otherwise usually wont to be, when 'tis not of ripe growth.

From these things 'tis evident, that out of one Must, grown in one and the same *Autumn*, there may with ease be made wines of 3, 4, or more kinds, according as there is more or less of this spirit added to the *Must* and fermented with it.

There is also another way, by the help whereof every austere wine is easily corrected and amended, thus: In the Vintage time, let the liquor of the *Must*, or of the expressed juice of the Grapes, be so boiled in peculiar Vessels, that the unprofitable moisture or tasteless water do exhale by little and little, until thou hast as much as thou wouldst, or as the efficacy of the wine, or the degree thou wouldst by correcting reduce it to, shall require: For, in the exhalation of the superfluous moisture nothing goes away, save that insipid water; but the sweetness and the austereness remains in that thick and condensate juice, like to Honey; so that that boiled mash comprehends all the strength and virtues of the wine, concentrated as it were, and condensate, and will again disclose them, if it doth again work, with water thereto added in a due proportion; but the use of this condensate *Must*, which as yet hath not wrought or fermented, is this, That it can be at all times carried, and most profitably sold in far remote Countries, which thing could not afore be done.

For every one knows, that when there is a cold Summer, Wines become immature and acid, and are not wont to keep; for as soon as they come to be a year old, they are covered over with a filmy skin, and being mouldy, corrupt, because they have not in them spirit enough. From whence it comes to pass, that many times Vintners, or Vineyard-keepers, suffer great loss, after that they have diligently betook themselves to dress the Vineyards for an whole year, and have lived sparingly and hardly, and working hard, have sustained their lives with Bread and Water, hoping that upon selling their wine they should scrape together a little Money, to buy them some Clothes and other Necessaries for their Family's supportation; for the expected plenty of the wine hoped for, and of the profit accruing by the store of Money for it, when sold, hath prop'd them up with this hope; but now the wine fading and deluding their hopes, and turning into an acid and austere taste, they cannot sell it, seeing 'tis scarce worth the carriage; or if it be sold, 'tis at such a mean rate, as scarcely sufficeth to discharge the Cost of dressing it; and what shall now be done for Food, Drink, Raiment, and other Necessaries to sustain the Family?

And

And yet the Vines must be dressed for the next year too, and more Monies laid out upon them; but from whence shall Monies come for Food and Raiment, in the mean time? Alas, what course will they take if some such-like years should follow one another together? Either the poor miserable men must, together with their Wives and Children, famish, or else turn Souldiers, and be kill'd, or be made so desperate, as to betake themselves to thieving and robbing, and so finish their daies by an Halter: For the present world is so much estrangd from Mercy, that one will not use so *much* Christian Charity, as to help another in his necessity.

And besides, the ingratitude it self of men doth sometimes make others slow and fearful of administring and affording a mutual help; forasmuch as very many, when they are rid out of their incumbrances, do refuse to restore those things, or by labour to requite or make amends for the things by which they were delivered out of their Straits.

Hence it comes to pass, that he who does a friendly good turn, for such an ingrateful man, loseth his Money, and by reason of that so ill placed formerly, abhors the lending his helping hand again.

Now, that such great inconveniences may be removed, and the Vine-dressers somewhat holpen, so as that they might every year sell their wines at a beneficial price, and may never be oppressed with that foresaid detriment; it may very conveniently be done by the help of this concentration or condensation, by evaporating the *Must* to the consistence of Honey, the which may profitably be carried into far distant places, in which no wine is accustomed to grow, and be there sold. Such now as buy up such Must thus condensated by boiling, do now know how by dilating it with Water, to reduce it again into good wines. This Artifice therefore being so laudable, will be helpful to both, to the Vine-dresser, in yielding him presently ready Money for his Must, and to the Merchant, in easilier furnishing him with Wine, and quitting him of so much Charges in the Carriage.

But that the business may be yet the better and more clearly understood, let us see by making computation, what the benefit and profit of this condensation is.

Let us suppose then, that a Wine not ripe remains acid and weak, and that a *Franconian* Urn, or half an Hogshead of *Frankfort* measure, yields scarce a Florin, or a Doller at the utmost. Such a Wine as this will not quit the Costs of the Carriage, though but for 12 miles; [*a* German *mile is three of ours.*] for it degenerates by the carrying it, and becomes mouldyish, as 'twere, and turns sowre, so that the Huckster can't sell the same, and he'l have a care how he buys such wines another time; and the Vineyard-keeper is even enforced to keep them to his great loss, forasmuch as all his safety or dependance is built thereupon.

As for the Rich men, tho' they have some acid wine, they are not undone by the loss, for they have still by them other better wines, which they mix those worser and more acid wines withal, and so sell them off; or else they keep such thin wines till the Autumn comes, with more plentiful and riper Grapes, and to the Must proceeding from them, do they pour this thin Wine, and let it work therewith anew, and by this means it becomes vendible. But yet the Gain arising hencefrom, is sufficiently poor and mean: For by how much the thinner the acid wine is than it ought to have been, tho' it be mixt with good Wine, yet doth this become so much the worser; nay, it sometimes happens, that both are corrupted and lost; for as much of help as the acid Wine gets from the good wine, so much of goodness doth depart even from the good wine. So that such a kind of bettering after whatmanner soever it be instituted, cannot be very profitable or advantageous.

For example, that I may be the better understood, let us instance in two pieces of Gold, each of which should be the value of 25 Imperials: Let them be put in the Balance and examined, and being examined, let one of them be the due weight, and let the other be less in weight or price the value of four Imperials. If now you are minded to take so much away from that piece which is of current weight, as to make them both of alike weight, you may indeed so do, but yet you are no waies benefited thereby, but rather suffer loss: Forasmuch as you took away from that piece that was of due weight, and added unto the other piece that wanted of weight, so much of its value is departed, and both pieces will be unfit to go in payment, as wanting their due value and weight. What profit therefore can hence redound unto any man? Even so is the case with the Wine, for if one should get some two load of wine, and could sell one of them for 20, and the other but for 10 Imperials, and yet should not be accounted of as vendible Wine, and now the Merchant should mix that thin wine with the better, that they may both be equal, would not that better wine become worse, and that thin wine be rendered not much the better? For my part therefore, I cannot see that such a kind of meliorating can bring much profit.

But as for my bettering and correction, it is always profitable, whereby the acid wines are not corrupted by the acid, but the good and superfluous humidity only is separated by the benefit of Art, and the good part being condensate in it self, and by it self is reduced into a narrower compass.

NB. He that is so minded, may separate from the sweet Must, a fourth part only, or a fifth or sixth part, by evaporation, and presently bring it to such a pass, as to work or ferment; for they become so much the better, by how much the more water hath been consumed by evaporation: If the Quintessence of wine be added to that working Must, the wines become the better, and the more generous. This kind of way may be made use of in those places in which the wine doth for the most part remain acid; for there needs not this Art to those Vines that Nature hath ripened.

Besides, the wines may be condensated to the thickness of Honey, that they may be thereby rendered the fitter for Transportation. Six Hogsheads, or *Omæ*, of Must, may be so condensated, that one Hogshead will hold them; the which (if need be) may again by the apposition of 5 Hogsheads of water, which quantity it lost in the condensation, make 6 Hogsheads of wine of the very same goodness and efficacy as it would have been of before the condensation, if it never had been condensated, but been presently put out of the Press into the Barrels, to have fermented and work'd into wine after the usual manner.

NB. But now if any be desirous of making his wine better and more noble than it would have been afore the Concentration, then he must not put five, but only 4 parts of water; for should he add but three Hogsheads or parts, it would be yet better and nobler by one degree than the others. Hence is it manifest, That it is in the hands of the Artist to make and alter these wines at his pleasure, and to render them strong, stronger, and middling, and by the addition of water to give them even what efficacy and what virtues you list. But now, to all the mixtures he may add the soul of wine, if he has it, that the wines may thereby be the sooner clear and pure. For the Quintessence of any wine being conjoined with new Musts, and working with them, brings them in a short space of time to clarity

clarity and purity, so that they become transparent, but principally when they are tartarized, or full of Tartar, for the Spirit of Wine brooks not any Tartar, but precipitates it in the fermentation to the bottom, or drives it away from it self, and so by consequence makes the Wine clear and transparent. But as concerning, what means the Tartarized (Spirit or) Essence of Wine is to be artificially prepared by, 'tis needless to repeat here, forasmuch as it is already described in divers of my Writings hitherto published, but especially in the Vegetable Work.

Besides, it is not so convenient, that every one should know, by what means the concentrated Musts may be prepared with water, and the Tartarized Quintessence. It is sufficient in this place, to know how the Musts are to be concentrated, or brought into a narrow compass, that so they may be transported and sold. Let this be the care of the Merchants to know how to use them when they have bought them. For the Brains of the Vineyard keepers are incapable of these things. Yet nevertheless, there will be some Men who will know how to make a due use of such boiled and condensed Musts, if they can but get them, and every one may be Master of this Affair, if he has but Coppers and Kettles, necessary for such an Operation; whereby he may make store enough of Juice. But yet every Countryman can't get such Kettles, neither will it be worth while, forasmuch as a small Portion of Wine, will not be able to quit the Costs. But whosoever bestows his Study and Moneys in exercising this Artifice, will reap thence from a great deal of Utility and Advantage. But whether he does these things, or does them not, he neither benefits, nor injures me. 'Tis sufficient, that I have evidently demonstrated to the Vineyard Masters, by what means they may always sell their Wines, whether they be ripe, or have come short of their Maturity.

But for the better instruction of the Courteous Reader, I will compute the Charges of this Operation, and show, what gain is to be expected from the Condensation of these Musts.

In the first place therefore, let us buy some Musts in those places, in which they are thin, and are sold for a mean price, *viz.* twelve Urnes, or six Hogsheads, or Oma's, for *xij.* Imperials; [an Imperial is about 4 *s.* 6 *d.*] this Must we will condense to the Consistency of Honey, so that there may be but one Hogshead, or Oma remaining. Let the Costs requisite to this Concentration (always provided you are furnished with the Copper Vessel) be valued at half a Dollar, or thereabouts; and the charge of the Wood we'll count an Imperial for. The Wine Cask which is to be filled with this condensate Juice, we will value at half an Imperial, its carriage forty Miles, we'll reckon six Imperials for. All which Charges being summed up, make nineteen Imperials and an half. And so much will be the Charges of one Hogshead, or one Oma of this Condensate Must, and its Carriage forty Miles. This Must now being brought into such a place where Wines are dear, you may at any time of the year, by the addition of Water, and by Fermentation, transmute into good Wine. And that one only Hogshead being the condensate Juice of six Hogsheads of Must, will yield thee so many Hogsheads of such Wine as the Must would have been afore its Concentration. And if thou desirest to have thy Wine stronger and nobler, than as it comes out of the Press, and than it could be afore this Condensation, you may omit the putting thereunto so much water as it lost in the Condensation, and lessen it proportionably, that so those six may make no more than four Hogsheads, and they will be the more generous; the which thou shalt far better have by this means, if *viz.* You know how thereunto to adjoin a Quintessence.

If now, that one Hogshead of juice, which afore its Condensation was six Hogsheads, doth again yield four [and no more] it must of necessity be much better, and more noble than otherwise it would have been, had it been made after a Natural manner, (*viz.* just as it came from the Press.) And by this means too, it will last the better, and may be the easilier transported and sold.

So then, if in such a place as is 40 Miles distant from Wine-making Countrys, an Hogshead, or Oma, is sold but for twelve Imperials, and you have of six Hogsheads of thin Wine, made four of better, and each of these you sell for but 12 Imperials, yet you shall have 48 Imperials, out of which substract your 19 and ½ Charges, you shall have clear Gains 28 Imperials, and ½. But I have set a most low price on this Wine, for in such places which are about some 40 Miles from those Countries, in which abundance of Wines grow, an Hogshead, or an Oma, is not usually sold at the Rate of 12, but of 24 Imperials. The gain therefore of about a Wayn-load of such a thin Wine, which haply would have corrupted with lying, and never yielded any profit, doth at the least yield above fifty Imperials.

Every one now may easily see how much Gains this Artifice of the Concentration of Musts doth bring. For besides this Commodity arising from this Labour, *viz.* That the Musts being presently sold, yield ready Money; there is this also, that the Money being again presently disburst, opens the way for the next years profit. The Merchant also has this benefit by this Labour, that he is not enforced to pay so much Water's carriage so long a Journey; and that he may even at his pleasure make his Wine more or less strong and efficacious; for what a deal of profit is this, for to have all the Wine of six Hogsheads, carried in one Hogshead.

Besides, the Merchant doth not only gain the price of the carriage of those five Hogsheads, but also is quitted of the fear of the Carter's corrupting, or spoiling that Juice by the way, as is usual with them to do with Wine, drawing it out, and filling up the Vessels again with Water. This danger these Juices are not subject unto; and may be kept in great plenty in fruitful years of Wine, until you need them. For they are not wont to be corrupted, if they are but kept in pure, and well shut Vessels. By this means every Vintner may in such exceeding plentiful years, furnish himself with a great Treasure, and store of Wines, and so afterwards, when a dear year comes, reduce his Juices into Wine, and enjoy a great deal of profit.

I have to this end described this so famous an Art, that the common Vine-Masters, may have present sale for their Musts, and not be enforced so long to keep them, till some Carrier comes and enquires after Wine, but may presently get their Moneys, and may profit themselves by bestowing them to the use of their Family. So then, it fares not only well, which the Vine-Masters, and the Merchants, but also with all such as dwell in those places which yield no Wine, because by the benefit of this Medium (or Artifice) they may also drink Wine at a cheaper rate. For if any Honest Citizen provides himself with an whole

Hogshead, or half an Hogshead of this Juice, he may turn it into stronger, and weaker Wines, and all times of the Year make new, and as yet fermenting sweet Musts, whensoever he pleaseth, and as oft as his need requires; and may by the apposition of Spices, or Herbs, make Aromatical, or Physical Wines; which thing cannot be effected without these Condensate Juices; forasmuch as Sweet *Musts*, cannot be carried by Land to any other place, for that they presently ferment, and boil up, and will either break out of the Vessels, or rend the Cask, and be lost, which (by having these Juices) is not at all to be feared. I do therefore think that I deserve exceedingly well of very many, by the faithful manifestation of this Artifice; which deed of mine, whether it be praised, or dispraised, yet will it not be despised by such men as shall apprehend, and perceive the benefit and Commodity of so great an Artifice.

It remains now, that we also describe, and set afore your Eyes the Instruments and Vessels serving to this Condensation, (without which, this Concentration cannot be effected) and withal shew the manner of proceeding, which is to be thus ordered.

In the First place, provide a Copper of such a bigness as you shall judge needful for the great, or less quantity of Juice you have; let it have a plain and even bottom, and let it have the sides about a Span high, and get it well Tinned over in the inside, and not Leaded, the which Vessel you must put in a Furnace of a sizeable bigness, and so order it, that being set in the Furnace, the Flame may come but only to the bottom, and not be able to touch the sides. The Walls of the Furnace are to be some two foot high, and must have an Iron front, or Stone Door, serving for the putting in the Wood, and registring the Fire, by opening and shutting it. At the backside is to be an hole of such a bigness, as may suffice for making the Fire burn by the access of the Air, and for carrying away the Smoke and Flame. But it must be so ordered, as to be covered with a broad stone, if need be, that so the fire may on such wise be regist red, that the Juices may not boil over by the overmuch fire, or taste of burning. These Juices are to be so long boiled with the wood, until they begin to wax thick, and then more new Must is to be thereunto added, this addition is to be so long made, and so often repeated, until the Copper be almost filled with those thick Juices. Then the holes of the Furnace that serve for giving air, are to be shut both above and below, that there may be no flame under the Copper, but the bare *heat* of the fire, and a sweet and gentle warmth, which will bring the Juices by a sweet decoction to the consistence of Honey, and will condense them without any adustion, insomuch that they will become as sweet as Sugar.

These Juices, you may let out by a Pipe, or Cock placed near the bottom of the Vessel, and shutting it again, pour in more to be condensed after the same manner, until all the Musts are condensed; but you must not presently put the Condensate Juices, assoon as ever they come hot out of your Copper, into your Barrels, but let them run first into some wooden Vessel, and be there left so long till they are cool, then put them up in your Barrels, and shut them up tight, and so may you keep them whole and sound, and free from Corruption, even as long as you list: For if you should put them hot into your Barrels, and so shut them up, the Barrels would burst, or else when you open them, would (by reason of the pent-up Vapours, which can have no exhalation) break or run out.

NB. And here comes a notable Secret, which I think good to add. When the Juices have rested some two or three weeks, and be afterwards dissolved with warm water, the residue of the Tartar which would have made the wines acid, will fall down undissolved to the bottom, in the form of small and big Crystals, and being washed with common water, may be used instead of Tartar forasmuch as it is nothing else than a meer absolute Tartar. Now this separation of the Tartar, is of great concernment as to the Wine, for it thereby becomes much better than if those Crystals had remained dissolved with it. Nor is any thing lost by this means, for that the Tartar is of as much value as the Juices: And besides, the Wines will be by this means freed from their acidity, and rendred better and sweeter; which thing verily deserves to be esteemed of as a great and profitable Artifice; and which, many there are that will know to use it to their great profit.

Verily, he that is of so dull an Apprehension, as not to be capable of understanding these things, that are so clearly, and evidently manifested, will not be any whit the better by larger Discourses. But he that has a desire of setting about this work, will insinuate, or work himself by a farther Meditation into the inmost centrality as 'twere of this so great an Artifice, and will with a far juster mind bear with me, in that I have not so much time at present, as to use a more prolix, or larger Stile.

But if so be, any do desire to have this Artifice declared unto him, by a more clear delivery, let him read my Explication of the Appendix adjoined to my Fifth part of the Philosophical Furnaces; as also the Vegetable work, and there he shall find more such Artifices. Or if haply it concerns him, he may see in my Laboratory, the Furnaces and Coppers requisite to such a work, together with the Manual Operations.

I am even constrained briefly, and as it were by the bye, to insert thus much, that if some more than usually unskilful Men cannot understand those things which I have declared concerning the three Principles, *viz.* That all Wine must needs consist of the same, to wit, Salt, Water, and Spirit; I dare boldly and confidently averr, that he who knows how to conjoin (according to art) these three Principles, may every where make good Wine.

NB. But yet I would not have such an one perswade himself that he can do any good, if he mixeth Tartar, Water, and Spirit of Wine together, no, no, that is not the way for him to be Master of his desire. There are far other-guise Manual Operations, requisite to this Artifice, and such as I think it inexpedient to manifest in this place. Let every one be content with the things at present shown him, haply God will sometime or other bestow (on him) better.

CHAP. II.

Treateth of Corn: Shewing what means it is to be Concentred, and Condensated by, so as to be Exported in great Quantities into other Countries, whereby both Gain and Moneys may be thereof made.

I Have instructed you in the foregoing Chapter, after what manner such VVines as are of a mean price,

price, may by the help of Concentration be conveniently transported out of one Country into others more remote, where no Wines grow, and produce good profit. The which Artifice may be of most great benefit to the Inhabitants of such Countries as abound in Wine, and want sometimes Chapmen or Merchants for the same.

'Tis very well known to every one, that in most places of *Germany* (but especially in *Franconia*, and in the other Countries adjoining) Corn is so exceedingly plenty, and of so vile a price, that the Inhabitants know not what to do therewith; and for that reason it lies and rots in their Barns and Granaries, the exceeding abundance thereof either hindring the sale of the same, or the great costs and charges of Carriage hinder the Transportation of it into the lower Countries of *Germany*, where 'tis dear enough.

Hence comes it to pass, that the miserable Inhabitants have indeed Wine and Corn enough, but want Moneys to pay the Tributes due to the Magistrate; so that tho' they have such plenty of the Divine Gifts, and so much Riches, yet for all that they are in great penury and want, in that they cannot sell off so much as to pay their Family's expence, *viz.* Men-servants and Maid-servants wages, or so much as to sustain them. Verily, this is a punishment from the hand of God, and a singular one too, by which he corrects us ungrateful men. In time of the Wars, when a huge Scarcity pinched the Inhabitants of *Germany*, then the common outcry went up to Heaven, and promised largely an amendment of life; but when the War was over, and all quiet, and a most wisht-for Peace returning, then all men generally became worser, and more wicked, tho' the goodness and bounty of God had bestowed on them such a great plenty of things so exceeding necessary: And now such great Fulness being enjoyed, they now gape after Money too, and murmur against God, as the *Israelites* did, who loathing, as 'twere, the plentiful abundance of things necessary, murmured at *Moses*.

The reason why Corn is so exceeding plenty, is this: After the making of Peace, and sending away the Souldiers, many Commanders being weary of warfare, and abounding with Money and Horses, bought (or rather squeez'd out) of the poor Inhabitants, every where destitute of Money, most notable Farms, for a very mean price, and did set themselves with the utmost of their Industry to till the Earth, which had lain fallow a long time; which Lands became so fruitful that it even amazed all men. The poor Inhabitants too, who now had gotten a little Money, they also set their hands to the Plough, and used even the utmost of their endeavours in the tillage of the Earth: From hence it came to pass, that they were so furnished with such a vast deal of Corn in a few years space, that they knew not at all what to do therewith. As for carrying it into far distant Countries, the troublesomeness and charges of the Carriage were too great an hindrance: To lay it up in the Granaries, that the Air will not suffer them to do, tho' in the time of *Joseph* such a thing was done in *Egypt*, where the Air being Nitrous, dry, and not so easily subject to corrupting, as ours is, preserved the Corn from Corruption.

What I have here written, hath proceeded forth from a good mind and sincere intention, and I hope 'twill do more good than hurt. I know that the eyes of many will be opened to see what a *Babylonish* Confusion the present World is in; I pray God to be an helper to the Good, and to be a reducer of the Wicked from the course of their Impiety, into the Right way.

The Process of Concentrating Corn is this:

IN the first place, you are to make a Malt of your Barly, Wheat, Oats, Spelt, or any other kind of Grain or Corn, the which dry either in the Sun or in the Air, or else in an Oven heated a little, and not to be scorched and parched as it were after the Brewers custom; for so the sharp fume of the wood would stick thereunto, and make it black and bitter, and it may easily be conjectured, that there would be no good come of it, for by this means the smoak of the wood would stick on to the Corn and the Sprouts it has thrust forth, and are moistened, and so would make the Ale that is boil'd thereoutof unwholsome, and of an ungrateful bitter savour: But now such Malt as is dried in the Air, Sun, or in a warm Stove or Oven, has no such ungrateful taste as comes from the smoak of the wood, but remains sweet and pleasant.

NB. Else you may do thus; The Corn, after it hath sprouted and hath been thrown abroad on some Floor, open to the air, and thereby been a little freed of some of its moisture, may be dried purely and quickly too in the Brewers great Coppers, in which they are wont to boil their Ale or Beer, provided it be continually stirred about with some wooden stick without ceasing, that it may be all over hot, and so become dry. But yet you must have a care that your fire be not too strong under your Copper wherein you dry your Malt, and so burn the Corn, and make it taste untowardly; this done, the dried Malt is to be ground as other Malt which is used to make Ale withal is wont to be, but yet so, that it be not too finely ground nor too grosly; for if it be too gross, and the Grains be unbroken, the water cannot sufficiently get out the Virtues and Juice in the boiling, but that the best part will remain in the boiled Grains, and so be thrown away on the Beasts in their nutriment; but if it be ground too small, it will run into heaps, and hinder the straining out of the Ale; therefore a mean is to be observed, and care taken that no errour be committed, by either excess or defect. The Malt being on this wise prepared, every one may boil his Ale according to his custom, and so much thereof as his Vessels, Coppers, and Coolers will admit of: Some do pour boiling water on their Malt, and mix them both by stirring them well together, and then let them settle for some time that the water may take into it self the strength of the same; then they draw out that water by a Tap, and pour on more, and repeat the Infusions so often, until the water can get out no more sweetness, and there remain nothing but the insipid Husks, the which are nourishment for Cattel.

NB. Othersome that have no Vessels to extract the Virtue out of the Malt in, by boiling water, do put the prepared Malt in wooden Vessels or Tubs, and pour thereon warm water or cold, and stir it very well about, and leave it so for some hours, that the Malt may be macerated; then do they put it in a Copper, and pour thereunto so much water as may keep the Malt from burning to in the boiling; and having boiled it for half an hour, they pour it out upon a bed of straw, fitted for that purpose, and placed over a Cooler, and so strain the Ale: This Labour of pouring on, boiling, and straining, is so oft repeated, till the water sucks no more sweetness out of the malt. This manner of boiling Ale is used by those only who want store of Vessels, and pretty large ones: The former way is not only better and more commodious, but likewise more fit for the boiling of a greater quantity of Ale.

NB. This

NB. This is to be obſerved in this place, when the beſt and firſt Juice or Extraction is drawn out of the Veſſel by a Tap, and freſh boiling water poured a ſecond time on the malt in the Copper, and again drawn off by the Tap, thoſe two waters in which the chiefeſt Virtue of the malt is, may be boiled and thickened by little and little in a plain or flat Copper. The third and fourth pouring on are indeed as yet good, but yet not fat enough, and ſeeing they are not very ſtrong, are not worth the boiling away, for they won't quit the coſts of the Fire, and therefore are to be applied to ſome other uſes. Now when a man is about this work, he may ſo order his boilings, as to have ſeveral of them one after another; and then thoſe pourings on, *viz.* the ſecond and third, remaining of the firſt courſe of boiling may be poured on the ſecond courſe of boiling, in the ſtead of bare water: And ſo is it to be handled, that alwaies the firſt and ſecond pouring on (and which contain in them the chiefeſt Virtues of the malt) may be boiled to the conſiſtency of Honey in a Copper made for that purpoſe, of Evaporation; and the third and fourth pouring on may be alwaies kept for the next following courſe of boiling, and be poured on the malt in the room of bare water, and ſo are to be condenſed by evaporation in a Copper, as the firſt and ſecond pouring on were done withal in the firſt courſe of the boiling; and ſo always the 3*d.* and 4*th.* pouring on of the former courſe of boiling, is to be the firſt and ſecond in the next following courſe of boiling; and this way of proceeding draws out of the malt its beſt and chiefeſt Virtues, and leſſens the charge of the boiling: For the Coſts would be far greater, if the third and fourth pouring on were to be boiled off *per ſe*.

NB. The Coppers and Pans neceſſary for the thus reducing theſe extracted Juices to the conſiſtency of Honey, are already deſcribed, where mention is made of the Concentration of Wines. He that can't well enough underſtand me, may take the pains to come and ſee my Furnaces, Coppers, and other Inſtruments appertaining to this work; as likewiſe the manual Operation, for I cannot help him any other way. And as for a larger deſcription of theſe things, my time will not permit me at this inſtant to make it. The Juices being condenſate, are to be drawn out of the Copper by a Tap faſtened therein, or laved out, and being cool, put them up in Barrels, and ſhut them up tight, that the external air may not get thereinto; for thus may you keep them uncorrupt, even as long as you pleaſe.

NB. In your boiling them you muſt be very diligent that the Juices be not burnt to, by the overmuchneſs of your Fire, or that by being heat too hot, they boil not over; all which may be prevented by Regiſters (as the *Chymiſts* call them) deſtinated for the regulating of the Fire. This is a moſt compendious way of extracting the Virtues out of Corn, and of reducing them into a narrow room, the which if you order according to Art, that nothing of your Juices be ſpilt or loſt, 8 Barrels of Malt will yield you one full of Juice, and which contains all the Virtues that were in thoſe eight Barrels; the reſidue ſerves to fatten Beaſts withal.

NB. He who knows how to convert thoſe remains to his uſe, in another kind of way will do better, and extract thereoutof ſo much as he is conſtrained to lay out in buying his Corn, inſomuch that he can have his Juices as it were even *gratis*. But of theſe things more hereafter.

As touching theſe Juices, they comprehend in them the whole Virtue of the Corn, out of which you may when you pleaſe boil Ale, make Aduſt or Brandy-wine or bake ſpiced Cakes; for if it be uſed to them inſtead of Honey, it makes them much the ſweeter. Theſe Juices therefore are to be prepared in thoſe places in which Corn is ſold at a very mean rate, and which cannot be exported to foreign parts, and is there in ſuch great plenty, as that the Country-men know not what to do therewith, but there it lies in great Stacks and rots. Farther, they are yet prepared with greater benefit and more gain where the plenty and cheapneſs of wood is, the which yields no ſmall encreaſe and addition to the Gains.

But that the nature and condition of this Labour may be the better underſtood, the following Computation will ſhew. Suppoſe I take 8 Barrels full of Corn and bring them into Malt, then boil it into Ale after the aforeſaid way, and condenſe it into a Juice, wherewithal I fill one Barrel: This one Barrel now is far more commodious to be carried into foreign places either by Waggon or by Ship, than thoſe 8 barrels, and will bring me double or treble the profit that 8 *Medimni* (a Meaſure containing ſome ſix buſhels, or the eight barrels) of Corn. Why? becauſe the greateſt labour is already over, and there remains but very little to boil the Ale out of the Juice, as the following Example will demonſtrate.

I buy me eight barrels in that place where Corn and Wood are to be had at a mean rate, and there paſſeth ſome River or other by the place, as the *Mhene* in *Franconia*, *Nicer* in *Suevia*, *Viſurgis* in *Haſſia*, and the Dukedome of *Brunſwick*, *Albis* in *Saxony* and *Miſnia*; for in all theſe places there is abundance of Corn, and ſtore of Wood, and the price of each, mean enough in conſcience. If now one *Medimnus* (or ſix buſhels) of Corn be eſteemed at the price of one Imperial, eight *Medimni* will yield eight Imperials; the Wood will coſt one Imperial, the Labour one Florin: The juice out of the 8 barrels of Corn may be put in a Fir-Cask, as they uſe to do with Honey, that ſo in paying the carriage, it may not be accompted for Wine or Ale, but ſome dry Goods, and ſo valued by the hundred, as other dry Wares are priced; ſo then the Barrel will coſt the Carriage by Water to ſome of the Maritine or Sea-coaſt Cities, two Florins. Now if we ſum up all theſe Expences upon the Corn, Carriage, Fire, and Labour, they come to 12 Florins or 8 Imperials. But now, out of that one Barrel of Juice there may be made eight Barrels of the beſt Ale, and if you will have it ſomewhat ſmaller, then 'twill make 10 or 12, according as you boil your Ale to a ſtronger or weaker degree. However, this is certain, that one Barrel of Corn will yield more than a Barrel of good Ale; ſo that out of one Barrel of Corn may be made one and an half of ſtrong Ale. Now then, if one of thoſe Barrels of Ale yield three Imperials, the eight Barrels, which coſt the buying, and reducing into one Barrel, and the tranſporting it, eight Imperials, may there be ſold for 24 Imperials; from which the eight being ſubſtracted, the remainder of the Gains is 16 Imperials, which verily is enough upon thoſe 8 Barrels.

But put caſe the Corn were dearer, and the Carriage of the Juices to thoſe places did coſt more, and that thoſe 8 Barrels of Corn, or one Barrel of Juice, did yield (beſides all the coſts) only 8 Imperials profit, yet would this be profit enough, and may well content a Man. I forbear to mention the other benefits and profits ariſing over and above beſides this Gains; for by this kind of way is ſaved and made vendible that Corn which would elſe be ſpoiled: Beſides in a plentiful time the mean-prized Corn may be bought up, con-

concentrated and kept till a scarcity come. Nor is there any cause of fear that it will be devoured by the Mice and Rats, or be spoiled with lying, or wax mouldy, or be any other way corrupted.

Nay more, it occupies less room than the Corn would; for where one Barrel of Juice lies, there should have lain eight Barrels of Corn.

Besides, the Magistrates and Subjects may by this means reap much profit and help. The Magistrate may be satisfied by taking Corn of the Inhabitants instead of tribute. The Subjects may by the benefit of this Medium satisfie the Magistrate, and there will not need the selling his Cattle, or Sheep in the Fold, or to borrow Money upon use, and to give his Wife and Children for pledges. For there is requisite no other labour than that the Magistrate appoint a place to boil his Ale, in which the Corn may be malted, boiled and thickned into Juices. As for Wood, that he has himself and needs not lay out a farthing upon that. So now, by this means may a Country be brought to that degree of happiness as never to want Money, Corn, or any other necessary things. For where the Juices can be but brought to the Sea-towns many thousand Barrels full may be sold to those Magistrates and Merchants which send their Ships into the *East* and *West-Indies*; in which Countries may be made good Ale at any time of the Year, even in the midst of Summer, or in the Dog-daies themselves, if you have but Hops and Water at hand; the which is far better and more profitable.

For in the room of this one Barrel of Juice, there must have been stowed 8 Barrels, and yet that sometimes turns sour too, and is spoiled, the which never betides these Juices. Now such Ale prepared of the Juices by means of Hops and Water are much wholsomer than the common Ales are, because that the Fire hath consumed all the Crudities; in the boiling of the Juices or hath corrected them, and this every one will readily believe or assent unto.

Nay more, these Juices may (and that with very great profit too) be sent into those places wherein (by reason of the abundance of People there) Corn and Ale is much esteemed, as in *Holland*, and the bordering Countries. If the Ale-brewers could but once get such Juices, without doubt they would not be at the costs to brew it out of the Corn, for they would not need so much time to brew in, nor such Coppers, nor so many Mens help, all which they must necessarily have in the common way of brewing. In these Juices, there is much sparing of Fuel, (the which makes the common way of brewing Ale, more costly,) and of Men's labour which doth likewise prove chargable. Nor are we silently to pass over that great benefit which they have hereby, for that good Ale and such as will not sour may be made without any danger even in the midst of the Dog-days. Every one knows what it is to brew Ale (then,) and that the brewing is at other times sufficiently troublesome, *viz.* so to order it as to prevent the danger of souring. But now this brewing (that I mention) is void of all this kind of fear of souring; whereas the usual kind of brewings do for the most part (in the Summer season) become sour either in the straining it through the Grains, or by standing in the Coolers: but these labours are in our brewing already dispatched, and that in those places where the charges of Labourers, Wood, and Room fit for boiling it in, are not so great.

This work therefore is of mighty profit both to the buyer and seller: For the seller can afford his Corn at a reasonable rate. And the buyer need not be at any other charges in brewing good and wholsome Ale at any time of the Year save only the hire of one man that may prepare or sit the Juices, and Hops, and Water for the boiling, and set it a-working or fermenting and pour it into the Vessels. Whereas on the contrary in the common brewing of Ale there needs many mens help, huge Coppers, and wooden Flats and a great deal of room to brew in, and store of Fire which is sufficiently dear in some Countries; all which are avoided in the brewing with the Juices. Do but consider I pray what a notable and profitable thing this would be in great Cities, and especially in those places where Houses, Fuel, and Mens labour are very dear, if such kinds of Juices were set to sale; that so every Master of a Family might buy up some Barrels of this Juice, and dissolve them at his own home with Water and Hops, in a small Copper according to his pleasure, and make the said Juices into Ale, as fat or as lean or small; and as bitter or as sweet as he listeth; and then put it up in his own purified and well cleansed Vessels, and he and his, drink thereof all the whole year; and if need be, might make either Physick-drink or Spiced-ale. And would it not be much better than the buying such Ales of the *Brewers*, which are sometimes either too new or too stale, and oft-times acid, impure, not well boiled, and stinking, and instead of Hops have Aloes, Xanthium or Burr, Henbane and such like Herbs put in them. For in some places, the *Brewers* use such kinds of Herbs and the like hurtful things, instead of Hops, to make their Ale bitter, and to save a few charges in the making their drink. Therefore all such as use to drink of such kind of Beer are never wont to be in compleat health; and especially in watery and moist places they are for the most part afflicted with the Scurvy, Melancholly, *&c.* which is the usual fruits of such kind of Drinks, for they obstruct the internal parts of the body and the principal members, and stir up such Diseases. But our Ales that are made of the Juices and good Hops do not only not stir up such Distempers, but do even (by their purity and clearness) resist them, and preserve men from them; but especially if such Juices be made of such Malt as has not a smatch of the smoke of Wood, but is dried in the Air, and which are so handled in the fermentation or working of them as that all the defilements settle to the bottom; for then will you have such Ale, as doth both in wholesomness and sweetness exceed such Wines as are infected with, or have a tang of, *Sulphur*, or that grow in a soil abounding with Chalk. They dull not the head, they do not cause windiness, they puff not up the body after the manner of other Ale; they do not stop the Urine but provoke it, and keep the Belly soluble: They are Medicinal without the addition of Physical Herbs, are sweet and wholsome, and of an excellent taste, and such as the like of them cannot be made without this medium or way.

Such Ales deserve a peculiar praise, and many would there be who would drink of Ales often, could they but get such: and would leave off the drinking troubled, unwholsome, and sulphured Wines. For my own part I will make use of such kind of Ale, and Wine, in my own house for the sustaining of mine own Family.

I could mention much more concerning such Ales if the time would permit me, but I have spoken enough already. And as for what remains unwritten here, may be gotten out of, (or understood by) the things here described. I question not but that good (or provident) Masters of Families will set about this

buſineſs of preparing theſe Juices, and of ſending them into ſuch places where they may be ſold to Ships that are bound for far Countries, and ſo mightily enrich thoſe Countries with ſtore of Money that abound with Corn.

Beſides, the *Brewers* of Ale or Beer that are in great Cities will not diſdain ſuch an excellent Art, but will themſelves buy ſuch Juices at a conſiderable rate.

Princes, Nobles, and great Cities, will alſo provide (or buy up) great quantities of ſuch Juices, and lay them up in their Forts and Caſtles, and in their Store-houſes as a good Treaſure, that ſo they may have it to uſe in time of neceſſity. Nor will good (or provident) Houſholders neglect to furniſh themſelves therewith, that ſo they may have wherewithal to ſuſtain them and theirs in a time of ſcarcity.

In the time of Wars, eminent Captains and other Military chieftains will take care to have them, and carry them into their ſtrong holds, and there looſen them (or put a proportionable quantity of Water to them) and turn them into good Ale; as for Water, there's to be found (enough) of that every where, and ſo need not ſtore up that, and as for Hops that is eaſie enough to be bought.

So then, there will be a notable benefit by this Artifice to ſtrong Holds and Caſtles, and ſuch fenced Places as fear a Siege. Briefly, Words cannot expreſs the benefit and profit which will redound to all places, by theſe Juices, in times both of Peace and War.

Therefore every Magiſtrate who has a care of his Subjects health and preſervation, will worthily and with his utmoſt diligence carefully provide for the having ſuch prepared Juices, that ſo in times of neceſſity they may be at hand for uſe.

But now, ſome may object and ſay; I perceive and well ſee that this Artifice is good and profitable, but 'tis not ſo eaſie a matter for every one to purchaſe himſelf Coppers requiſite for this work? To ſuch I anſwer. 'Tis not ſo needful that every one ſhould furniſh himſelf with ſuch (utenſils); if there be in every City but one man only that is imployed thereabouts, who may buy off his Neighbours Corn and pay them their Money for the ſame, 'tis ſufficient. And if others alſo betake themſelves thereunto, there will be the more Money gotten, and the Country made the richer; neither is any reaſon to fear or doubt, but that, if he ſhall bring eight thouſand Barrels of Corn condenſed into a thouſand Barrels of Juice unto the Cities on the Sea coaſt, he will ſell it off for ready money. Will a thouſand Barrels (think you) be ſufficient (or be a drug) in ſome populous City wherein are daily drunk ſome thouſands of barrels of Ale? Verily he that ſhall expoſe to ſale in ſuch a like City many thouſand Barrels, would not ſtay long there, but would be loaden (or furniſhed) with ready Money for the ſame, by thoſe who knew the Art of making Ale with ſuch Juices.

I do verily believe that it would be altogether much better to ſell Corn after ſuch a manner, and ſo to have profit by it, than let it periſh with lying; which is a great ſin before God, and a ſhameful diſgraceful thing before Men.

But further, It may be objected and ſaid. If this Artifice of making Ale were ſet up in thoſe places, in which there is wont to be a certain Tribute paid the Magiſtrates for every Barrel (of Ale,) it would not be allowed of, becauſe by this means the Tribute or Cuſtoms due to the Magiſtrates would be diminiſhed. This inconvenience is eaſily prevented, if the Magiſtrate impoſe the ſame Tribute of Ale on the Juices. For by this means the Tributes or Cuſtoms would not be at all diminiſhed, but be equally as profitable upon the Juices, as upon Ale. The like may be done with the condenſate Juices of Wine.

So then 'tis clearly evident, that there cannot poſſibly ariſe any detriment from theſe Juices, but rather infinite profits and commodity. And therefore every Magiſtrate ſhould ſeriouſly cauſe his Subjects to make theſe kind of Juices of ſuch Corn as they cannot ſell, and inſtead of ſpoiling it get riches by it. Certainly this would be far better, and far more profitable for ſuch Subjects as are very poor and go miſerably tattered and naked, and have nothing to help themſelves (of which ſort there are not a few.) Verily there would be no want of any thing, but the Subjects as well as their Rulers would have enough: And for this reaſon have I willingly undergone this trouble and this labour in manifeſting and laying open this Artifice.

And although I am not to expect any reward from any body for manifeſting a thing of ſo much concernment (for this is an unthankful World) yet have I obeyed the will of God and have out of a Chriſtian love benefited my Neighbour, and in this well-doing do I reſt, no ways doubting but that God the rewarder of every good (action) will recompenſe in another place, this my well-doing which I beſtow upon the World.

Farther, I can in a kind of a Prophetical manner predict, that if regard be had of this my wholſome Doctrine and Admonition, many Countries will in a very ſhort time recover their former happineſs, and both the higheſt and loweſt will live in a proſperous condition; but eſpecially thoſe who firſt ſet upon this buſineſs afore it becomes common, will get great riches. Now then, whoſoever they be that by the help and benefit of this way ſhall get the bleſſing of God, let them not forget the poor, but beſtow that bleſſing on the cherriſhing and comforting poor Orphans and Widows, to the Honour of God. For the Treaſures and Riches in this temporal Life cannot be better laid out, and laid up, than in diſtributing them amongſt the poor. For by that means there's no fear of being ſpoiled of them by Thieves and Robbers; And more, in the Life to come, they ſhall be recompenſed with a ten-fold reward.

CHAP. III.

Of the Concentration of Vegetables.

WE have already taught in the two foregoing Chapters by what means Wine and Corn are to be by an Artificial condenſation reduced into a narrow compaſs, and brought to be a gainful Merchandice. It now remains to ſhew the way conducing to a condenſation of the Virtues lying hid in Herbs, Buſhes, Shrubs, and Trees: (which Vegetables do moſt plentifully abound in moſt places and yield no profit) that ſo even out of them as well as from Wine and Corn may be reaped a very great profit. No body is ignorant of this, *viz.* That there is nothing more vile and of leſs eſteem than the Graſs (or Herbs) of the Field, and Briars or Buſhes, and Shrubs, and lofty Trees too, eſpecially when being at a good diſtance from Men's dwellings they cannot be applied to any uſe, and upon this account are they not valued at all,

nor

nor by reason of their distance profitable to any, but there they grow and perish in those vast woods and desart places. And this is to be seen in those most huge Woods of *Germany*, such as are the *Ingriones*, the Wood *Ardenne*, the *Ottonicane*, *Hercinian*, *Semane*, and *Bohemian* Woods, and the woods of other Countries, in which woods there rots and is spoiled above tentimes more wood than men make use of.

Now no body hath hitherto known what use to put those Woods unto; such Woods as are not too far off from Cities or Villages, do Men make use of for building, for firing, for boiling, or brewing, and for baking, and other occasions, so that the Wood which is daily used, and every year fetch'd from the bordering Woods or Forests, is thereby saved from rotting and being spoiled.
